

ASCI 615 - Module 9 Discussion: Was It an Organizational Issue?

Accident investigators have a variety of different tools that they use when looking into the causes of crashes. These include doing interviews with individuals that were involved with the event, reviewing records, looking at aircraft documentation, and also evaluating weather conditions at the time of the incident. Some of the tools that they may also use are looking at operational procedures, the airport layout, air traffic control, as well as maintenance records and maintenance practices at a particular operator. Investigators use that to try to piece together what exactly happened and why.

In this discussion, make sure you not only reply to at least one peer, but, considering that this is the last module of the course, try to tie in as much as you can about what you have learned so far.
