

Tomi Huss-Shetler

Tuesday

Hello Group D!

We have chosen the topic of electric cars.

Environmental ethics according to the Stanford Encyclopedia of Philosophy is the discipline in philosophy that studies the moral relationship of human beings to, and also the value and moral status of, the environment and its non-human contents.

So far here are my ideas on the questions presented above. Please add your ideas as well!

The key problems related to electronic cars are: rapid wear of battery, the battery capacity only allows for short distances, lack of electric stations for charging, and sitting in traffic.

The key elements of your project: pros and cons lists in areas such as economics, environment, manufacturing, and finances.

Team responsibilities: Everyone has their position and we are also splitting up the areas above to research.

What will be our strategy? We have a group text and I assume we will set up a weekly meeting and continue to post in the group discussion board.
