Hello Everyone,

Environmental ethics in the contemporary moment means to use our knowledge and technology to live our lives in a way that respects the environment and everything in it and to reverse the damage we have done to the environment when we were ignorant of the effects of things like air and water pollution, using all our nonrenewable natural resources, and deforestation. Or as our lesson says "environmental ethics can be described as an ethical system that considers ethical impacts beyond human experience, and it incorporates the natural world" (Harrison, 2021)

Hello Class,

We can describe environmental ethics in this contemporary moment as a number 1 priority. As the days go on the world becomes more polluted, whether that be the ocean waters being filled with trash or oil from ships to the atmosphere having all the carbon dioxide from manufacturers or vehicles polluting the air. So in this contemporary moment, we strive to make technological advances in the world that allow for not only the evolution of new technologies but be able to save the environment at the same time. Some of the main advances in today's world would be moving from fossil fuels to electric-powered vehicles with leading brands such as Tesla or NIO. It's important to understand that as technology advances, we are continuously attempting to find new ways to save the environment because obviously, we want to survive longer on this planet as a society but many don't really grasp that concept. In short, I would define environmental ethics at this current point in time as a number one priority to think about when making technological advances in upcoming technology.
