

Author's Notes after the Reference page.

Beyond that, let me give you a series of comments and suggestions taken from experiences with student papers and the need to write assignments for this course.

Paraphrase the critical research as much as possible and use direct quotes when it is the only best way to give the information.

Begin with a **thesis** or purpose for the paper giving the reader a heads up on what to expect. Write in an organized fashion that builds from the general to the in-depth specifics with a scholarly, neurological discussion of structures and functions around the subject.

Include epigenetic influences and theories as well as research and treatments. **Focus on the neuroscience in the brain.**

End with a **conclusion** that summarizes the salient points you have given in the text writing.

Give **citations for everything that is not common**
