explicit power which displaces generalizations is a new and stronger form of individuality. Bonetou's work has an individuality equaled in the work of only a few artists. These are mostly Americans, the various American hierarchies are bad enough, but apparently those elsewhere are worse.

''New York Notes''

Art International, May 1965

So far, mechanical motion hasn't been used much more clearly than the other phenomena. It will be an important aspect of art but isn't yet, and it isn't developing quickly. Motion is usually either subsidiary or occurs in a context which suggests scientific experiments. There is less wrong with Len Lyne's use of movement than with anyone else's in the United States. Lyne is sixty-three and has been using motion, according to the Howard Wise Gallery, since just before Gabo used it in 1920. Lyne must not have done much with it until recently. At any rate it has been shown only in the last few years. Subsidiary motion is all right but motion can be the whole work. It is pretty much in Lyne's pieces. The most interesting one is a steel band in a loop twenty-two feet in circumference. The loop rests in a catenary oblong. At intervals an electromagnet pulls the upper side down. When it is released the band jumps and rolls back and forth. It's attached only in the center of the lower side. This piece was shown a year or so ago without a suspended ball which, this time, the loop strikes as it jumps. The ball and the sound aren't necessary. They suggest that the movement of the band isn't sufficient. The piece is good because the band is sufficient. Its movement is massive and peculiar. The piece was on a simple trestle the first time and on a better one this time, but that also complicates it. The piece and neither way is so good. The bases, which conceal the machinery, are a problem in the other pieces too. Perhaps they should all be built in the largest work in the show is built into the ceiling. There are three parts, two straight steel bands on either side of a loop of steel. The piece at rest, an oval flanked by two verticals, looks a little magisterial. This is another chronic failing in the use of motion. There isn't much imagery of this kind in Lyne's work, but

some were influenced by him, most notably and extensively Cézanne. Several of the paintings have been damaged by excessive varnish, for example, *La Cote du Chou à Pontaise*, 1882, which resembles Renoir's paintings some. Pissarro's application of paint was fairly dry; the syrup is a contradiction; the damage is as serious as if the painting had a hole in it. One of the fine paintings is *Le Jardin de la Ville, Pontaise*, 1874. It is casual and ordinary, and beautifully composed and colored. A tree trunk runs up the center, across the whole picture, supporting a middling dark area of foliage. The rectangle of foreground is light. The structure of the horizontal wall and the vertical tree is like the structure of many of Cézanne's paintings, the one in Minneapolis for example. Pissarro's painting is earlier of course. Another good painting and a very different one is *Le Chemin de Fer de Dieppe, Eragry*, 1886, which is sparse and influenced by Seurat. The railway is small. The painting is only fields and sky.

There is always a moderate amount of work around like Stanley Twardowicz's paintings at Peridot. It's hard to consider it in only one way. It seems too good and too relevant to reject but it's too conservative and derivative to like. I forget it but that seems unfair. This kind of work is better than most. All of Twardowicz's paintings are resolved. They look like Louis's paintings with vertical stripes and by Rothko's work. There is a wide, fairly flat and dense band down the center of each of the vertical canvases. The edges of the bands have bled into the unpainted canvas. One painting has an olive band with magenta edges. In addition to the new conservation of the derivation, the color, surface and space are somewhat conservative in the old sense. The color and surface and space are somewhat conservative in the old sense. The color and surface are broken a little within the bands. The spatial location and definition of the bands are partially from an earlier context. Twardowicz isn't quite doing what he seems to be doing. He's not at all, as Louis did, he's inserting a separate, older space.

There is a two-man show at the Bridge Gallery of paintings by David Lee and Peter Gourfain. Neither is so unusual but

they're both capable. Gourfain's paintings are powerful but in a way somewhat easy to achieve. Lee's are not as strong, though not weak either. Gourfain constructs large shallow paintings of parts resembling short lengths of thick pipe with flaps on either end. The pipes are black and are modelled in a commercial way to a central highlight. The interstices are white. The wall of volumes is of a little color or composition. Lee, in some of his paintings, is doing something intrinsically more interesting, though doing it moderately, for example, using several shades of yellow together. A vertical painting is divided into three horizontal parts. The top is light, the middle next, and the bottom smallest. Sets of two concentric squares in yellow are painted on the sections as there were no cuts. The yellows at the top are close and those at the bottom divergent. The two cuts run through different contrasts and are thus different themselves.

Robert Huot's paintings are most like Ellsworth Kelly's, except that they are much more geometric than organic. Their simplicity, scale and power is not much less than Kelly's. The relationship may not be one of derivation but there is a common context, one which is fairly familiar, though not so much so that there isn't work within it as good as Huot's. A large painting, *Christ*, has two parallel wide yellow bands, bent at an oblique angle and not extending to the edge, placed on blue. The space between the bands is about the same width, so that the blue there is on the yellow or within it. Most of the forms turn the ground color into an enclosed positive color. One of the best paintings, *Carpiet*, a smaller one, has this to the greatest extent. The apparently positive form is a dull red and the apparently negative ground is a full cobalt blue. The band of red runs near and parallel to the left edge and up on the diagonal of the horizontal rectangle. As always none of the bands extends to the edges. Within that angle there are second and third lines parallel to the diagonal, progressively shorter and also connected to the upright arm. The red pattern seems to knife into the blue. The blue, since it runs between the diagonal lines, knives into the red and into itself. That's not bad. None of this is spatial or illusionistic. It's only a matter of color and arrangement.

first principles or delimiting rules. Three-dimensionality is not as near being simply a container as painting and sculpture have seemed to be, but it tends to be that. But now painting and sculpture are less neutral, less containers, more defined, not undeniably and uncircumscribed. They are particular forms circumscribed after all, producing fairly definite qualities. Much of the motivation in the new work is to get clear of these forms. The use of these dimensions is an obvious alternative. It opens up anything. Many of the reasons for this use are negative, points against painting and sculpture, and since both are common sources, the negative reasons are those nearest common sense. "The motive to change is always some uneasiness: nothing setting us upon the change of state, or upon any new action, but some uneasiness." The positive reasons are more particular. Another reason for listing the insufficiencies of painting and sculpture first is that both are familiar and their elements and qualities more easily located.

The objections to painting and sculpture are going to sound more intolerant than they are. There are qualifications. The disinterest in painting and sculpture is a disinterest in doing it again, not in it as being done by those who developed the last advanced versions. New work always involves objections to the old, but these objections are really relevant only to the new. They are part of it. If the earlier work is first-rate it is complete. New ineffectiveness and limitations aren't retroactive; they concern only work that is being developed. Obviously, three-dimensional work will not clearly succeed painting and sculpture. It's not like a movement; any way, movements no longer work; also, linear history has unraveled somewhat. The new work exceeds painting in plain power, but power isn't the only consideration, though the difference between it and expression can't be too great either. There are other ways than power and form in which one kind of art can be more or less than another. Finally, a flat and rectangular surface is too handy to give up. Some things can be done only on a flat surface. Lichtenstein's representation of a representation is a good instance. But this work which is neither painting nor sculpture challenges both. It will have to be taken into account by new artists. It will probably change painting and sculpture. The main thing wrong with painting is that it is a rectangular plane placed flat against the wall. A rectangle is a shape

which is neither painting nor sculpture. The common aspects are too general and too little common to define a movement. The differences are greater than the similarities. The similarities are selected from the work; they aren't a movement's

Statement

which appeared in "ABC Art"

Art in America,

October/November 1965

One of the important things in any art is its degree of generality and specificity and another is how each of these occurs. The extent and the occurrence have to be credible. I'd like my work to be somewhat more specific than art has been and also specific and general in a different way. This is also probably the intention of a few other artists. Although I admire the work of some of the older artists, I can't altogether believe its generality. Earlier art is less credible. Of course, finally, I only believe my own work. It is necessary to make general statements, but it is impossible and not even desirable to believe most generalizations. No one has the knowledge to form a comprehensive group of reliable generalizations. It is silly to have opinions about many things on that you're supposed to have opinions on. About others, where it seems necessary, the necessity and the opinion are mostly guesses. Some of my generalizations, like these verbal ones, are about this situation. Other generalizations and much of the specificity are assertions of my own interests and those that have settled in the public domain.

Arts Yearbook 8, 1965

Specific Objects

Half or more of the best new work in the last few years has been neither painting nor sculpture. Usually it has been related, closely or distantly, to one or the other. The work is diverse, and much in it that is not in painting and sculpture is also diverse. But there are some things that occur nearly in common.

The new three-dimensional work doesn't constitute a movement, school or style. The common aspects are too general and too little common to define a movement. The differences are greater than the similarities. The similarities are selected from the work; they aren't a movement's

itself: it is obviously the whole shape; it determines and limits the arrangement of whatever is on or inside of it. In work before 1946 the edges of the rectangle are a boundary, the end of the picture. The composition must react to the edges, but the rectangle must be unified, but the shape of the rectangle is not stressed; the parts are more important, and the relationships of color and form occur among them. In the paintings of Pollock, Rothko, Still and Newman, and more recently of Reinhardt and Noland, the rectangle is emphasized. The elements inside the rectangle are broad and simple and correspond closely to the rectangle. The shapes and surface are only those which can occur plausibly within and on a rectangular plane. The parts are few and so subordinate to the unity as not to be parts in an ordinary sense. A painting is nearly an entity, one thing, and not the indefinable sum of a group of entities and references. The one thing overpowers the earlier painting. It also establishes the rectangle as a definite form: it is no longer a fairly neutral limit. A form can be used only in so many ways. The rectangular plane is given a life span. The simplicity required to emphasize the rectangle limits the arrangements possible within it. The sense of singleness also has a duration, but it is only beginning and has a better future outside of painting. Its occurrence in painting now looks like a beginning, in which new forms are often made from earlier schemes and materials.

The plane is also emphasized and nearly single. It is clearly a plane one or two inches in front of another plane, the wall, and parallel to it. The relationship of the two planes is specific; it is a form. Everything on or slightly in the plane of the painting must be arranged laterally.

Almost all paintings are spatial, in one way or another. Yves Klein's blue paintings are the only ones that are unspatial, and there is little that is nearly unspatial, mainly Stella's work. It's possible that not much can be done with both an upright rectangular plane and an absence of space. Anything on a surface has space behind it. Two colors on the same surface almost always lie on different depths. An even color, especially in oil paint, covering all or much of a painting is almost always both flat and infinitely spatial. The space is shallow in all of the work in which the rectangular plane is stressed. Rothko's space is shallow and the soft rectangles are parallel to the plane, but the space is almost traditionally illusionistic. In Reinhardt's paintings, just back from the plane of the canvas, there is

a flat plane and this seems in turn indefinitely deep. Pollock's point is obviously on the canvas, and the space is mainly that made by any marks on a surface, so that it is not very descriptive and illusionistic. Noland's concentric bands are not as specifically paint-on-a-surface as Pollock's paint, but the bands flatten the literal space more. As flat and unillusionistic as Noland's paintings are, the bands do advance and recede. Even a single circle will warp the surface to it, will have a little space behind it.

Jasper Johns, *Large Construction* (1955)

expressive parts, and the rest of the canvas, the plane and the rectangle. The central forms still occur in a wider and indefinite context, although the singleness of the paintings bridges the general and the solipsistic quality of earlier work. Fields are also usually not limited, and they give the appearance of sections cut from something indefinitely larger.

Oil paint and canvas aren't as strong as commercial paints and as the colors and surfaces of materials, especially if the materials are used in three dimensions. Oil and canvas are familiar and, like the rectangular plane, have a certain quality and have limits. The quality is especially identified with art.

The new work obviously resembles sculpture more than it does painting, but it is nearer to painting. Most sculpture is like the painting which preceded Pollock, Rothko, Still and Newman. The newest thing about it is its broad scale. Its materials are somewhat more emphasized than before. The imagery involves a couple of salient resemblances to other visible things and a number of more oblique references, everything generalized to compatibility. The parts and the space are allusive, descriptive and somewhat naturalistic. Higgins' sculpture is an example, and, dissimilarly, Di Suvero's. Higgins' sculpture mainly suggests machines and truncated bodies. Its combination of plaster and metal is more specific. Di Suvero uses beams as if they were brush strokes, imitating movement, as Kline did. The material never has its own movement. A beam thrusts, a piece of iron follows a gesture; together they form a naturalistic and anthropomorphic image. The space corresponds.

Most sculpture is made part by part, by addition, composed. The main parts remain fairly discrete. They and the small parts are a collection of variations, slight through great. There are hierarchies of clarity and strength and of proximity to one or two main ideas. Wood and metal are the usual materials, either alone or together, and if together it is without much of a contrast. There is seldom any color. The middling contrast and the natural monochrome are general and help to unify the parts.

There is little of any of this in the new three-dimensional work. So far the most obvious difference within this diverse work is between that which is something of an object, a single thing, and that which is open and extended, more or less environmental. There isn't as great a difference in their nature as in their appearance.

Robert Rauschenberg, *Odalisque* (1955-58)

ance, though. Oldenburg and others have done both. There are precedents for some of the characteristics of the new work. The parts are usually subordinate and not separate in Art's sculpture and often in Brancusi's. Duchamp's ready-mades and other Dada objects are also seen at once and not part by part. Cornell's boxes have too many parts to seem at first to be structured. Part-by-part structure can't be too simple or too complicated. It has to seem orderly. The degree of Art's abstraction, the moderate extent of his reference to the human body, neither imitative nor very oblique, is unlike the imagery of most of the new three-dimensional work. Duchamp's bottle-drying rack is close to some of it. The work of Johns and Rauschenberg and assemblage and low-relief generally, Oldenburg's reliefs for example, are preliminaries. Johns's lines inside correspond. The stripes are nowhere near being discrete parts.

Rauschenberg's works, such as the goat with the tire, are beginnings.

Some European paintings are related to objects. Klein's for instance, and Castellani's, which have unvaried fields of low-relief elements. Arman and a few others work in three dimensions. Dick Smith did some large pieces in London with canvas stretched over cockeyed parallelogram frames and with the surfaces painted as if the pieces were paintings. Philip King, also in London, seems to be making objects. Some of the work on the West Coast seems to be along this line, that of Larry Bell, Kenneth Price, Tony Delap, Sven Lukin, Bruce Conner, Kienholz of course, and others. Some of the work in New York having some or most of the characteristics is that by George Brecht, Ronald Bladen, John Wilkenbocher, Ralph Ortiz, Anne Truitt, Paul Harris, Barry McDowell, John Chamberlain, Robert Tanner, Aaron Kurloff, Robert Morris, Nathan Raisen, Tony Smith, Richard Nadin, Chas Oldenburg, Robert Watts, Yoshimura, John Anderson, Harry Saviak. Yayoi Kusama, Frank Stella, Salvatore Scaritta, Neil Williams, George Segal, Michael Snow, Richard Artschwager, Arakawa, Lucas Samaras, Lee Bontecou, Dan Flavin and Robert Whitman. H.C. Westermann works in Connecticut. Some of these artists do both three-dimensional work and paintings. A small amount of the work of others, Warhol and Rosenquist for instance, is three-dimensional.

The composition and imagery of Chamberlain's work is primarily the same as that of earlier painting, but these are secondary to an appearance of disorder and are at first concealed by the material. It is neutral at first, not artistic, and later seems objective. When the structure and imagery become apparent, there seems to be too much tin and space, more chance and casualness than order. The aspects of neutrality, redundancy and form and imagery could not be coexistent without three dimensions and without the particular material. The color is also both neutral and sensitive and, unlike oil colors, has a wide range. Most color that is integral, other than in painting, has been used in three-dimensional work. Color is never unimportant, as it usually is in sculpture.

Stella's shaped paintings involve several important characteristics of three-dimensional work. The periphery of a piece and the lines inside correspond. The stripes are nowhere near being discrete parts.

The surface is farther from the wall than usual, though it remains parallel to it. Since the surface is exceptionally unified and involves little or no space, the parallel plane is unusually distinct. The order is not rationalistic and underlying but is simply order, like that of continuity, one thing after another. A painting isn't an image. The shapes, the unity, projection, order and color are specific, aggressive and powerful.

Painting and sculpture have become set forms. A fair amount of their meaning isn't credible. The use of three dimensions isn't the use of a given form. There hasn't been enough time and work to see limits. So far, considered most widely, three dimensions are mostly a space to move into. The characteristics of three dimensions are those of only a small amount of work, little compared to painting and sculpture. A few of the more general aspects may persist, such as the work's being like an object or being specific, but other characteristics are bound to develop. Since its range is so wide, three-dimensional work will probably divide into a number of forms. At any rate, it will be larger than painting and much larger than sculpture, which, compared to painting, is fairly particular, much nearer to what is usually called a form, having a certain kind of form. Because the nature of three dimensions isn't set, given beforehand, something credible can be made, almost anything. Of

course something can be done within a given form, such as painting, but with some narrowness and less strength and variation. Since sculpture isn't so general a form, it can probably be only what it is now — which means that if it changes a great deal it will be something else, so it is finished.

Three dimensions are real space. That gets rid of the problem of illusionism and of literal space, space in and around marks and colors — which is riddance of one of the salient and most objectionable relics of European art. The several limits of painting are no longer present. A work can be as powerful as it can be thought to be. Actual space is intrinsically more powerful and specific than paint on a flat surface. Obviously, anything in three dimensions can be any shape, regular or irregular, and can have any relation to the wall, floor, ceiling, room, rooms or exterior or none at all. Any material can be used, as is or painted.

A work needs only to be interesting. Most works finally have one quality. In earlier art the complexity was displayed and built the quality. In recent painting the complexity was in the format and the few main shapes, which had been made according to various interests and problems. A painting by Newman is finally no simpler than one by Cézanne. In the three-dimensional work the whole thing is made according to complex purposes, and these are not scattered but asserted

by one form. It isn't necessary for a work to have a lot of things to look at, to compare, to analyze one by one, to contemplate. The thing as a whole, its quality as a whole, is what is interesting. The main things are alone and are more intense, clear and powerful. They are not diluted by an inherited format, variations of a form, mild contrasts and connecting parts and areas. European art had to represent a space and its contents as well as have sufficient unity and aesthetic interest. Abstract painting before 1946 and most subsequent painting kept the representational subordination of the whole to its parts. Sculpture still does. In the new work the shape, image, color and surface are single and not partial or scattered. There aren't any neutral or moderate areas or parts, any connections or transitional areas. The difference between the new work and earlier painting and present sculpture is like that between one of Brunelleschi's windows in the Palazzo Rucellai, which is only an undeveloped rectangle as a whole and is mainly a collection of highly ordered parts.

The use of three dimensions makes it possible to use all sorts of materials and colors. Most of the work involves new materials, either recent inventions or things not used before in art. Little was done until lately with the wide range of industrial products. Almost nothing has been done with industrial techniques and, because of the cost, probably won't be for some time. Art could be mass-produced, and possibilities otherwise unavailable, such as stamping, could be used. Dan Flavin, who uses fluorescent lights, has appropriated the results of industrial production. Materials vary greatly and are simply materials — formica, aluminum, cold-rolled steel, plexiglas, red and common brass, and so forth. They are specific. If they are used directly, they are more specific. Also, they are usually aggressive. There is an objectivity to the obdurate identity of a material. Also, of course, the qualities of materials — hard mass, soft mass, thickness of 1/32, 1/16, 1/8 inch, pliability, slickness, translucency, dullness — have unobjective uses. The vinyl of Oldenburg's soft objects looks the same as ever, slick, flaccid and a little disagreeable, and is objective, but it is pliable and can be sewn and stuffed with air and kapok and hung or set down, sagging or collapsing. Most of the new materials are not as accessible as oil on canvas and are hard to relate to one another. They aren't obviously art. The form of a work and its materials are

Richard Artschwager, *Untitled* (1964)

closely related. In earlier work the structure and the imagery were executed in some neutral and homogeneous material. Since not many things are lumps, there are problems in combining the different surfaces and colors and in relating the parts so as not to weaken the unity.

Three-dimensional work usually doesn't involve ordinary anthropomorphic imagery. If there is a reference it is single and explicit. In any case the chief interests are obvious. Each of Boniecau's reliefs is an image. The image, all of the parts and the whole shape are coextensive. The parts are either part of the hole or part of the mound which forms the hole. The hole and the mound are only two things, which, after all, are the same thing. The parts and divisions are either radial or concentric in regard to the hole, leading in and out and enclosing. The radial and concentric parts meet more or less at right angles and in detail are structure in the old sense, but collectively are subordinate to the single form. Most of the new work has no structure in the usual sense, especially the work of Oldenburg and Stella. Chamberlain's work does involve composition. The nature of Boniecau's single image is not so different from that of images which occurred in a small way in semiabstract painting. The image is primarily a single emotive one, which alone wouldn't resemble the old imagery so much, but to which internal and external references, such as violence and war, have been added. The additions are somewhat pictorial, but the image is essentially new and surprising: an image has never before been the whole work, been so large, been so explicit and aggressive. The abatised orifice is like a strange and dangerous object. The qual-

Philip King, *Rosebud*

Don Judd, *Untitled* (1963)

ity is intense and narrow and obsessive. The head and the furniture that Kusama covered with white protrusions have a related intensity and obsessiveness and are also strange objects. Kusama is interested in obsessive repetition, which is a single interest. Yves Klein's blue paintings are also narrow and intense.

The faces, figures, food or furniture in a painting have a shape or contain shapes that are emotive. Oldenburg has taken this anthropomorphism to an extreme and made the emotive form, with him basic and biopsychological, the same as the shape of an object, and by bluntness subverted the idea of the natural presence of human qualities in all things. And further, Oldenburg avoids trees and people. All of Oldenburg's grossly anthropomorphized objects are manmade — which right away is an empirical matter. Someone or many made these things and incorporated their preferences. As practical as an ice-cream cone is, a lot of people made a choice, and more agreed, as to its appearance and existence. This interest shows more in the recent appliances and fixtures from the home and especially in the bedroom suite, where the choice is flagrant. Oldenburg exaggerates the accepted or chosen form and turns it into one of his own. Nothing made is completely objective, purely practical or merely present. Oldenburg gets along very well without anything that would ordinarily be called structure. The ball and cone of the large ice-cream cone are enough. The whole thing is a profound form, such as sometimes occurs in primitive art. Three fat layers with a small one on top are enough. So is a flaccid, flamingo switch draped from two points. Simple form and one or two colors are considered less by old standards. If changes in art are compared backwards, there always seems to be a reduction, since only old attributes are counted and these are always fewer. But obviously new things are more, such as Oldenburg's techniques and materials. Oldenburg needs three dimensions in order to simulate and enlarge a real object and to equate it and an emotive form. If a hamburger were painted it would retain something of the traditional anthropomorphism. George Brecht and Robert Morris use real objects and depend on the viewer's knowledge of these objects.

The editor, not I, included the photograph of my work.

Claes Oldenburg, *Switches Sketch* (1964)
