

ASCI 615 - Module 7 Discussion: Aircraft Systems

So, you have been given access to numerous industry resources and no doubt you have discussed other appropriate resources with your instructor and your fellow students. Your task in this discussion is to select a specific aircraft system such as the fuel system or hydraulic system from an aircraft which you are familiar with. Then you want to analyze and discuss the system from an investigation process perspective. Hint: Critical thinking skills are good to apply at this point. One good idea is to provide various examples of accident investigations that demonstrate different investigative techniques for this system or this aircraft.
