8. *This certainty is as great as our condition needs.*—But yet, if after all this any one will be so sceptical as to distrust his senses, and to affirm that all we see and hear, feel and taste, think and do, during our whole being, is but the series and deluding appearances of a long dream, whereof there is no reality; and therefore will question the existence of all things, or our knowledge of anything: I must desire him to consider, that, if all be a dream, then he doth but dream that he makes the question, and so it is not much matter that a waking man should answer him. But yet, if he pleases, he may dream that I make him this answer, That the certainty of things existing in *rerum natura* when we have the testimony of our senses for it is not only as great as our frame can attain to, but as our condition needs. For, our faculties being suited not to the full extent of being, nor to a perfect, clear, comprehensive knowledge of things free from all doubt and scruple; but to the preservation of us, in whom they are; and accommodated to the use of life: they serve to our purpose well enough, if they will but give us certain notice of those things, which are convenient or inconvenient to us. For he that sees a candle burning, and hath experimented the force of its flame by putting his finger in it, will little doubt that this is something existing without him, which does him harm, and puts him to great pain: which is assurance enough, when no man requires

greater certainty to govern his actions by than what is as certain as his actions themselves. And if our dreamer pleases to try whether the glowing heat of a glass furnace be barely a wandering imagination in a drowsy man's fancy, by putting his hand into it, he may perhaps be wakened into a certainty greater than he could wish, that it is something more than bare imagination. So that this evidence is as great as we can desire, being as certain to us as our pleasure or pain, i.e., happiness or misery; beyond which we have no concernment, either of knowing or being. Such an assurance of the existence of things without us is sufficient to direct us in the attaining the good and avoiding the evil which is caused by them, which is the important concernment we have of being made acquainted with them.

9. *But reaches no further than actual sensation.*—In fine, then, when our senses do actually convey into our understandings any idea, we cannot but be satisfied that there doth something *at that time* really exist without us, which doth affect our senses, and by them give notice of itself to our apprehensive faculties, and actually produce that idea which we then perceive: and we cannot so far distrust their testimony, as to doubt that such *collections* of simple ideas as we have observed by our senses to be united together, do really exist together. But this knowledge extends as far as the present testimony of our senses, employed about particular objects that do then affect them, and no further. For if I saw such a collection of simple ideas as is wont to be called *man*, existing together one minute since, and am now alone, I cannot be certain that the same man exists now, since there is no *necessary connexion* of his existence a minute since with his existence now: by a thousand ways he may cease to be, since I had the testimony of my senses for his existence. And if I cannot be certain that the man I saw last today is now in being, I can less be certain that he is so who hath been longer removed from my senses, and I have not seen since yesterday, or since the last year: and much less can I be certain of the existence of men that I never saw. And, therefore, though it be highly probable that millions of men do now exist, yet, whilst I am alone, writing this, I have not that certainty of it which we strictly call knowledge; though the great likelihood of it puts me past doubt, and it be reasonable for me to do several things upon the confidence that there are men (and men also of my acquaintance, with whom I have to do) now in the world: but this is but probability, not knowledge.

10. *Folly to expect demonstration in everything.*—Whereby yet we may observe how foolish and vain a thing it is for a man of a narrow knowledge, who having reason given him to judge of the different evidence and probability of things, and to be swayed accordingly; how vain, I say, it is to expect demonstration and certainty in things not capable of it—and refuse assent to very rational propositions, and act contrary to very plain and clear truths, because they cannot be made out so evident, as to surmount every the least (I will not say reason, but) pretence of doubting. He that, in the ordinary affairs of life, would admit of nothing but direct plain demonstration would be sure of nothing in this world but of perishing quickly. The wholesomeness of his meat or drink would not give him reason to venture on it: and I would fain know what it is he could do upon such grounds as are capable of no doubt, no objection.

GOTTFRIED LEIBNIZ

1646–1716

Gottfried Wilhelm Von Leibniz was born and raised in academe. His father was a professor of moral philosophy at the University of Leipzig, and his mother was the daughter of a law professor at the same institution. His advance was prodigious: At 15, he began his study of the history of philosophy at the university; at 17, after defending his thesis, he proceeded to the University of Jena where he studied mathematics and law; at 18, he published his treatise on law; and at 20, he was ready to present himself as a candidate for the doctor of law degree, but he was declared too young. So he moved to the University of Altdorf, where he not only received his doctoral degree but was offered a professorship. He declined this invitation and settled into a position with Johann Philipp von Schönborn, elector of Mainz.

While in the service of the Mainz court, he lived for a time in Paris, where he made the acquaintance of leading thinkers of his day, such as the physicist Christian Huygens and the philosophers Antoine Arnauld and Nicolas Malebranche. As part of his mission in Paris, Leibniz prepared a plan for invading Egypt for Louis XIV (hoping to deflect Louis from military action in Europe). Though Louis never acted on the plan, many scholars believe that Napoleon used the scheme 120 years later.

In addition to diplomatic initiatives, Leibniz worked extensively on mathematics while he was in Paris. He invented a calculating machine that could add, subtract, multiply, divide, and extract square roots. When he demonstrated his machine in London, he was made a member of the Royal Society (1673). He also discovered differential and integral calculus—though years later there was an unpleasant dispute over whether Leibniz or Newton should get the credit for it. Did one of these great men steal the idea from the other? The Royal Society officially belittled Leibniz's achievement (quite unjustly according to the verdict of subsequent scholarship). It has been said that the dispute “redounded to the

discredit of all concerned.” It may be best to credit both men with the discovery. It is interesting that Leibniz’s notation proved the more convenient and is the system currently used.

In 1676, Leibniz went into the service of the Duke of Brunswick in Hanover, where he remained the rest of his life. He traveled extensively and met notable people such as Spinoza and the chemist Robert Boyle. In 1700, he was elected a foreign member of the French Academy. In the same year, by his inspiration, the *Akademie der Wissenschaften* was founded in Berlin and he was elected its first president. He was a close friend of Sophie Charlotte, the wife of the Elector of Brandenburg (subsequently the first king of Prussia). The only large systematic philosophic work he published, *Theodicy* (1710), grew out of his discussions with Sophie Charlotte.

Despite his accomplishments, Leibniz was not well liked. As Bertrand Russell later commented, “Leibniz was one of the supreme intellects of all time, but he was not admirable.” Leibniz’s death in 1716 was ignored not only by the Royal Society in London but also by the *Akademie* in Berlin and by the court at Hanover. His secretary is said to have been his only mourner, and an eyewitness reports in his memoirs that Leibniz “was buried more like a robber than what he really was, the ornament of his country.”

Leibniz Stamp, 1980. Leibniz’s death in 1716 was ignored by virtually everyone and, as one eyewitness said, he “was buried more like a robber than what he really was, the ornament of his country.” The neglect of Leibniz in his lifetime has given way to great admiration for the scope and originality of his thought. (*Deutsche Bundespost*)

At his death, he left an enormous number of unpublished letters and manuscripts. One major work was published in 1765: his detailed critique of Locke's *Essay*, entitled *Nouveaux essais sur L'entendement humain*. Leibniz had completed the book in 1704 but withheld it from publication when Locke died the same year. The book greatly stimulated Immanuel Kant, particularly his *Critique of Pure Reason*. In the twentieth century, thinkers such as Bertrand Russell and Ernst Cassirer have focused attention on Leibniz's work in logic. The neglect of Leibniz in his lifetime has given way to the current great admiration for the scope and originality of his thought.

* * *

Leibniz's philosophy begins by rejecting the notion that extension is a substance (as Descartes claimed) or an attribute of substance (as Spinoza thought). Instead of understanding nature as a collection of discrete extended entities, such as atoms, Leibniz says that the basic substance is a "Monad," or a unit of psychic force. Such Monads are without parts (i.e., simple) and have no interaction with one another. As Leibniz puts it, they have "no windows through which anything may come in or go out." Each Monad has within itself an internal principle of "appetition" that causes it to change. Although there is no causal interaction between Monads, they may *appear* to influence one another. This connection is merely a reflection of the "pre-established harmony" by which God created each of the Monads to "mirror" the others. A Monad's entire past and present are contained within it so that whatever it does, it does so by necessity. If we could know the entire past of a given Monad, we could predict its entire future.

Monads all differ qualitatively and occupy different points of view. This means that each Monad "mirrors" the world in a slightly different way and with different levels of clarity. Rocks and dirt are made of colonies of "low-level" Monads that have only dull and confused perceptions as they mirror the world. It might seem odd to talk about rocks as having perceptions at all, but according to Leibniz, every Monad has some sort of psychic life: Each Monad has an "internal state [by which it] represent[s] external things." Those Monads whose perceptions are "more distinct and are accompanied by memory" are on a higher level. The dominant Monad of an animal, for example, has distinct perceptions and memory of those perceptions: "If you show a stick to a dog, for instance, it remembers the pain caused by it and howls or runs away." This dominant Monad Leibniz calls a "soul" to distinguish it from lower level or "naked" Monads. Human beings are Monad aggregates of yet a higher degree. Whereas human bodies are colonies of lower Monads, the dominant Monad in a person is a "spirit," because it is capable of performing "reflective acts." Spirits are also capable of knowing the universe and of entering into a relationship with the chief Monad, God.

Leibniz's metaphysics seems to exclude the possibility of freedom. If each Monad has its entire future within it, and if it thus unfolds that future by necessity, how can we, as colonies of a dominant "spirit" Monad and lower "body" Monads, be free? Leibniz's answer to this question turns on his definition of "freedom." To be "free," claims Leibniz, does not mean "liberty of indifference." Instead we are "free" in that our actions flow from our wills and there is no logical contradiction in our willing other than we do. As Leibniz put it, "there is always a prevailing reason which prompts the will to its choice, and for the maintenance of freedom

for the will it suffices that this reason should incline without necessitating.” Of course, he also claims that our wills are created by God and that God foreknows what we will will ourselves to do. But the action of our wills is not necessary in the sense that willing something else involves a logical contradiction; hence, our wills can be said to be “free.”

* * *

Leibniz never wrote a *magnum opus* that clearly defined his position on philosophical issues. *The Discourse on Metaphysics* (1686), reprinted here (complete) in the Martin and Brown translation, gives his early ideas on metaphysics. The *Monadology* (1714), also reprinted here (complete) in the Paul Schrecker and Anne Martin Schrecker translation, presents his mature position on metaphysics.

For general introductions to Leibniz’s philosophy, see Nicholas Rescher, *The Philosophy of Leibniz* (Englewood Cliffs, NJ: Prentice Hall, 1967); C.D. Broad, *Leibniz: An Introduction*, edited by C. Lewy (Cambridge: Cambridge University Press, 1975); Stuart Brown, *Leibniz* (Minneapolis: University of Minnesota Press, 1984); Robert Merrihew Adams, *Leibniz: Determinist, Theist, Idealist* (Oxford: Oxford University Press, 1994); Donald Rutherford, *Leibniz and the Rational Order of Nature* (Cambridge: Cambridge University Press, 1997); Nicholas Jolley, *Leibniz* (London: Routledge, 2005); Lloyd Strickland, *Leibniz Reinterpreted* (London: Continuum, 2006); Franklin Perkins, *Leibniz: A Guide for the Perplexed* (London: Continuum, 2007); and Maria Rosa Antognazza, *Leibniz: An Intellectual Biography* (Cambridge: Cambridge University Press, 2009). For a discussion of the logic and metaphysics of Leibniz, Bertrand Russell, *A Critical Exposition of the Philosophy of Leibniz* (London: George Allen & Unwin, 1900), is still a valuable source. For more recent treatments of these issues, see Hidé Ishiguro, *Leibniz’s Philosophy of Logic and Language* (Ithaca, NY: Cornell University Press, 1972); Benson Mates, *The Philosophy of Leibniz: Metaphysics and Language* (Oxford: Oxford University Press, 1986); Reginald Osburn Savage, *Real Alternatives: Leibniz’s Metaphysics of Choice* (Norwell, MA: Kluwer, 1998); Christia Mercer, *Leibniz’s Metaphysics: Its Origins and Development* (Cambridge: Cambridge University Press, 1999) and Daniel Garber, *Leibniz: Body, Substance, Monad* (Oxford: Oxford University Press, 2009). For a commentaries on *The Monadology*, see Herbert Wildon Carr, *The Monadology of Leibniz* (Los Angeles: University of Southern California Press, 1930) and Anthony Savile, *Routledge Philosophy Guidebook to Leibniz and the Monadology* (London: Routledge, 2000). For collections of essays, see Harry G. Frankfurt, ed., *Leibniz: A Collection of Critical Essays* (Garden City, NY: Doubleday, 1972); R.S. Woolhouse, ed., *Leibniz: Metaphysics and Philosophy of Science* (Oxford: Oxford University Press, 1981); Michael Hooker, *Leibniz: Critical and Interpretive Essays* (Minneapolis: University of Minnesota Press, 1984); Vere Chappell, ed., *Essays on Early Modern Philosophers: Gottfried Wilhelm Leibniz* (Hamden, CT: Garland Press, 1992); Nicholas Jolley, ed., *The Cambridge Companion to Leibniz* (Cambridge: Cambridge University Press, 1995); Catherine Wilson, ed., *Leibniz* (New York: Ashgate, 2000); and Donald Rutherford and J.A. Cover, eds., *Leibniz: Nature and Freedom* (Oxford: Oxford University Press, 2005).

DISCOURSE ON METAPHYSICS

1. ON THE DIVINE PERFECTION: GOD DOES EVERYTHING IN THE MOST DESIRABLE WAY

The most commonly accepted notion of God we have, and the one most full of meaning, is well enough expressed in these terms: God is an absolutely perfect being. Not enough thought, however, is given to its consequences. If we are to make progress, it is relevant to note that in nature there are several entirely different perfections, that God possesses them all together, and that each belongs to Him to the highest degree.

We also need to understand what a perfection is. A sure enough mark of one is that forms or natures not admitting of an ultimate degree are not perfections, as for example the nature of numbers or of shape. For the greatest of all numbers (or rather the number of all numbers), and the greatest of all shapes imply contradictions while omniscience and omnipotence involve no impossibility. Consequently, power and knowledge are perfections, and to the extent that they belong to God, they have no limits.

Hence it follows that since God possesses supreme and infinite wisdom, He acts in the most perfect manner, not only in the metaphysical sense, but also morally speaking. From our point of view we can express ourselves thus: the more we are enlightened and informed about the works of God, the more we shall be disposed to find that they are excellent and satisfactory in every way we could hope.

2. AGAINST THOSE WHO MAINTAIN THAT THERE IS NO GOODNESS IN THE WORKS OF GOD, OR THAT THE RULES OF GOODNESS AND BEAUTY ARE ARBITRARY

Thus I am far removed from the opinion of those who maintain that there are no rules of goodness or perfection in the nature of things or in the ideas God has of them, and that the works of God are good only for the formal reason that God made them. For if that were so, since God knew He was their author, He had only to look at them after making them to find them good, in accordance with the testimony of Holy Scripture. But Scripture seems to have made use of this anthropomorphic way of speaking only to make us realise that we recognise the excellence of God's works by considering them by themselves, even when we disregard the purely extrinsic denomination that refers them to their cause. This is all the more true in that it is by considering the works that we can discover the Worker, so that the works must carry His marks in themselves. I confess that the contrary opinion seems to me extremely dangerous, and very close to

Gottfried Leibniz, *Discourse on Metaphysics and Related Writings*, edited and translated with an introduction, notes and glossary by R. Niall D. Martin and Stuart Brown, Manchester University Press, 1988. [The translation used comes from our edition in which we attempted to help scholars understand the document and the thinking behind it by including additions and deletions to highlight Leibniz's evolving thought, and to show other relevant documents from the same period for a like purpose. We would encourage users of this edition particularly interested in Leibniz to consult our edition and its scholarly apparatus.]

[Leibniz made minor additions, deletions, and/or changes to virtually every paragraph of this work. I have chosen to reproduce Leibniz's text minus all material deleted by Leibniz.]

the way the Spinozists think of goodness and harmony. Their opinion is that the beauty of the universe and the goodness we attribute to the works of God are no more than the chimeras of men who conceive God according to their own way of thinking. Also, if we say that things are good by no rule of goodness beyond the will of God alone, we thoughtlessly destroy, I feel, all the love and glory of God. For why praise Him for what He had done if He would be equally praiseworthy for doing the opposite? Where will His justice and His wisdom be, if all that remains of Him is some kind of a despotic power, if His will takes the place of reason, and if, by the very definition of tyranny, what pleases the Almighty is *ipso facto* just? Besides, it seems that every act of willing presupposes some reason for willing, and that reason is naturally prior to will. That is why I still find altogether strange the expression of Descartes who says that even the eternal truths of metaphysics and geometry, and consequently also the rules of goodness, justice and perfection are no more than the effects of God's will. It seems to me, rather, that they are no more than the consequences of His understanding, which certainly does not depend on His will, any more His essence does.

3. AGAINST THOSE WHO THINK GOD COULD HAVE DONE BETTER

Neither can I approve the opinion of some scholastics who maintain boldly that what God has done is not absolutely perfect, and that He could have done much better. For it seems to me that the consequences of this opinion are altogether contrary to the glory of God. "Just as the lesser evil contains a proportion of good, so the lesser good contains a proportion of evil." To act with less perfection than one could have done is to act imperfectly. To show that an architect could have done better is to find fault with his work. It also runs counter to the assurance of the goodness of God's works in Holy Scripture. For, since perfections decrease to infinity, however God did his work, it would always be good in comparison with the less perfect, if that were enough. But a thing is not very praiseworthy if it is only so in that way. I also think that a very large number of passages favouring my opinion could be found in the divine Scriptures and the holy Fathers, with scarcely any favouring that of those new scholastics a view unknown, in my opinion, to the whole of antiquity. It is based on our insufficient knowledge of the general harmony of the universe and of the hidden reasons for God's conduct which lead us to the rash judgement that many things could have been done better. Besides, these moderns insist on some subtleties that are not very sound, for they imagine that nothing is so perfect but that there is something that is more perfect, which is a mistake. There is an infinity of regular figures, but one is the most perfect, namely the circle. If a triangle had to be made and there was no further specification of the kind of triangle, God would assuredly make an equilateral triangle because, absolutely speaking, that is the most perfect.

They also think that in this way they are providing for the liberty of God, as if it were not the highest liberty to act in accordance with sovereign reason. For, apart from its apparent impossibility, the belief that God acts in some matter without any reason for His act of will is hardly consistent with His glory. Suppose, for example, that God chooses between A and B, and that He takes A without any reason for preferring it to B; I say that that action of God would at the least not be praiseworthy. For every praise must be based on some reason and here *ex hypothesi* there is none. On the contrary, I hold that God does nothing for which He does not merit being glorified.

4. LOVING GOD DEMANDS COMPLETE SATISFACTION WITH
AND ACQUIESCENCE IN WHAT HE DOES, BUT WE DO NOT,
ON THAT ACCOUNT, HAVE TO BE QUIETISTS

The general recognition of this great truth—that God always acts in the most perfect and desirable manner possible—is to my mind the basis of the love we owe to God concerning all things. For he who loves seeks his satisfaction in the happiness or perfection of the loved one and his actions. “True friendship is to want the same and to reject the same.” And I think that it is difficult to love God well when not disposed to will what He wills, if changing that were in our power. Indeed those who are not satisfied with what He does seem to me like discontented subjects of a king or of a republic whose intentions are little different from those of rebels.

Hence, in accordance with these principles, I hold that to act in conformity with the love of God it is not enough to be patient under duress. We must be truly satisfied with all that happens to us in consequence of His will. I mean this acquiescence to apply to the past. As far as the future is concerned, we must not be quietists nor wait ridiculously with arms folded for what God will do, in accordance with the sophism the Ancients called (*logon aegon*) lazy reason. On the contrary, we must act in accordance with the presumptive will of God, as far as we can judge it, trying with all our ability to contribute to the general good, especially to the adornment and perfection of what concerns us or is near us, or, so to speak, within our range. For when the outcome shows that God may perhaps not want our good will to have its effect for the present, it does not follow that He does not want us to do what we have done. On the contrary, since He is the best of all masters, He never asks for more than the right intentions, and it is for Him to know the hour and the place for bringing good plans to fruition.

5. WHAT ARE THE RULES OF PERFECTION OF GOD’S CONDUCT;
AND THAT THE SIMPLICITY OF MEANS IS BALANCED
BY THE RICHNESS OF EFFECTS

Hence it is enough to have this confidence in God, that He does everything for the best and that nothing can harm those who love him. But to know in detail the reasons that could have moved Him to choose this order of the universe, to allow sins, or to dispense His saving grace in a particular way, is beyond the power of a finite mind, particularly of a finite mind that has not yet attained enjoyment of the sight of God.

Nevertheless, some general remarks can be made on the conduct of Providence in the government of things. Thus it can be said that whatever encloses more reality in less volume is more perfect, that he who acts perfectly is like an excellent geometer who knows how to find the best constructions for a problem; like a good architect who arranges his site and the funds intended for the building in the most advantageous manner, so as to leave nothing that jars or lacks the beauty of which it is capable; like a good householder who uses his property so that nothing is left uncultivated or barren; like a skilled engineer who achieves his result by the least complicated way that could be chosen; like an experienced author who includes as much reality as he is able in the least space. Now the most perfect of all beings, occupying the least volume, in other words, those which hinder the least, are minds, and their perfections are the virtues. That is why we must not doubt that the happiness of minds is the principal objective of God and that He pursues it as much as the general harmony allows. More will be said of this presently.

As for the simplicity of God's ways, that applies properly in respect of means whereas the variety, richness or abundance applies to aims or effects. The one has to be in balance with the other, like the expenses of a building with the size and beauty expected of it. It is true that nothing costs God anything, much less than it costs a philosopher to make hypotheses for the construction of his imaginary world, since God has only to make decrees to bring a real world to birth; but in relation to wisdom, in so far as they are mutually independent, decrees or hypotheses take the place of expenditure, for reason demands that we avoid a multiplicity of hypotheses or principles; in almost the same way the simplest system is always preferred in astronomy.

6. GOD DOES NOTHING OUT OF ORDER AND IT IS NOT EVEN POSSIBLE TO IMAGINE EVENTS THAT ARE NOT REGULAR

The decisions or actions of God are commonly divided into ordinary and extraordinary. But it is well to bear in mind that God does nothing out of order. So, whatever passes for extraordinary is only so in relation to some particular order established among creatures. For, in relation to the universal order, everything conforms to it. So true is this, that not only does nothing happen in the world that is absolutely irregular, but such a thing cannot even be imagined. Suppose, for example, that someone puts a number of points on paper completely at random like those who practise the ridiculous art of geomancy, then I say that it is possible to find a geometric line whose notion is constant and uniform according to some rule, so that this line passes through all these points and does so in the same order as they were made by the hand.

And if someone were to draw in one movement a line that was sometimes straight, sometimes circular, and sometimes of some other kind, it is possible to find a notion, a rule, or an equation common to all the points in that line and in virtue of which these same changes had to occur. For example there is no face whose contour is not part of a geometric line and cannot be drawn all in one movement by some rule-governed motion. But when a rule is very complicated, what conforms to it is taken to be irregular.

Thus it can be said that however God might have created the world, it would always have been regular and within some general order. But God chose that world that is the most perfect, i.e. the one that is simultaneously the simplest in hypotheses and richest in phenomena, just as a geometric line might be if its construction was easy but its properties most admirable and extensive. I make use of these comparisons to sketch some kind of imperfect resemblance to the divine wisdom and to say something that could at least raise our minds to conceive in some way what cannot be adequately expressed. But by this I do not claim to explain the great mystery on which the whole universe depends.

7. MIRACLES CONFORM TO THE GENERAL ORDER ALTHOUGH THEY ARE CONTRARY TO SUBALTERN NORMS. WHAT GOD WISHES OR PERMITS BY A GENERAL OR PARTICULAR WILL

Now, since nothing can take place that is not within the order, it can be said that miracles are just as much within the order as natural operations, are so called because they conform to certain subaltern norms we call the nature of things. For it can be said that this "nature" is no more than a custom of God from which He can exempt Himself in virtue of a stronger reason than the one that moved Him to make use of these norms.

As for the general and particular wills, depending on how we take the matter, it can be said that God does everything in accordance with His most general will, the one in conformity with the most perfect order He chose. But it can also be said that He has particular wills, which are exceptions to the subaltern norms mentioned above; for the most general of the laws of God, by means of which He regulates the whole universe, are without exception.

It can also be said that God wills everything that is an object of His particular will. But as for the objects of His general will, such as the actions of other creatures, particularly of those that are rational, and with which, (i.e. the *actions*) God wishes to concur, we must draw a distinction: if the action is good in itself, it can be said that God wills it and sometimes commands it, even when it does not happen; but if it is evil in itself, and only becomes good by accident, it has to be said that God permits it and not that He wills it, though He concurs in it through the laws of nature established by Him, and because he is able to draw from it greater good. This comes about because the sequence of things, particularly punishment and recompense, corrects its evil nature, and compensates for the evil with interest, so that in the end there is more perfection in all that follows than if none of the evil had happened.

8. IN ORDER TO DISTINGUISH THE ACTIONS OF GOD FROM THOSE OF CREATURES, AN EXPLANATION IS GIVEN OF THE NOTION OF AN INDIVIDUAL SUBSTANCE

It is rather difficult to distinguish the actions of God from those of creatures as well as the actions and passions of these same creatures. For there are those who think that God does everything, while others imagine that He does no more than conserve the force He has given to creatures. What follows will show how far either of these can be said. Now since, properly speaking, actions belong to individual substances ("actions belong to *subposita*"), it will be necessary to explain just what such a substance is.

It seems to me that when several predications are attributed to the same subject and this subject is not attributed to any other, this subject is called an individual substance. But that is not enough and such an explanation is merely nominal, so we need to consider what it is to be truly attributed to a particular subject.

Now it is acknowledged that all true predication has some basis in the nature of things, and when a proposition is not an identity, that is, when the predicate is not expressly included in the subject, it must be so included virtually. That is what the Philosophers call *inesse*, when they say that the predicate is in the subject. Thus the subject term must always include that of the predicate, so that whoever understood the notion of the subject perfectly would also judge that the predicate belongs to it.

That being so, we can say that the nature of an individual substance or complete being is to have such a complete notion as to include and entail all the predicates of the subject that notion is attributed to. In contrast, an accident is a being whose notion does not include all that can be attributed to the subject it is attributed to. Thus* the quality of being king that belongs to Alexander the Great, taken in abstraction from the subject, is

*The first edition of the text used the following example: "Thus the circular figure of the ring of Gyges, does not contain everything that makes up the individual notion of this ring. Whereas God sees in it at the same time the foundation and cause for all the predicates that can truly be applied to it, such as that it would be swallowed by a fish and nevertheless returned to its master. I speak here as if this ring were a substance."

not sufficiently determinate for one individual, and does not include the other qualities of the same subject, nor everything that the notion of this prince includes, whereas God who sees the individual notion or *haecceity*** of Alexander sees in it at the same time the foundation and reason for all the predicates that can truly be ascribed to him, such as that he would defeat Darius and Porus even to the point of knowing *a priori* (and not by experience) whether he died naturally or by poison, something we can only know historically. Also, when we consider well the connection of things, we can say that there is in the soul of Alexander for all time traces of everything that happened to him, and marks of everything that will happen to him, and even traces of everything happening in the universe, though to recognise them all belongs to God alone.

9. EACH UNIQUE SUBSTANCE EXPRESSES THE WHOLE UNIVERSE IN ITS OWN WAY, AND INCLUDED IN ITS NOTION ARE ALL THE EVENTS THAT HAPPEN TO IT WITH ALL THEIR CIRCUMSTANCES, AND THE WHOLE SEQUENCE OF EXTERNAL THINGS

Among several paradoxical conclusions following from this, is that it is not true that two substances are completely alike, differing only numerically, and what St Thomas has to say on this point about angels and intelligences (“in these cases every individual is a lowest species”) is true of all substances provided that the specific difference is taken in the way geometers take it in relation to their figures. Likewise, if bodies are substances, their natures cannot possibly consist solely in size, figure and motion: something else is needed. Likewise, a substance can begin only by creation and perish only by annihilation; a substance cannot be divided into two, nor can two substances become one, and so the number of substances does not naturally increase or diminish, though they are frequently transformed.

Moreover every substance is as it were an entire world and a mirror of God, or rather of the whole universe, expressing it in its own way, somewhat as the same town is variously represented according to the different positions of an observer. It can even be said that every substance bears in some way the mark of the infinite wisdom and omnipotence of God, imitating Him as far as it is capable. For it expresses, if only confusedly, all that happens in the universe, past, present and future, and this has some resemblance to an infinite perception or knowledge. And since all other substances in turn express it and are accommodated to it, it can be said to extend its power over all the others in imitation of the omnipotence of the Creator.

10. THERE IS SOME SOUNDNESS TO THE BELIEF IN SUBSTANTIAL FORMS, BUT THESE MAKE NO DIFFERENCE TO THE PHENOMENA, AND SHOULD NOT BE USED TO EXPLAIN PARTICULAR EFFECTS

It seems that the ancients in distinguishing an *ens per se* from an *ens per accidens* and in introducing substantial forms, as well as the many able people who were accustomed to profound meditations and who taught theology and philosophy centuries ago, many

**Literally “thisness,” an allusion to the theory of what makes something an individual substance produced by Duns Scotus and in which Leibniz had taken an interest when writing a student dissertation. Every individual has its own *haecceity*, according to Duns Scotus, though (like Leibniz) he believed it was only known to God.

of them praiseworthy for their sanctity, had some knowledge of what we have just said. This is what led them to introduce and uphold the substantial forms so much in disfavour today. But they are neither so far from the truth nor as ridiculous as the common run of our modern philosophers imagine.

I agree that the knowledge of forms is of no use in the details of physics and should not be used for explaining the particulars of phenomena. That is where our scholastics went wrong, and with them the physicians of the past who followed their example, in thinking to account for the properties of bodies by mentioning forms and qualities without taking the trouble to examine their manner of operation. It is as if we were to content ourselves with saying that a clock has the horodictic [time-telling] quality deriving from its form without considering what that consists in. That indeed might be enough for whoever buys the clock, provided he left its maintenance to someone else.

But this shortcoming and misuse of forms should not make us reject something whose knowledge is so necessary in metaphysics that without it, I hold, the first principles cannot be well understood, nor the mind sufficiently raised to the knowledge of incorporeal natures and the wonders of God.

Nevertheless, a geometer has no need to trouble his mind with the famous labyrinth of the composition of the continuum, and neither has any moral philosopher, and still less any legal expert or politician, any need to trouble himself with the great difficulties involved in reconciling the freedom of the will with the providence of God. For the geometer can complete all his demonstrations and the politician conclude all his deliberations without entering into these discussions, important as they are in philosophy and theology. In the same way, a physicist can account for experiments, sometimes by means of simpler experiments carried out before, and sometimes by means of geometrical and mechanical demonstrations, without the need of forms and other general considerations belonging to another sphere. If he employs the extraordinary concurrence of God, or some soul, *arché* or other thing of that nature, he is wandering as far off course as he who tries to introduce the nature of destiny and our liberty into a deliberation about an important practical matter. Men often make this mistake without thinking when they trouble their minds by considering fate, and sometimes they are even diverted from some good resolution or necessary care as a result.

11. THE MEDITATIONS OF THE THEOLOGIANS AND PHILOSOPHERS CALLED "SCHOLASTICS" ARE NOT TO BE DESPISED ENTIRELY

I know that in claiming in some way to rehabilitate the old philosophy and restore the all but banished substantial forms to which not enough justice has been done to life, I am proposing a big paradox. But I only do this on the supposition that it is possible to speak of bodies as substances. But perhaps I shall not be lightly condemned if it is known that I have long meditated on modern philosophy, and spent much time on physical experiments and geometrical demonstrations, and that I was long persuaded of the vanity of such beings. But I was eventually obliged to take them up again against my will and as if by force. It was as a result of carrying out my own researches that I was made to recognise that our moderns do not do full justice to St. Thomas and other great men of those times, and that the opinions of scholastic philosophers and theologians are much more sound than is imagined, as long as they are used appropriately and in their place. I am even convinced that if some exact and reflecting mind took the trouble to

clarify and digest their thoughts in the manner of analytical geometry, he would find a treasure store of very important truths which could be demonstrated completely.

12. NOTIONS DEFINED BY EXTENSION INVOLVE SOMETHING
IMAGINARY AND CANNOT CONSTITUTE THE ESSENCE OF BODIES

But, to take up again the thread of our considerations, I believe that any one who meditates on the nature of substance as I have explained it above will find that either bodies are not substances in strict metaphysical rigour (the view indeed of the Platonists), or that the whole nature of body does not consist solely in extension, i.e. in size, shape and motion. On the contrary, something related to souls which is commonly called a “substantial form” has necessarily to be recognised in them, though that makes no more difference to the phenomena than the souls of animals, if they have any. It can even be demonstrated that the notions of size, shape and motion are not so distinct as is imagined and that they involve something imaginary and relative to our perceptions, just as colour, heat and other similar qualities also do, (to an even greater extent)—we may doubt that these are truly in the nature of external things. That is why qualities of these kinds could not constitute any substance. And if there were no other principle of identity in body than the one just considered, no body would ever last more than a moment.

Nevertheless, souls and substantial forms of other bodies are very different from intelligent souls, who alone know what they do, and which not only do not naturally perish but even for ever retain the basis of the knowledge of what they are. This makes them liable to punishment and reward, and makes them citizens of the republic of the universe whose monarch is God. It also follows that all other creatures ought to serve them, something we shall discuss more fully presently.

13. SINCE THE INDIVIDUAL NOTION OF EVERY PERSON INCLUDES
ONCE FOR ALL EVERYTHING THAT WILL EVER HAPPEN TO HIM,
IN IT ARE TO BE SEEN THE *A PRIORI* PROOFS OF EACH EVENT,
OR RATHER WHY ONE HAPPENED RATHER THAN THE OTHER.
BUT ALTHOUGH THESE TRUTHS ARE ASSURED, THEY DO NOT
CEASE TO BE CONTINGENT, SINCE THEY ARE BASED ON THE FREE
WILL OF GOD OR OF CREATURES. THERE ARE ALWAYS REASONS
FOR THEIR CHOICES BUT THESE INCLINE WITHOUT NECESSITATING

But a great difficulty can arise from the foundations laid above, and before proceeding further, we must try to deal with it. We said that the notion of an individual substance includes once for all everything that can ever happen to it, and that by considering this notion, we can see in it everything that can truly be stated about it, just as we can see in the nature of the circle all the properties that can be derived from it. But from that it seems that all events will become fatally necessary that the difference between necessary and contingent truths will be destroyed, that all the fate of the Stoics will take the place of liberty, there will no longer be any room for human liberty, and absolute fate will reign over all our actions as well as over all other events in the world. My reply is: we must distinguish between what is certain and what is necessary. Everyone agrees that future contingents are assured since God foresees them, but it is not for all that admitted that they are necessary. But (it will be said) if

some conclusion can be infallibly deduced from a definition or notion, it will be necessary. Now in fact we do maintain that everything that is to happen to a person is already included virtually in his nature or notion, just as the properties of a circle are included in its definition. So the difficulty remains. In order to give a sound answer, I claim that connection or derivation is of two kinds: one is absolutely necessary (its contrary implies a contradiction) and occurs with eternal truths like those of geometry; the other is necessary only *ex hypothesi*, by accident, so to speak, but in itself it is contingent, since its contrary does not imply a contradiction. This connection is based, not on the absolutely pure ideas and God's bare understanding alone, but also on His free decrees and the connection of the universe.

Let us take an example. Since Peter will deny our Lord, that action is included in his notion, for we are supposing it to be in the nature of such a perfect notion to include everything, so that the predicate should be included in it, *ut possit inesse subjecto*. We could say that it is not in virtue of this notion or idea or nature that he must sin, since that only applies to him because God knows everything. But, it will be insisted, his nature or form corresponds to his notion. I reply that it is indeed true and since God imposed this personality on him he must henceforth conform to it. I could reply with the objection of future contingents, for these have as yet no reality outside the understanding and the will, and since God gave them this form in advance, they will have to conform to it all the same.

But I prefer to deal with difficulties than make excuses for them with examples of some other similar difficulties, and what I am going to say will help clarify both. Thus it is here that we must apply the distinction between the kinds of connection. I say that what happens in accordance with these prior conditions is assured, but that it is not necessary; and if he did the opposite, he would be doing nothing impossible in itself though it would be *ex hypothesi* impossible that this should happen. For if someone were capable of completing the whole of the demonstration by virtue of which he proved the connection between the subject Peter and the predicate (namely, his denial), he would show that this fact had its basis in his notion or nature, and that it was reasonable and consequently assured that it should come about; but he would not show that it was necessary in itself, nor that its contrary implied a contradiction. In almost the same way, it is reasonable and assured that God will always do the best, although what is less perfect involves no contradiction in itself.

For it would be found that this demonstration of this predicate of Peter is not as absolute as those of numbers and geometry, but that it supposes the sequence of things freely chosen by God and founded on the first free decree of God, which always leads him to do what is most perfect, as well as on the decree God made (in consequence of the first) concerning human nature, which is that man will always (although freely) do what seems best. Now every truth founded on decrees of this kind is contingent, although certain, since those decrees make no difference to the possibility of things and, as I have already said, although God assuredly always chooses the best, that does not prevent what is less perfect remaining possible in itself, though it does not happen. It is not its impossibility but its imperfection that causes it to be rejected. Nothing is necessary if its contrary is possible.

Hence, we are in a position to meet such difficulties, great as they may appear to be (and indeed they are no less pressing for all others who have ever dealt with this matter), provided it is fully realised that contingent propositions have reasons for being that way rather than otherwise, or (what comes to the same thing) that there are *a priori* proofs of their truth which make them certain and show that the subject-predicate

connection in these propositions has its basis in the nature of each. But these are not necessary demonstrations, since these reasons are only based on the principle of the contingency or of the existence of things, i.e. on what is or seems to be the best of several equally possible things; whereas necessary truths are founded on the principle of contradiction and on the possibility or impossibility of the essences themselves, without regard to the free will of God or of creatures.

14. GOD PRODUCES DIFFERENT SUBSTANCES ACCORDING
TO THE DIFFERENT VIEWS HE HAS OF THE UNIVERSE.
THE DISTINCTIVE NATURE OF EACH SUBSTANCE ENSURES,
BY THE (MEDIATION) OF GOD, THAT WHAT HAPPENS TO EACH
CORRESPONDS TO WHAT HAPPENS TO ALL THE OTHERS,
WITHOUT THEM ACTING DIRECTLY ON EACH OTHER

Having after a fashion come to know what the nature of created substances consists in, we must try to explain their mutual dependence and their actions and passions. Now, in the first place, it is altogether obvious that created substances depend on God who conserves them—and even continually produces them by a kind of emanation, as we do our thoughts. For as God, so to speak, turns on all its sides and in all ways the general system of phenomena which He finds it good to produce to manifest His glory, and as He looks at all the faces of the world in all possible ways—because there is no relation that escapes His omniscience—the result of each view of the universe as if seen from a particular place is a substance expressing the universe in conformity with that view, if God finds it good to make His thought effective and produce this substance. And since the view of God is always true, our perceptions are so too; it is those of our judgements that derive from us that deceive us.

Now we have said above, and it follows from what we have just said, that each substance is like a world on its own, independent of everything else apart from God. Hence all our phenomena, that is, all that can ever happen to us, are consequences of our natures and, since we are free substances, of our wills. Since these phenomena preserve a particular order conforming to our nature or, so to speak, the world within us, so that we are able (to make observations useful for regulating our conduct which are justified by the favourable outcome of future phenomena) and to judge the future by the past without error, this enables us to say that these phenomena are true, without worrying whether they are outside us or whether others perceive them as well. Nevertheless, it is very true that the perceptions or qualities of all substances correspond with each other, so that each, carefully following the particular reasons or laws it has observed, fits in with the other in doing the same, just as when several people agree with each other to be at a particular place at a prearranged day, they can in fact do so if they wish. Now although all express the same phenomena, it does not follow from this that their expressions should be perfectly similar: it is enough that they are proportionate to each other. In the same way several spectators think they have seen the same thing and indeed agree with each other, although each sees and speaks according to his point of view.

Now it is God from whom all substances emanate continually and He sees the universe, not only as they see it, but quite differently from them all as well. He is the only cause of this correspondence between their phenomena, and He alone makes what is peculiar to one public to all, otherwise there would be no connection between them.

Hence it can be said in a manner of speaking and in a sense that is good, though remote from ordinary usage that a particular substance never acts on another particular substance and is not acted upon by another either. This follows if we remember that what happens to each is only a consequence of its idea or complete notion alone, since that idea already includes all the predicates or events, and expresses the whole universe. Indeed, nothing can happen to us but thoughts and perceptions, and all our thoughts and our future perceptions are no more than consequences, albeit contingent, of our previous thoughts and perceptions. Hence, if I were capable of considering distinctly everything happening or appearing to me at the present time, I would be able to see therein everything that would ever happen or appear to me. This would not fail, but would happen in any case, if everything outside me were destroyed and only God and myself remained. But as we attribute to other things, as if to causes acting on us, what we perceive in some way in other things, we have to consider the basis of this judgement, and what truth there is in it.

It is above all agreed that if we desire some phenomenon to happen at a certain time and it occurs in the ordinary course of things, we say that we acted and that we were the cause of it, as when I want to, as we say, "move my hand." Also, when it seems to me that by my will something happens to what I call another substance (and that this is the way it would happen as I judge from frequent observation) although it was not willed by it, I judge that this substance is acted upon. I admit this of myself when something happens to me in accordance with the will of another substance. Also, when we will something to happen, and something else follows from it that we did not want, we still say that we did it, provided that we understood how it followed. There are also some phenomena of extension that we attribute to ourselves more particularly and which have their basis *a parte rei* in what is called our body. As everything of importance happening to it (i.e. all the notable changes appearing to us in it) make themselves strongly felt in it, ordinarily at least, we attribute all the passions to this body to ourselves. We do so with very good reason, for even if we did not perceive them at the time, we do not fail to become well aware of the consequences, just as if we had been transported from one place to another while asleep. We also attribute to ourselves the actions of this body, as when we run, hit or fall, and when our body, continuing the motion once begun, has some effect. But I do not attribute to myself what happens to other bodies, because I realise that great changes can happen that I cannot perceive, unless my body is exposed to them in a way I conceive appropriate to that assumption.

So it is quite clear that although all the bodies of the universe belong to us in some way and harmonise with ours, we do not attribute to ourselves what happens to them. For when my body is pushed, I say that I myself have been pushed, but if someone else is pushed, I do not say that I have been pushed, even though I may perceive it and some passion in me may arise from it, since I measure where I am by the place my body is in. And this language is highly reasonable because it is appropriate for clear expression in everyday practice. As for the mind, it can be said briefly that our acts of will and judgements or reasonings are actions while our perceptions or sensations are passions. As for the body, we say that a change that happens to it is an action when it follows from a previous change, but otherwise it is a passion.

In general, to give our terms a meaning that reconciles metaphysics with practice, it can be said that when several powers are affected by the same change the one that passes to a higher degree of perfection or continues in the same acts, while the one that immediately becomes more limited thereby, so that its expressions become more confused, is acted upon.

15. THE ACTION OF ONE FINITE SUBSTANCE ON ANOTHER
CONSISTS SOLELY IN THE INCREASE IN THE DEGREE OF ITS
EXPRESSION TOGETHER WITH THE DIMINUTION OF THAT
OF THE OTHER, IN SO FAR AS GOD HAS MADE THEM
CONFORM TO EACH OTHER

But without getting involved in a long discussion, it is enough for the present to reconcile the language of metaphysics with that of practice by noting that we attribute to ourselves our more clear and distinct perceptions and that we can in general attribute to a substance its more clear and distinct expression and, with reason, the phenomena we express more perfectly, while we attribute to other substances what each best expresses. Thus a substance of infinite extension, in so far as it expresses everything, becomes limited by its more or less perfect manner of expression. Thus in this way it is possible to conceive that substances mutually hinder or limit each other and, consequently, in this sense, to say that they act on each other and, so to speak, are obliged to conform to each other. For it can happen that a change which increases the expression of the one diminishes that of the other. Now, the virtue of a particular substance is to express well the glory of God, and it is there that it is least limited, and everything that exerts its virtue or power, that is when it acts, changes for the better and is extended in so far as it acts. Thus when a change affects several substances (since indeed every change touches all of them), I think that it can be said that the one that thereby passes to a higher degree of perfection or to a more perfect expression exerts its power and acts, while the other one that passes to a lesser degree shows its weakness and is acted upon. So I hold that every action of a substance possessing perception implies some pleasure and every passion some pain, and vice versa. This notwithstanding that it can easily happen that a present advantage is destroyed in what follows. Hence it follows that it is possible to sin by acting or exerting one's power and finding pleasure therein.

16. THE EXTRAORDINARY CONCURRENCE OF GOD IS INCLUDED
IN THE EXPRESSION OF OUR ESSENCE BECAUSE IT APPLIES TO
EVERYTHING, BUT IT TRANSCENDS THE POWERS OF OUR NATURE
OF DISTINCT EXPRESSION (WHICH IS FINITE AND FOLLOWS
PARTICULAR SUBALTERN NORMS)

All that remains for the present is to explain how it is sometimes possible for God to have influence on men or other substances through an extraordinary or miraculous concurrence, since it seems that everything that has to happen to them is natural in so far as it is a consequence of their substance. But what we said above about miracles in the universe must be remembered: they always conform to the universal laws of the general order, even though these transcend the subordinate norms. And, to the extent that every person or substance is like a little world expressing the great one, it can even be said that this extraordinary concurrence of God is included in the general order of the universe in so far as that is expressed by the nature of this person, but it does not cease to be miraculous and to be beyond the norms. That is why, if everything it expresses is included in our nature, nothing is supernatural with respect to it, for it extends to everything, since an effect always expresses its cause and God is the true cause of substances. But since what our nature expresses more perfectly particularly belongs to it, that is what its power consists in—and since, as I have just explained, it is limited, there are many

things that surpass the powers of our natures, and even those of every limited nature. Consequently, to speak more clearly, I say that miracles and the extraordinary acts of God's concurrence have the particular character that they could not be foreseen by the reasoning of any created mind, however enlightened it might be, since the comprehension of the general order surpasses them all, while everything called natural depends on the less general norms creatures can understand. Hence, in order to say nothing of these norms or laws of nature that might cause offence, it would be good to link particular ways of speaking with particular thoughts: whatever includes everything we express could then be called our essence or idea, and since it expresses our union with God, it has no limits and nothing exceeds it. But what is limited in us could be called our nature or power, and in this respect what exceeds the natures of all created substances is supernatural.

17. EXAMPLE OF A SUBALTERN NORM OR LAW OF NATURE;
IN WHICH IT IS SHOWN THAT GOD ALWAYS PRESERVES
THE SAME FORCE, BUT NOT THE SAME QUANTITY OF MOTION . . .
AGAINST THE CARTESIANS AND SOME OTHERS

I have often mentioned subaltern maxims or laws of nature already, and it would be good to give an example. Our new philosophers commonly make use of that famous rule advanced by Descartes that God always preserves the same quantity of motion in the world. It seems highly plausible indeed, and in the past I held it to be indubitable. But I have since come to recognise wherein lay its error. It is that Descartes and many other able mathematicians thought that the quantity of motion (i.e. the speed times the size of the mobile) was the same thing as the force, or at least expressed it perfectly, or geometrically speaking, that the forces are in compound proportion of the speeds and the bodies. Now it is obvious indeed that the same force should always be preserved in the universe. So, when we attend to the phenomena with care, we see clearly that mechanical perpetual motion does not occur, because then the force of a machine, which is continually being slightly diminished by friction, and must consequently soon cease, would be replaced and so would increase of itself without any new impulsion from outside. We also note that the force of a body is diminished solely to the extent that it gives some of it to neighbouring bodies or to its own parts in so far as these have independent motions.

Thus they thought that what can be said of force could also be said of quantity of motion. But, to show the difference, I suppose that a body falling from a particular height acquires the force needed to climb up again, if its direction of travel should take it that way, unless there are hindrances. For example, a pendulum would rise right back again to the height it had fallen from if the resistance of the air and other small obstacles did not somehow diminish the force acquired.

I *suppose* also that as much force is needed to raise a body A of one pound a height CD of four fathoms as to raise a body B of four pounds a height EF of one fathom. All this is accepted by our new philosophers.

Hence, it is manifest that body (A), after falling from the height CD has acquired as much force precisely as body (B) after falling from the height EF. For when body (B) has arrived at F and has the force to climb back to E (by the first supposition), it has in consequence the force to carry a body of four pounds, that is its own body, to the height EF of one fathom, and similarly, when body (A) has reached D and has the force to climb back to C, it has the force to carry a body of one pound, that is its own body, to

the height CD of four fathoms. Hence (by the second supposition), the forces of the two bodies are equal.

Now let us see whether the quantity of motion is also the same in both cases: but it is here that there will be surprise at finding a very great difference. For it has been demonstrated by Galileo that the speed acquired in the fall CD is twice that acquired in the fall EF, though the height is quadruple. If then, we multiply the body (A), in the proportion 1, by the speed, in the proportion 2, the product or quantity of motion will be as 2, and if on the other hand, we multiply the body (B), which is as 4, by its speed, which is as 1, then the product or quantity of motion will be as 4. Hence the quantity of motion of body (A) at point D is half the quantity of motion of body (B) at point F, though their forces are equal. Hence there is a great difference between the quantity of motion and the force, as was to be proved.

From this it is seen that the force must be measured by the quantity of the effect it can produce, e.g. by the height to which a heavy body of a particular size and kind can be raised, something very different from the speed that can be given it, and that to give it twice the speed more than twice the force is needed.

Nothing is simpler than this proof. Descartes only fell into error here because he trusted too much in his thoughts before they had matured enough with a confidence based on the happy success of some of his thoughts and on his experience of the penetration of his mind, which rendered him rather too rash in the end. But I am astonished that his followers have not recognised this error since, and I fear that little by little they begin to imitate the Peripatetics they so make fun of, and that like them they grow accustomed to consulting the books of their master rather than reason and nature.

18. IMPORTANCE OF THE DISTINCTION BETWEEN FORCE AND QUANTITY OF MOTION INTER ALIA IN DECIDING THAT WE MUST HAVE RECOURSE TO METAPHYSICAL CONSIDERATIONS DISTINCT FROM EXTENSION TO EXPLAIN THE NATURE OF BODIES

This consideration of the distinction of force from quantity of motion is important enough, not only in physics and mechanics in the discovery of the true laws of nature and rules of motions, and even in the correction of several practical errors that have

slipped into the writings of some able mathematicians, but also in metaphysics, in the better understanding of the principles of things. For motion, if its precise formal content only—i.e. change of place—is considered, is not a completely real thing, and when several bodies mutually exchange their places, it is impossible to determine from these changes alone which of them ought to have motion or rest attributed to it, as I could show geometrically if I wanted to dwell on this point now.

But the force or direct cause of these changes is something more real, and there is some basis for attributing it to one body rather than to another, and it is only thereby that we can know which one the motion is best attributed to. Now, this force is something different from size and motion, and it can be concluded from this that what is conceived in bodies does not consist solely in extension and its modifications, contrary to the conviction of our moderns. Hence, too, we are obliged to re-establish some of the beings or forms banished by them. And although all the particular phenomena of corporeal nature can be explained mathematically or mechanically by those who understand them, it nevertheless appears more and more that the general principles of corporeal mechanical nature itself are metaphysical rather than geometrical, belonging to forms or indivisible natures functioning as causes of the matter or extension rather than to corporeal or extended mass—a reflection capable of reconciling the mechanical philosophy of the moderns with the circumspection of some intelligent well-intentioned people who fear quite reasonably that we are moving too far from immaterial beings to the disadvantage of piety.

19. USEFULNESS OF FINAL CAUSES IN PHYSICS

As I do not like to judge people's intentions, or only do so favourably if I can, I am not accusing our new philosophers of impiety when they claim to banish final causes in physics. Nevertheless I am obliged to admit that I do not recognise their usual intelligence and prudence therein and that the consequences of this opinion seem dangerous to me, particularly when it is connected with that refuted by me at the beginning of this discourse, which seems to lead to their removal altogether, as if God never had any aim, whether good or active, or as if the good were not the object of His will. . . . For my part, I hold on the contrary that it is just there that we have to seek the principle of all existences and even of the laws of nature, since God always intends what is best and most perfect.

I am happy to admit that we are liable to error when we want to determine the aims and counsels of God, but that is only when we try to restrict them to a particular plan, in the belief that He has only one single thing in view, whereas in fact He considers everything at once. Thus, when we think that God made the world for us alone, we are greatly mistaken, although it is true that He made it in its totality for us and that there is nothing in the world that does not affect us and does not also conform to His concerns for us, in accordance with the above principles. Thus, when we see some good effect or perfection happening or resulting from the works of God, we can certainly say that God intended it, for He does nothing by chance and unlike us does not sometimes fail to do well. That is why, far from being in an error here, akin to that of the overly political who attribute excessive refinement to the designs of princes, or to that of commentators who search for too much erudition in their authors, we cannot attribute too many reflections to this infinite Wisdom, and there is no matter in which there is less danger of error as long as we only affirm and avoid negative propositions here that limit the plans of God.

Everyone who sees the admirable structure of animals is led to recognise the wisdom of the Author of things, and I advise those with any feeling of piety or even of true Philosophy to avoid the expression of some would-be tough minds who say that we see because we happen to have eyes, without noting that the eyes were made to see. If we are seriously involved in these opinions that assign everything to the necessity of matter or to a particular chance (although both must seem ridiculous to those who understand what we have explained above), we will inevitably fail to recognise an intelligent Author of nature. For it is ridiculous to introduce a Sovereign Intelligence as the Ordainer of things and not use His wisdom to account for phenomena. As if, in accounting for the conquest of a great prince in capturing an important position, a historian tried to say that it was because the particles of the gunpowder liberated by lighting the fuse escaped at a speed capable of pushing a hard heavy body against the walls of the position, while the branches of the particles composing the copper of the cannon were sufficiently intertwined not to be separated by this speed, instead of showing how the foresight of the victor caused him to choose the appropriate time and means, and how his power overcame all the obstacles.

20. REMARKABLE PASSAGE OF SOCRATES IN PLATO AGAINST EXCESSIVELY MATERIALISTIC PHILOSOPHERS. M

This point reminds me of a fine passage of Socrates in Plato's *Phaedo*. In marvellous agreement with my thoughts on this point, it seems to be written expressly against our excessively materialistic philosophers. So this account made me want to translate it, and though it is rather long, perhaps this sample will give one of us the occasion to share many other fine sound thoughts from the writings of the great man.

"One day," he said, "I heard someone read a book of Anaxagoras, where there were these words 'that an Intelligent Being was the cause of all things, and that He arranged and adorned them.' I was extremely pleased with that, for I thought that if the world was the result of an Intelligence, everything would have been made in the most perfect way possible. That is why I thought that he who wanted to explain why things came to be, perished or subsisted had to search for what suited the perfection of each. Thus man would only have to consider in himself or in some other thing, what was best or most perfect, alone. For he who knew the most perfect would easily decide thereby what was imperfect, since there is only one true knowledge of both.

"In view of all this, I rejoiced to have found a master able to teach the reason of things: whether, for example, the earth was round or flat, and why it was best that way rather than otherwise. . . . Moreover, I expected that when he said that the earth was or was not at the centre of the universe, he would explain to me why that was the most suitable. And when he said the same of the sun, the moon, the stars and their motions. . . . And finally, after showing what was suitable to each thing individually, he would show me what was best in general.

"Full of this hope, I took and skimmed through the books of Anaxagoras with great eagerness, but I was far from my expectation, for I was surprised to see that he made no use of this governing Intelligence, set out in advance, that he spoke no more of the adornment and the perfection of things, and introduced some rather implausible ethereal matters.

"In this he was rather like the man who said that Socrates did things intelligently, but when he came to explaining in particular the causes of his actions, thereupon said that he was sitting here because he had a body composed of bone, flesh and nerves, that

the bones were solid, but had gaps and joints, that the nerves could be tensed or relaxed, and that was why the body was flexible and I was sitting. Or if he wanted to explain the present speech, he had recourse to the air, to vocal and aural organs and like things, while forgetting the true causes, that is that the Athenians thought it better to condemn than to acquit me, and I for my part thought it better to sit here than to take flight. For, by my faith, these nerves and these bones would long since be with the Boeotians and the Megarans, if I had not found it more just and more honest for me to suffer the penalty the fatherland wants to impose on me than live elsewhere a wanderer in exile. That is why it is unreasonable to call these bones and nerves and their motions causes.

"It is true that whoever said that I could not do all this without bones and nerves would be right, but the true cause is something else . . . and that is no more than a condition without which the cause could not be the cause. . . .

"People who say no more than, for example, that the motions of the bodies surrounding the earth support the earth where it is, forget that the divine power arranges everything in the finest way, and do not understand that it is the good and the beautiful that join, form and preserve the world. . . ." Thus far Socrates, for the things about ideas or forms that follow in Plato are not less excellent but a bit more difficult.

21. IF THE RULES OF MECHANICS DEPENDED ON GEOMETRY ALONE WITHOUT METAPHYSICS, THE PHENOMENA WOULD BE QUITE DIFFERENT

Now, since the wisdom of God has always been recognised in the details of the mechanical structures of particular bodies, it is very necessary that it should also be shown in the general set-up of the world and the constitution of the laws of nature. This is so true that the counsels of this Wisdom are observed in the laws of motion in general. For if there were nothing else to bodies but an extended mass and nothing to motion but change of place, and if everything had to and could be deduced from these definitions alone by geometrical necessity, it would follow, as I have shown elsewhere, that the least body would give the same speed as its own to the largest resting body it met without losing any of its own, and many other rules of this sort would have to be accepted, such as are altogether contrary to the construction of a system. But the decree of the divine wisdom to preserve always the same total force and direction has provided for this.

I even find that many natural effects can be demonstrated doubly, i.e. through the efficient cause and separately through the final cause as well, by using for example the decree of God to produce His effect by the simplest and most determinate ways, as I have shown elsewhere in my account of the rules of catoptrics and dioptrics, and I shall say more of it below.

22. RECONCILIATION OF THE TWO WAYS BY FINAL AND EFFICIENT CAUSES IN DEFENCE OF BOTH THOSE WHO EXPLAIN NATURE MECHANICALLY AND THOSE WHO HAVE RECOURSE TO INCORPOREAL NATURES

It is good to note this point to reconcile those who hope to explain mechanically the formation of the first tissues of an animal and the complete machine of its parts with those who account for the same structure by final causes. Both are good and both can be

useful, not only for admiring the artifice of the great Workman, but also in discovering something useful in physics and medicine. Authors who follow these different routes should not be hard on each other.

For I see that those who concentrate on explaining the beauty of divine Anatomy laugh at others who imagine that an apparently fortuitous motion of particular fluids can make such a beautiful variety of members, and call such people rash and profane, while on the other hand the latter call the former simple and superstitious like the ancients who took it that the physicists were impious when they held that it was not Jupiter that thundered but some matter in the clouds. The best thing would be to unite both considerations, for, to use a vulgar comparison, the skill of a workman is recognised and praised not only by showing what designs he had when he made the parts of his machine, but also by explaining the tools he used to make each part, particularly when these tools are simple and ingeniously contrived. *God is skilful enough an artisan* to produce a machine a thousand times still more ingenious than that of our body if that were possible, using only a few simple enough fluids expressly formed so that only the ordinary laws of nature are needed to sort them out as necessary to produce such an admirable effect, but it is also true that this would not happen if God were not the Author of nature.

I find, nevertheless, that the way of efficient causes is while indeed more profound and in one way more direct and *a priori*, on the other hand rather difficult when we get down to details and I think that our Philosophers are most often still rather far from that. In contrast, the way of final causes is easier and is moreover often helpful in guessing important and useful truths that would have been a long time in the searching by the former more physical route, and of this Anatomy can furnish important examples. I also hold that Snell, the first discoverer of the rules of refraction, would have taken a long time to find them if he had tried to find out first how light was formed. But he seems to have followed the method the ancients used in catoptrics, that of final causes in fact. For, in the search for the easiest way of conducting a ray from one given point to another by reflection at a given plane (supposing that this is nature's design), they discovered the equality of the angles of incidence and reflection, as can be seen in a little treatise of Heliodorus of Larissa and elsewhere. That is what in my opinion Snell, and after him (though without knowing anything about him) Fermat, applied more ingeniously to refraction. For when in the same media the rays observe the same proportion of sines which is also that of the resistances of the media, it turns out to be the easiest, or at least the most determinate way of passing from a given point in one medium to a given point in the other. The demonstration Descartes tried to give of this same theorem by the way of efficient causes is far from being as good. At least there are grounds for suspecting that he would never have found it that way if he had not heard something of Snell's discovery in Holland.

23. RETURNING TO IMMATERIAL SUBSTANCES; THE EXPLANATION OF HOW GOD ACTS ON THE UNDERSTANDING OF MINDS AND OF WHETHER WE ALWAYS HAVE AN IDEA OF WHAT WE THINK

I have found it relevant to insist somewhat on these considerations concerning final causes, incorporeal natures and an Intelligent Cause in relation to bodies, to make known their use even in physics and mathematics. On the one hand, this is to purge the mechanical philosophy of the profanity imputed to it. On the other hand it is to raise

the minds of our philosophers from mere material considerations to more noble meditations. It is now time to return from bodies to immaterial natures, to minds in particular, and to say something of the ways God uses to illumine them and act on them, for we must not doubt that here too there are laws of nature, a point I could discuss more fully elsewhere. For now, it is enough to touch a little on ideas, on whether we see all things in God, and on how God is our light.

Now, it is relevant to note that several errors are occasioned by the misuse of ideas. For when we reason on something we imagine we have an idea of it, and on that foundation some recent authors have built a demonstration of God that is, rigorously speaking, very imperfect. For, they say, I must have an idea of God or of a perfect being, since I am thinking of Him, and it is impossible to think without an idea. Now the idea of this Being includes all the perfections and existence is one of these, so that consequently He exists. But as we often think of impossible chimerae, such as the ultimate degree of speed or the greatest number or the meeting of the conchoid [a plane curve in geometry] with its base or rule, this reasoning is not enough. Hence in this sense a person can say he has true or false ideas according as the thing in question is possible or not, and it is only when we are assured of its possibility that we can boast of having an idea of the thing. Thus the above argument proves at least that God necessarily exists if He is possible. This is indeed an excellent privilege of the divine nature: to need only its possibility or essence to exist in fact, just what is called an *Ens a se*.

24. JUST WHAT IS CLEAR OR OBSCURE, DISTINCT OR CONFUSED,
ADEQUATE AND INTUITIVE OR SUPPOSITIVE KNOWLEDGE,
AND WHAT ARE NOMINAL, REAL, CAUSAL
AND ESSENTIAL DEFINITIONS

The better to understand the nature of ideas, we have to touch a little on the varieties of knowledge. When I know only through experience that something is possible, because everything that exists is possible, my knowledge is confused. It is in this way that we know bodies and their qualities. But when I can prove *a priori* that something is possible, this knowledge is distinct. When I can recognise one thing among others without being able to say in what its *differentiae* or properties consist, my knowledge is confused. Thus it is that we sometimes know *clearly* without being in any doubt at all whether a poem or picture is well or badly made, because there is an I don't know what that satisfies or shocks us. But only when I can explain the marks available to me is my knowledge called *distinct*. Such is the knowledge of the assayer who discerns the true and the false by particular tests or marks comprising the definition of gold.

But there are degrees of distinct knowledge, for the notions that enter the definition would ordinarily themselves need definition and are only confusedly known. But when every thing that enters a definition or distinct item of knowledge is distinctly known right back to the primitive notions, I call this knowledge *adequate*, and when my mind understands all the primitive ingredients of a notion all at once and distinctly, then it has an intuitive knowledge of it, something very rare since most human knowledge is confused or even *suppositive*.

It is also good to distinguish nominal definitions from real ones. I refer to a nominal definition when it is still possible to doubt that the notion defined is possible. Thus, for example, when I say that an endless screw is a solid line whose parts are congruent or can coincide with each other, whoever did not otherwise know what an endless screw

was could doubt the possibility of such a line, though indeed it was a reciprocal property of an endless screw, since the other lines whose parts are congruent are planar (the circumference of the circle and the straight line only), that is they can be drawn *in a plane*. This shows that every reciprocal property can be used in a nominal definition, whereas when the property makes known the possibility of the thing, it makes the definition real. As long as we have a mere nominal definition, we could never be sure of the consequences drawn from it, for if it concealed some contradiction or impossibility, contrary conclusions could be drawn from it. That is why truths do not depend on names and are not arbitrary as held by some new philosophers.

25. IN WHAT CASE OUR KNOWLEDGE IS JOINED TO THE CONTEMPLATION OF THE IDEA

Now it is obvious that we have no idea of a notion when it is impossible. And when our knowledge is merely *suppositive*, when we have the idea we do not contemplate it, for such a notion is known only in the same way as those that are occultly impossible, and if it is possible it is not learned by that method of knowing. For example, when I think of a thousand, or of chiliagon [a group of one thousand things], I often do so without contemplating the idea, as when I say that a thousand is ten times a hundred without putting myself to the trouble of thinking what ten and a hundred are. That is because I *suppose* I know it and see no need for the present to pause to conceive it. Thus it can easily happen, as indeed it does often enough, that I am in error with respect to a notion I suppose or believe I understand, although in truth it is impossible, or at least incompatible with the others I join it to. Whether or not I am in error, this suppositive way of conceiving remains the same. Hence, it is only when our knowledge of confused things is *clear* or our knowledge of distinct things intuitive, that we contemplate the complete idea of them.

26. WE HAVE ALL IDEAS IN US; PLATO'S NOTION OF REMINISCENCE

If we are to conceive properly what an idea is, we must avoid an ambiguity. For there are some who take the idea to be the form or way of distinguishing our thoughts. On this view we have the idea in our minds only to the extent that we think of it, and whenever we think of it again, we have ideas of the same thing different from though similar to the previous ones. But it seems that others take the idea to be an immediate object of thought, or some permanent form remaining when we do not contemplate it. Indeed, there is always in our souls the capacity to conceive any nature or form whatever, when the opportunity of thinking of it presents itself. I think that this capacity of our souls, to the extent that it expresses some nature, form or essence, is properly speaking the idea of the thing, in us and always in us, whether we think of it or not. For our soul expresses God and the universe, and all essences as well as all existences.

This follows from my principles, for nothing enters our minds naturally from outside, and it is a bad habit of ours to think as if our souls received some messenger—species or had gates and windows. We have all the forms in our minds, for all time even, because the mind always expresses all its future thoughts, and already thinks confusedly everything it will ever think distinctly. Nothing could be taught us whose idea was not already present in our minds as the matter from which this thought was formed.

That is what Plato understood so well when he put forward his doctrine of reminiscence, which is very sound provided we take it the right way and purge it of the error of pre-existence, and do not imagine that the soul has to have once known and distinctly thought what it is now learning and thinking. He also confirmed his opinion by a beautiful experiment. He introduced a little boy in his dialogue called *Meno* whom he led insensibly into the most difficult geometrical truths concerning incommensurables, without teaching him anything, merely putting relevant questions in order. This shows that our souls have virtual knowledge of everything. They need only attention to know the truths, and consequently have at least the truths on which these truths depend. It can even be said, if the latter are taken for the relations of ideas, that they already possess these truths.

27. IN WHAT SENSE OUR SOULS MAY BE COMPARED TO EMPTY TABLETS, AND HOW OUR NOTIONS COME FROM THE SENSES

Aristotle preferred to compare our souls to tablets that were still bare with space for writing on, and he claimed that nothing was in our understanding that did not come from the senses. As is the way with Aristotle, this is more in conformity with popular notions, whereas Plato goes deeper. Nevertheless, such everyday expressions or practical sayings are liable to pass into common usage, almost as with the followers of Copernicus who continue to say that the sun rises and sets. I often find, even, that a good sense can be given to them in accordance with which there is nothing wrong with them. Just as I have already remarked on the way it is possible to say truly that particular substances act on each other, in this same sense it can be said that we receive some knowledge from outside by the ministry of the senses, because some external things contain, or more particularly express, the reasons determining our souls to particular thoughts. But when we are concerned with the accuracy of metaphysical truths, it is important to recognise the extent and independence of our souls. This goes infinitely further than is vulgarly supposed, although in the ordinary course of life only what is more certainly perceived and belongs to us in a particular way is attributed to it, since there is no purpose in going further.

Nevertheless, it would be good to choose special terms for both senses to avoid ambiguity. Hence, expressions in our souls, whether conceived or not, can be called ideas, while those we conceive or form can be called *notions* or *concepts*. But however we take it, it is always false to say that all our notions come from the senses called external, since the one I have of myself, and of my thoughts, and consequently of being, substance, action, identity and many others, comes from internal experience.

28. GOD ALONE IS THE IMMEDIATE OBJECT OF OUR PERCEPTIONS EXISTING OUTSIDE US, FOR HE ALONE IS OUR LIGHT

Now, in the rigour of metaphysical truth, there is no external cause acting on us but God alone, and He alone communicates himself to us directly in virtue of our continual dependence. It follows from this that there is no other external object touching our souls and exciting our perceptions directly. So it is only in virtue of the continual action of God on us that we have in our souls the ideas of everything, i.e. because every effect expresses its cause and hence the essence of our souls is a particular expression, imitation, or image

of the essence, thought and will of God and of all the ideas included in Him. Hence, it can be said that God alone is our immediate object outside us, and that it is in Him that we see all things. For example, when we see the sun and the stars, it is God who gave us them and preserves their ideas in us, and in fact determines us to think of them at the time at which our senses are disposed in a particular way, through His ordinary concurrence and in accordance with the laws established by Him. God is the sun and light of souls, “the light enlightening every man born into the world.” It is not just today that people are of this opinion. After Holy Scripture and the Fathers—always more for Plato than for Aristotle—I recall noticing once that in the time of the Scholastics some believed that God was the light of the soul and, in their way of speaking, “the active intellect of the rational soul.” The Averroists gave this a bad meaning, but others such as, I think, William of St. Amour, doctor of the Sorbonne, and several mystical theologians, took it in a manner worthy of God and capable of raising the soul to the knowledge of its good.

29. NEVERTHELESS WE THINK DIRECTLY BY OUR OWN IDEAS AND NOT BY THOSE OF GOD

Nevertheless I am not of the opinion of some able philosophers who seem to maintain that our very ideas are in God, and not at all in us. In my opinion, this comes about because they have still not pondered enough what we have just explained concerning substances, nor the entire extent and independence of our souls (which means that they include everything happening to them and express the essence of God, and with Him all possible and actual beings, like an effect its cause). Also, it is inconceivable that I should think by means of the thoughts of someone else. It is very necessary that an effect should express its cause and it is also very necessary that the soul should be actually affected in a particular way when it thinks of something and that it should have in advance, not only the passive power of being affected in this way, something already determined, but also an active power, in virtue of which there has always been in its nature the marks of the future production of that thought and dispositions to produce it when the time came. All this already includes the idea contained in that thought.

30. HOW GOD INCLINES WITHOUT NECESSITATING; WE HAVE NO RIGHT TO COMPLAIN, AND WE MUST NOT ASK WHY JUDAS SINS SINCE THIS FREE ACTION IS INCLUDED IN HIS NOTION, ONLY WHY JUDAS THE SINNER IS ADMITTED TO EXISTENCE IN PREFERENCE TO OTHER POSSIBLE PERSONS. THE ORIGIN OF EVIL COMES FROM THIS, THE ORIGINAL IMPERFECTION BEFORE SIN, AND THE DEGREES OF GRACE

Concerning the action of God on the human will, there are many rather difficult questions that would take time to pursue here. Nevertheless, in outline, this is what can be said. When God concurs in our actions, He ordinarily does no more than follow the laws of nature He has established, i.e. He preserves and continually produces our nature, so that the thoughts spontaneously and naturally or freely happen to us in the order carried by the notion of our individual substance, within which they could have been foreseen from all eternity. Moreover, in virtue of the decree that the will should always tend

towards the apparent good, and so express or imitate God's will in certain particular respects in respect of which this apparent good always has something of the true, He determines our will to choose what seems the best without nonetheless necessitating it. For, absolutely speaking, in so far as it may be opposed to necessity, our will is indifferent and has the power to do otherwise or to suspend its action altogether, since both are and remain possible.

Hence it falls to the soul to take precautions against the appearances taking it by surprise by means of a firm resolve to reflect and to refuse to act or judge on particular occasions without thorough deliberation. Nevertheless it is true and even certain from all eternity that a particular soul will not use this power on one such occasion. But who could do anything about it or do other than complain about himself? For all complaints after the fact are unjust when they would have been unjust before. Now would this soul, shortly before sinning, be in the right to complain of God, who has not determined him to flee from the sin as if He had determined him to sin? Since God's determinations in these matters are unforeseeable, how does he know himself to be determined to sin, unless in fact he is already actually sinning? It is only a matter of not willing, and God could propose no easier or juster condition. Moreover, any judge stops only to consider how far a man's will is bad without searching for the reasons disposing him to have a bad will. But perhaps it is certain from all eternity that I will sin? Answer yourself: perhaps not. Do not think about what you cannot know and cannot enlighten you, but act in accordance with the duty you know.

But, someone else will ask, whence comes it that that man will certainly do this sin? The answer is easy: otherwise he would not be that man. For God sees for all time that there will be a certain Judas whose notion, or idea God has of him, contains this future free action. Hence the only question that remains is why such a Judas, the traitor, who is merely a possible in the idea of God actually exists. But to that question there is no answer to be expected here below, unless that in general we must say that since God thought it good for him to exist, despite the sin he foresaw this evil must be repaid with interest in the universe, that God will obtain a greater good from it; and that in all He will find this sequence of things including the existence of this sinner the most perfect of all the other possible ones. But to explain in all cases the admirable economy of this choice is not possible while we are travellers in this vale of tears in this world. It is enough to know without understanding it. It is time here to recognise "the height of the riches," the width and depth of the divine wisdom, without seeking a detail involving these infinite considerations.

Nevertheless, it is clear that God is not the cause of evil. For not only did original sin take hold of the soul after the loss of innocence but before then there was a limitation or original imperfection common to the natures of all creatures making them capable of sin or liable to fail. Thus there is no more difficulty with regard to the supralapsarians* than with the others. In my opinion, it is to this that the opinion of St. Augustine and other authors that the root of evil is in nothingness should be reduced, i.e. in the privation or the limitation of creatures that God graciously remedies by giving them the degree of perfection it pleases Him to give. Whether ordinary or extraordinary, this grace of God has its degrees and measures, always in itself efficacious in producing a proportionate effect. Moreover it is always sufficient, not only to guarantee us against sin, but to produce salvation, if the man joins himself to it with his will, though it is not always sufficient to surmount human inclinations, otherwise it would depend on nothing more,

*Calvinists who believe that election to heaven or hell was a part of God's original plan.

and that is reserved to the absolutely efficacious grace alone that is always victorious whether by itself or by the congruity of circumstances.

31. THE FOREKNOWLEDGE OF MERIT, THE DISPENSING OF GRACE,
THE MOTIVES OF ELECTION, THE MIDDLE KNOWLEDGE,
THE ABSOLUTE DECREE; THAT EVERYTHING REDUCES
TO THE REASON WHY GOD CHOSE A PARTICULAR POSSIBLE
PERSON FOR EXISTENCE, WHOSE NOTION INCLUDES THAT
PARTICULAR SEQUENCE OF GRACES AND FREE ACTIONS,
SO THAT ALL THE DIFFICULTIES ARE REMOVED AT ONCE

In the end, the graces of God are graces pure and simple over which creatures have no claim. However, just as when we are giving an account of the action of God in dispensing these graces it is not enough to have recourse to His fore-sight, whether absolute or conditional, of the future actions of men, so we must not imagine absolute decrees with no reasonable motive. As regards God's fore-sight of faith and good works, it is very true that God has elected only those whose faith and charity He foresaw, "those He foreknew He would give faith to," but the same question returns: why God will give the grace of faith and good works to some rather than to others. As for this middle knowledge of God's, the fore-sight, not of good works, but of their matter and predisposition, or of what the man would contribute from his side (since it is true that there is diversity on the human side wherever there is on the side of grace, and since indeed, although man needs to be excited towards the good and converted, it is very necessary that he should also play his part here after the fact) some people think that it could be said that since God sees what man would do without grace or extraordinary assistance, or at least what he will have on his side apart from grace, He could resolve to give grace to those whose natural disposition was the best or at any rate the least imperfect or least evil. But if that was the case, it could be said that these natural dispositions, in so far as they are good, are still the effect of an act of grace, even if an ordinary one, since God has advantaged some more than others. And since He well knows that these natural advantages He gives will provide the motive for grace or extraordinary assistance, does it not follow from the doctrine that truly everything in the end reduces to His mercy?

Hence, I believe (since we do not know how much or how God takes account of natural dispositions in dispensing grace) that the most accurate and certain thing to say is, as already noted and in conformity with our principles, that among the possible beings there should be the person of Peter or John whose notion or idea contains the whole sequence of ordinary and extraordinary graces and all the other events along with their circumstances, and that it pleased God to choose him from among an infinity of other equally possible persons for actual existence. After that it seems that there is no more to ask and that all the difficulties disappear.

For, considering this single great question, why it pleased God to choose one from so many other possible persons, we would have to be unreasonable indeed not to be satisfied with the general reasons given, for which the detail is beyond our reach. So, we should not have recourse to an absolute decree, which is unreasonable since there is no reason for it, or to reasons that do not succeed in resolving the difficulty. Instead the best will be to say with St. Paul that there are certain grand reasons for this unknown to mortals and founded in the general order whose aim is the greatest perfection of the universe, and that God has observed these. It is to this that the motives of the glory of God

and the manifestation of His justice reduce, as well as His mercy and His perfections generally, and finally that immense depth of His riches Paul's soul was enchanted with.

32. USEFULNESS OF THESE PRINCIPLES IN MATTERS OF PIETY AND RELIGION

For the rest, it seems that the thoughts we have just explained, particularly the grand principle of the perfection of the operations of God and the notion of the substance including all the events with all their circumstances, far from harming religion, serve to confirm it, removing very great difficulties, inflaming souls with a divine love and raising minds to the knowledge of incorporeal substances to a much greater extent than the hypotheses we have seen up to now. For it is clear that just as thoughts depend on our substance, all other substances depend on God, that God is all in all, and that He is intimately united with all creatures (though to the extent of their perfection), and that He alone determines them externally by His influence. And if to act is to determine directly, it can be said in this sense, in the language of metaphysics, that God operates on me and is alone able to do me good or ill, while other substances are nothing but occasional causes, for the reason that as God considers all of them, He distributes His acts of goodness and obliges them to conform to each other. Also, God alone makes the connection and communication of substances, and it is by Him that phenomena of any given substance meet and fit with those of the others, and consequently that there is reality in our perceptions. But in practice action is attributed to particular occasional causes in the sense explained above, because it is not always necessary to mention the universal cause in particular cases.

It is seen also that every substance has a perfect spontaneity (which in intelligent substances becomes liberty): that everything that happens to it is a consequence of its ideas or being, and that it is determined by nothing but God alone. That is why a person of noble mind whose sanctity is greatly revered used to say that the soul must often think as if there were only God and it in the world.

Now nothing makes immortality more completely comprehensible than this independence and extent of the soul. It protects it absolutely from all external things, since it alone constitutes the whole world and, with God, suffices to itself. It is also impossible for it to perish other than by annihilation, and impossible for the world (of which it is a living and perpetual expression) to destroy itself. Hence, it is not possible for the changes in that extended mass called our body to do anything to our soul, or for the disappearance of that body to destroy what is indivisible.

33. EXPLANATION OF THE UNION OF SOUL AND BODY SOMETHING ONCE THOUGHT INEXPLICABLE OR MIRACULOUS, AND THE ORIGIN OF CONFUSED PERCEPTIONS

Also clear is the unexpected solution of that great mystery of the union of soul and body, i.e. how it happens that the actions and passions of the one are accompanied by the actions and passions, or rather appropriate phenomena, of the other. For there is no way of conceiving any influence of the one on the other, and it is unreasonable simply to have recourse to the extraordinary operation of the universal cause in something ordinary and particular. But here is the true reason. We have said that everything happening to the soul and to every substance is a consequence of its notion. Hence the very idea or essence of the soul makes all its appearances or perceptions arise spontaneously out of its own

nature, and just so, that they answer of themselves to what happens in the whole universe, though particularly in the body assigned to it, because in a way and for a time, it is in accordance with the relation of other bodies to its own that the soul expresses the state of the universe. This shows yet again how our bodies belong to us without nevertheless being attached to our essences. I believe that persons able to meditate will see advantage in our principles in just this, that it is easy to see in what exactly the connection between soul and body—apparently inexplicable by any other means—consists.

It can also be seen that the perceptions of our senses, even when they are clear, must necessarily contain some confused sensations. For as all the bodies in the universe are in sympathy, ours receive the impressions of all the others. Although our senses relate to everything, it is not possible for our souls to attend to all individually, and that is why our confused sensations are the result of a variety, altogether infinite, of perceptions. It is almost like the confused murmur heard by those approaching the shores of the sea that arises from the accumulation of the reverberations of innumerable waves. Now if of several perceptions (not coming together to become a single one) none stands out above the others, and if they make almost equally strong impressions, or are equally capable of determining the attention of the soul, it can only register them confusedly.

34. THE EXCELLENCE OF MINDS COMPARED WITH OTHER SUBSTANCES OR SUBSTANTIAL FORMS. THE IMMORTALITY CALLED FOR IMPLIES MEMORY

One thing I do not propose to decide is whether in metaphysical rigour bodies are substances or are no more than *true* phenomena like the rainbow, nor consequently whether there are substances, souls or substantial forms that are not intelligent. But if we suppose that bodies like man that constitute unities in themselves are substances and have substantial forms, we are obliged to admit that these souls and substantial forms could no more entirely perish than atoms if there are any or ultimate particles of matter can, in the opinion of other philosophers. For though it may become quite different, no substance perishes. Although more imperfectly than minds, they too express the whole universe. But the principal difference is that they do not know what they are nor what they are doing. Consequently, since they have no power of reflection, they are unable to discover necessary and universal truths. It is also for want of reflection on themselves that they have no moral qualities, so that, when we consider how a caterpillar changes into a butterfly through almost a thousand transformations, it comes to the same for morals and practice as saying that they perish, as can indeed be said physically (as we say of bodies that they perish by corruption). But the intelligent soul that knows what it is, and is capable of pronouncing this me which says so much, not only remains the same metaphysically to a greater extent than the others, but it also remains morally the same and constitutes the same personality. For it is the memory and knowledge of this me that makes it liable to punishment and reward. Also, the immortality called for both in morality and religion does not consist merely in that perpetual subsistence proper to all substances. For without the memory of what has been, there would be nothing desirable about it. Let us suppose that some poor wretch suddenly became King of China, but only on condition that he forgot what he had been, as if he had just been reborn: does that not come to the same in practice, or in the effects that could be registered, as if he had to be annihilated and a King of China created at the same instant and at the same place? Something this individual has no reason to desire.

35. THE EXCELLENCE OF MINDS. GOD CONSIDERS THEM IN PREFERENCE TO OTHER CREATURES. MINDS EXPRESS GOD RATHER THAN THE WORLD, BUT OTHER SUBSTANCES EXPRESS THE WORLD RATHER THAN GOD

But to show by natural reasons that God always will preserve not only our substance but also our personality, that is memory and knowledge of what we are although distinct knowledge of that may sometimes be suspended when asleep or unconscious, morality must be joined to Metaphysics. That is, God has not only to be considered as the principle and cause of all substances and all beings, but also as the chief of all persons or intelligent substances and the absolute monarch of the most perfect city or republic, like that of the universe composed of all minds together, since God himself is the most accomplished of all Minds as well as the greatest of all Beings. For assuredly, minds are either the only substances existing in the world if bodies are no more than true phenomena, or else they are at least the most perfect ones. And since the whole nature, end, virtue and function of substances is merely to express God and the universe, as has been sufficiently explained, there are no grounds for doubting that substances expressing Him in the knowledge of what they are doing, and capable of knowing great truths regarding God and the universe, express Him incomparably better than those natures that are either animal and incapable of knowing truths, or altogether destitute of sense and knowledge; and the difference between intelligent substances and those that are not is as great as that between the mirror and he who sees.

And since God Himself is the greatest and wisest of minds, it is easy to conclude that beings with whom He can so to speak enter into conversation or even into fellowship, communicating His thoughts and intentions individually, so that they can know and love their Benefactor, must concern Him infinitely more than all other beings, able only to pass for the tools of minds, just as we can see wise persons taking infinitely more account of a man than of some other thing, however precious that may be. It seems that the greatest satisfaction an otherwise contented soul can have is to see himself loved by others although in respect of God there is this difference that His glory and our worship can add nothing to His satisfaction, since the knowledge of creatures is no more than a consequence of His sovereign and perfect happiness and very far from contributing to the latter or being part of the cause thereof. Nevertheless, what is good and reasonable in finite minds is supremely so in Him and just as we would praise a king who preferred to preserve the life of a man before the most precious and rare of animals, we should not doubt that the most enlightened and just of all Monarchs is of the same opinion.

36. GOD IS THE MONARCH OF THAT MOST PERFECT REPUBLIC THAT CONSISTS OF ALL MINDS, AND THE HAPPINESS OF THIS CITY OF GOD IS HIS PRINCIPAL DESIGN

In fact, minds are the most perfectible of all substances and their perfections have this characteristic that they hinder each other the least, or rather that they assist each other, for only the most virtuous can be the most perfect friends. Hence it manifestly follows that God who always looks to the greatest perfection in general, will have the most care of minds, and will give them, not only generally but to each individually, the greatest perfection the universal harmony can permit.

It can even be said that God, in so far as He is a mind, is the origin of existent things—if there were no will to choose best there would be no reason for one possible

thing to exist in preference to others. Hence God's quality of being Himself a mind precedes all other considerations He may have with respect to creatures. Minds only are made in His image, and it is as if they are of His race and children of His house, since they alone can serve Him freely and act consciously in imitation of the divine nature. One mind is worth an entire world, since it does not only express it, but knows it, and governs itself there in the manner of God. So much so that it seems that while every substance expresses the whole universe, other substances express the world rather than God while minds express God rather than the world. And this natural nobility of minds, which brings them as near to the divine as is possible for mere creatures, means that God receives from them infinitely more glory than from other beings, or rather other beings merely give minds matter for glorifying Him.

That is why this moral quality of God that makes Him the Lord and Monarch of Minds, affects Him so to speak personally in a quite special manner. It is in this that He becomes human and is willing to allow human ways of speaking about Him, and enters into fellowship with us like a Prince with his subjects. This consideration is so dear to Him that the happy and flourishing state of His empire, that consists in the greatest possible happiness of the inhabitants, becomes the supreme subaltern law of His conduct. For happiness is to persons what perfection is to beings, and if the first principle of existence of the physical world is the decree giving it the greatest possible perfection, the first principle of existence of the moral world or City of God, the most noble part of the universe, must be to spread as much happiness as possible in it.

Hence it must not be doubted that God so ordained (not only that minds could live forever, which is inevitable, but also that they should conserve forever their moral nature) so that this city should lose no person just as the world loses no substance. And consequently, they will always know what they are, otherwise they would not be liable to reward or punishment, which however is the essence of any republic, above all of one that is the most perfect, in which nothing can be neglected.

Finally, since God is at once the most just and the most good-natured of monarchs, and asks only for good will, provided that it is sincere and serious, His subjects could not hope for better conditions: to make them perfectly happy, He wants only that they love Him.

37. JESUS CHRIST HAS REVEALED TO MEN THE MYSTERY AND ADMIRABLE LAWS OF THE KINGDOM OF HEAVEN AND THE GREATNESS OF THE SUPREME HAPPINESS GOD PREPARES FOR THOSE WHO LOVE HIM

The ancient philosophers had very little knowledge of these important truths. Jesus Christ alone expressed them divinely well and in such a clear and familiar way, that the most crude minds came to understand them. So His gospel changed the entire face of human affairs. He brought us knowledge of the Kingdom of Heaven or this perfect republic of minds that merits the title "City of God" whose admirable laws he revealed to us, and he alone shows us how much God loves us; the exactness with which He has provided for all that concerns us; that since He cares for sparrows, He will not neglect the reasonable creatures who are infinitely more dear to Him; that all the hairs in our heads are counted; that heaven and earth will pass away before the Word of God and everything belonging to the pattern of our salvation is changed; God has more concern with the least of intelligent souls than with the whole machine of the world; that we must not fear those who can destroy the body but are unable to harm souls, since God alone can make them happy or unhappy; that the just are in His hand protected from all

the revolutions of the universe, since nothing can act on them but God alone; that none of our actions is forgotten; that everything is taken into account, right down to unguarded words, and a spoonful of water well used; and finally that all things must result in the greatest good for those that are good; that the just are like suns and that neither our senses nor our minds have ever tasted anything approaching the happiness God prepares for those who love Him.

THE MONADOLOGY

1. The object of this discourse, the *monad*, is nothing else than a simple substance, which enters into the composites; *simple* meaning, which has no parts.

2. And there must be simple substances, since there are composites; for the composite is nothing else than an accumulation or aggregate of the simples.

3. But where there are no parts, neither extension, nor figure, nor divisibility is possible. Thus, these monads are the veritable atoms of nature, and, in one word, the elements of all things.

4. Hence no dissolution is to be feared for them, and a simple substance cannot perish naturally in any conceivable manner.

5. For the same reason, no simple substance can come into being naturally, since it cannot be formed by composition.

6. Thus it may be maintained that monads cannot begin or end otherwise than instantaneously, that is, they can begin only by creation, and end only by annihilation; while what is complete begins and ends through and in its parts.

7. It is impossible also to explain how a monad can be altered, that is, internally changed, by any other creature. For there is nothing in it which might be transposed, nor can there be conceived in it any internal movement which could be excited, directed, or diminished. In composites this is possible, since the parts can interchange place. The monads have no windows through which anything could come in or go out.

8. Nevertheless, the monads must have some qualities, otherwise they would not even be beings. And if the simple substances did not differ through their qualities, there would be no means at all of perceiving any change in things. For what is in the composites can come only from the ingredient simples. So the monads, if they were without qualities, would be indistinguishable the one from the other, since they do not differ in quantity either. The plenum being presupposed, no space, consequently, could ever receive through movement anything but the equivalent of what has been in it, and one state of things would be indiscernible from another.

9. Each monad must even be different from every other. For in nature there are never two beings which are perfectly like one another, and between which it would not be possible to find an internal difference, that is, a difference founded on an intrinsic denomination.

10. I take it also for granted that all created beings, consequently the created monads as well, are subject to change, and that this change is even continual in each one.

11. In consequence of what has been said, the natural changes of the monads must result from an *internal principle*, since no external cause could influence their interior.

12. But besides the principle of change, there must be a *particular trait of what is changing*, which produces, so to speak, the specification and variety of the simple substances.

13. This particular must comprehend a multiplicity in the unity, that is, in the simple. For since all natural change proceeds by degrees, something changes and something remains. Consequently, there must be in the simple substance a plurality of affections and relations, though it has no parts.

14. The passing state which comprehends and represents a multiplicity in the unity or simple substance is nothing but what is called *perception*; it must be clearly distinguished from apperception or consciousness, as will become clear later on. On this point the Cartesian doctrine has been very defective, since it has entirely neglected those perceptions which are not apperceived; the same failure to distinguish has made the Cartesians believe that only spirits are monads, and that there are neither animal souls nor other entelechies. Therefore, they, like the unlearned, have confused a long swoon with death, strictly speaking, and yielded to the scholastic prejudice that there are entirely separated souls. The same error has even confirmed unsound minds in the opinion that souls are mortal.

15. The action of the internal principle which produces change, that is, the passage from one perception to another, may be called *appetition*. It is true that appetition may not always entirely attain the whole perception toward which it tends, but it always obtains something and arrives at new perceptions.

16. We ourselves experience a multiplicity in the simple substance, when we observe that the least thought which we apperceive in ourselves comprehends a variety in its object. Thus, all those who recognize that the soul is a simple substance must recognize this multiplicity in the monad. Pierre Bayle should not have found a difficulty in this theory, as he indeed did in the article "Rorarius" of his *Dictionary*.

17. Moreover, it must be avowed that *perception* and what depends upon it *cannot possibly be explained by mechanical reasons*, that is, by figure and movement. Suppose that there be a machine, the structure of which produces thinking, feeling, and perceiving; imagine this machine enlarged but preserving the same proportions, so that you could enter it as if it were a mill. This being supposed, you might visit its inside; but what would you observe there? Nothing but parts which push and move each other, and never anything that could explain perception. This explanation must therefore be sought in the simple substance, not in the composite, that is, in the machine. However, there is nothing else to be found in the simple substance but perceptions and their changes. In this alone can consist all the *internal actions* of simple substances.

18. The name *entelechies* would fit all the simple substances or created monads. For they have in themselves a certain perfection [*echousi to enteles*], and they are endowed with a selfsufficiency [*autarkeia*] which makes them the sources of their own actions and, so to speak, incorporeal automata.

19. If we want to call *soul* all that has perception and appetition, in the general sense explained above, we might give the name soul to all simple substances or created monads. But since sensation is something more than a simple perception, I agree that the general name monad or entelechy may suffice for those simple substances which have nothing but perception and appetition; the name souls may then be reserved for those having perception that is more distinct and is accompanied by memory.

20. Indeed, we experience in ourselves a state in which we remember nothing and have no distinct perception at all, e.g., when we faint or are overcome by a deep and

dreamless sleep. In this state the soul is not noticeably different from a simple monad. However, since this state does not last, the soul being able to pull itself out of it, the soul is more than a simple monad.

21. Besides, it does not follow at all that in such a state the simple substance entirely lacks perception. For the reasons propounded a while ago, this lack is not possible; for the monad cannot perish, nor can it subsist without some affection, which is nothing but its perception. But when there is a great multitude of minute perceptions lacking distinctness, one becomes dizzy: for example, when you turn around several consecutive times, you get a vertigo which may make you faint and leave you without any distinct perception. Death may throw animals into such a state for a time.

22. The present state of a simple substance is the natural result of its precedent state, so much so that the present is pregnant with the future.

23. Therefore, since on awakening from such a swoon, you apperceive your perceptions, it follows that you must have had some perceptions immediately before, though you did not apperceive them. For a perception cannot come naturally except from another perception, just as movement cannot come naturally except from another movement.

24. Hence it is evident that if in our perceptions there were nothing distinct nor anything, so to speak, in relief and of a more marked taste, we would always be in a swoon. And that is the state of the mere naked monads.

25. We see indeed that nature has given distinct perceptions to the animals, for care has been taken to provide them with organs which collect several light rays or several air waves, to unite them and thereby give them greater effect. Something similar occurs in scent, taste, and touch, and perhaps in many other senses unknown to us. I shall explain soon how what occurs in the soul represents what occurs in the sense organs.

26. Memory provides the souls with a sort of *consistency* which imitates reason but has to be distinguished from it. For we see that animals, perceiving something which impresses them and of which they have previously had a resembling perception, are brought by the representation of their memory to expect what has been associated with this perception in the past and are moved to feelings similar to those they had then. If you show a stick to a dog, for instance, it remembers the pain caused by it and howls or runs away.

27. The vividness of the imagination which strikes and moves animals comes from either the strength or the frequency of preceding perceptions. For often one strong impression produces at once the effect of a long *habit* or of many reiterated impressions of minor strength.

28. Men act like animals in so far as the succession of their perceptions is brought about by the principle of memory. In this they resemble medical empiricists whose practice is not backed by theory. In fact, we are mere empiricists in three quarters of all our actions. If you expect, for instance, that the sun will rise tomorrow because up to now it has always happened, you act as an empiricist. The astronomer alone judges by reason.

29. Knowledge of necessary and eternal truths, however, distinguishes us from mere animals and grants us *reason* and the sciences, elevating us to the knowledge of ourselves and of God. This possession is what is called our reasonable soul or *spirit*.

30. By this knowledge of necessary truths and by the abstractions made possible through them, we also are raised to *acts of reflection* which enable us to think of the so-called *self* and to consider this or that to be in us. Thinking thus about ourselves, we think of being, substance, the simple and the composite, the immaterial, and even of God, conceiving what is limited in us as without limit in him. These acts of reflection furnish the principal objects of our reasoning.

31. Our reasoning is founded on two great principles: The first is the principle of *contradiction*, by virtue of which we consider as false what implies a contradiction and as true what is the opposite of the contradictory or false.

32. The second is the principle of *sufficient reason*, by virtue of which we hold that no fact can be true or existing and no statement truthful without a sufficient reason for its being so and not different; albeit these reasons most frequently must remain unknown to us.

33. There are also two kinds of *truths*: those of *reason*, which are necessary and of which the opposite is impossible, and those of *fact*, which are contingent and of which the opposite is possible. When a truth is necessary, the reasons for it can be found through analysis, that is, by resolving it into simpler ideas and truths until one comes to primitives.

34. Thus the mathematicians, using the analytical method, reduce the speculative theorems and the practical canons to *definitions*, *axioms*, and *postulates*.

35. In the end, there are simple ideas of which no definition can be given. Moreover, there are axioms and postulates, in short, *primitive principles*, which cannot be demonstrated and do not need demonstration. They are *identical propositions*, the opposite of which contains an express contradiction.

36. A *sufficient reason*, however, must also exist for *contingent truths* or *truths of fact*, that is, for the series of things comprehended in the universe of creatures. Here the resolution into particular reasons could be continued without limit; for the variety of natural things is immense, and bodies are infinitely divided. There is an infinity of figures and movements, past and present, which contribute to the efficient cause of my presently writing this. And there is an infinity of minute inclinations and dispositions of my soul, which contribute to the final cause of my writing.

37. Now, all of this detail implies previous or more particular contingents, each of which again stands in need of a similar analysis to be accounted for, so that nothing is gained by such an analysis. The sufficient or ultimate reason must therefore exist outside the succession or series of contingent particulars, infinite though this series may be.

38. Consequently, the ultimate reason of all things must subsist in a necessary substance, in which all particular changes may exist only virtually as in its source: this substance is what we call *God*.

39. Now, this substance is the sufficient reason for all this particular existence which is, moreover, interconnected throughout. Hence, there is but one God, and this God suffices.

40. This Supreme Substance is unique, universal, and necessary. There is nothing existing apart from it which would be independent of it, and the existence of this being is a simple consequence of its possibility. It follows that this substance does not admit of any limitation and must contain as much reality as is possible.

41. God, therefore, is absolutely perfect, *perfection* meaning the quantity of positive reality. In things which have limits, that is, in finite things, this perfection has to be strictly interpreted, namely as the quantity of positive reality within their given limits. But where there are no limits, namely in God, perfection is absolutely infinite.

42. It follows that creatures owe their perfections to the divine influence, but their imperfections to their proper nature, which is incapable of being without limits. For it is in this that they are distinguished from God. The created things' *original imperfection* manifests itself through the *natural inertia* of all bodies.

43. Moreover, it is true that in God is the source not only of all existence, but also of all essence endowed with reality, that is, the source of what is real in the possibles. For the divine understanding is the region of the eternal truths and of the ideas on which

they depend, and without him there would not be anything real in the possibles; that is, without him there would not only be nothing existing, but even nothing possible.

44. Indeed, if there is to be any reality in the essences or possibles, that is, in the necessary truths, this reality must be founded on the existence of the necessary being whose essence implies its existence, that is, to which it suffices to be possible in order to be actual.

45. Thus God alone (or the necessary being) has the privilege of existing necessarily, provided only he be possible. Now, since nothing can hinder the possibility of the substance which contains no limits, no negation, and hence no contradiction, this provides a sufficient reason for the knowledge *a priori* of God's existence. Besides, we have proved it by the reality of the eternal truths. In addition, we also have proved this existence *a posteriori* by the existence of contingent beings. For the sufficient and ultimate reason of these can lie only in the necessary being which has in itself the reason of its existence.

46. It must not be imagined, however, as certain authors have imagined, that since the eternal truths depend upon God, they are arbitrary and depend upon his will. Descartes seems to have thought so, and after him Poiret. This is true only of the contingent truths which are based on the principle of fitness, that is, the choice of the best possible; while the necessary truths depend only on his understanding, of which they are the internal object.

47. Thus God is the only primitive unit or the only original simple substance, of which all the created or derivative monads are the products, born, so to speak, every moment by continual fulgurations from the divinity, and limited by the capacities of creatures, to which limitation is essential.

48. In God there are his *power* which is the source of everything, his *knowledge* which contains the particulars of the ideas, and finally his *will* which is the source of change or production and acts according to the principle of the best possible. Corresponding to these divine attributes, there is in the created monads the subject or basis, namely, the faculty of perception and the faculty of appetite. In God, however, these attributes are absolutely infinite and perfect, whereas in the created monads or *entelechies* (Hermolaus Barbarus translated this word into Latin by *perfectihabies*) these attributes are only likenesses, possessed by the monads in proportion to their perfections.

49. Creatures are said to act outwardly in so far as they have perfection, and to *suffer* from other creatures in so far as they are imperfect. Thus *activity* has to be attributed to the monad in so far as it has distinct perceptions, and passivity in so far as it has confused perceptions.

50. One creature is more perfect than another, in so far as there is found in the former a reason to account *a priori* for what is happening in the latter; this is why one says that the former acts upon the latter.

51. But in the simple substances this influence of one monad upon the other is but *ideal* and can take effect only through the intervention of God; in the ideas of God, indeed, any monad reasonably requires that in his ruling of all others, God, from the beginning, take that monad into consideration. For since no created monad can exercise a physical influence upon the interior of any other, this is the only means by which the one can depend upon the other.

52. By this means actions and passions among creatures are mutual. For when God compares two simple substances, he finds in either one reasons which oblige him to adjust the other to it. What appears as active in certain respects, consequently appears as passive from another point of view: it appears as *active* in so far as what is distinctly known in one monad serves to account for what happens in another; it appears as passive in so far as the reason for what happens in it is to be found in what is distinctly known in another.

53. Now, since in the divine ideas there is an infinity of possible universes of which only one can exist, the choice made by God must have a sufficient reason which determines him to the one rather than to another.

54. This reason can be found only in fitness, that is, in the degree of perfection contained in these worlds. For each possible has a right to claim existence in proportion to the perfection it involves. Thus nothing is entirely arbitrary.

55. This is the cause for the existence of the best, which is disclosed to him by his wisdom, determines his choice by his goodness, and is produced by his power.

56. This *connection* of all created things with every single one of them and their adaptation to every single one, as well as the connection and adaptation of every single thing to all others, has the result that every single substance stands in relations which express all the others. Whence every single substance is a perpetual living mirror of the universe.

57. Just as the same city regarded from different sides offers quite different aspects, and thus appears multiplied *by the perspective*, so it also happens that the infinite multitude of simple substances creates the appearance of as many different universes. Yet they are but perspectives of a single universe, varied according to the *points of view*, which differ in each monad.

58. This is the means of obtaining the greatest possible variety, together with the greatest possible order; in other words, it is the means of obtaining as much perfection as possible.

59. Only by this hypothesis (which I dare to call demonstrated) can the greatness of God be exalted as it ought to be. Pierre Bayle has recognized this when he objected to the hypothesis in the article "Rorarius" of his *Dictionary*. In that passage he was inclined to believe that I attributed to God too much, and even more than is possible. But he was unable to adduce any reason why this universal harmony, due to which every substance exactly expresses all the others through the relations it has with them, should be impossible.

60. In what I have just stated, there can also be discerned reasons *a priori* why things could not be different. For God, legislating the whole, has considered every part and particularly every monad. And since the nature of every monad is representative, there is nothing which could limit it to representing only a part of all things. It is true, however, that this representation is but confused concerning the particulars of the whole universe and can be distinct concerning only a small part of all things, namely those which are either the nearest or the largest in respect to each of the monads. For otherwise every monad would be a deity. It is not in the objects of their knowledge, but in the modes of this knowledge that the monads are limited. All of them have a confused knowledge of the infinite, that is, of the whole; but they are limited and distinguished by the degrees of distinct perception.

61. The composite substances are in this respect symbols of the simples. For since all is a plenum, all matter is connected and all movement in the plenum produces some effect on the distant bodies, in proportion to the distance. Hence every body is affected not only by those with which it is in contact, and thus feels in some way everything that happens to them; but through them it also feels those that touch the ones with which it is in immediate contact. Hence it follows that this communication extends over any distance whatever. Consequently, every body experiences everything that goes on in the universe, so much so that he who sees everything might read in any body what is happening anywhere, and even what has happened or will happen. He would be able to observe in the present what is remote in both time and space: [*sumpnoia panta*], as Hippocrates stated. A soul, however, can read in itself only what is distinctly represented in it; it is unable to unfold all at once all its folds; for these go on into infinity.

62. Thus, every created monad represents the whole universe; nevertheless, it represents more distinctly the body which is particularly attached to it and of which it is the entelechy. And since this body expresses the whole universe through the interconnection of all the matter in the plenum, the soul, too, represents the whole universe by representing this body which in a particular manner belongs to it.

63. The body belonging to a monad which is its entelechy or its soul constitutes, together with this entelechy, what may be called a *living unit*, and together with this soul what may be called an *animal*. This body of a living being or of an animal is always an organism. For since every monad is, in its way, a mirror of the universe, and since the universe is ruled in a perfect order, there must also be an order in the representing, that is, in the perceptions of the soul, and consequently in the body. The representation of the universe in the body evinces this order.

64. Thus every body of a living being is a sort of divine machine or natural automaton, which infinitely surpasses all artificial automata. For a machine made by human art is not a machine in all its parts. The cog on a brass wheel, for instance, has parts or fragments which for us are no longer artificial things, and are no longer proper to the machine with respect to the purpose for which the wheel was designed. The machines of nature (namely, the living bodies) are, on the contrary, machines even in their smallest parts without any limit. Herein lies the difference between nature and art, that is, between divine and human art.

65. The author of nature, indeed, has been able to practice this divine and infinitely marvellous art because any portion of matter is not only infinitely divisible, as the ancients recognized, but also actually subdivided *ad infinitum*: every part having parts each of which has its own particular movement. For otherwise it would be impossible for every portion of matter to express the whole universe.

66. Hence it can be seen that in the smallest portion of matter there is a world of creatures, living beings, animals, entelechies, and souls.

67. Thus every portion of matter can be conceived as a garden full of plants or as a pond full of fish. But every branch of the plant, every limb of the animal, every drop of its humors, is again such a garden or such a pond.

68. And though the soil and the air in the intervals between the plants of the garden is not a plant, nor the water between the fishes a fish, yet these intervals contain again plants or fishes. But these living beings most frequently are so minute that they remain imperceptible to us.

69. Thus there is nothing uncultured, sterile or dead in the universe, no chaos, no disorder, though this may be what appears. It would be about the same with a pond seen from a distance: you would perceive a confused movement, a squirming of fishes, if I may say so, without discerning the single fish.

70. Hence it becomes clear that every living body has a dominant entelechy which in an animal is its soul. But the limbs of this living body are full of other living beings, plants or animals, each of which again has its entelechy or its dominant soul.

71. But you must not imagine—like some authors who have misinterpreted my thought—that each soul has a mass or portion of matter forever belonging or attached to it and that, consequently, it owns other living, though inferior, beings forever destined to serve it. For all bodies are, like rivers, in a perpetual flux; small parts enter and leave them continually.

72. Thus the soul changes its body bit by bit, and by degrees, so that it never is deprived all at once of all its organs; in animals there is frequently metamorphosis. Never, however, is there metempsychosis nor transmigration of souls. Nor are there any totally separate *souls*, nor *genii* without body. God alone is entirely bodiless.

73. This also proves that, strictly speaking, there never is either complete generation or perfect death, which would consist in the separation of the soul. What we call *generation* consists in developments and growths, just as what we call *death* consists in involutions and diminutions.

74. Philosophers formerly have been very perplexed concerning the origin of forms, entelechies, or souls. Today, however, it has been discovered through precise observations made on plants, insects, and animals that the organized bodies of nature are never produced out of a chaos or putrefaction, but always out of seeds, in which doubtless there has been some *preformation*. Hence it has been concluded, not only that the organized body was already in the seed before conception, but also that there was a soul in this body, and, in short, the animal itself. Through the conception, furthermore, the animal has only been disposed to a great transformation, namely to become an animal of a different species. Something similar can even be observed outside generation, as, for instance, when worms become flies, or caterpillars butterflies.

75. Those animals among which some are elevated by means of the conception to the grade of larger animals, may be called *spermatic*; while those among them which remain within their species, that is, the majority, are born, multiply, and are destroyed like the large animals. Only a small number of elect pass on to a greater stage.

76. This, so far, has been but half the truth. Therefore I have concluded that if it be true that the animal never begins naturally, it will not end naturally either, and that consequently there will be, strictly speaking, neither generation nor entire destruction, that is, death. These arguments made *a posteriori* and drawn from experience agree perfectly with my principles deduced *a priori* a while ago.

77. Thus it may be said that not only the soul (mirror of an indestructible universe) is indestructible, but also that the animal itself is indestructible, albeit its machine often partly perishes, and casts off or takes on organic accretions.

78. These principles have enabled me to propose a natural explanation for the union or conformity of the soul and the organized body. The soul follows its own laws, and so does the body. They meet by virtue of the *pre-established harmony* prevailing among all substances, since they all are representations of one and the same universe.

79. The souls act according to the laws of final causes, through appetitions, ends, and means. The bodies act according to the laws of efficient causes, that is, of motion. And the two realms, that of efficient causes and that of final causes, are in mutual harmony.

80. Descartes has recognized that souls cannot impart force to bodies, because there is always the same quantity of force in matter. He believed, however, that the soul was able to change the directions of bodies. For at his time it was unknown yet that there is a law of nature according to which the total direction of matter is equally conserved. If he had been aware of this, he would have hit upon my system of preestablished harmony.

81. This system maintains that bodies act as though there were no souls (assuming the impossible); and that souls act as though there were no bodies; and that both act as though the one influenced the other.

82. As to *spirits* or reasonable souls, I find that essentially all the living beings and animals have the same nature, as I have said before, namely that the animal and the soul begin with the world and end no more than the world. Nevertheless, the reasonable souls have this in particular, that their little spermatic animals have only ordinary or sensitive souls, as long as they remain undeveloped. As soon, however, as those who, so to speak, are elected attain human nature through an actual conception, their sensitive souls are promoted to the rank of human nature and to the prerogative of spirits.

83. Among other differences existing between ordinary souls and spirits, some of which I have already pointed out, there is also this one, that souls in general are living mirrors or images of the created universe, while the spirits are in addition the images of the Deity itself or of the author of nature himself. They are capable of knowing the system of the universe and of imitating some of it by architectonic specimens, each spirit being like a small deity in his field.

84. This is the reason why the spirits are capable of entering a kind of society with God, and why with respect to them he is not only as an inventor is to his machine (this being the relation of God to the other creatures), but also as a prince to his subjects and even as a father to his children.

85. Hence it may easily be concluded that the assemblage of all the spirits must compose the City of God, that is, the most perfect city possible, under the most perfect monarch possible.

86. This City of God, this truly universal monarchy, is a moral world within the natural world; it is among the works of God the most exalted and the most divine. In it consists veritably the glory of God: for he would be without glory unless his greatness and goodness were recognized and admired by the spirits. Properly speaking, his goodness is directed toward this divine City, while his wisdom and power manifest themselves everywhere.

87. We have established above the perfect harmony between two natural realms, that of efficient causes and the other of final causes. To this we must add here still another harmony, namely, between the physical realm of nature and the moral realm of grace, that is, between God considered as the architect of the machine of the universe, and God considered as the monarch of the divine city of the spirits.

88. This harmony has the result that events lead to grace through the very processes of nature, and that our globe, for instance, must be destroyed and repaired through natural processes at the moments when the government of the spirits so demands, to chastise some and to reward others.

89. One may add that God as the architect satisfies in all respects God as the legislator. Thus sin must entail punishment according to the order of nature and as the very result of the mechanical structure of the universe; and, analogously, good actions will attract their rewards through machinelike corporeal processes. Of course, these results cannot be and ought not always to be obtained as an immediate consequence.

90. Finally, under this perfect government, no good action will remain without its reward, no evil action without its punishment. All events in this city conspire to the advantage of the good people, that is, of those who are not discontented in this great State; who, once they have fulfilled their duties, trust in providence and duly love and imitate the author of all good; who enjoy the contemplation of his perfections as required by the nature of the true *pure love*, which consists in taking pleasure in the felicity of the beloved. This pure love makes the wise and virtuous people work at everything that seems conformable to the divine will, presumed or antecedent, and yet renders them contented with any event that God actually brings about through his secret, consequent, and decisive will. They realize that, could we only understand sufficiently the order of the universe, we should find that this order surpasses all the wishes of the wisest and that it is impossible to improve it; that it is the best not only for the whole in general, but also for ourselves in particular. For ourselves, that is, provided we are duly attached to the author of all things, not only as to the architect and efficient cause of our being, but also as to the master and to the final cause who ought to provide the sole goal of our will and who alone can give us happiness.

GEORGE BERKELEY

1685–1753

George Berkeley was born near Kilkenny, Ireland, and, although an Anglican of English descent, he emphatically considered himself to be Irish. He studied at Kilkenny College and in 1700 went on to Trinity College, Dublin. There he read Descartes, Newton, and Locke. In 1707, he became a Fellow of the College and was ordained in the Anglican church. The next six years were to be the most philosophically productive in his life. In 1709, he published his *New Theory of Vision*, and in the following year his most important philosophic work, *A Treatise Concerning the Principles of Human Knowledge*. In 1711, he wrote *Discourse on Passive Obedience*. Two years later, he published a more popular exposition of the doctrine of his *Principles* in the form of *Three Dialogues Between Hylas and Philonous*.

For the next eleven years, Berkeley traveled widely, visiting with many of the great thinkers of his day. He became Dean of Derry in 1724, though most of his energy at this time seems to have been given to the founding of a college in the Bermudas. With promises of financial support, he sailed for Rhode Island in 1728 to establish farms for supplying his future college with food. Berkeley spent two and a half years in Rhode Island with his new wife and friends, waiting for the 20,000 pounds the government had promised. When the funds never arrived, he finally gave up and returned to London.

In 1733, he published *Alciphron*, or *The Minute Philosopher*, against the free-thinkers (agnostics), and in the following year *The Analyst*, a criticism of Newton. That same year, he was made Bishop of Cloyne. For the next eighteen years, he energetically served his remote, poor diocese. Among the works he wrote during this period are *The Querist* (1737), which used questions to propose public works and education as remedies to the crushing poverty he observed, and *Siris* (1744), an unusual work dealing with the medicinal value of tar water. In 1751, he lost his eldest son, and the next year he moved to Oxford,

where another son was beginning his studies. On January 14, 1753, Berkeley died suddenly; he was buried at Christ Church, Oxford.

* * *

Like Locke before him, Berkeley accepted the empiricist doctrine that all we can know are ideas and that ideas come from perception or reflection. But Berkeley saw a problem in Locke's assertion of an external world of material "substances" giving rise to perceptions. If all we can know are ideas, how can we know there is a world "out there" giving rise to our ideas? Locke had said that the primary qualities of an "external object" (such as extension and solidity) are "utterly inseparable" from the objects themselves, whereas this is not the case with secondary qualities (such as color, taste, etc.). But again, asked Berkeley, how can Locke know this? He cannot get "outside himself" to see which of his perceptions are actually a part of objects "out there." Berkeley concluded that Locke's philosophy will lead to skepticism, whereby we must admit that we cannot really know anything about the world "out there."

To avoid this skepticism, Berkeley made the radical claim that there is no "out there," or, more precisely, there is no *matter*. Berkeley's position, which is called "idealism," can be summed up in his famous phrase "*esse is percipi*": to be is to be perceived. What we call "bodies," or physical objects, are simply stable collections of perceptions to which we give names such as "apples," "trees," and so on. These collections of perceptions have no existence apart from a perceiving mind. The answer to the famous conundrum "If a tree falls in the forest and no one hears it, does it make a sound?" is that if no one is perceiving it, it not only does not make a sound, the tree does not even exist!

Does this mean that trees go out of existence when no one is left in the forest to perceive them and that they come back into existence when someone enters the forest to perceive them again? It would seem that Berkeley must accept this odd conclusion were it not for one important point: God never leaves the forest, and God is *always* perceiving the trees. By always holding all collections of perceptions in the divine mind, God ensures their continued existence and the perceived regularity in what we call "nature." This point has been classically formulated in the following limericks:

There was a young man who said, "God,
Must think it exceedingly odd
If he finds that this tree
Continues to be
When there's no one about in the Quad."

REPLY:
"Dear Sir: Your astonishment's odd;
I am always about in the Quad.
And that's why the tree
Continues to be,
Since observed by, Yours faithfully, God."

Berkeley saw his philosophy as a common-sense attack on the metaphysical excesses of medieval Scholastics, Continental Rationalists, and even fellow empiricists such as Hobbes and Locke. Although Berkeley understood his philosophy to

be common sense, his readers drew different conclusions. One prominent physician of his day claimed Berkeley was insane. The great Dr. Samuel Johnson dismissed Berkeley's ideas with his famous "I refute Berkeley *thus*" and then he kicked a rock. Of course, this did not refute Berkeley at all. It only proved Johnson had not understood Berkeley's point. Berkeley did not claim the nonexistence of stones or that kicking a stone will not produce sensation. He claimed the rock did not exist apart from the perception of its solidity or the perception of pain when struck, and so on. An oft-repeated epitaph summarizes the general reaction to Berkeley: "His arguments produce no conviction, though they cannot be refuted."

* * *

In our reading, *Three Dialogues between Hylas and Philonous* (1713), given here complete, Philonous represents Berkeley's position while Hylas is his adversary. (The name "Hylas" is a derivative of the Greek word for "matter"—against which Berkeley argues.)

For general introductions to Berkeley, see G.J. Warnock, *Berkeley* (Harmondsworth, Middlesex: Penguin Books, 1953); Harry M. Bracken, *Berkeley* (New York: St. Martin's Press, 1974); J.O. Urmson, *Berkeley* (Oxford: Oxford University Press, 1982)—part of the Past Masters series, now reprinted in the combined volume John Dunn et al., eds., *The British Empiricists* (Oxford: Oxford University Press, 1992); David Berman, *George Berkeley: Idealism and the Man* (Oxford: Oxford University Press, 1994); David Berman, *Berkeley* (London: Routledge, 1999); George S. Pappas, *Berkeley's Thought* (Ithaca, NY: Cornell University Press, 2000); Anthony Savile, *Routledge Philosophy Guidebook to Berkeley and the Principles of Human Knowledge* (London: Routledge, 2001); and David Berman, *Berkeley and Irish Philosophy* (London: Continuum, 2005). For a discussion of our reading, see Aaron Garrett, *Berkeley's Three Dialogues: A Reader's Guide* (London: Continuum, 2008). For interesting but difficult discussions of Berkeley's arguments, see George Pitcher, *Berkeley* (London: Routledge, 1977) or Kenneth Winkler, *Berkeley: An Interpretation* (Oxford: Oxford University Press, 1989). Turbayne, ed., *Berkeley: Critical and Interpretive Essays* (Minneapolis: University of Minnesota Press, 1982); John Foster and Howard Robinson, eds., *Essays on Berkeley: A Tercentennial Celebration* (Oxford: Oxford University Press, 1985); D.M. Armstrong and C.B. Martin, *Berkeley: A Collection of Critical Essays* (Hamden, CT: Garland, 1992)—a reprint of the second half of *Locke and Berkeley: A Collection of Critical Essays* (Garden City, NY: Doubleday, 1968); and Kenneth P. Winkler, ed., *The Cambridge Companion to Berkeley* (Cambridge: Cambridge University Press, 2006).

THREE DIALOGUES BETWEEN HYLAS AND PHILONOUS, IN OPPOSITION TO SCEPTICS AND ATHEISTS

THE FIRST DIALOGUE

PHILONOUS: Good morrow, Hylas: I did not expect to find you abroad so early.

HYLAS: It is indeed something unusual; but my thoughts were so taken up with a subject I was discoursing of last night, that finding I could not sleep, I resolved to rise and take a turn in the garden.

PHILONOUS: It happened well, to let you see what innocent and agreeable pleasures you lose every morning. Can there be a pleasanter time of the day, or a more delightful season of the year? That purple sky, those wild but sweet notes of birds, the fragrant bloom upon the trees and flowers, the gentle influence of the rising sun, these

Fruits and Dishes on the Table, by Jan Davids de Heem (1606–1683). The underlying theme of *Vanitas* in Dutch still life presents a dual message in the arrangement of fine and rare objects. On the one hand, the objects represent the joy of possessions and the good life, yet the half-eaten pie and the peeled fruit cause reflection on the brevity of human existence and the fleeting nature of material objects. Berkeley takes this a step further by denying material substance and claiming that such objects do not exist apart from a perceiving mind. (©Bridgeman-Giraudon/Art Resource, NY)

and a thousand nameless beauties of nature inspire the soul with secret transports; its faculties too being at this time fresh and lively, are fit for those meditations, which the solitude of a garden and tranquillity of the morning naturally dispose us to. But I am afraid I interrupt your thoughts: for you seemed very intent on something.

HYLAS: It is true, I was, and shall be obliged to you if you will permit me to go on in the same vein; not that I would by any means deprive myself of your company, for my thoughts always flow more easily in conversation with a friend, than when I am alone: but my request is, that you would suffer me to impart my reflexions to you.

PHILONOUS: With all my heart, it is what I should have requested myself if you had not prevented me.

HYLAS: I was considering the odd fate of those men who have in all ages, through an affectation of being distinguished from the vulgar, or some unaccountable turn of thought, pretended either to believe nothing at all, or to believe the most extravagant things in the world. This however might be borne, if their paradoxes and scepticism did not draw after them some consequences of general disadvantage to mankind. But the mischief lies here; that when men of less leisure see them who are supposed to have spent their whole time in the pursuits of knowledge professing an entire ignorance of all things, or advancing such notions as are repugnant to plain and commonly received principles, they will be tempted to entertain suspicions concerning the most important truths, which they had hitherto held sacred and unquestionable.

PHILONOUS: I entirely agree with you, as to the ill tendency of the affected doubts of some philosophers, and fantastical conceits of others. I am even so far gone of late in this way of thinking, that I have quitted several of the sublime notions I had got in their schools for vulgar opinions. And I give it you on my word; since this revolt from metaphysical notions to the plain dictates of nature and common sense, I find my understanding strangely enlightened, so that I can now easily comprehend a great many things which before were all mystery and riddle.

HYLAS: I am glad to find there was nothing in the accounts I heard of you.

PHILONOUS: Pray, what were those?

HYLAS: You were represented, in last night's conversation, as one who maintained the most extravagant opinion that ever entered into the mind of man, to wit, that there is no such thing as *material substance* in the world.

PHILONOUS: That there is no such thing as what philosophers call *material substance*, I am seriously persuaded: but, if I were made to see anything absurd or sceptical in this, I should then have the same reason to renounce this that I imagine I have now to reject the contrary opinion.

HYLAS: What! Can anything be more fantastical, more repugnant to common sense, or a more manifest piece of scepticism, than to believe there is no such thing as *matter*?

PHILONOUS: Softly, good Hylas. What if it should prove that you, who hold there is, are, by virtue of that opinion, a greater *sceptic*, and maintain more paradoxes and repugnances to common sense, than I who believe no such thing?

HYLAS: You may as soon persuade me, the part is greater than the whole, as that, in order to avoid absurdity and scepticism, I should ever be obliged to give up my opinion in this point

PHILONOUS: Well then, are you content to admit that opinion for true, which upon examination shall appear most agreeable to common sense, and remote from scepticism?

HYLAS: With all my heart. Since you are for raising disputes about the plainest things in nature, I am content for once to hear what you have to say.

PHILONOUS: Pray, Hylas, what do you mean by a *sceptic*?

HYLAS: I mean what all men mean—one that doubts of everything.

PHILONOUS: He then who entertains no doubts concerning some particular point, with regard to that point cannot be thought a *sceptic*.

HYLAS: I agree with you.

PHILONOUS: Whether does doubting consist in embracing the affirmative or negative side of a question?

HYLAS: In neither; for whoever understands English cannot but know that doubting signifies a suspense between both.

PHILONOUS: He then that denies any point, can no more be said to doubt of it, than he who affirms it with the same degree of assurance.

HYLAS: True.

PHILONOUS: And, consequently, for such his denial is no more to be esteemed a *sceptic* than the other.

HYLAS: I acknowledge it.

PHILONOUS: How comes it to pass then, Hylas, that you pronounce me a *sceptic*, because I deny what you affirm, to wit the existence of matter? Since, for aught you can tell I am as peremptory in my denial, as you in your affirmation.

HYLAS: Hold, Philonous, I have been a little out in my definition; but every false step a man makes in discourse is not to be insisted on. I said indeed that a *sceptic* was one who doubted of everything; but I should have added, or who denies the reality and truth of things.

PHILONOUS: What things? Do you mean the principles and theorems of sciences? But these you know are universal intellectual notions, and consequently independent of matter. The denial therefore of this does not imply the denying them.

HYLAS: I grant it. But are there no other things? What think you of distrusting the senses, of denying the real existence of sensible things, or pretending to know nothing of them. Is not this sufficient to denominate a man a *sceptic*?

PHILONOUS: Shall we therefore examine which of us it is that denies the reality of sensible things, or professes the greatest ignorance of them; since, if I take you rightly, he is to be esteemed the greatest *sceptic*?

HYLAS: That is what I desire.

PHILONOUS: What mean you by Sensible Things?

HYLAS: Those things which are perceived by the senses. Can you imagine that I mean anything else?

PHILONOUS: Pardon me, Hylas, if I am desirous clearly to apprehend your notions, since this may much shorten our inquiry. Suffer me then to ask you this farther question. Are those things only perceived by the senses which are perceived immediately? Or, may those things properly be said to be *sensible* which are perceived mediately, or not without the intervention of others?

HYLAS: I do not sufficiently understand you.

PHILONOUS: In reading a book, what I immediately perceive are the letters; but mediately, or by means of these, are suggested to my mind the notions of God, virtue, truth, &c. Now, that the letters are truly sensible things, or perceived by sense, there is no doubt: but I would know whether you take the things suggested by them to be so too.

HYLAS: No, certainly: it were absurd to think *God* or *virtue* sensible things; though they may be signified and suggested to the mind by sensible marks, with which they have an arbitrary connexion.

PHILONOUS: It seems then, that by *sensible things* you mean those only which can be perceived immediately by sense?

HYLAS: Right.

PHILONOUS: Does it not follow from this, that though I see one part of the sky red, and another blue, and that my reason does thence evidently conclude there must be some cause of that diversity of colours, yet that cause cannot be said to be a sensible thing, or perceived by the sense of seeing?

HYLAS: It does.

PHILONOUS: In like manner, though I hear variety of sounds, yet I cannot be said to hear the causes of those sounds?

HYLAS: You cannot.

PHILONOUS: And when by my touch I perceive a thing to be hot and heavy, I cannot say, with any truth or propriety, that I feel the cause of its heat or weight?

HYLAS: To prevent any more questions of this kind, I tell you once for all, that by *sensible things* I mean those only which are perceived by sense; and that in truth the senses perceive nothing which they do not perceive immediately: for they make no inferences. The deducing therefore of causes or occasions from effects and appearances, which alone are perceived by sense, entirely relates to reason.

PHILONOUS: This point then is agreed between us—That *sensible things are those only which are immediately perceived by sense*. You will farther inform me, whether we immediately perceive by sight anything beside light, and colours, and figures; or by hearing, anything but sounds; by the palate, anything beside tastes; by the smell, beside odours; or by the touch, more than tangible qualities.

HYLAS: We do not.

PHILONOUS: It seems, therefore, that if you take away all sensible qualities, there remains nothing sensible?

HYLAS: I grant it.

PHILONOUS: Sensible things therefore are nothing else but so many sensible qualities, or combinations of sensible qualities?

HYLAS: Nothing else.

PHILONOUS: Heat then is a sensible thing?

HYLAS: Certainly.

PHILONOUS: Does the reality of sensible things consist in being perceived? Or, is it something distinct from their being perceived, and that bears no relation to the mind?

HYLAS: To *exist* is one thing, and to be *perceived* is another.

PHILONOUS: I speak with regard to sensible things only. And of these I ask, whether by their real existence you mean a subsistence exterior to the mind, and distinct from their being perceived?

HYLAS: I mean a real absolute being, distinct from, and without any relation to, their being perceived.

PHILONOUS: Heat therefore, if it be allowed a real being, must exist without the mind?

HYLAS: It must.

PHILONOUS: Tell me, Hylas, is this real existence equally compatible to all degrees of heat, which we perceive; or is there any reason why we should attribute it to some, and deny it to others? And if there be, pray let me know that reason.

HYLAS: Whatever degree of heat we perceive by sense, we may be sure the same exists in the object that occasions it.

PHILONOUS: What! The greatest as well as the least?

HYLAS: I tell you, the reason is plainly the same in respect of both. They are both perceived by sense; nay, the greater degree of heat is more sensibly perceived, and

consequently, if there is any difference, we are more certain of its real existence than we can be of the reality of a lesser degree.

PHILONOUS: But is not the most vehement and intense degree of heat a very great pain?

HYLAS: No one can deny it.

PHILONOUS: And is any unperceiving thing capable of pain or pleasure?

HYLAS: No, certainly.

PHILONOUS: Is your material substance a senseless being, or a being endowed with sense and perception?

HYLAS: It is senseless without doubt.

PHILONOUS: It cannot therefore be the subject of pain?

HYLAS: By no means.

PHILONOUS: Nor consequently of the greatest heat perceived by sense, since you acknowledge this to be no small pain?

HYLAS: I grant it.

PHILONOUS: What shall we say then of your external object; is it a material substance, or no?

HYLAS: It is a material substance with the sensible qualities inhering in it.

PHILONOUS: How then can a great heat exist in it, since you own it cannot in a material substance? I desire you would clear this point.

HYLAS: Hold, Philonous, I fear I was out in yielding intense heat to be a pain. It should seem rather, that pain is something distinct from heat, and the consequence or effect of it.

PHILONOUS: Upon putting your hand near the fire, do you perceive one simple uniform sensation, or two distinct sensations?

HYLAS: But one simple sensation.

PHILONOUS: Is not the heat immediately perceived?

HYLAS: It is.

PHILONOUS: And the pain?

HYLAS: True.

PHILONOUS: Seeing therefore they are both immediately perceived at the same time, and the fire affects you only with one simple or uncompounded idea, it follows that this same simple idea is both the intense heat immediately perceived, and the pain; and, consequently, that the intense heat immediately perceived is nothing distinct from a particular sort of pain.

HYLAS: It seems so.

PHILONOUS: Again, try in your thoughts, Hylas, if you can conceive a vehement sensation to be without pain or pleasure.

HYLAS: I cannot.

PHILONOUS: Or can you frame to yourself an idea of sensible pain or pleasure in general, abstracted from every particular idea of heat, cold, tastes, smells etc.?

HYLAS: I do not find that I can.

PHILONOUS: Does it not therefore follow, that sensible pain is nothing distinct from those sensations or ideas, in an intense degree?

HYLAS: It is undeniable; and, to speak the truth, I begin to suspect a very great heat cannot exist but in a mind perceiving it.

PHILONOUS: What! Are you then in that *sceptical* state of suspense, between affirming and denying?

HYLAS: I think I may be positive in the point. A very violent and painful heat cannot exist without the mind.

PHILONOUS: It hath not therefore, according to you, any real being?

HYLAS: I own it.

PHILONOUS: Is it therefore certain, that there is no body in nature really hot?

HYLAS: I have not denied there is any real heat in bodies. I only say, there is no such thing as an intense real heat.

PHILONOUS: But, did you not say before that all degrees of heat were equally real; or, if there was any difference, that the greater were more undoubtedly real than the lesser?

HYLAS: True: but it was because I did not then consider the ground there is for distinguishing between them, which I now plainly see. And it is this: because intense heat is nothing else but a particular kind of painful sensation; and pain cannot exist but in a perceiving being; it follows that no intense heat can really exist in an unperceiving corporeal substance. But this is no reason why we should deny heat in an inferior degree to exist in such a substance.

PHILONOUS: But how shall we be able to discern those degrees of heat which exist only in the mind from those which exist without it?

HYLAS: That is no difficult matter. You know the least pain cannot exist unperceived; whatever, therefore, degree of heat is a pain exists only in the mind. But, as for all other degrees of heat, nothing obliges us to think the same of them.

PHILONOUS: I think you granted before that no unperceiving being was capable of pleasure, any more than of pain.

HYLAS: I did.

PHILONOUS: And is not warmth, or a more gentle degree of heat than what causes uneasiness, a pleasure?

HYLAS: What then?

PHILONOUS: Consequently, it cannot exist without the mind in an unperceiving substance, or body.

HYLAS: So it seems.

PHILONOUS: Since, therefore, as well those degrees of heat that are not painful, as those that are, can exist only in a thinking substance; may we not conclude that external bodies are absolutely incapable of any degree of heat whatsoever?

HYLAS: On second thoughts, I do not think it so evident that warmth is a pleasure as that a great degree of heat is a pain.

PHILONOUS: I do not pretend that warmth is as great a pleasure as heat is a pain. But, if you grant it to be even a small pleasure, it serves to make good my conclusion.

HYLAS: I could rather call it an *indolence*. It seems to be nothing more than a privation of both pain and pleasure. And that such a quality or state as this may agree to an unthinking substance, I hope you will not deny.

PHILONOUS: If you are resolved to maintain that warmth, or a gentle degree of heat, is no pleasure, I know not how to convince you otherwise than by appealing to your own sense. But what think you of cold?

HYLAS: The same that I do of heat. An intense degree of cold is a pain; for to feel a very great cold, is to perceive a great uneasiness: it cannot therefore exist without the mind; but a lesser degree of cold may, as well as a lesser degree of heat.

PHILONOUS: Those bodies, therefore, upon whose application to our own, we perceive a moderate degree of heat, must be concluded to have a moderate degree of heat or warmth in them—and those, upon whose application we feel a like degree of cold, must be thought to have cold in them.

HYLAS: They must.

PHILONOUS: Can any doctrine be true that necessarily leads a man into an absurdity?

HYLAS: Without doubt it cannot.

PHILONOUS: Is it not an absurdity to think that the same thing should be at the same time both cold and warm?

HYLAS: It is.

PHILONOUS: Suppose now one of your hands hot, and the other cold, and that they are both at once put into the same vessel of water, in an intermediate state; will not the water seem cold to one hand, and warm to the other?

HYLAS: It will.

PHILONOUS: Ought we not therefore, by your principles, to conclude it is really both cold and warm at the same time, that is, according to your own concession, to believe an absurdity?

HYLAS: I confess it seems so.

PHILONOUS: Consequently, the principles themselves are false, since you have granted that no true principle leads to an absurdity.

HYLAS: But, after all, can anything be more absurd than to say, *there is no heat in the fire?*

PHILONOUS: To make the point still clearer; tell me whether, in two cases exactly alike, we ought not to make the same judgment?

HYLAS: We ought.

PHILONOUS: When a pin pricks your finger, does it not rend and divide the fibres of your flesh?

HYLAS: It does.

PHILONOUS: And when a coal burns your finger, does it any more?

HYLAS: It does not.

PHILONOUS: Since, therefore, you neither judge the sensation itself occasioned by the pin, nor anything like it to be in the pin; you should not, conformably to what you have now granted, judge the sensation occasioned by the fire, or anything like it, to be in the fire.

HYLAS: Well, since it must be so, I am content to yield this point, and acknowledge that heat and cold are only sensations existing in our minds. But there still remain qualities enough to secure the reality of external things.

PHILONOUS: But what will you say, Hylas, if it shall appear that the case is the same with regard to all other sensible qualities, and that they can no more be supposed to exist without the mind, than heat and cold?

HYLAS: Then indeed you will have done something to the purpose; but that is what I despair of seeing proved.

PHILONOUS: Let us examine them in order. What think you of tastes—do they exist without the mind, or no?

HYLAS: Can any man in his senses doubt whether sugar is sweet, or wormwood bitter?

PHILONOUS: Inform me, Hylas. Is a sweet taste a particular kind of pleasure or pleasant sensation, or is it not?

HYLAS: It is.

PHILONOUS: And is not bitterness some kind of uneasiness or pain?

HYLAS: I grant it.

PHILONOUS: If therefore sugar and wormwood are unthinking corporeal substances existing without the mind, how can sweetness and bitterness, that is, pleasure and pain, agree to them?

HYLAS: Hold, Philonous, I now see what it was deluded me all this time. You asked whether heat and cold, sweetness and bitterness, were not particular sorts of pleasure and pain; to which I answered simply, that they were. Whereas I should have thus distinguished:—those qualities, as perceived by us, are pleasures or pains; but not as existing in the external objects. We must not therefore conclude absolutely, that there is no heat in the fire, or sweetness in the sugar, but only that heat or sweetness, as perceived by us, are not in the fire or sugar. What say you to this?

PHILONOUS: I say it is nothing to the purpose. Our discourse proceeded altogether concerning sensible things, which you defined to be, the things we *immediately perceive by our senses*. Whatever other qualities, therefore, you speak of as distinct from these, I know nothing of them, neither do they at all belong to the point in dispute. You may, indeed, pretend to have discovered certain qualities which you do not perceive, and assert those insensible qualities exist in fire and sugar. But what use can be made of this to your present purpose, I am at a loss to conceive. Tell me then once more, do you acknowledge that heat and cold, sweetness and bitterness (meaning those qualities which are perceived by the senses), do not exist without the mind?

HYLAS: I see it is to no purpose to hold out, so I give up the cause as to those mentioned qualities. Though I profess it sounds oddly, to say that sugar is not sweet.

PHILONOUS: But, for your farther satisfaction, take this along with you: that which at other times seems sweet, shall, to a distempered palate, appear bitter. And, nothing can be plainer than that divers persons perceive different tastes in the same food; since that which one man delights in, another abhors. And how could this be, if the taste was something really inherent in the food?

HYLAS: I acknowledge I know not how.

PHILONOUS: In the next place, *odours* are to be considered. And, with regard to these, I would fain know whether what hath been said of tastes does not exactly agree to them? Are they not so many pleasing or displeasing sensations?

HYLAS: They are.

PHILONOUS: Can you then conceive it possible that they should exist in an unperceiving thing?

HYLAS: I cannot.

PHILONOUS: Or, can you imagine that filth and ordure affect those brute animals that feed on them out of choice, with the same smells which we perceive in them?

HYLAS: By no means.

PHILONOUS: May we not therefore conclude of smells, as of the other forementioned qualities, that they cannot exist in any but a perceiving substance or mind?

HYLAS: I think so.

PHILONOUS: Then as to *sounds*, what must we think of them: are they accidents really inherent in external bodies, or not?

HYLAS: That they inhere not in the sonorous bodies is plain from hence: because a bell struck in the exhausted receiver of an air- pump sends forth no sound. The air, therefore, must be thought the subject of sound.

PHILONOUS: What reason is there for that, Hylas?

HYLAS: Because, when any motion is raised in the air, we perceive a sound greater or lesser, according to the air's motion; but without some motion in the air, we never hear any sound at all.

PHILONOUS: And granting that we never hear a sound but when some motion is produced in the air, yet I do not see how you can infer from thence, that the sound itself is in the air.

HYLAS: It is this very motion in the external air that produces in the mind the sensation of *sound*. For, striking on the drum of the ear, it causes a vibration, which by the auditory nerves being communicated to the brain, the soul is thereupon affected with the sensation called *sound*.

PHILONOUS: What! Is sound then a sensation?

HYLAS: I tell you, as perceived by us, it is a particular sensation in the mind.

PHILONOUS: And can any sensation exist without the mind?

HYLAS: No, certainly.

PHILONOUS: How then can sound, being a sensation, exist in the air, if by the *air* you mean a senseless substance existing without the mind?

HYLAS: You must distinguish, Philonous, between sound as it is perceived by us, and as it is in itself; or (which is the same thing) between the sound we immediately perceive, and that which exists without us. The former, indeed, is a particular kind of sensation, but the latter is merely a vibrative or undulatory motion in the air.

PHILONOUS: I thought I had already obviated that distinction, by the answer I gave when you were applying it in a like case before. But, to say no more of that, are you sure then that sound is really nothing but motion?

HYLAS: I am.

PHILONOUS: Whatever therefore agrees to real sound, may with truth be attributed to motion?

HYLAS: It may.

PHILONOUS: It is then good sense to speak of *motion* as of a thing that is *loud*, *sweet*, *acute*, or *grave*.

HYLAS: I see you are resolved not to understand me. Is it not evident those accidents or modes belong only to sensible sound, or *sound* in the common acceptation of the word, but not to *sound* in the real and philosophic sense; which, as I just now told you, is nothing but a certain motion of the air?

PHILONOUS: It seems then there are two sorts of sound—the one vulgar, or that which is heard, the other philosophical and real?

HYLAS: Even so.

PHILONOUS: And the latter consists in motion?

HYLAS: I told you so before.

PHILONOUS: Tell me, Hylas, to which of the senses, think you, the idea of motion belongs? To the hearing?

HYLAS: No, certainly; but to the sight and touch.

PHILONOUS: It should follow then, that, according to you, real sounds may possibly be *seen* or *felt*, but never *heard*.

HYLAS: Look you, Philonous, you may, if you please, make a jest of my opinion, but that will not alter the truth of things. I own, indeed, the inferences you draw me into sound something oddly, but common language, you know, is framed by, and for the use of the vulgar: we must not therefore wonder if expressions adapted to exact philosophic notions seem uncouth and out of the way.

PHILONOUS: Is it come to that? I assure you, I imagine myself to have gained no small point, since you make so light of departing from common phrases and opinions; it being a main part of our inquiry, to examine whose notions are widest of the common road, and most repugnant to the general sense of the world. But, can you think it no more than a philosophical paradox, to say that *real sounds are never heard*, and that the idea of them is obtained by some other sense? And is there nothing in this contrary to nature and the truth of things?

HYLAS: To deal ingenuously, I do not like it. And, after the concessions already made, I had as well grant that sounds too have no real being without the mind.

PHILONOUS: And I hope you will make no difficulty to acknowledge the same of colours.

HYLAS: Pardon me: the case of colours is very different. Can anything be plainer than that we see them on the objects?

PHILONOUS: The objects you speak of are I suppose, corporeal substances existing without the mind?

HYLAS: They are.

PHILONOUS: And have true and real colours inhering in them?

HYLAS: Each visible object hath that colour which we see in it.

PHILONOUS: How! Is there anything visible but what we perceive by sight?

HYLAS: There is not.

PHILONOUS: And, do we perceive anything by sense which we do not perceive immediately?

HYLAS: How often must I be obliged to repeat the same thing? I tell you, we do not.

PHILONOUS: Have patience, good Hylas; and tell me once more, whether there is anything immediately perceived by the senses, except sensible qualities. I know you asserted there was not; but I would now be informed, whether you still persist in the same opinion.

HYLAS: I do.

PHILONOUS: Pray, is your corporeal substance either a sensible quality, or made up of sensible qualities?

HYLAS: What a question that is! Who ever thought it was?

PHILONOUS: My reason for asking was, because in saying, *each visible object hath that colour which we see in it*, you make visible objects to be corporeal substances; which implies either that corporeal substances are sensible qualities, or else that there is something besides sensible qualities perceived by sight: but, as this point was formerly agreed between us, and is still maintained by you, it is a clear consequence, that your corporeal substance is nothing distinct from sensible qualities.

HYLAS: You may draw as many absurd consequences as you please, and endeavour to perplex the plainest things; but you shall never persuade me out of my senses. I clearly understand my own meaning.

PHILONOUS: I wish you would make me understand it too. But, since you are unwilling to have your notion of corporeal substance examined, I shall urge that point no farther. Only be pleased to let me know, whether the same colours which we see exist in external bodies, or some other.

HYLAS: The very same.

PHILONOUS: What! Are then the beautiful red and purple we see on yonder clouds really in them? Or do you imagine, they have in themselves any other form than that of a dark mist or vapour?

HYLAS: I must own, Philonous, those colours are not really in the clouds as they seem to be at this distance. They are only apparent colours.

PHILONOUS: *Apparent* call you them? How shall we distinguish these apparent colours from real?

HYLAS: Very easily. Those are to be thought apparent which, appearing only at a distance, vanish upon a nearer approach.

PHILONOUS: And those, I suppose, are to be thought real which are discovered by the most near and exact survey.

HYLAS: Right.

PHILONOUS: Is the nearest and exactest survey made by the help of a microscope, or by the naked eye?

HYLAS: By a microscope, doubtless.

PHILONOUS: But a microscope often discovers colours in an object different from those perceived by the unassisted sight. And, in case we had microscopes magnifying to any assigned degree, it is certain that no object whatsoever, viewed through them, would appear in the same colour which it exhibits to the naked eye.

HYLAS: And what will you conclude from all this? You cannot argue that there are really and naturally no colours on objects: because by artificial managements they may be altered, or made to vanish.

PHILONOUS: I think it may evidently be concluded from your own concessions, that all the colours we see with our naked eyes are only apparent as those on the clouds, since they vanish upon a more close and accurate inspection which is afforded us by a microscope. Then, as to what you say by way of prevention: I ask you whether the real and natural state of an object is better discovered by a very sharp and piercing sight, or by one which is less sharp?

HYLAS: By the former without doubt.

PHILONOUS: Is it not plain from *Dioptrics* that microscopes make the sight more penetrating, and represent objects as they would appear to the eye in case it were naturally endowed with a most exquisite sharpness?

HYLAS: It is.

PHILONOUS: Consequently the microscopical representation is to be thought that which best sets forth the real nature of the thing, or what it is in itself. The colours, therefore, by it perceived are more genuine and real than those perceived otherwise.

HYLAS: I confess there is something in what you say.

PHILONOUS: Besides, it is not only possible but manifest, that there actually are animals whose eyes are by nature framed to perceive those things which by reason of their minuteness escape our sight. What think you of those inconceivably small animals perceived by glasses? Must we suppose they are all stark blind? Or, in case they see, can it be imagined their sight hath not the same use in preserving their bodies from injuries, which appears in that of all other animals? And if it hath, is it not evident they must see particles less than their own bodies; which will present them with a far different view in each object from that which strikes our senses? Even our own eyes do not always represent objects to us after the same manner. In the jaundice every one knows that all things seem yellow. Is it not therefore highly probable those animals in whose eyes we discern a very different texture from that of ours, and whose bodies abound with different humors, do not see the same colours in every object that we do? From all which, should it not seem to follow that all colours are equally apparent, and that none of those which we perceive are really inherent in any outward object?

HYLAS: It should.

PHILONOUS: The point will be past all doubt, if you consider that, in case colours were real properties or affections inherent in external bodies, they could admit of no alteration without some change wrought in the very bodies themselves: but, is it not evident from what hath been said that, upon the use of microscopes, upon a change happening in the humors of the eye, or a variation of distance, without any manner of real alteration in the thing itself, the colours of any object are either changed, or totally disappear? Nay, all other circumstances remaining the same, change but the situation of some objects, and they shall present different colours to the eye. The same thing

happens upon viewing an object in various degrees of light. And what is more known than that the same bodies appear differently colored by candle-light from what they do in the open day? Add to these the experiment of a prism which, separating the heterogeneous rays of light, alters the colour of any object, and will cause the whitest to appear of a deep blue or red to the naked eye. And now tell me whether you are still of opinion that every body hath its true real colour inhering in it; and, if you think it hath, I would fain know farther from you, what certain distance and position of the object, what peculiar texture and formation of the eye, what degree or kind of light is necessary for ascertaining that true colour, and distinguishing it from apparent ones.

HYLAS: I own myself entirely satisfied, that they are all equally apparent, and that there is no such thing as colour really inhering in external bodies, but that it is altogether in the light. And what confirms me in this opinion is, that in proportion to the light colours are still more or less vivid; and if there be no light, then are there no colours perceived. Besides, allowing there are colours on external objects, yet, how is it possible for us to perceive them? For no external body affects the mind, unless it acts first on our organs of sense. But the only action of bodies is motion; and motion cannot be communicated otherwise than by impulse. A distant object therefore cannot act on the eye, nor consequently make itself or its properties perceivable to the soul. Whence it plainly follows that it is immediately some contiguous substance, which, operating on the eye, occasions a perception of colours: and such is light.

PHILONOUS: How! Is light then a substance?

HYLAS: I tell you, Philonous, external light is nothing but a thin fluid substance, whose minute particles being agitated with a brisk motion, and in various manners reflected from the different surfaces of outward objects to the eyes, communicate different motions to the optic nerves; which, being propagated to the brain, cause therein various impressions; and these are attended with the sensations of red, blue, yellow, &c.

PHILONOUS: It seems then the light does no more than shake the optic nerves.

HYLAS: Nothing else.

PHILONOUS: And consequent to each particular motion of the nerves, the mind is affected with a sensation, which is some particular colour.

HYLAS: Right.

PHILONOUS: And these sensations have no existence without the mind.

HYLAS: They have not.

PHILONOUS: How then do you affirm that colours are in the light; since by light you understand a corporeal substance external to the mind?

HYLAS: Light and colours, as immediately perceived by us, I grant cannot exist without the mind. But in themselves they are only the motions and configurations of certain insensible particles of matter.

PHILONOUS: Colours then, in the vulgar sense, or taken for the immediate objects of sight, cannot agree to any but a perceiving substance.

HYLAS: That is what I say.

PHILONOUS: Well then, since you give up the point as to those sensible qualities which are alone thought colours by all mankind beside, you may hold what you please with regard to those invisible ones of the philosophers. It is not my business to dispute about them; only I would advise you to bethink yourself, whether, considering the inquiry we are upon, it be prudent for you to affirm—*the red and blue which we see are not real colours, but certain unknown motions and figures which no man ever did or can see are truly so*. Are not these shocking notions, and are not they subject to as many ridiculous inferences, as those you were obliged to renounce before in the case of sounds?

HYLAS: I frankly own, Philonous, that it is in vain to stand out any longer. Colours, sounds, tastes, in a word all those termed *secondary qualities*, have certainly no existence without the mind. But by this acknowledgment I must not be supposed to derogate anything from the reality of matter, or external objects; seeing it is no more than several philosophers maintain, who nevertheless are the farthest imaginable from denying matter. For the clearer understanding of this, you must know sensible qualities are by philosophers divided into *primary* and *secondary*. The former are extension, figure, solidity, gravity, motion, and rest; and these they hold exist really in bodies. The latter are those above enumerated; or, briefly, all sensible qualities beside the primary; which they assert are only so many sensations or ideas existing nowhere but in the mind. But all this, I doubt not, you are apprised of. For my part, I have been a long time sensible there was such an opinion current among philosophers, but was never thoroughly convinced of its truth until now.

PHILONOUS: You are still then of opinion that extension and figures are inherent in external unthinking substances?

HYLAS: I am.

PHILONOUS: But what if the same arguments which are brought against secondary qualities will hold good against these also?

HYLAS: Why then I shall be obliged to think, they too exist only in the mind.

PHILONOUS: Is it your opinion the very figure and extension which you perceive by sense exist in the outward object or material substance?

HYLAS: It is.

PHILONOUS: Have all other animals as good grounds to think the same of the figure and extension which they see and feel?

HYLAS: Without doubt, if they have any thought at all.

PHILONOUS: Answer me, Hylas. Think you the senses were bestowed upon all animals for their preservation and well-being in life? Or were they given to men alone for this end?

HYLAS: I make no question but they have the same use in all other animals.

PHILONOUS: If so, is it not necessary they should be enabled by them to perceive their own limbs, and those bodies which are capable of harming them?

HYLAS: Certainly.

PHILONOUS: A mite therefore must be supposed to see his own foot, and things equal or even less than it, as bodies of some considerable dimension, though at the same time they appear to you scarce discernible, or at best as so many visible points?

HYLAS: I cannot deny it.

PHILONOUS: And to creatures less than the mite they will seem yet larger?

HYLAS: They will.

PHILONOUS: Insomuch that what you can hardly discern will to another extremely minute animal appear as some huge mountain?

HYLAS: All this I grant.

PHILONOUS: Can one and the same thing be at the same time in itself of different dimensions?

HYLAS: That were absurd to imagine.

PHILONOUS: But, from what you have laid down it follows that both the extension by you perceived, and that perceived by the mite itself, as likewise all those perceived by lesser animals, are each of them the true extension of the mite's foot; that is to say, by your own principles you are led into an absurdity.

HYLAS: There seems to be some difficulty in the point.

PHILONOUS: Again, have you not acknowledged that no real inherent property of any object can be changed without some change in the thing itself?

HYLAS: I have.

PHILONOUS: But, as we approach to or recede from an object, the visible extension varies, being at one distance ten or a hundred times greater than another. Does it not therefore follow from hence likewise that it is not really inherent in the object?

HYLAS: I own I am at a loss what to think.

PHILONOUS: Your judgment will soon be determined, if you will venture to think as freely concerning this quality as you have done concerning the rest. Was it not admitted as a good argument, that neither heat nor cold was in the water, because it seemed warm to one hand and cold to the other?

HYLAS: It was.

PHILONOUS: Is it not the very same reasoning to conclude, there is no extension or figure in an object, because to one eye it shall seem little, smooth, and round, when at the same time it appears to the other, great, uneven, and regular?

HYLAS: The very same. But does this latter fact ever happen?

PHILONOUS: You may at any time make the experiment, by looking with one eye bare, and with the other through a microscope.

HYLAS: I know not how to maintain it; and yet I am loath to give up *extension*, I see so many odd consequences following upon such a concession.

PHILONOUS: Odd, say you? After the concessions already made, I hope you will stick at nothing for its oddness. But, on the other hand, should it not seem very odd, if the general reasoning which includes all other sensible qualities did not also include extension? If it be allowed that no idea, nor anything like an idea, can exist in an unperceiving substance, then surely it follows that no figure, or mode of extension, which we can either perceive, or imagine, or have any idea of, can be really inherent in matter; not to mention the peculiar difficulty there must be in conceiving a material substance, prior to and distinct from extension to be the *substratum* of extension. Be the sensible quality what it will—figure, or sound, or colour, it seems alike impossible it should subsist in that which does not perceive it.

HYLAS: I give up the point for the present, reserving still a right to retract my opinion, in case I shall hereafter discover any false step in my progress to it.

PHILONOUS: That is a right you cannot be denied. Figures and extension being dispatched, we proceed next to *motion*. Can a real motion in any external body be at the same time very swift and very slow?

HYLAS: It cannot.

PHILONOUS: Is not the motion of a body swift in a reciprocal proportion to the time it takes up in describing any given space? Thus a body that describes a mile in an hour moves three times faster than it would in case it described only a mile in three hours.

HYLAS: I agree with you.

PHILONOUS: And is not time measured by the succession of ideas in our minds?

HYLAS: It is.

PHILONOUS: And is it not possible ideas should succeed one another twice as fast in your mind as they do in mine, or in that of some spirit of another kind?

HYLAS: I own it.

PHILONOUS: Consequently the same body may to another seem to perform its motion over any space in half the time that it does to you. And the same reasoning will hold as to any other proportion: that is to say, according to your principles (since the

motions perceived are both really in the object) it is possible one and the same body shall be really moved the same way at once, both very swift and very slow. How is this consistent either with common sense, or with what you just now granted?

HYLAS: I have nothing to say to it.

PHILONOUS: Then as for *solidity*; either you do not mean any sensible quality by that word, and so it is beside our inquiry: or if you do, it must be either hardness or resistance. But both the one and the other are plainly relative to our senses: it being evident that what seems hard to one animal may appear soft to another, who hath greater force and firmness of limbs. Nor is it less plain that the resistance I feel is not in the body.

HYLAS: I own the very sensation of resistance, which is all you immediately perceive, is not in the *body*; but the cause of that sensation is.

PHILONOUS: But the causes of our sensations are not things immediately perceived, and therefore are not sensible. This point I thought had been already determined.

HYLAS: I own it was; but you will pardon me if I seem a little embarrassed: I know not how to quit my old notions.

PHILONOUS: To help you out, do but consider that if extension be once acknowledged to have no existence without the mind, the same must necessarily be granted of motion, solidity, and gravity; since they all evidently suppose extension. It is therefore superfluous to inquire particularly concerning each of them. In denying extension, you have denied them all to have any real existence.

HYLAS: I wonder, Philonous, if what you say be true, why those philosophers who deny the secondary qualities any real existence should yet attribute it to the primary. If there is no difference between them, how can this be accounted for?

PHILONOUS: It is not my business to account for every opinion of the philosophers. But, among other reasons which may be assigned for this, it seems probable that pleasure and pain being rather annexed to the former than the latter may be one. Heat and cold, tastes and smells, have something more vividly pleasing or disagreeable than the ideas of extension, figure, and motion affect us with. And, it being too visibly absurd to hold that pain or pleasure can be in an unperceiving substance, men are more easily weaned from believing the external existence of the secondary than the primary qualities. You will be satisfied there is something in this, if you recollect the difference you made between an intense and more moderate degree of heat; allowing the one a real existence, while you denied it to the other. But, after all, there is no rational ground for that distinction; for, surely an indifferent sensation is as truly a *sensation* as one more pleasing or painful; and consequently should not any more than they be supposed to exist in an unthinking subject.

HYLAS: It is just come into my head, Philonous, that I have somewhere heard of a distinction between absolute and sensible extension. Now, though it be acknowledged that *great* and *small*, consisting merely in the relation which other extended beings have to the parts of our own bodies, do not really inhere in the substances themselves; yet nothing obliges us to hold the same with regard to *absolute extension*, which is something abstracted from *great* and *small*, from this or that particular magnitude or figure. So likewise as to motion; *swift* and *slow* are altogether relative to the succession of ideas in our own minds. But, it does not follow, because those modifications of motion exist not without the mind, that therefore absolute motion abstracted from them does not.

PHILONOUS: Pray what is it that distinguishes one motion, or one part of extension, from another? Is it not something sensible, as some degree of swiftness or slowness, some certain magnitude or figure peculiar to each?

HYLAS: I think so.

PHILONOUS: These qualities, therefore, stripped of all sensible properties, are without all specific and numerical differences, as the schools call them.

HYLAS: They are.

PHILONOUS: That is to say, they are extension in general, and motion in general.

HYLAS: Let it be so.

PHILONOUS: But it is a universally received maxim that *Everything which exists is particular*. How then can motion in general, or extension in general, exist in any corporeal substance?

HYLAS: I will take time to solve your difficulty.

PHILONOUS: But I think the point may be speedily decided. Without doubt you can tell whether you are able to frame this or that idea. Now I am content to put our dispute on this issue. If you can frame in your thoughts a distinct abstract idea of motion or extension, divested of all those sensible modes, as swift and slow, great and small, round and square, and the like, which are acknowledged to exist only in the mind, I will then yield the point you contend for. But if you cannot, it will be unreasonable on your side to insist any longer upon what you have no notion of.

HYLAS: To confess ingenuously, I cannot.

PHILONOUS: Can you even separate the ideas of extension and motion from the ideas of all those qualities which they who make the distinction term *secondary*?

HYLAS: What! Is it not an easy matter to consider extension and motion by themselves, abstracted from all other sensible qualities? Pray how do the mathematicians treat of them?

PHILONOUS: I acknowledge, Hylas, it is not difficult to form general propositions and reasonings about those qualities, without mentioning any other; and, in this sense, to consider or treat of them abstractedly. But, how does it follow that, because I can pronounce the word *motion* by itself, I can form the idea of it in my mind exclusive of body? Or, because theorems may be made of extension and figures, without any mention of *great* or *small*, or any other sensible mode or quality, that therefore it is possible such an abstract idea of extension, without any particular size or figure, or sensible quality, should be distinctly formed, and apprehended by the mind? Mathematicians treat of quantity, without regarding what other sensible qualities it is attended with, as being altogether indifferent to their demonstrations. But, when laying aside the words, they contemplate the bare ideas, I believe you will find, they are not the pure abstracted ideas of extension.

HYLAS: But what say you to *pure intellect*? May not abstracted ideas be framed by that faculty?

PHILONOUS: Since I cannot frame abstract ideas at all, it is plain I cannot frame them by the help of *pure intellect*; whatsoever faculty you understand by those words. Besides, not to inquire into the nature of pure intellect and its spiritual objects, as *virtue*, *reason*, *God*, or the like, thus much seems manifest—that sensible things are only to be perceived by sense, or represented by the imagination. Figures, therefore, and extension, being originally perceived by sense, do not belong to pure intellect: but, for your farther satisfaction, try if you can frame the idea of any figure, abstracted from all particularities of size, or even from other sensible qualities.

HYLAS: Let me think a little—I do not find that I can.

PHILONOUS: And can you think it possible that should really exist in nature which implies a repugnancy in its conception?

HYLAS: By no means.

PHILONOUS: Since therefore it is impossible even for the mind to disunite the ideas of extension and motion from all other sensible qualities, does it not follow, that where the one exist there necessarily the other exist likewise?

HYLAS: It should seem so.

PHILONOUS: Consequently, the very same arguments which you admitted as conclusive against the secondary qualities are, without any farther application of force, against the primary too. Besides, if you will trust your senses, is it not plain all sensible qualities coexist, or to them appear as being in the same place? Do they ever represent a motion, or figure, as being divested of all other visible and tangible qualities?

HYLAS: You need say no more on this head. I am free to own, if there be no secret error or oversight in our proceedings hitherto, that all sensible qualities are alike to be denied existence without the mind. But, my fear is that I have been too liberal in my former concessions, or overlooked some fallacy or other. In short, I did not take time to think.

PHILONOUS: For that matter, Hylas, you may take what time you please in reviewing the progress of our inquiry. You are at liberty to recover any slips you might have made, or offer whatever you have omitted which makes for your first opinion.

HYLAS: One great oversight I take to be this—that I did not sufficiently distinguish the *object* from the *sensation*. Now though this latter may not exist without the mind, yet it will not thence follow that the former cannot.

PHILONOUS: What object do you mean? The object of the senses?

HYLAS: The same.

PHILONOUS: It is then immediately perceived?

HYLAS: Right.

PHILONOUS: Make me to understand the difference between what is immediately perceived and a sensation.

HYLAS: The sensation I take to be an act of the mind perceiving; besides which, there is something perceived, and this I call the *object*. For example, there is red and yellow on that tulip. But then the act of perceiving those colours is in me only, and not in the tulip.

PHILONOUS: What tulip do you speak of? Is it that which you see?

HYLAS: The same.

PHILONOUS: And what do you see beside colour, figure, and extension?

HYLAS: Nothing.

PHILONOUS: What you would say then is that the red and yellow are coexistent with the extension; is it not?

HYLAS: That is not all; I would say they have a real existence without the mind, in some unthinking substance.

PHILONOUS: That the colours are really in the tulip which I see is manifest. Neither can it be denied that this tulip may exist independent of your mind or mine; but, that any immediate object of the senses—that is, any idea, or combination of ideas—should exist in an unthinking substance, or exterior to all minds, is in itself an evident contradiction. Nor can I imagine how this follows from what you said just now, to wit, that the red and yellow were on the tulip *you saw*, since you do not pretend to see that unthinking substance.

HYLAS: You have an artful way, Philonous, of diverting our inquiry from the subject.

PHILONOUS: I see you have no mind to be pressed that way. To return then to your distinction between *sensation* and *object*; if I take you right, you distinguish in every perception two things, the one an action of the mind, the other not.

HYLAS: True.

PHILONOUS: And this action cannot exist in, or belong to, any unthinking thing; but, whatever beside is implied in a perception may?

HYLAS: That is my meaning.

PHILONOUS: So that if there was a perception without any act of the mind, it were possible such a perception should exist in an unthinking substance?

HYLAS: I grant it. But it is impossible there should be such a perception.

PHILONOUS: When is the mind said to be active?

HYLAS: When it produces, puts an end to, or changes, anything.

PHILONOUS: Can the mind produce, discontinue, or change anything, but by an act of the will?

HYLAS: It cannot.

PHILONOUS: The mind therefore is to be accounted active in its perceptions so far forth as volition is included in them?

HYLAS: It is.

PHILONOUS: In plucking this flower I am *active*; because I do it by the motion of my hand, which was consequent upon my *volition*; so likewise in applying it to my nose. But is either of these smelling?

HYLAS: No.

PHILONOUS: I act too in drawing the air through my nose; because my breathing so rather than otherwise is the effect of my volition. But neither can this be called *smelling*: for, if it were, I should smell every time I breathed in that manner?

HYLAS: True.

PHILONOUS: Smelling then is somewhat consequent to all this?

HYLAS: It is.

PHILONOUS: But I do not find my will concerned any farther. Whatever more there is—as that I perceive such a particular smell, or any smell at all—this is independent of my will, and therein I am altogether passive. Do you find it otherwise with you, Hylas?

HYLAS: No, the very same.

PHILONOUS: Then, as to seeing, is it not in your power to open your eyes, or keep them shut; to turn them this or that way?

HYLAS: Without doubt.

PHILONOUS: But does it in like manner depend on your will that in looking on this flower you perceive *white* rather any other colour? Or, directing your open eyes towards yonder part of the heaven, can you avoid seeing the sun? Or is light or darkness the effect of your volition?

HYLAS: No, certainly.

PHILONOUS: You are then in these respects altogether passive?

HYLAS: I am.

PHILONOUS: Tell me now, whether *seeing* consists in perceiving light and colours, or in opening and turning the eyes?

HYLAS: Without doubt, in the former.

PHILONOUS: Since therefore you are in the very perception of light and colours altogether passive, what is become of that action you were speaking of as an ingredient in every sensation? And, does it not follow from your own concessions, that the perception of light and colours, including no action in it, may exist in an unperceiving substance? And is not this a plain contradiction?

HYLAS: I know not what to think of it.

PHILONOUS: Besides, since you distinguish the *active* and *passive* in every perception, you must do it in that of pain. But how is it possible that pain, be it as little active as you please, should exist in an unperceiving substance? In short, do but consider the point, and then confess ingenuously, whether light and colours, tastes, sounds, &c. are not all equally passions or sensations in the soul. You may indeed call them *external objects*, and give them in words what subsistence you please. But, examine your own thoughts, and then tell me whether it be not as I say?

HYLAS: I acknowledge, Philonous, that, upon a fair observation of what passes in my mind I can discover nothing else but that I am a thinking being, affected with variety of sensations; neither is it possible to conceive how a sensation should exist in an unperceiving substance.—But then, on the other hand, when I look on sensible things in a different view, considering them as so many modes and qualities, I find it necessary to suppose a *material substratum*, without which they cannot be conceived to exist.

PHILONOUS: *Material substratum* call you it? Pray, by which of your senses came you acquainted with that being?

HYLAS: It is not itself sensible; its modes and qualities only being perceived by the senses.

PHILONOUS: I presume then it was by reflexion and reason you obtained the idea of it?

HYLAS: I do not pretend to any proper positive idea of it. However, I conclude it exists, because qualities cannot be conceived to exist without a support.

PHILONOUS: It seems then you have only a relative notion of it, or that you conceive it not otherwise than by conceiving the relation it bears to sensible qualities?

HYLAS: Right.

PHILONOUS: Be pleased therefore to let me know wherein that relation consists.

HYLAS: Is it not sufficiently expressed in the term *substratum*, or *substance*?

PHILONOUS: If so, the word *substratum* should import that it is spread under the sensible qualities or accidents?

HYLAS: True.

PHILONOUS: And consequently under extension?

HYLAS: I own it.

PHILONOUS: It is therefore somewhat in its own nature entirely distinct from extension?

HYLAS: I tell you, extension is only a mode, and matter is something that supports modes. And is it not evident the thing supported is different from the thing supporting?

PHILONOUS: So that something distinct from, and exclusive of, extension is supposed to be the substratum of extension?

HYLAS: Just so.

PHILONOUS: Answer me, Hylas. Can a thing be spread without extension? or is not the idea of extension necessarily included in *spreading*?

HYLAS: It is.

PHILONOUS: Whatsoever therefore you suppose spread under anything must have in itself an extension distinct from the extension of that thing under which it is spread?

HYLAS: It must.

PHILONOUS: Consequently, every corporeal substance, being the *substratum* of extension, must have in itself another extension, by which it is qualified to be a *substratum*: and so on to infinity. And I ask whether this be not absurd in itself, and repugnant to what you granted just now, to wit, that the *substratum* was something distinct from and exclusive of extension?

HYLAS: Aye but, Philonous, you take me wrong. I do not mean that matter is *spread* in a gross literal sense under extension. The word *substratum* is used only to express in general the same thing with *substance*.

PHILONOUS: Well then, let us examine the relation implied in the term *substance*. Is it not that it stands under accidents?

HYLAS: The very same.

PHILONOUS: But, that one thing may stand under or support another, must it not be extended?

HYLAS: It must.

PHILONOUS: Is not therefore this supposition liable to the same absurdity with the former?

HYLAS: You still take things in a strict literal sense. That is not fair, Philonous.

PHILONOUS: I am not for imposing any sense on your words: you are at liberty to explain them as you please. Only, I beseech you, make me understand something by them. You tell me matter supports or stands under accidents. How! is it as your legs support your body?

HYLAS: No; that is the literal sense.

PHILONOUS: Pray let me know any sense, literal or not literal, that you understand it in.—How long must I wait for an answer, Hylas?

HYLAS: I declare I know not what to say. I once thought I understood well enough what was meant by matter's supporting accidents. But now, the more I think on it the less can I comprehend it: in short I find that I know nothing of it.

PHILONOUS: It seems then you have no idea at all, neither relative nor positive, of matter; you know neither what it is in itself, nor what relation it bears to accidents?

HYLAS: I acknowledge it.

PHILONOUS: And yet you asserted that you could not conceive how qualities or accidents should really exist, without conceiving at the same time a material support of them?

HYLAS: I did.

PHILONOUS: That is to say, when you conceive the real existence of qualities, you do withal conceive something which you cannot conceive?

HYLAS: It was wrong, I own. But still I fear there is some fallacy or other. Pray what think you of this? It is just come into my head that the ground of all our mistake lies in your treating of each quality by itself. Now, I grant that each quality cannot singly subsist without the mind. Colour cannot without extension, neither can figure without some other sensible quality. But, as the several qualities united or blended together form entire sensible things, nothing hinders why such things may not be supposed to exist without the mind.

PHILONOUS: Either, Hylas, you are jesting, or have a very bad memory. Though indeed we went through all the qualities by name one after another, yet my arguments or rather your concessions, nowhere tended to prove that the secondary qualities did not subsist each alone by itself; but, that they were not *at all* without the mind. Indeed, in treating of figure and motion we concluded they could not exist without the mind, because it was impossible even in thought to separate them from all secondary qualities, so as to conceive them existing by themselves. But then this was not the only argument made use of upon that occasion. But (to pass by all that hath been hitherto said, and reckon it for nothing, if you will have it so) I am content to put the whole upon this issue. If you can conceive it possible for any mixture or combination of qualities, or any sensible object whatever, to exist without the mind, then I will grant it actually to be so.

HYLAS: If it comes to that the point will soon be decided. What more easy than to conceive a tree or house existing by itself, independent of, and unperceived by, any mind whatsoever? I do at this present time conceive them existing after that manner.

PHILONOUS: How say you, Hylas, can you see a thing which is at the same time unseen?

HYLAS: No, that were a contradiction.

PHILONOUS: Is it not as great a contradiction to talk of *conceiving* a thing which is *unconceived*?

HYLAS: It is.

PHILONOUS: The tree or house therefore which you think of is conceived by you?

HYLAS: How should it be otherwise?

PHILONOUS: And what is conceived is surely in the mind?

HYLAS: Without question, that which is conceived is in the mind.

PHILONOUS: How then came you to say, you conceived a house or tree existing independent and out of all minds whatsoever?

HYLAS: That was I own an oversight; but stay, let me consider what led me into it.—It is a pleasant mistake enough. As I was thinking of a tree in a solitary place, where no one was present to see it, methought that was to conceive a tree as existing unperceived or unthought of; not considering that I myself conceived it all the while. But now I plainly see that all I can do is to frame ideas in my own mind. I may indeed conceive in my own thoughts the idea of a tree, or a house, or a mountain, but that is all. And this is far from proving that I can conceive them *existing out of the minds of all spirits*.

PHILONOUS: You acknowledge then that you cannot possibly conceive how any one corporeal sensible thing should exist otherwise than in the mind?

HYLAS: I do.

PHILONOUS: And yet you will earnestly contend for the truth of that which you cannot so much as conceive?

HYLAS I profess I know not what to think, but still there are some scruples remain with me. Is it not certain I *see* things at a distance? Do we not perceive the stars and moon, for example, to be a great way off? Is not this, say, manifest to the senses?

PHILONOUS: Do you not in a dream too perceive those or the like objects?

HYLAS: I do.

PHILONOUS: And have they not then the same appearance of being distant?

HYLAS: They have.

PHILONOUS: But you do not thence conclude the apparitions in a dream to be without the mind?

HYLAS: By no means.

PHILONOUS: You ought not therefore to conclude that sensible objects are without the mind, from their appearance, or manner wherein they are perceived.

HYLAS: I acknowledge it. But does not my sense deceive me in those cases?

PHILONOUS: By no means. The idea or thing which you immediately perceive, neither sense nor reason informs you that it actually exists without the mind. By sense you only know that you are affected with such certain sensations of light and colours, etc. And these you will not say are without the mind.

HYLAS: True; but, beside all that, do you not think the sight suggests something of *outness* or *distance*?

PHILONOUS: Upon approaching a distant object, do the visible size and figure change perpetually, or do they appear the same at all distances?

HYLAS: They are in a continual change.

PHILONOUS: Sight therefore does not suggest, or any way inform you, that the visible object you immediately perceive exists at a distance, or will be perceived when you advance farther onward; there being a continued series of visible objects succeeding each other during the whole time of your approach.

HYLAS: It does not; but still I know, upon seeing an object, what object I shall perceive after having passed over a certain distance: no matter whether it be exactly the same or no: there is still something of distance suggested in the case.

PHILONOUS: Good Hylas, do but reflect a little on the point, and then tell me whether there be any more in it than this: from the ideas you actually perceive by sight, you have by experience learned to collect what other ideas you will (according to the standing order of nature) be affected with, after such a certain succession of time and motion.

HYLAS: Upon the whole, I take it to be nothing else.

PHILONOUS: Now, is it not plain that if we suppose a man born blind was on a sudden made to see, he could at first have no experience of what may be suggested by sight?

HYLAS: It is.

PHILONOUS: He would not then, according to you, have any notion of distance annexed to the things he saw; but would take them for a new set of sensations, existing only in his mind?

HYLAS: It is undeniable.

PHILONOUS: But, to make it still more plain: is not *distance* a line turned endwise to the eye?

HYLAS: It is.

PHILONOUS: And can a line so situated be perceived by sight?

HYLAS: It cannot.

PHILONOUS: Does it not therefore follow that distance is not properly and immediately perceived by sight?

HYLAS: It should seem so.

PHILONOUS: Again, is it your opinion that colours are at a distance?

HYLAS: It must be acknowledged they are only in the mind.

PHILONOUS: But do not colours appear to the eye as coexisting in the same place with extension and figures?

HYLAS: They do.

PHILONOUS: How can you then conclude from sight that figures exist without, when you acknowledge colours do not; the sensible appearance being the very same with regard to both?

HYLAS: I know not what to answer.

PHILONOUS: But, allowing that distance was truly and immediately perceived by the mind, yet it would not thence follow it existed out of the mind. For, whatever is immediately perceived is an idea: and can any *idea* exist out of the mind?

HYLAS: To suppose that were absurd: but, inform me, Philonous, can we perceive or know nothing beside our ideas?

PHILONOUS: As for the rational deducing of causes from effects, that is beside our inquiry. And, by the senses you can best tell whether you perceive anything which is not immediately perceived. And I ask you, whether the things immediately perceived are other than your own sensations or ideas? You have indeed more than once, in the course of this conversation, declared yourself on those points; but you seem, by this last question, to have departed from what you then thought.

HYLAS: To speak the truth, Philonous, I think there are two kinds of objects:—the one perceived immediately, which are likewise called *ideas*; the other are real things or external

objects, perceived by the mediation of ideas, which are their images and representations. Now, I own ideas do not exist without the mind; but the latter sort of objects do. I am sorry I did not think of this distinction sooner; it would probably have cut short your discourse.

PHILONOUS: Are those external objects perceived by sense or by some other faculty?

HYLAS: They are perceived by sense.

PHILONOUS: How! Is there any thing perceived by sense which is not immediately perceived?

HYLAS: Yes, Philonous, in some sort there is. For example when I look on a picture or statue of Julius Caesar, I may be said after a manner to perceive him (though not immediately) by my senses.

PHILONOUS: It seems then you will have our ideas, which alone are immediately perceived, to be pictures of external things: and that these also are perceived by sense, inasmuch as they have a conformity or resemblance to our ideas?

HYLAS: That is my meaning.

PHILONOUS: And, in the same way that Julius Caesar, in himself invisible, is nevertheless perceived by sight; real things, in themselves imperceptible, are perceived by sense.

HYLAS: In the very same.

PHILONOUS: Tell me, Hylas, when you behold the picture of Julius Caesar, do you see with your eyes any more than some colours and figures, with a certain symmetry and composition of the whole?

HYLAS: Nothing else.

PHILONOUS: And would not a man who had never known anything of Julius Caesar see as much?

HYLAS: He would.

PHILONOUS: Consequently he hath his sight, and the use of it, in as perfect a degree as you?

HYLAS: I agree with you.

PHILONOUS: Whence comes it then that your thoughts are directed to the Roman emperor, and his are not? This cannot proceed from the sensations or ideas of sense by you then perceived; since you acknowledge you have no advantage over him in that respect. It should seem therefore to proceed from reason and memory: should it not?

HYLAS: It should.

PHILONOUS: Consequently, it will not follow from that instance that anything is perceived by sense which is not immediately perceived. Though I grant we may, in one acceptation, be said to perceive sensible things mediately by sense: that is, when, from a frequently perceived connexion, the immediate perception of ideas by one sense suggests to the mind others, perhaps belonging to another sense, which are wont to be connected with them. For instance, when I hear a coach drive along the streets, immediately I perceive only the sound; but, from the experience I have had that such a sound is connected with a coach, I am said to hear the coach. It is nevertheless evident that, in truth and strictness, nothing can be *heard* but *sound*; and the coach is not then properly perceived by sense, but suggested from experience. So likewise when we are said to see a red-hot bar of iron; the solidity and heat of the iron are not the objects of sight, but suggested to the imagination by the colour and figure which are properly perceived by that sense. In short, those things alone are actually and strictly perceived by any sense, which would have been perceived in case that same sense had then been first conferred on us. As for other things, it is plain they are only suggested to the mind by experience, grounded on former perceptions. But, to return to your comparison of Caesar's picture, it

is plain, if you keep to that, you must hold the real things, or archetypes of our ideas, are not perceived by sense, but by some internal faculty of the soul, as reason or memory. I would therefore fain know what arguments you can draw from reason for the existence of what you call *things* or *material objects*. Or, whether you remember to have seen them formerly as they are in themselves; or, if you have heard or read of any one that did.

HYLAS: I see, Philonous, you are disposed to raillery; but that will never convince me.

PHILONOUS: My aim is only to learn from you the way to come at the knowledge of *material beings*. Whatever we perceive is perceived immediately or mediately: by sense, or by reason and reflexion. But, as you have excluded sense, pray show me what reason you have to believe their existence; or what *medium* you can possibly make use of to prove it, either to mine or your own understanding.

HYLAS: To deal ingenuously, Philonous, now I consider the point, I do not find I can give you any good reason for it. But, thus much seems pretty plain, that it is at least possible such things may really exist. And, as long as there is no absurdity in supposing them, I am resolved to believe as I did, till you bring good reasons to the contrary.

PHILONOUS: What! Is it come to this, that you only believe the existence of material objects, and that your belief is founded barely on the possibility of its being true? Then you will have me bring reasons against it: though another would think it reasonable the proof should lie on him who holds the affirmative. And, after all, this very point which you are now resolved to maintain, without any reason, is in effect what you have more than once during this discourse seen good reason to give up. But, to pass over all this; if I understand you rightly, you say our ideas do not exist without the mind, but that they are copies, images, or representations, of certain originals that do?

HYLAS: You take me right.

PHILONOUS: They are then like external things?

HYLAS: They are.

PHILONOUS: Have those things a stable and permanent nature, independent of our senses; or are they in a perpetual change, upon our producing any motions in our bodies—suspending, exerting, or altering, our faculties or organs of sense?

HYLAS: Real things, it is plain, have a fixed and real nature, which remains the same notwithstanding any change in our senses, or in the posture and motion of our bodies; which indeed may affect the ideas in our minds, but it were absurd to think they had the same effect on things existing without the mind.

PHILONOUS: How then is it possible that things perpetually fleeting and variable as our ideas should be copies or images of anything fixed and constant? Or, in other words, since all sensible qualities, as size, figure, colour, &c., that is, our ideas, are continually changing, upon every alteration in the distance, medium, or instruments of sensation; how can any determinate material objects be properly represented or painted forth by several distinct things, each of which is so different from and unlike the rest? Or, if you say it resembles some one only of our ideas, how shall we be able to distinguish the true copy from all the false ones?

HYLAS: I profess, Philonous, I am at a loss. I know not what to say to this.

PHILONOUS: But neither is this all. Which are material objects in themselves—perceptible or imperceptible?

HYLAS: Properly and immediately nothing can be perceived but ideas. All material things, therefore, are in themselves insensible, and to be perceived only by our ideas.

PHILONOUS: Ideas then are sensible, and their archetypes or originals insensible?

HYLAS: Right.

PHILONOUS: But how can that which is sensible be like that which is insensible? Can a real thing, in itself *invisible*, be like a *colour*; or a real thing, which is not *audible*,

be like a *sound*? In a word, can anything be like a sensation or idea, but another sensation or idea?

HYLAS: I must own, I think not.

PHILONOUS: Is it possible there should be any doubt on the point? Do you not perfectly know your own ideas?

HYLAS: I know them perfectly; since what I do not perceive or know can be no part of my idea.

PHILONOUS: Consider, therefore, and examine them, and then tell me if there be anything in them which can exist without the mind: or if you can conceive anything like them existing without the mind.

HYLAS: Upon inquiry, I find it is impossible for me to conceive or understand how anything but an idea can be like an idea. And it is most evident that *no idea can exist without the mind*.

PHILONOUS: You are therefore, by your principles, forced to deny the reality of sensible things; since you made it to consist in an absolute existence exterior to the mind. That is to say, you are a downright *sceptic*. So I have gained my point, which was to show your principles led to scepticism.

HYLAS: For the present I am, if not entirely convinced, at least silenced.

PHILONOUS: I would fain know what more you would require in order to a perfect conviction. Have you not had the liberty of explaining yourself all manner of ways? Were any little slips in discourse laid hold and insisted on? Or were you not allowed to retract or reinforce anything you had offered, as best served your purpose? Hath not everything you could say been heard and examined with all the fairness imaginable? In a word, have you not in every point been convinced out of your own mouth? And, if you can at present discover any flaw in any of your former concessions, or think of any remaining subterfuge, any new distinction, colour, or comment whatsoever, why do you not produce it?

HYLAS: A little patience, Philonous. I am at present so amazed to see myself ensnared, and as it were imprisoned in the labyrinths you have drawn me into, that on the sudden it cannot be expected I should find my way out. You must give me time to look about me and recollect myself.

PHILONOUS: Hark; is not this the college bell?

HYLAS: It rings for prayers.

PHILONOUS: We will go in then, if you please, and meet here again tomorrow morning. In the meantime, you may employ your thoughts on this morning's discourse, and try if you can find any fallacy in it, or invent any new means to extricate yourself.

HYLAS: Agreed.

THE SECOND DIALOGUE

HYLAS: I beg your pardon, Philonous, for not meeting you sooner. All this morning my head was so filled with our late conversation that I had not leisure to think of the time of the day, or indeed of anything else.

PHILONOUS: I am glad you were so intent upon it, in hopes if there were any mistakes in your concessions, or fallacies in my reasonings from them, you will now discover them to me.

HYLAS: I assure you I have done nothing ever since I saw you but search after mistakes and fallacies, and, with that view, have minutely examined the whole series of yesterday's discourse: but all in vain, for the notions it led me into, upon review, appear still more clear and evident; and, the more I consider them, the more irresistibly do they force my assent.

PHILONOUS: And is not this, think you, a sign that they are genuine, that they proceed from nature, and are conformable to right reason? Truth and beauty are in this alike, that the strictest survey sets them both off to advantage; while the false lustre of error and disguise cannot endure being reviewed, or too nearly inspected.

HYLAS: I own there is a great deal in what you say. Nor can any one be more entirely satisfied of the truth of those odd consequences, so long as I have in view the reasonings that lead to them. But, when these are out of my thoughts, there seems, on the other hand, something so satisfactory, so natural and intelligible, in the modern way of explaining things that, I profess, I know not how to reject it.

PHILONOUS: I know not what way you mean.

HYLAS: I mean the way of accounting for our sensations or ideas.

PHILONOUS: How is that?

HYLAS: It is supposed the soul makes her residence in some part of the brain, from which the nerves take their rise, and are thence extended to all parts of the body; and that outward objects, by the different impressions they make on the organs of sense, communicate certain vibrative motions to the nerves; and these being filled with spirits propagate them to the brain or seat of the soul, which, according to the various impressions or traces thereby made in the brain, is variously affected with ideas.

PHILONOUS: And call you this an explication of the manner whereby we are affected with ideas?

HYLAS: Why not, Philonous? Have you anything to object against it?

PHILONOUS: I would first know whether I rightly understand your hypothesis. You make certain traces in the brain to be the causes or occasions of our ideas. Pray tell me whether by the brain you mean any sensible thing.

HYLAS: What else think you I could mean?

PHILONOUS: Sensible things are all immediately perceivable; and those things which are immediately perceivable are ideas; and these exist only in the mind. Thus much you have, if I mistake not, long since agreed to.

HYLAS: I do not deny it.

PHILONOUS: The brain therefore you speak of, being a sensible thing, exists only in the mind. Now, I would fain know whether you think it reasonable to suppose that one idea or thing existing in the mind occasions all other ideas. And, if you think so, pray how do you account for the origin of that primary idea or brain itself?

HYLAS: I do not explain the origin of our ideas by that brain which is perceivable to sense—this being itself only a combination of sensible ideas—but by another which I imagine.

PHILONOUS: But are not things imagined as truly *in the mind* as things perceived?

HYLAS: I must confess they are.

PHILONOUS: It comes therefore, to the same thing; and you have been all this while accounting for ideas by certain motions or impressions of the brain; that is, by some alterations in an idea, whether sensible or imaginable it matters not.

HYLAS: I begin to suspect my hypothesis.

PHILONOUS: Besides spirits, all that we know or conceive are our own ideas. When, therefore, you say all ideas are occasioned by impressions in the brain, do you

conceive this brain or no? If you do, then you talk of ideas imprinted in an idea causing that same idea, which is absurd. If you do not conceive it, you talk unintelligibly, instead of forming a reasonable hypothesis.

HYLAS: I now clearly see it was a mere dream. There is nothing in it.

PHILONOUS: You need not be much concerned at it; for after all, this way of explaining things, as you called it, could never have satisfied any reasonable man. What connexion is there between a motion in the nerves, and the sensations of sound or colour in the mind? Or how is it possible these should be the effect of that?

HYLAS: But I could never think it had so little in it as now it seems to have.

PHILONOUS: Well then, are you at length satisfied that no sensible things have a real existence; and that you are in truth an arrant *sceptic*?

HYLAS: It is too plain to be denied.

PHILONOUS: Look! Are not the fields covered with a delightful verdure? Is there not something in the woods and groves, in the rivers and clear springs, that soothes, that delights, that transports the soul? At the prospect of the wide and deep ocean, or some huge mountain whose top is lost in the clouds, or of an old gloomy forest, are not our minds filled with a pleasing horror? Even in rocks and deserts is there not an agreeable wildness? How sincere a pleasure is it to behold the natural beauties of the earth! To preserve and renew our relish for them, is not the veil of night alternately drawn over her face, and does she not change her dress with the seasons? How aptly are the elements disposed! What variety and use in the meanest productions of nature! What delicacy, what beauty, what contrivance, in animal and vegetable bodies! How exquisitely are all things suited, as well to their particular ends, as to constitute opposite parts of the whole! And, while they mutually aid and support, do they not also set off and illustrate each other? Raise now your thoughts from this ball of earth to all those glorious luminaries that adorn the high arch of heaven. The motion and situation of the planets, are they not admirable for use and order? Were those (miscalled *erratic*) globes once known to stray, in their repeated journeys through the pathless void? Do they not measure areas round the sun ever proportioned to the times? So fixed, so immutable are the laws by which the unseen author of nature actuates the universe. How vivid and radiant is the lustre of the fixed stars! How magnificent and rich that negligent profusion with which they appear to be scattered throughout the whole azure vault! Yet, if you take the telescope, it brings into your sight a new host of stars that escape the naked eye. Here they seem contiguous and minute, but to a nearer view immense orbs of light at various distances, far sunk in the abyss of space. Now you must call imagination to your aid. The feeble narrow sense cannot descry innumerable worlds revolving round the central fires and in those worlds the energy of an all-perfect mind displayed in endless forms. But, neither sense nor imagination are big enough to comprehend the boundless extent, with all its glittering furniture. Though the labouring mind exert and strain each power to its utmost reach, there still stands out ungrasped a surplusage immeasurable. Yet all the vast bodies that compose this mighty frame, how distant and remote soever, are by some secret mechanism, some divine art and force, linked in a mutual dependence and intercourse with each other; even with this earth, which was almost slipt from my thoughts and lost in the crowd of worlds. Is not the whole system immense, beautiful, glorious beyond expression and beyond thought! What treatment, then, do those philosophers deserve, who would deprive these noble and delightful scenes of all reality? How should those principles be entertained that lead us to think all the visible beauty of the creation a false imaginary glare? To be plain, can you expect this scepticism of yours will not be thought extravagantly absurd by all men of sense?

HYLAS: Other men may think as they please; but for your part you have nothing to reproach me with. My comfort is, you are as much a *sceptic* as I am.

PHILONOUS: There, Hylas, I must beg leave to differ from you.

HYLAS: What! Have you all along agreed to the premises, and do you now deny the conclusion, and leave me to maintain those paradoxes by myself which you led me into? This surely is not fair.

PHILONOUS: I deny that I agreed with you in those notions that led to scepticism. You indeed said the *reality* of sensible things consisted in an *absolute existence* out of the minds of spirits, or distinct from their being perceived. And pursuant to this notion of reality, you are obliged to deny sensible things any real existence: that is, according to your own definition, you profess yourself a *sceptic*. But I neither said nor thought the reality of sensible things was to be defined after that manner. To me it is evident for the reasons you allow of, that sensible things cannot exist otherwise than in a mind or spirit. Whence I conclude, not that they have no real existence, but that, seeing they depend not on my thought, and have an existence distinct from being perceived by me, *there must be some other mind wherein they exist*. As sure, therefore, as the sensible world really exists, so sure is there an infinite omnipresent spirit who contains and supports it.

HYLAS: What! This is no more than I and all Christians hold; nay, and all others too who believe there is a God, and that he knows and comprehends all things.

PHILONOUS: Aye, but here lies the difference. Men commonly believe that all things are known or perceived by God, because they believe the being of a God; whereas I, on the other side, immediately and necessarily conclude the being of a God, because all sensible things must be perceived by him.

HYLAS: But, so long as we all believe the same thing, what matter is it how we come by that belief?

PHILONOUS: But neither do we agree in the same opinion. For philosophers, though they acknowledge all corporeal beings to be perceived by God, yet they attribute to them an absolute subsistence distinct from their being perceived by any mind whatever; which I do not. Besides, is there no difference between saying, *There is a God, therefore he perceives all things*; and saying, *Sensible things do really exist; and, if they really exist, they are necessarily perceived by an infinite mind: therefore there is an infinite mind or God*? This furnishes you with a direct and immediate demonstration, from a most evident principle, of the *being of a God*. Divines and philosophers had proved beyond all controversy, from the beauty and usefulness of the several parts of the creation, that it was the workmanship of God. But that—setting aside all help of astronomy and natural philosophy, all contemplation of the contrivance, order, and adjustment of things—an infinite mind should be necessarily inferred from the bare *existence* of the sensible world, is an advantage to them only who have made this easy reflexion: that the sensible world is that which we perceive by our several senses; and that nothing is perceived by the senses beside ideas; and that no idea or archetype of an idea can exist otherwise than in a mind. You may now, without any laborious search into the sciences, without any subtlety of reason, or tedious length of discourse, oppose and baffle the most strenuous advocate for Atheism. Those miserable refuges, whether in an eternal succession of unthinking causes and effects, or in a fortuitous concourse of atoms; those wild imaginations of Vanini, Hobbes, and Spinoza: in a word, the whole system of Atheism, is it not entirely overthrown, by this single reflexion on the repugnancy included in supposing the whole, or any part, even the most rude and shapeless, of the visible world, to exist without a mind? Let any one of those abettors of impiety but look into his own thoughts, and there try if he can conceive how so much as a rock, a desert, a chaos, or confused jumble

of atoms; how anything at all, either sensible or imaginable, can exist independent of a mind, and he need go no farther to be convinced of his folly. Can anything be fairer than to put a dispute on such an issue, and leave it to a man himself to see if he can conceive, even in thought, what he holds to be true in fact, and from a notional to allow it a real existence?

HYLAS: It cannot be denied there is something highly serviceable to religion in what you advance. But do you not think it looks very like a notion entertained by some eminent moderns, of *seeing all things in God*?

PHILONOUS: I would gladly know that opinion: pray explain it to me.

HYLAS: They conceive that the soul, being immaterial, is incapable of being united with material things, so as to perceive them in themselves; but that she perceives them by her union with the substance of God, which, being spiritual, is therefore purely intelligible, or capable of being the immediate object of a spirit's thought. Besides the divine essence contains in it perfections correspondent to each created being; and which are, for that reason, proper to exhibit or represent them to the mind.

PHILONOUS: I do not understand how our ideas, which are things altogether passive and inert, can be the essence, or any part (or like any part) of the essence or substance of God, who is an impassive, indivisible, pure, active being. Many more difficulties and objections there are which occur at first view against this hypothesis; but I shall only add that it is liable to all the absurdities of the common hypothesis, in making a created world exist otherwise than in the mind of a spirit. Besides all which it hath this peculiar to itself; that it makes that material world serve to no purpose. And, if it pass for a good argument against other hypotheses in the sciences, that they suppose nature, or the divine wisdom, to make something in vain, or do that by tedious roundabout methods which might have been performed in a much more easy and compendious way, what shall we think of that hypothesis which supposes the whole world made in vain?

HYLAS: But what say you? Are not you too of opinion that we see all things in God? If I mistake not, what you advance comes near it.

PHILONOUS: Few men think; yet all have opinions. Hence men's opinions are superficial and confused. It is nothing strange that tenets which in themselves are ever so different, should nevertheless be confounded with each other, by those who do not consider them attentively. I shall not therefore be surprised if some men imagine that I run into the enthusiasm of Malebranche; though in truth I am very remote from it. He builds on the most abstract general ideas, which I entirely disclaim. He asserts an absolute external world, which I deny. He maintains that we are deceived by our senses, and know not the real natures or the true forms and figures of extended beings; of all which I hold the direct contrary. So that upon the whole there are no principles more fundamentally opposite than his and mine. It must be owned that I entirely agree with what the holy Scripture says, "That in God we live and move and have our being" [Acts 17:28]. But that we see things in His essence, after the manner above set forth, I am far from believing. Take here in brief my meaning:—It is evident that the things I perceive are my own ideas, and that no idea can exist unless it be in a mind: nor is it less plain that these ideas or things by me perceived, either themselves or their archetypes, exist independently of my mind, since I know myself not to be their author, it being out of my power to determine at pleasure what particular ideas I shall be affected with upon opening my eyes or ears: they must therefore exist in some other mind, whose will it is they should be exhibited to me. The things, I say, immediately perceived are ideas or sensations, call them which you will. But how can any idea or sensation exist in, or be

produced by, anything but a mind or spirit? This indeed is inconceivable. And to assert that which is inconceivable is to talk nonsense: is it not?

HYLAS: Without doubt.

PHILONOUS: But, on the other hand, it is very conceivable that they should exist in and be produced by a spirit; since this is no more than I daily experience in myself, inasmuch as I perceive numberless ideas; and, by an act of my will, can form a great variety of them, and raise them up in my imagination: though, it must be confessed, these creatures of the fancy are not altogether so distinct, so strong, vivid, and permanent, as those perceived by my senses—which latter are called *real things*. From all which I conclude, *there is a mind which affects me every moment with all the sensible impressions I perceive*. And, from the variety, order, and manner of these, I conclude the author of them to be *wise, powerful, and good, beyond comprehension*. Mark it well; I do not say, I see things by perceiving that which represents them in the intelligible substance of God. This I do not understand; but I say, the things by me perceived are known by the understanding, and produced by the will of an infinite spirit. And is not all this most plain and evident? Is there any more in it than what a little observation in our own minds, and that which passes in them, not only enables us to conceive, but also obliges us to acknowledge.

HYLAS: I think I understand you very clearly; and own the proof you give of a deity seems no less evident than it is surprising. But, allowing that God is the supreme and universal cause of all things, yet, may there not be still a third nature besides spirits and ideas? May we not admit a subordinate and limited cause of our ideas? In a word, may there not for all that be *matter*?

PHILONOUS: How often must I inculcate the same thing? You allow the things immediately perceived by sense to exist nowhere without the mind; but there is nothing perceived by sense which is not perceived immediately: therefore there is nothing sensible that exists without the mind. The matter, therefore, which you still insist on is something intelligible, I suppose; something that may be discovered by reason, and not by sense.

HYLAS: You are in the right.

PHILONOUS: Pray let me know what reasoning your belief of matter is grounded on; and what this matter is, in your present sense of it.

HYLAS: I find myself affected with various ideas, whereof I know I am not the cause; neither are they the cause of themselves, or of one another, or capable of subsisting by themselves, as being altogether inactive, fleeting, dependent beings. They have therefore some cause distinct from me and them: of which I pretend to know no more than that it is *the cause of my ideas*. And this thing, whatever it be, I call matter.

PHILONOUS: Tell me, Hylas, hath every one a liberty to change the current proper signification attached to a common name in any language? For example, suppose a traveler should tell you that in a certain country men pass unhurt through the fire; and, upon explaining himself, you found he meant by the word *fire* that which others call *water*. Or, if he should assert that there are trees that walk upon two legs, meaning men by the term *trees*. Would you think this reasonable?

HYLAS: No; I should think it very absurd. Common custom is the standard of propriety in language. And for any man to affect speaking improperly is to pervert the use of speech, and can never serve to a better purpose than to protract and multiply disputes where there is no difference in opinion.

PHILONOUS: And does not *matter*, in the common current acceptance of the word, signify an extended, solid, moveable, unthinking, inactive substance?

HYLAS: It does.

PHILONOUS: And, has it not been made evident that no such substance can possibly exist? And, though it should be allowed to exist, yet how can that which is *inactive* be a cause; or that which is *unthinking* be a *cause of thought*? You may, indeed, if you please, annex to the word *matter* a contrary meaning to what is vulgarly received; and tell me you understand by it, an unextended, thinking, active being, which is the cause of our ideas. But what else is this than to play with words, and run into that very fault you just now condemned with so much reason? I do by no means find fault with your reasoning, in that you collect a cause from the *phenomena*: but I deny that the cause deducible by reason can properly be termed matter.

HYLAS: There is indeed something in what you say. But I am afraid you do not thoroughly comprehend my meaning. I would by no means be thought to deny that God, or an infinite spirit, is the supreme cause of all things. All I contend for is, that, subordinate to the supreme agent, there is a cause of a limited and inferior nature, which concurs in the production of our ideas, not by any act of will, or spiritual efficiency, but by that kind of action which belongs to matter, *viz.* motion.

PHILONOUS: I find you are at every turn relapsing into your old exploded conceit, of a moveable, and consequently an extended, substance, existing without the mind. What! Have you already forgotten you were convinced; or are you willing I should repeat what has been said on that head? In truth this is not fair dealing in you, still to suppose the being of that which you have so often acknowledged to have no being. But, not to insist farther on what has been so largely handled, I ask whether all your ideas are not perfectly passive and inert, including nothing of action in them.

HYLAS: They are.

PHILONOUS: And are sensible qualities anything else but ideas?

HYLAS: How often have I acknowledged that they are not.

PHILONOUS: But is not motion a sensible quality?

HYLAS: It is.

PHILONOUS: Consequently it is no action?

HYLAS: I agree with you. And indeed it is very plain that when I stir my finger, it remains passive; but my will which produced the motion is active.

PHILONOUS: Now, I desire to know, in the first place, whether motion being allowed to be no action, you can conceive any action besides volition: and, in the second place, whether to say something and conceive nothing be not to talk nonsense: and, lastly, whether, having considered the premises, you do not perceive that to suppose any efficient or active cause of our ideas, other than *spirit*, is highly absurd and unreasonable?

HYLAS: I give up the point entirely. But, though matter may not be a cause, yet what hinders its being an *instrument*, subservient to the supreme agent in the production of our ideas?

PHILONOUS: An instrument say you; pray what may be the figure, springs, wheels, and motions, of that instrument?

HYLAS: Those I pretend to determine nothing of, both the substance and its qualities being entirely unknown to me.

PHILONOUS: What? You are then of opinion it is made up of unknown parts, that it hath unknown motions, and an unknown shape?

HYLAS: I do not believe that it hath any figure or motion at all, being already convinced, that no sensible qualities can exist in an unperceiving substance.

PHILONOUS: But what notion is it possible to frame of an instrument void of all sensible qualities, even extension itself?

HYLAS: I do not pretend to have any notion of it.

PHILONOUS: And what reason have you to think this unknown, this inconceivable somewhat does exist? Is it that you imagine God cannot act as well without it; or that you find by experience the use of some such thing, when you form ideas in your own mind?

HYLAS: You are always teasing me for reasons of my belief. Pray what reasons have you not to believe it?

PHILONOUS: It is to me a sufficient reason not to believe the existence of anything, if I see no reason for believing it. But, not to insist on reasons for believing, you will not so much as let me know what it is you would have me believe; since you say you have no manner of notion of it. After all, let me entreat you to consider whether it be like a philosopher, or even like a man of common sense, to pretend to believe you know not what, and you know not why.

HYLAS: Hold, Philonous. When I tell you matter is an *instrument*, I do not mean altogether nothing. It is true I know not the particular kind of instrument; but, however, I have some notion of *instrument in general*, which I apply to it.

PHILONOUS: But what if it should prove that there is something, even in the most general notion of *instrument*, as taken in a distinct sense from *cause*, which makes the use of it inconsistent with the divine attributes?

HYLAS: Make that appear and I shall give up the point.

PHILONOUS: What mean you by the general nature or notion of instrument?

HYLAS: That which is common to all particular instruments composes the general notion.

PHILONOUS: Is it not common to all instruments, that they are applied to the doing those things only which cannot be performed by the mere act of our wills? Thus, for instance, I never use an instrument to move my finger, because it is done by a volition. But I should use one if I were to remove part of a rock, or tear up a tree by the roots. Are you of the same mind? Or, can you show any example where an instrument is made use of in producing an effect immediately depending on the will of the agent?

HYLAS: I own I cannot.

PHILONOUS: How therefore can you suppose that an all-perfect spirit, on whose will all things have an absolute and immediate dependence, should need an instrument in his operations, or, not needing it, make use of it? Thus it seems to me that you are obliged to own the use of a lifeless inactive instrument to be incompatible with the infinite perfection of God; that is, by your own confession, to give up the point.

HYLAS: It does not readily occur what I can answer you.

PHILONOUS: But, methinks you should be ready to own the truth, when it has been fairly proved to you. We indeed, who are beings of finite powers, are forced to make use of instruments. And the use of an instrument shows the agent to be limited by rules of another's prescription, and that he cannot obtain his end but in such a way, and by such conditions. Whence it seems a clear consequence, that the supreme unlimited agent uses no tool or instrument at all. The will of an omnipotent spirit is no sooner exerted than executed, without the application of means; which, if they are employed by inferior agents, it is not upon account of any real efficacy that is in them, or necessary aptitude to produce any effect, but merely in compliance with the laws of nature, or those conditions prescribed to them by the first cause, who is himself above all limitation or prescription whatsoever.

HYLAS: I will no longer maintain that matter is an instrument. However, I would not be understood to give up its existence neither; since, notwithstanding what hath been said, it may still be an *occasion*.

PHILONOUS: How many shapes is your matter to take? Or, how often must it be proved not to exist, before you are content to part with it? But, to say no more of this (though by all the laws of disputation I may justly blame you for so frequently changing the signification of the principal term)—I would fain know what you mean by affirming that matter is an occasion, having already denied it to be a cause. And, when you have shown in what sense you understand *occasion*, pray, in the next place be pleased to show me what reason induces you to believe there is such an occasion of our ideas?

HYLAS: As to the first point: by *occasion* I mean an inactive unthinking being, at the presence whereof God excites ideas in our minds.

PHILONOUS: And what may be the nature of that inactive unthinking being?

HYLAS: I know nothing of its nature.

PHILONOUS: Proceed then to the second point, and assign some reason why we should allow an existence to this inactive, unthinking, unknown thing.

HYLAS: When we see ideas produced in our minds, after an orderly and constant manner, it is natural to think they have some fixed and regular occasions, at the presence of which they are excited.

PHILONOUS: You acknowledge then God alone to be the cause of our ideas, and that he causes them at the presence of those occasions.

HYLAS: That is my opinion.

PHILONOUS: Those things which you say are present to God, without doubt he perceives.

HYLAS: Certainly; otherwise they could not be to him an occasion of acting.

PHILONOUS: Not to insist now on your making sense of this hypothesis, or answering all the puzzling questions and difficulties it is liable to: I only ask whether the order and regularity observable in the series of our ideas, or the course of nature, be not sufficiently accounted for by the wisdom and power of God; and whether it does not derogate from those attributes, to suppose he is influenced, directed, or put in mind, when and what he is to act, by an unthinking substance? And, lastly, whether, in case I granted all you contend for, it would make anything to your purpose; it not being easy to conceive how the external or absolute existence of an unthinking substance, distinct from its being perceived, can be inferred from my allowing that there are certain things perceived by the mind of God, which are to him the occasion of producing ideas in us?

HYLAS: I am perfectly at a loss what to think, this notion of occasion seeming now altogether as groundless as the rest.

PHILONOUS: Do you not at length perceive that in all these different acceptations of *matter*, you have been only supposing you know not what, for no manner of reason, and to no kind of use?

HYLAS: I freely own myself less fond of my notions since they have been so accurately examined. But still, methinks, I have some confused perception that there is such a thing as *matter*.

PHILONOUS: Either you perceive the being of matter immediately or mediately. If immediately, pray inform me by which of the senses you perceive it. If mediately, let me know by what reasoning it is inferred from those things which you perceive immediately. So much for the perception. Then for the matter itself, I ask whether it is object, *substratum*, cause, instrument, or occasion? You have already pleaded for each of these, shifting your notions, and making matter to appear sometimes in one shape, then in another. And what you have offered hath been disapproved and rejected by yourself. If you have anything new to advance I would gladly bear it.

HYLAS: I think I have already offered all I had to say on those heads. I am at a loss what more to urge.

PHILONOUS: And yet you are loath to part with your old prejudice. But, to make you quit it more easily, I desire that, beside what has been hitherto suggested, you will farther consider whether, upon supposition that matter exists, you can possibly conceive how you should be affected by it. Or, supposing it did not exist, whether it be not evident you might for all that be affected with the same ideas you now are, and consequently have the very same reasons to believe its existence that you now can have.

HYLAS: I acknowledge it is possible we might perceive all things just as we do now, though there was no matter in the world; neither can I conceive, if there be matter, how it should produce any idea in our minds. And, I do farther grant you have entirely satisfied me that it is impossible there should be such a thing as matter in any of the foregoing acceptations. But still I cannot help supposing that there is *matter* in some sense or other. What that is I do not indeed pretend to determine.

PHILONOUS: I do not expect you should define exactly the nature of that unknown being. Only be pleased to tell me whether it is a substance; and if so, whether you can suppose a substance without accidents; or, in case you suppose it to have accidents or qualities, I desire you will let me know what those qualities are, at least what is meant by matter's supporting them?

HYLAS: We have already argued on those points. I have no more to say to them. But, to prevent any farther questions, let me tell you I at present understand by *matter* neither substance nor accident, thinking nor extended being, neither cause, instrument, nor occasion, but something entirely unknown, distinct from all these.

PHILONOUS: It seems then you include in your present notion of matter nothing but the general abstract idea of *entity*.

HYLAS: Nothing else; save only that I superadd to this general idea the negation of all those particular things, qualities, or ideas, that I perceive, imagine, or in anywise apprehend.

PHILONOUS: Pray where do you suppose this unknown matter to exist?

HYLAS: Oh Philonous! Now you think you have entangled me, for, if I say it exists in place, then you will infer that it exists in the mind, since it is agreed that place or extension exists only in the mind. But I am not ashamed to own my ignorance. I know not where it exists; only I am sure it exists not in place. There is a negative answer for you. And you must expect no other to all the questions you put for the future about matter.

PHILONOUS: Since you will not tell me where it exists, be pleased to inform me after what manner you suppose it to exist, or what you mean by its *existence*?

HYLAS: It neither thinks nor acts, neither perceives nor is perceived.

PHILONOUS: But what is there positive in your abstracted notion of its existence?

HYLAS: Upon a nice observation, I do not find I have any positive notion or meaning at all. I tell you again, I am not ashamed to own my ignorance. I know not what is meant by its *existence*, or how it exists.

PHILONOUS: Continue, good Hylas, to act the same ingenuous part, and tell me sincerely whether you can frame a distinct idea of Entity in general, prescinded from and exclusive of all thinking and corporeal beings, all particular things whatsoever.

HYLAS: Hold, let me think a little—I profess, Philonous I do not find that I can. At first glance, methought I had some dilute and airy notion of pure entity in abstract; but, upon closer attention, it hath quite vanished out of sight. The more I think on it, the more am I confirmed in my prudent resolution of giving none but negative answers, and not pretending to the least degree of any positive knowledge or conception of matter, its *where*, its *how*, its *entity*, or anything belonging to it.

PHILONOUS: When, therefore, you speak of the existence of matter, you have not any notion in your mind?

HYLAS: None at all.

PHILONOUS: Pray tell me if the case stands not thus: At first, from a belief of material substance, you would have it that the immediate objects existed without the mind; then that they are archetypes; then causes; next instruments; then occasions: lastly *something in general*, which being interpreted proves *nothing*. So matter comes to nothing. What think you, Hylas, is not this a fair summary of your whole proceeding?

HYLAS: Be that as it will, yet I still insist upon it, that our not being able to conceive a thing is no argument against its existence.

PHILONOUS: That from a cause, effect, operation, sign, or other circumstance, there may reasonably be inferred the existence of a thing not immediately perceived; and that it were absurd for any man to argue against the existence of that thing, from his having no direct and positive notion of it, I freely own. But, where there is nothing of all this; where neither reason nor revelation induces us to believe the existence of a thing; where we have not even a relative notion of it; where an abstraction is made from perceiving and being perceived, from spirit and idea: lastly, where there is not so much as

the most inadequate or faint idea pretended to—I will not indeed thence conclude against the reality of any notion, or existence of anything; but my inference shall be, that you mean nothing at all; that you employ words to no manner of purpose, without any design or signification whatsoever. And I leave it to you to consider how mere jargon should be treated.

HYLAS: To deal frankly with you, Philonous, your arguments seem in themselves unanswerable; but they have not so great an effect on me as to produce that entire conviction, that hearty acquiescence, which attends demonstration. I find myself relapsing into an obscure surmise of I know not what, *matter*:

PHILONOUS: But, are you not sensible, Hylas, that two things must concur to take away all scruple, and work a plenary assent in the mind? Let a visible object be set in never so clear a light, yet, if there is any imperfection in the sight, or if the eye is not directed towards it, it will not be distinctly seen. And though a demonstration be never so well grounded and fairly proposed, yet, if there is withal a stain of prejudice, or a wrong bias on the understanding, can it be expected on a sudden to perceive clearly, and adhere firmly to the truth? No; there is need of time and pains: the attention must be awakened and detained by a frequent repetition of the same thing placed oft in the same, oft in different lights. I have said it already, and find I must still repeat and inculcate, that it is an unaccountable licence you take, in pretending to maintain you know not what, for you know not what reason, to you know not what purpose. Can this be paralleled in any art or science, any sect or profession of men? Or is there anything so barefacedly groundless and unreasonable to be met with even in the lowest of common conversation? But, perhaps you will still say, matter may exist; though at the same time you neither know what is meant by *matter*, or by its *existence*. This indeed is surprising, and the more so because it is altogether voluntary, you not being led to it by any one reason; for I challenge you to show me that thing in nature which needs matter to explain or account for it.

HYLAS: The reality of things cannot be maintained without supposing the existence of matter. And is not this, think you, a good reason why I should be earnest in its defence?

PHILONOUS: The reality of things! What things, sensible or intelligible?

HYLAS: Sensible things.

PHILONOUS: My glove for example?

HYLAS: That, or any other thing perceived by the senses.

PHILONOUS: But to fix on some particular thing. Is it not a sufficient evidence to me of the existence of this *glove*, that I see it, and feel it, and wear it? Or, if this will not do, how is it possible I should be assured of the reality of this thing, which I actually see in this place, by supposing that some unknown thing, which I never did or can see, exists after an unknown manner, in an unknown place, or in no place at all? How can the supposed reality of that which is intangible be a proof that anything tangible really exists? Or, of that which is invisible, that any visible thing, or, in general of anything which is imperceptible, that a perceptible exists? Do but explain this and I shall think nothing too hard for you.

HYLAS: Upon the whole, I am content to own the existence of matter is highly improbable, but the direct and absolute impossibility of it does not appear to me.

PHILONOUS: But granting matter to be possible, yet, upon that account merely, it can have no more claim to existence than a golden mountain, or a centaur.

HYLAS: I acknowledge it; but still you do not deny it is possible; and that which is possible, for aught you know, may actually exist.

PHILONOUS: I deny it to be possible; and have, if I mistake not, evidently proved, from your own concessions, that it is not. In the common sense of the word *matter*, is there any more implied than an extended, solid, figured, movable substance, existing without the mind? And have not you acknowledged, over and over, that you have seen evident reason for denying the possibility of such a substance?

HYLAS: True, but that is only one sense of the term *matter*.

PHILONOUS: But is it not the only proper genuine received sense? And, if *matter*, in such a sense, be proved impossible, may it not be thought with good grounds absolutely impossible? Else how could anything be proved impossible? Or, indeed, how could there be any proof at all one way or other, to a man who takes the liberty to unsettle and change the common signification of words?

HYLAS: I thought philosophers might be allowed to speak more accurately than the vulgar, and were not always confined to the common acceptation of a term.

PHILONOUS: But this now mentioned is the common received sense among philosophers themselves. But, not to insist on that, have you not been allowed to take *matter* in what sense you pleased? And have you not used this privilege in the utmost extent; sometimes entirely changing, at others leaving out, or putting into the definition of it whatever, for the present, best served your design, contrary to all the known rules of reason and logic? And hath not this shifting, unfair method of yours spun out our dispute to an unnecessary length; *matter* having been particularly examined, and by your own confession refuted in each of those senses? And can any more be required to prove the absolute impossibility of a thing, than the proving it impossible in every particular sense that either you or any one else understands it in?

HYLAS: But I am not so thoroughly satisfied that you have proved the impossibility of *matter*, in the last most obscure abstracted and indefinite sense.

PHILONOUS: When is a thing shown to be impossible?

HYLAS: When a repugnancy is demonstrated between the ideas comprehended in its definition

PHILONOUS: But where there are no ideas, there no repugnancy can be demonstrated between ideas?

HYLAS: I agree with you.

PHILONOUS: Now, in that which you call the obscure indefinite sense of the word *matter*, it is plain, by your own confession, there was included no idea at all, no sense except an unknown sense; which is the same thing as none. You are not, therefore, to expect I should prove a repugnancy between ideas, where there are no ideas; or the impossibility of *matter* taken in an *unknown* sense, that is, no sense at all. My business was only to show you meant *nothing*; and this you were brought to own. So that, in all your various senses, you have been showed either to mean nothing at all, or, if anything, an absurdity. And if this be not sufficient to prove the impossibility of a thing, I desire you will let me know what is.

HYLAS: I acknowledge you have proved that *matter* is impossible; nor do I see what more can be said in defence of it. But, at the same time that I give up this, I suspect all my other notions. For surely none could be more seemingly evident than this once was: and yet it now seems as false and absurd as ever it did true before. But I think we have discussed the point sufficiently for the present. The remaining part of the day I would willingly spend in running over in my thoughts the several heads of this morning's conversation, and tomorrow shall be glad to meet you here again about the same time.

PHILONOUS: I will not fail to attend you.

THE THIRD DIALOGUE

PHILONOUS: Tell me, Hylas, what are the fruits of yesterday's meditation? Has it confirmed you in the same mind you were in at parting? or have you since seen cause to change your opinion?

HYLAS: Truly my opinion is that all our opinions are alike vain and uncertain. What we approve today, we condemn tomorrow. We keep a stir about knowledge, and spend our lives in the pursuit of it, when, alas! we know nothing all the while: nor do I think it possible for us ever to know anything in this life. Our faculties are too narrow and too few. Nature certainly never intended us for speculation.

PHILONOUS: What! Say you we can know nothing, Hylas?

HYLAS: There is not that single thing in the world whereof we can know the real nature, or what it is in itself.

PHILONOUS: Will you tell me I do not really know what fire or water is?

HYLAS: You may indeed know that fire appears hot, and water fluid; but this is no more than knowing what sensations are produced in your own mind, upon the application of fire and water to your organs of sense. Their internal constitution, their true and real nature, you are utterly in the dark as to *that*.

PHILONOUS: Do I not know this to be a real stone that I stand on, and that which I see before my eyes to be a real tree?

HYLAS: Know? No, it is impossible you or any man alive should know it. All you know is, that you have such a certain idea or appearance in your own mind. But what is this to the real tree or stone? I tell you that colour, figure, and hardness, which you perceive, are not the real natures of those things, or in the least like them. The same may be said of all other real things, or corporeal substances, which compose the world. They have none of them anything of themselves, like those sensible qualities by us perceived. We should not therefore pretend to affirm or know anything of them, as they are in their own nature.

PHILONOUS: But surely, Hylas, I can distinguish gold, for example, from iron: and how could this be, if I knew not what either truly was?

HYLAS: Believe me, Philonous, you can only distinguish between your own ideas. That yellowness, that weight, and other sensible qualities, think you they are really in the gold? They are only relative to the senses, and have no absolute existence in nature. And in pretending to distinguish the species of real things, by the appearances in your mind, you may perhaps act as wisely as he that should conclude two men were of a different species, because their clothes were not of the same colour.

PHILONOUS: It seems, then, we are altogether put off with the appearances of things, and those false ones too. The very meat I eat, and the cloth I wear, have nothing in them like what I see and feel.

HYLAS: Even so.

PHILONOUS: But is it not strange the whole world should be thus imposed on, and so foolish as to believe their senses? And yet I know not how it is, but men eat, and drink, and sleep, and perform all the offices of life, as comfortably and conveniently as if they really knew the things they are conversant about.

HYLAS: They do so: but you know ordinary practice does not require a nicety of speculative knowledge. Hence the vulgar retain their mistakes, and for all that make a shift to bustle through the affairs of life. But philosophers know better things.

PHILONOUS: You mean, they know that they *know nothing*.

HYLAS: That is the very top and perfection of human knowledge.

PHILONOUS: But are you all this while in earnest, Hylas; and are you seriously persuaded that you know nothing real in the world? Suppose you are going to write, would you not call for pen, ink, and paper, like another man; and do you not know what it is you call for?

HYLAS: How often must I tell you, that I know not the real nature of any one thing in the universe? I may indeed upon occasion make use of pen, ink, and paper. But what any one of them is in its own true nature, I declare positively I know not. And the same is true with regard to every other corporeal thing. And, what is more, we are not only ignorant of the true and real nature of things, but even of their existence. It cannot be denied that we perceive such certain appearances or ideas; but it cannot be concluded from thence that bodies really exist. Nay, now I think on it, I must, agreeably to my former concessions, farther declare that it is impossible any real corporeal thing should exist in nature.

PHILONOUS: You amaze me. Was ever anything more wild and extravagant than the notions you now maintain: and is it not evident you are led into all these extravagances by the belief of *material substance*? This makes you dream of those unknown natures in everything. It is this occasions your distinguishing between the reality and sensible appearances of things. It is to this you are indebted for being ignorant of what everybody else knows perfectly well. Nor is this all: you are not only ignorant of the true nature of everything, but you know not whether anything really exists, or whether there are any true natures at all; forasmuch as you attribute to your material beings an absolute or external existence, wherein you suppose their reality consists. And, as you are forced in the end to acknowledge such an existence means either a direct repugnancy, or nothing at all, it follows that you are obliged to pull down your own hypothesis of material substance, and positively to deny the real existence of any part of the universe. And so you are plunged into the deepest and most deplorable *scepticism* that ever man was. Tell me, Hylas, is it not as I say?

HYLAS: I agree with you. *Material substance* was no more than an hypothesis; and a false and groundless one too. I will no longer spend my breath in defence of it. But whatever hypothesis you advance, or whatsoever scheme of things you introduce in its stead, I doubt not it will appear every whit as false: let me but be allowed to question you upon it. That is, suffer me to serve you in your own kind, and I warrant it shall conduct you through as many perplexities and contradictions, to the very same state of scepticism that I myself am in at present.

PHILONOUS: I assure you, Hylas, I do not pretend to frame any hypothesis at all. I am of a vulgar cast, simple enough to believe my senses, and leave things as I find them. To be plain, it is my opinion that the real things are those very things I see, and feel, and perceive by my senses. These I know; and, finding they answer all the necessities and purposes of life, have no reason to be solicitous about any other unknown beings. A piece of sensible bread, for instance, would stay my stomach better than ten thousand times as much of that insensible, unintelligible, real bread you speak of. It is likewise my opinion that colours and other sensible qualities are on the objects. I cannot for my life help thinking that snow is white, and fire hot. You indeed, who by *snow* and *fire* mean certain external, unperceived, unperceiving substances, are in the right to deny whiteness or heat to be affections inherent in them. But I, who understand by those words the things I see and feel, am obliged to think like other folks. And, as I am no sceptic with regard to the nature of things, so neither am I as to their existence. That a thing should be really perceived by my senses, and at the same time not really exist, is

to me a plain contradiction; since I cannot prescind or abstract, even in thought, the existence of a sensible thing from its being perceived. Wood, stones, fire, water, flesh, iron, and the like things, which I name and discourse of, are things that I know. And I should not have known them but that I perceived them by my senses; and things perceived by the senses are immediately perceived; and things immediately perceived are ideas; and ideas cannot exist without the mind, their existence therefore consists in being perceived; when, therefore, they are actually perceived there can be no doubt of their existence. Away then with all that scepticism, all those ridiculous philosophical doubts. What a jest is it for a philosopher to question the existence of sensible things, till he hath it proved to him from the veracity of God; or to pretend our knowledge in this point falls short of intuition or demonstration! I might as well doubt of my own being, as of the being of those things I actually see and feel.

HYLAS: Not so fast, PHILONOUS: you say you cannot conceive how sensible things should exist without the mind. Do you not?

PHILONOUS: I do.

HYLAS: Supposing you were annihilated, cannot you conceive it possible that things perceivable by sense may still exist?

PHILONOUS: I can, but then it must be in another mind. When I deny sensible things an existence out of the mind, I do not mean my mind in particular, but all minds. Now, it is plain they have an existence exterior to my mind, since I find them by experience to be independent of it. There is therefore some other mind wherein they exist, during the intervals between the times of my perceiving them: as likewise they did before my birth, and would do after my supposed annihilation. And, as the same is true with regard to all other finite created spirits, it necessarily follows there is an *omnipresent eternal mind*, which knows and comprehends all things, and exhibits them to our view in such a manner, and according to such rules, as he himself hath ordained, and are by us termed the *laws of nature*.

HYLAS: Answer me, Philonous. Are all our ideas perfectly inert beings? Or have they any agency included in them?

PHILONOUS: They are altogether passive and inert.

HYLAS: And is not God an agent, a being purely active?

PHILONOUS: I acknowledge it.

HYLAS: No idea therefore can be like unto, or represent the nature of God?

PHILONOUS: It cannot.

HYLAS: Since therefore you have no idea of the mind of God, how can you conceive it possible that things should exist in His mind? Or, if you can conceive the mind of God, without having an idea of it, why may not I be allowed to conceive the existence of matter, notwithstanding I have no idea of it?

PHILONOUS: As to your first question: I own I have properly no idea, either of God or any other spirit; for these being active, cannot be represented by things perfectly inert, as our ideas are. I do nevertheless know that I, who am a spirit or thinking substance, exist as certainly as I know my ideas exist. Farther, I know what I mean by the terms *I* and *myself*; and I know this immediately or intuitively, though I do not perceive it as I perceive a triangle, a colour, or a sound. The mind, spirit, or soul is that indivisible unextended thing which thinks, acts, and perceives. I say *indivisible*, because *unextended*; and unextended, because extended, figured, movable things are ideas; and that which perceives ideas, which thinks and wills, is plainly itself no idea, nor like an idea. Ideas are things inactive, and perceived. And spirits a sort of beings altogether different from them. I do not therefore say my soul is an idea, or like an idea. However,

taking the word *idea* in a large sense, my soul may be said to furnish me with an idea, that is, an image or likeness of God—though indeed extremely inadequate. For, all the notion I have of God is obtained by reflecting on my own soul, heightening its powers, and removing its imperfections. I have, therefore, though not an inactive idea, yet in *myself* some sort of an active thinking image of the Deity. And, though I perceive him not by sense, yet I have a notion of him, or know him by reflexion and reasoning. My own mind and my own ideas I have an immediate knowledge of; and, by the help of these, do mediately apprehend the possibility of the existence of other spirits and ideas. Farther, from my own being, and from the dependency I find in myself and my ideas, I do, by an act of reason, necessarily infer the existence of a God, and of all created things in the mind of God. So much for your first question. For the second: I suppose by this time you can answer it yourself. For you neither perceive matter objectively, as you do an inactive being or idea; nor know it, as you do yourself, by a reflex act, neither do you mediately apprehend it by similitude of the one or the other; nor yet collect it by reasoning from that which you know immediately. All which makes the case of *matter* widely different from that of the *Deity*.

HYLAS: You say your own soul supplies you with some sort of an idea or image of God. But, at the same time, you acknowledge you have, properly speaking, no idea of your own soul. You even affirm that spirits are a sort of beings altogether different from ideas. Consequently that no idea can be like a spirit. We have therefore no idea of any spirit. You admit nevertheless that there is spiritual substance, although you have no idea of it; while you deny there can be such a thing as material substance, because you have no notion or idea of it. Is this fair dealing? To act consistently, you must either admit matter or reject spirit. What say you to this?

PHILONOUS: I say, in the first place, that I do not deny the existence of material substance, merely because I have no notion of it, but because the notion of it is inconsistent; or, in other words, because it is repugnant that there should be a notion of it. Many things, for aught I know, may exist, whereof neither I nor any other man hath or can have any idea or notion whatsoever. But then those things must be possible, that is, nothing inconsistent must be included in their definition. I say, secondly, that, although we believe things to exist which we do not perceive, yet we may not believe that any particular thing exists, without some reason for such belief: but I have no reason for believing the existence of matter. I have no immediate intuition thereof: neither can I immediately from my sensations, ideas, notions, actions, or passions, infer an unthinking, unperceiving, inactive substance—either by probable deduction, or necessary consequence. Whereas the being of my Self, that is, my own soul, mind, or thinking principle, I evidently know by reflexion. You will forgive me if I repeat the same things in answer to the same objections. In the very notion or definition of *material substance*, there is included a manifest repugnance and inconsistency. But this cannot be said of the notion of spirit. That ideas should exist in what does not perceive or be produced by what does not act, is repugnant. But, it is no repugnancy to say that a perceiving thing should be the subject of ideas, or an active thing the cause of them. It is granted we have neither an immediate evidence nor a demonstrative knowledge of the existence of other finite spirits; but it will not thence follow that such spirits are on a foot with material substances: if to suppose the one be inconsistent, and it be not inconsistent to suppose the other; if the one can be inferred by no argument, and there is a probability for the other; if we see signs and effects indicating distinct finite agents like ourselves, and see no sign or symptom whatever that leads to a rational belief of matter. I say, lastly, that I have a notion of spirit, though I have not, strictly speaking, an idea of it. I do not perceive it as an idea, or by means of an idea, but know it by reflexion.

HYLAS: Notwithstanding all you have said, to me it seems that, according to your own way of thinking, and in consequence of your own principles, it should follow that you are only a system of floating ideas, without any substance to support them. Words are not to be used without a meaning. And, as there is no more meaning in *spiritual substance* than in *material substance*, the one is to be exploded as well as the other.

PHILONOUS: How often must I repeat, that I know or am conscious of my own being; and that *I myself* am not my ideas, but somewhat else, a thinking, active principle that perceives, knows, wills, and operates about ideas I know that I, one and the same self, perceive both colours and sounds: that a colour cannot perceive a sound, nor a sound a colour: that I am therefore one individual principle, distinct from colour and sound, and, for the same reason, from all other sensible things and inert ideas. But, I am not in like manner conscious either of the existence or essence of matter. On the contrary, I know that nothing inconsistent can exist, and that the existence of matter implies an inconsistency. Farther, I know what I mean when I affirm that there is a spiritual substance or support of ideas, that is, that a spirit knows and perceives ideas. But, I do not know what is meant when it is said that an unperceiving substance hath inherent in it and supports either ideas or the archetypes of ideas. There is therefore upon the whole no parity of case between spirit and matter.

HYLAS: I own myself satisfied in this point. But, do you in earnest think the real existence of sensible things consists in their being actually perceived? If so; how comes it that all mankind distinguish between them? Ask the first man you meet, and he shall tell you, *to be perceived* is one thing, and *to exist* is another.

PHILONOUS: I am content, Hylas, to appeal to the common sense of the world for the truth of my notion. Ask the gardener why he thinks yonder cherry-tree exists in the garden, and he shall tell you, because he sees and feels it; in a word, because he perceives it by his senses. Ask him why he thinks an orange-tree not to be there, and he shall tell you, because he does not perceive it. What he perceives by sense, that he terms a real being, and says it *is* or *exists*; but, that which is not perceivable, the same, he says, has no being.

HYLAS: Yes, Philonous, I grant the existence of a sensible thing consists in being perceivable, but not in being actually perceived.

PHILONOUS: And what is perceivable but an idea? And can an idea exist without being actually perceived? These are points long since agreed between us.

HYLAS: But, be your opinion never so true, yet surely you will not deny it is shocking, and contrary to the common sense of men. Ask the fellow whether yonder tree hath an existence out of his mind: what answer think you he would make?

PHILONOUS: The same that I should myself, to wit, that it does exist out of his mind. But then to a Christian it cannot surely be shocking to say, the real tree, existing without his mind, is truly known and comprehended by (that is *exists in*) the infinite mind of God. Probably he may not at first glance be aware of the direct and immediate proof there is of this; inasmuch as the very being of a tree, or any other sensible thing, implies a mind wherein it is. But the point itself he cannot deny. The question between the materialists and me is not, whether things have a real existence out of the mind of this or that person, but whether they have an absolute existence, distinct from being perceived by God, and exterior to all minds. This indeed some heathens and philosophers have affirmed, but whoever entertains notions of the Deity suitable to the Holy Scriptures will be of another opinion.

HYLAS: But, according to your notions, what difference is there between real things, and chimeras formed by the imagination, or the visions of a dream—since they are all equally in the mind?

PHILONOUS: The ideas formed by the imagination are faint and indistinct; they have, besides, an entire dependence on the will. But the ideas perceived by sense, that is, real things, are more vivid and clear; and, being imprinted on the mind by a spirit distinct from us, have not the like dependence on our will. There is therefore no danger of confounding these with the foregoing; and there is as little of confounding them with the visions of a dream, which are dim, irregular, and confused. And, though they should happen to be never so lively and natural, yet, by their not being connected, and of a piece with the preceding and subsequent transactions of our lives, they might easily be distinguished from realities. In short, by whatever method you distinguish *things* from *chimeras* on your scheme, the same, it is evident, will hold also upon mine. For, it must be, I presume, by some perceived difference; and I am not for depriving you of any one thing that you perceive.

HYLAS: But still, Philonous, you hold, there is nothing in the world but spirits and ideas. And this, you must needs acknowledge, sounds very oddly.

PHILONOUS: I own the word *idea*, not being commonly used for *thing*, sounds something out of the way. My reason for using it was, because a necessary relation to the mind is understood to be implied by that term; and it is now commonly used by philosophers to denote the immediate objects of the understanding. But, however oddly the proposition may sound in words, yet it includes nothing so very strange or shocking in its sense, which in effect amounts to no more than this, to wit, that there are only things perceiving, and things perceived; or that every unthinking being is necessarily, and from the very nature of its existence, perceived by some mind; if not by a finite created mind, yet certainly by the infinite mind of God, in whom “we live, and move, and have our being.” Is this as strange as to say, the sensible qualities are not on the objects: or that we cannot be sure of the existence of things, or know any thing of their real natures—though we both see and feel them, and perceive them by all our senses?

HYLAS: And, in consequence of this, must we not think there are no such things as physical or corporeal causes; but that a spirit is the immediate cause of all the phenomena in nature? Can there be anything more extravagant than this?

PHILONOUS: Yes, it is infinitely more extravagant to say—a thing which is inert operates on the mind, and which is unperceiving is the cause of our perceptions, without any regard either to consistency, or the old known axiom: *Nothing can give to another that which it hath not itself*. Besides, that which to you, I know not for what reason, seems so extravagant is no more than the Holy Scriptures assert in a hundred places. In them God is represented as the sole and immediate author of all those effects which some heathens and philosophers are wont to ascribe to nature, matter, fate, or the like unthinking principle. This is so much the constant language of Scripture that it were needless to confirm it by citations.

HYLAS: You are not aware Philonous, that in making God the immediate author of all the motions in nature, you make him the author of murder, sacrilege, adultery, and the like heinous sins.

PHILONOUS: In answer to that, I observe, first, that the imputation of guilt is the same, whether a person commits an action with or without an instrument. In case therefore you suppose God to act by the mediation of an instrument or occasion, called *matter*, you as truly make him the author of sin as I, who think him the immediate agent in all those operations vulgarly ascribed to nature. I farther observe that sin or moral turpitude does not consist in the outward physical action or motion, but in the internal deviation of the will from the laws of reason and religion. This is plain, in that the killing an enemy in a battle, or putting a criminal legally to death, is not thought sinful; though the outward

act be the very same with that in the case of murder. Since therefore, sin does not consist in the physical action, the making God an immediate cause of all such actions is not making him the author of sin. Lastly, I have nowhere said that God is the only agent who produces all the motions in bodies. It is true I have denied there are any other agents besides spirits, but this is very consistent with allowing to thinking rational beings, in the production of motions, the use of limited powers, ultimately indeed derived from God, but immediately under the direction of their own wills which is sufficient to entitle them to all the guilt of their actions.

HYLAS: But the denying matter, Philonous, or corporeal substance; there is the point. You can never persuade me that this is not repugnant to the universal sense of mankind. Were our dispute to be determined by most voices, I am confident you would give up the point, without gathering the votes.

PHILONOUS: I wish both our opinions were fairly stated and submitted to the judgment of men who had plain common sense, without the prejudices of a learned education. Let me be represented as one who trusts his senses, who thinks he knows the things he sees and feels, and entertains no doubts of their existence, and you fairly set forth with all your doubts, your paradoxes, and your scepticism about you, and I shall willingly acquiesce in the determination of any indifferent person. That there is no substance wherein ideas can exist beside spirit is to me evident. And that the objects immediately perceived are ideas, is on all hands agreed. And that sensible qualities are objects immediately perceived no one can deny. It is therefore evident there can be no *substratum* of those qualities but spirit; in which they exist, not by way of mode or property, but as a thing perceived in that which perceives it. I deny therefore that there is any unthinking *substratum* of the objects of sense, and in that acceptance that there is any material substance. But if by *material substance* is meant only sensible body—that which is seen and felt (and the unphilosophical part of the world, I dare say, mean no more)—then I am more certain of matter's existence than you or any other philosopher pretend to be. If there be anything which makes the generality of mankind averse from the notions I espouse: it is a misapprehension that I deny the reality of sensible things. But, as it is you who are guilty of that, and not I, it follows that in truth their aversion is against your notions and not mine. I do therefore assert that I am as certain as of my own being, that there are bodies or corporeal substances (meaning the things I perceive by my senses); and that, granting this, the bulk of mankind will take no thought about, nor think themselves at all concerned in the fate of those unknown natures, and philosophical quiddities, which some men are so fond of.

HYLAS: What say you to this? Since, according to you, men judge of the reality of things by their senses, how can a man be mistaken in thinking the moon a plain lucid surface, about a foot in diameter; or a square tower, seen at a distance, round; or an oar, with one end in the water, crooked?

PHILONOUS: He is not mistaken with regard to the ideas he actually perceives, but in the inference he makes from his present perceptions. Thus, in the case of the oar, what he immediately perceives by sight is certainly crooked; and so far he is in the right. But if he thence conclude that upon taking the oar out of the water he shall perceive the same crookedness; or that it would affect his touch as crooked things are wont to do; in that he is mistaken. In like manner, if he shall conclude from what he perceives in one station, that, in case he advances towards the moon or tower, he should still be affected with the like ideas, he is mistaken. But his mistake lies not in what he perceives immediately, and at present, (it being a manifest contradiction to suppose he should err in respect of that) but in the wrong judgment he makes concerning the ideas he apprehends

to be connected with those immediately perceived: or, concerning the ideas that, from what he perceives at present, he imagines would be perceived in other circumstances. The case is the same with regard to the Copernican system. We do not here perceive any motion of the earth: but it were erroneous thence to conclude, that, in case we were placed at as great a distance from that as we are now from the other planets, we should not then perceive its motion.

HYLAS: I understand you; and must needs own you say things plausible enough. But, give me leave to put you in mind of one thing. Pray, Philonous, were you not formerly as positive that matter existed, as you are now that it does not?

PHILONOUS: I was. But here lies the difference. Before, my positiveness was founded, without examination, upon prejudice; but now, after inquiry, upon evidence.

HYLAS: After all, it seems our dispute is rather about words than things. We agree in the thing, but differ in the name. That we are affected with ideas from without is evident, and it is no less evident that there must be (I will not say archetypes, but) Powers without the mind, corresponding to those ideas. And, as these Powers cannot subsist by themselves, there is some subject of them necessarily to be admitted; which I call *matter*, and you call *spirit*. This is all the difference.

PHILONOUS: Pray, Hylas, is that powerful being, or subject of powers, extended?

HYLAS: It hath not extension; but it hath the power to raise in you the idea of extension.

PHILONOUS: It is therefore itself unextended?

HYLAS: I grant it.

PHILONOUS: Is it not also active?

HYLAS: Without doubt. Otherwise, how could we attribute powers to it?

PHILONOUS: Now let me ask you two questions: *First*, whether it be agreeable to the usage either of philosophers or others to give the name *matter* to an unextended active being? And, *secondly*, whether it be not ridiculously absurd to misapply names contrary to the common use of language?

HYLAS: Well then, let it not be called matter, since you will have it so, but some *third nature* distinct from matter and spirit. For what reason is there why you should call it spirit? Does not the notion of spirit imply that it is thinking, as well as active and unextended?

PHILONOUS: My reason is this: because I have a mind to have some notion of meaning in what I say: but I have no notion of any action distinct from volition, neither can I conceive volition to be anywhere but in a spirit: therefore, when I speak of an active being, I am obliged to mean a spirit. Beside, what can be plainer than that a thing which hath no ideas in itself cannot impart them to me, and, if it hath ideas, surely it must be a spirit. To make you comprehend the point still more clearly if it be possible, I assert as well as you that, since we are affected from without, we must allow powers to be without, in a being distinct from ourselves. So far we are agreed. But then we differ as to the kind of this powerful being. I will have it to be spirit, you matter, or I know not what (I may add too, you know not what) third nature. Thus, I prove it to be spirit. From the effects I see produced, I conclude there are actions; and, because actions, volitions; and, because there are volitions, there must be a will. Again, the things I perceive must have an existence, they or their archetypes, out of my mind: but, being ideas, neither they nor their archetypes can exist otherwise than in an understanding, there is therefore an understanding. But will and understanding constitute in the strictest sense a mind or spirit. The powerful cause, therefore, of my ideas is in strict propriety of speech a *spirit*.

HYLAS: And now I warrant you think you have made the point very clear, little suspecting that what you advance leads directly to a contradiction. Is it not an absurdity to imagine any imperfection in God?

PHILONOUS: Without a doubt.

HYLAS: To suffer pain is an imperfection?

PHILONOUS: It is.

HYLAS: Are we not sometimes affected with pain and uneasiness by some other being?

PHILONOUS: We are.

HYLAS: And have you not said that being is a spirit, and is not that spirit God?

PHILONOUS: I grant it.

HYLAS: But you have asserted that whatever ideas we perceive from without are in the mind which affects us. The ideas, therefore, of pain and uneasiness are in God; or, in other words, God suffers pain: that is to say, there is an imperfection in the divine nature: which, you acknowledged, was absurd. So you are caught in a plain contradiction.

PHILONOUS: That God knows or understands all things, and that he knows, among other things, what pain is, even every sort of painful sensation, and what it is for His creatures to suffer pain, I make no question. But, that God, though he knows and sometimes causes painful sensations in us, can himself suffer pain, I positively deny. We, who are limited and dependent spirits, are liable to impressions of sense, the effects of an external agent, which, being produced against our wills, are sometimes painful and uneasy. But God, whom no external being can affect, who perceives nothing by sense as we do; whose will is absolute and independent, causing all things, and liable to be thwarted or resisted by nothing: it is evident, such a being as this can suffer nothing, nor be affected with any painful sensation, or indeed any sensation at all. We are chained to a body: that is to say, our perceptions are connected with corporeal motions. By the law of our nature, we are affected upon every alteration in the nervous parts of our sensible body; which sensible body, rightly considered, is nothing but a complexion of such qualities or ideas as have no existence distinct from being perceived by a mind. So that this connexion of sensations with corporeal motions means no more than a correspondence in the order of nature, between two sets of ideas, or things immediately perceivable. But God is a pure spirit, disengaged from all such sympathy, or natural ties. No corporeal motions are attended with the sensations of pain or pleasure in His mind. To know everything knowable, is certainly a perfection; but to endure or suffer, or feel anything by sense, is an imperfection. The former, I say, agrees to God, but not the latter. God knows, or hath ideas; but His ideas are not conveyed to him by sense, as ours are. Your not distinguishing, where there is so manifest a difference, makes you fancy you see an absurdity where there is none.

HYLAS: But, all this while you have not considered that the quantity of matter has been demonstrated to be proportioned to the gravity of bodies. And what can withstand demonstration?

PHILONOUS: Let me see how you demonstrate that point.

HYLAS: I lay it down for a principle, that the moments or quantities of motion in bodies are in a direct compounded reason of the velocities and quantities of matter contained in them. Hence, where the velocities are equal, it follows the moments are directly as the quantity of matter in each. But it is found by experience that all bodies (bating the small inequalities, arising from the resistance of the air) descend with an equal velocity; the motion therefore of descending bodies, and consequently their gravity, which is the cause or principle of that motion, is proportional to the quantity of matter; which was to be demonstrated.

PHILONOUS: You lay it down as a self-evident principle that the quantity of motion in any body is proportional to the velocity and *matter* taken together: and this is made use of to prove a proposition from whence the existence of *matter* is inferred. Pray is not this arguing in a circle?

HYLAS: In the premise I only mean that the motion is proportional to the velocity, jointly with the extension and solidity.

PHILONOUS: But, allowing this to be true, yet it will not thence follow that gravity is proportional to *matter*; in your philosophic sense of the word, except you take it for granted that unknown *substratum*, or whatever else you call it, is proportional to those sensible qualities; which to suppose is plainly begging the question. That there is magnitude and solidity, or resistance, perceived by sense, I readily grant, as likewise, that gravity may be proportional to those qualities I will not dispute. But that either these qualities as perceived by us, or the powers producing them, do exist in a *material substratum*; this is what I deny, and you indeed affirm, but, notwithstanding your demonstration, have not yet proved.

HYLAS: I shall insist no longer on that point. Do you think, however, you shall persuade me the natural philosophers have been dreaming all this while? Pray what becomes of all their hypotheses and explications of the *phenomena*, which suppose the existence of matter?

PHILONOUS: What mean you, Hylas, by the *phenomena*?

HYLAS: I mean the appearances which I perceive by my senses.

PHILONOUS: And the appearances perceived by sense, are they not ideas?

HYLAS: I have told you so a hundred times.

PHILONOUS: Therefore, to explain the phenomena, is, to show how we come to be affected with ideas, in that manner and order wherein they are imprinted on our senses. Is it not?

HYLAS: It is.

PHILONOUS: Now, if you can prove that any philosopher has explained the production of any one idea in our minds by the help of *matter*; I shall for ever acquiesce, and look on all that hath been said against it as nothing; but, if you cannot, it is vain to urge the explication of *phenomena*. That a being endowed with knowledge and will should produce or exhibit ideas is easily understood. But that a being which is utterly destitute of these faculties should be able to produce ideas, or in any sort to affect an intelligence, this I can never understand. This I say, though we had some positive conception of matter, though we knew its qualities, and could comprehend its existence, would yet be so far from explaining things, that it is itself the most inexplicable thing in the world. And yet, for all this, it will not follow that philosophers have been doing nothing; for, by observing and reasoning upon the connexion of ideas, they discover the laws and methods of nature, which is a part of knowledge both useful and entertaining.

HYLAS: After all, can it be supposed God would deceive all mankind? Do you imagine he would have induced the whole world to believe the being of matter, if there was no such thing?

PHILONOUS: That every epidemical opinion, arising from prejudice, or passion, or thoughtlessness, may be imputed to God, as the author of it, I believe you will not affirm. Whatsoever opinion we father on him, it must be either because he has discovered it to us by supernatural revelation; or because it is so evident to our natural faculties, which were framed and given us by God, that it is impossible we should withhold our assent from it. But where is the revelation? Or where is the evidence that extorts the belief of matter? Nay, how does it appear, that matter, taken for something distinct from what we perceive by our senses, is thought to exist by all mankind; or indeed, by any

except a few philosophers, who do not know what they would be at? Your question supposes these points are clear; and, when you have cleared them, I shall think myself obliged to give you another answer. In the meantime, let it suffice. That I tell you, I do not suppose God has deceived mankind at all.

HYLAS: But the novelty, Philonous, the novelty! There lies the danger. New notions should always be discountenanced; they unsettle men's minds, and nobody knows where they will end.

PHILONOUS: Why the rejecting a notion that has no foundation, either in sense, or in reason, or in divine authority, should be thought to unsettle the belief of such opinions as are grounded on all or any of these, I cannot imagine. That innovations in government and religion are dangerous, and ought to be discountenanced, I freely own. But is there the like reason why they should be discouraged in philosophy? The making anything known which was unknown before is an innovation in knowledge: and, if all such innovations had been forbidden, men would have made a notable progress in the arts and sciences. But it is none of my business to plead for novelties and paradoxes. That the qualities we perceive are not on the objects: that we must not believe our senses: that we know nothing of the real nature of things, and can never be assured even of their existence: that real colours and sounds are nothing but certain unknown figures and motions: that motions are in themselves neither swift nor slow: that there are in bodies absolute extensions, without any particular magnitude or figure: that a thing stupid, thoughtless, and inactive, operates on a spirit: that the least particle of a body contains innumerable extended parts:—these are the novelties, these are the strange notions which shock the genuine uncorrupted judgment of all mankind; and being once admitted, embarrass the mind with endless doubts and difficulties. And it is against these and the like innovations I endeavour to vindicate common sense. It is true, in doing this, I may perhaps be obliged to use some *ambages*, and ways of speech not common. But, if my notions are once thoroughly understood, that which is most singular in them will, in effect, be found to amount to no more than this:—that it is absolutely impossible, and a plain contradiction, to suppose any unthinking being should exist without being perceived by a mind. And, if this notion be singular, it is a shame it should be so, at this time of day, and in a Christian country.

HYLAS: As for the difficulties other opinions may be liable to, those are out of the question. It is your business to defend your own opinion. Can anything be plainer than that you are for changing all things into ideas? You, I say, who are not ashamed to charge me with *scepticism*. This is so plain, there is no denying it.

PHILONOUS: You mistake me. I am not for changing things into ideas, but rather ideas into things; since those immediate objects of perception, which, according to you, are only appearances of things, I take to be the real things themselves.

HYLAS: Things! You may pretend what you please; but it is certain you leave us nothing but the empty forms of things, the outside only which strikes the senses.

PHILONOUS: What you call the empty forms and outside of things seem to me the very things themselves. Nor are they empty or incomplete, otherwise than upon your supposition—that matter is an essential part of all corporeal things. We both, therefore, agree in this, that we perceive only sensible forms: but herein we differ—you will have them to be empty appearances, I real beings. In short, you do not trust your senses, I do.

HYLAS: You say you believe your senses; and seem to applaud yourself that in this you agree with the vulgar. According to you, therefore, the true nature of a thing is discovered by the senses. If so, whence comes that disagreement? Why is not the same figure, and other sensible qualities, perceived all manner of ways? And why should we

use a microscope the better to discover the true nature of a body, if it were discoverable to the naked eye?

PHILONOUS: Strictly speaking, Hylas, we do not see the same object that we feel; neither is the same object perceived by the microscope which was by the naked eye. But, in case every variation was thought sufficient to constitute a new kind of individual, the endless number of confusion of names would render language impracticable. Therefore, to avoid this, as well as other inconveniences which are obvious upon a little thought, men combine together several ideas, apprehended by divers senses, or by the same sense at different times, or in different circumstances, but observed, however, to have some connexion in nature, either with respect to co-existence or succession; all which they refer to one name, and consider as one thing. Hence it follows that when I examine, by my other senses, a thing I have seen, it is not in order to understand better the same object which I had perceived by sight, the object of one sense not being perceived by the other senses. And, when I look through a microscope, it is not that I may perceive more clearly what I perceived already with my bare eyes; the object perceived by the glass being quite different from the former. But, in both cases, my aim is only to know what ideas are connected together; and the more a man knows of the connexion of ideas, the more he is said to know of the nature of things. What, therefore, if our ideas are variable; what if our senses are not in all circumstances affected with the same appearances. It will not thence follow they are not to be trusted; or that they are inconsistent either with themselves or anything else: except it be with your preconceived notion of (I know not what) one single, unchanged, unperceivable, real nature, marked by each name. Which prejudice seems to have taken its rise from not rightly understanding the common language of men, speaking of several distinct ideas as united into one thing by the mind. And, indeed, there is cause to suspect several erroneous conceits of the philosophers are owing to the same original: while they began to build their schemes not so much on notions as on words, which were framed by the vulgar, merely for conveniency and dispatch in the common actions of life, without any regard to speculation.

HYLAS: Methinks I apprehend your meaning.

PHILONOUS: It is your opinion the ideas we perceive by our senses are not real things, but images or copies of them. Our knowledge, therefore, is no farther real than as our ideas are the true representations of those originals. But, as these supposed originals are in themselves unknown, it is impossible to know how far our ideas resemble them; or whether they resemble them at all. We cannot, therefore, be sure we have any real knowledge. Farther, as our ideas are perpetually varied, without any change in the supposed real things, it necessarily follows they cannot all be true copies of them: or, if some are and others are not, it is impossible to distinguish the former from the latter. And this plunges us yet deeper in uncertainty. Again, when we consider the point, we cannot conceive how any idea, or anything like an idea, should have an absolute existence out of a mind: nor consequently, according to you, how there should be any real thing in nature. The result of all which is that we are thrown into the most hopeless and abandoned *scepticism*. Now, give me leave to ask you, *first*, whether your referring ideas to certain absolutely existing unperceived substances, as their originals, be not the source of all this *scepticism*? *Secondly*, whether you are informed, either by sense or reason, of the existence of those unknown originals? And, in case you are not, whether it be not absurd to suppose them? *Thirdly*, whether, upon inquiry, you find there is anything distinctly conceived or meant by the *absolute or external existence of unperceiving substances*? *Lastly*, whether, the premises considered, it be not the wisest way to follow nature, trust your senses, and, laying aside all anxious thought about

unknown natures or substances, admit with the vulgar those for real things which are perceived by the senses?

HYLAS: For the present, I have no inclination to the answering part. I would much rather see how you can get over what follows. Pray are not the objects perceived by the senses of one, likewise perceivable to others present? If there were a hundred more here, they would all see the garden, the trees, and flowers, as I see them. But they are not in the same manner affected with the ideas I frame in my imagination. Does not this make a difference between the former sort of objects and the latter?

PHILONOUS: I grant it does. Nor have I ever denied a difference between the objects of sense and those of imagination. But what would you infer from thence? You cannot say that sensible objects exist unperceived, because they are perceived by many.

HYLAS: I own I can make nothing of that objection: but it hath led me into another. Is it not your opinion that by our senses we perceive only the ideas existing in our minds?

PHILONOUS: It is.

HYLAS: But the same idea which is in my mind cannot be in yours, or in any other mind. Does it not therefore follow, from your principles, that no two can see the same thing? And is not this highly absurd?

PHILONOUS: If the term *same* be taken in the vulgar acceptation, it is certain (and not at all repugnant to the principles I maintain) that different persons may perceive the same thing; or the same thing or idea exist in different minds. Words are of arbitrary imposition, and since men are used to apply the word *same* where no distinction or variety is perceived, and I do not pretend to alter their perceptions, it follows that, as men have said before, *several saw the same thing*, so they may, upon like occasions, still continue to use the same phrase, without any deviation either from propriety of language, or the truth of things. But, if the term *same* be used in the acceptation of philosophers, who pretend to an abstracted notion of identity, then, according to their sundry definitions of this notion (for it is not yet agreed wherein that philosophic identity consists), it may or may not be possible for divers persons to perceive the same thing. But whether philosophers shall think fit to call a thing the *same* or no, is, I conceive, of small importance. Let us suppose several men together, all endued with the same faculties, and consequently affected in like sort by their senses, and who had yet never known the use of language; they would, without question, agree in their perceptions. Though perhaps, when they came to the use of speech, some regarding the uniformness of what was perceived, might call it the *same* thing: others, especially regarding the diversity of persons who perceived, might choose the denomination of *different* things. But who sees not that all the dispute is about a word? To wit, whether what is perceived by different persons may yet have the term *same* applied to it? Or, suppose a house, whose walls or outward shell remaining unaltered, the chambers are all pulled down, and new ones built in their place; and that you should call this the *same*, and I should say it was not the *same* house:—would we not, for all this, perfectly agree in our thoughts of the house, considered in itself? And would not all the difference consist in a sound? If you should say, We differed in our notions; for that you superadded to your idea of the house the simple abstracted idea of identity, whereas I did not; I would tell you, I know not what you mean by the *abstracted idea of identity*; and should desire you to look into your own thoughts, and be sure you understood yourself.—Why so silent, Hylas? Are you not yet satisfied men may dispute about identity and diversity, without any real difference in their thoughts and opinions, abstracted from names? Take this farther reflexion with you—that whether matter be allowed to exist or no, the case

is exactly the same as to the point in hand. For the materialists themselves acknowledge what we immediately perceive by our senses to be our own ideas. Your difficulty, therefore, that no two see the same thing, makes equally against the materialists and me.

HYLAS: But they suppose an external archetype, to which referring their several ideas they may truly be said to perceive the same thing.

PHILONOUS: And (not to mention your having discarded those archetypes) so may you suppose an external archetype on my principles; *external*, I mean, to your own mind: though indeed it must be supposed to exist in that mind which comprehends all things; but then, this serves all the ends of identity, as well as if it existed out of a mind. And I am sure you yourself will not say it is less intelligible.

HYLAS: You have indeed clearly satisfied me—either that there is no difficulty at bottom in this point; or, if there be, that it makes equally against both opinions.

PHILONOUS: But that which makes equally against two contradictory opinions can be a proof against neither.

HYLAS: I acknowledge it. But, after all, Philonous, when I consider the substance of what you advance against *scepticism*, it amounts to no more than this:—We are sure that we really see, hear, feel; in a word, that we are affected with sensible impressions.

PHILONOUS: And how are we concerned any farther? I see this *cherry*, I feel it, I taste it: and I am sure *nothing* cannot be seen, or felt, or tasted: it is therefore *real*. Take away the sensations of softness, moisture, redness, tartness, and you take away the *cherry*, since it is not a being distinct from sensations. A *cherry*, I say, is nothing but a congeries of sensible impressions, or ideas perceived by various senses: which ideas are united into one thing (or have one name given them) by the mind, because they are observed to attend each other. Thus, when the palate is affected with such a particular taste, the sight is affected with a red colour, the touch with roundness, softness, &c. Hence, when I see, and feel, and taste, in such sundry certain manners, I am sure the *cherry* exists, or is real; its reality being in my opinion nothing abstracted from those sensations. But if by the word *cherry* you mean an unknown nature, distinct from all those sensible qualities, and by its existence something distinct from its being perceived; then, indeed, I own, neither you nor I, nor any one else, can be sure it exists.

HYLAS: But, what would you say, Philonous, if I should bring the very same reasons against the existence of sensible things in a mind, which you have offered against their existing in a material *substratum*?

PHILONOUS: When I see your reasons, you shall hear what I have to say to them.

HYLAS: Is the mind extended or unextended?

PHILONOUS: Unextended, without doubt.

HYLAS: Do you say the things you perceive are in your mind?

PHILONOUS: They are.

HYLAS: Again, have I not heard you speak of sensible impressions?

PHILONOUS: I believe you may.

HYLAS: Explain to me now, O Philonous! how it is possible there should be room for all those trees and houses to exist in your mind. Can extended things be contained in that which is unextended? Or, are we to imagine impressions made on a thing void of all solidity? You cannot say objects are in your mind, as books in your study: or that things are imprinted on it, as the figure of a seal upon wax. In what sense, therefore, are we to understand those expressions? Explain me this if you can: and I shall then be able to answer all those queries you formerly put to me about my *substratum*.

PHILONOUS: Look you, Hylas, when I speak of objects as existing in the mind, or imprinted on the senses, I would not be understood in the gross literal sense, as when

bodies are said to exist in a place, or a seal to make an impression upon wax. My meaning is only that the mind comprehends or perceives them; and that it is affected from without, or by some being distinct from itself. This is my explication of your difficulty; and how it can serve to make your tenet of an unperceiving material substratum intelligible, I would fain know.

HYLAS: Nay, if that be all, I confess I do not see what use can be made of it. But are you not guilty of some abuse of language in this?

PHILONOUS: None at all. It is no more than common custom, which you know is the rule of language, hath authorised: nothing being more usual, than for philosophers to speak of the immediate objects of the understanding as things existing in the mind. Nor is there anything in this but what is conformable to the general analogy of language; most part of the mental operations being signified by words borrowed from sensible things; as is plain in the terms *comprehend*, *reflect*, *discourse*, etc., which, being applied to the mind, must not be taken in their gross, original sense.

HYLAS: You have, I own, satisfied me in this point. But there still remains one great difficulty, which I know not how you will get over. And, indeed, it is of such importance that if you could solve all others, without being able to find a solution for this, you must never expect to make me a proselyte to your principles.

PHILONOUS: Let me know this mighty difficulty.

HYLAS: The Scripture account of the creation is what appears to me utterly irreconcilable with your notions. Moses tells us of a creation: a creation of what? Of ideas? No, certainly, but of things, of real things, solid corporeal substances. Bring your principles to agree with this, and I shall perhaps agree with you.

PHILONOUS: Moses mentions the sun, moon, and stars, earth and sea, plants and animals. That all these do really exist, and were in the beginning created by God, I make no question. If by *ideas* you mean fictions and fancies of the mind, then these are no ideas. If by *ideas* you mean immediate objects of the understanding, or sensible things, which cannot exist unperceived, or out of a mind, then these things are ideas. But whether you do or do not call them *ideas*, it matters little. The difference is only about a name. And, whether that name be retained or rejected, the sense, the truth, and reality of things continues the same. In common talk, the objects of our senses are not termed *ideas*, but *things*. Call them so still: provided you do not attribute to them any absolute external existence, and I shall never quarrel with you for a word. The creation, therefore, I allow to have been a creation of things, of *real* things. Neither is this in the least inconsistent with my principles, as is evident from what I have now said; and would have been evident to you without this, if you had not forgotten what had been so often said before. But as for solid corporeal substances, I desire you to show where Moses makes any mention of them; and, if they should be mentioned by him, or any other inspired writer, it would still be incumbent on you to show those words were not taken in the vulgar acceptation, for things falling under our senses, but in the philosophic acceptation, for matter, or an unknown quiddity, with an absolute existence. When you have proved these points, then (and not till then) may you bring the authority of Moses into our dispute.

HYLAS: It is in vain to dispute about a point so clear. I am content to refer it to your own conscience. Are you not satisfied there is some peculiar repugnancy between the Mosaic account of the creation and your notions?

PHILONOUS: If all possible sense which can be put on the first chapter of Genesis may be conceived as consistently with my principles as any other, then it has no peculiar repugnancy with them. But there is no sense you may not as well conceive, believing as

I do. Since, besides spirits, all you conceive are ideas; and the existence of these I do not deny. Neither do you pretend they exist without the mind.

HYLAS: Pray let me see any sense you can understand it in.

PHILONOUS: Why, I imagine that if I had been present at the creation, I should have seen things produced into being—that is become perceptible—in the order prescribed by the sacred historian. I never before believed the Mosaic account of the creation, and now find no alteration in my manner of believing it. When things are said to begin or end their existence, we do not mean this with regard to God, but His creatures. All objects are eternally known by God, or, which is the same thing, have an eternal existence in His mind: but when things, before imperceptible to creatures, are, by a decree of God, perceptible to them, then are they said to begin a relative existence, with respect to created minds. Upon reading therefore the Mosaic account of the creation, I understand that the several parts of the world became gradually perceivable to finite spirits, endowed with proper faculties; so that, whoever such were present, they were in truth perceived by them. This is the literal obvious sense suggested to me by the words of the Holy Scripture: in which is included no mention, or no thought, either of *substratum*, instrument, occasion, or absolute existence. And, upon inquiry, I doubt not it will be found that most plain honest men, who believe the creation, never think of those things any more than I. What metaphysical sense you may understand it in, you only can tell.

HYLAS: But, Philonous, you do not seem to be aware that you allow created things, in the beginning, only a relative, and consequently hypothetical being: that is to say, upon supposition there were men to perceive them; without which they have no actuality of absolute existence, wherein creation might terminate. Is it not, therefore, according to you, plainly impossible the creation of any inanimate creatures should precede that of man? And is not this directly contrary to the Mosaic account?

PHILONOUS: In answer to that, I say, *first*, created beings might begin to exist in the mind of other created intelligences, beside men. You will not therefore be able to prove any contradiction between Moses and my notions, unless you first show there was no other order of finite created spirits in being, before man. I say farther, in case we conceive the creation, as we should at this time, a parcel of plants or vegetables of all sorts produced, by an invisible Power, in a desert where nobody was present—that this way of explaining or conceiving it is consistent with my principles, since they deprive you of nothing, either sensible or imaginable; that it exactly suits with the common, natural, and undebauched notions of mankind; that it manifests the dependence of all things on God; and consequently hath all the good effect or influence, which it is possible that important article of our faith should have in making men humble, thankful, and resigned to their great creator. I say, moreover, that, in this naked conception of things, divested of words, there will not be found any notion of what you call the *actuality of absolute existence*. You may indeed raise a dust with those terms, and so lengthen our dispute to no purpose. But I entreat you calmly to look into your own thoughts, and then tell me if they are not a useless and unintelligible jargon.

HYLAS: I own I have no very clear notion annexed to them. But what say you to this? Do you not make the existence of sensible things consist in their being in a mind? And were not all things eternally in the mind of God? Did they not therefore exist from all eternity, according to you? And how could that which was eternal be created in time? Can anything be clearer or better connected than this?

PHILONOUS: And are not you too of opinion, that God knew all things from eternity?

HYLAS: I am.

PHILONOUS: Consequently they always had a being in the divine intellect.

HYLAS: This I acknowledge.

PHILONOUS: By your own confession, therefore, nothing is new, or begins to be, in respect of the mind of God. So we are agreed in that point.

HYLAS: What shall we make then of the creation?

PHILONOUS: May we not understand it to have been entirely in respect of finite spirits; so that things, with regard to us, may properly be said to begin their existence, or be created, when God decreed they should become perceptible to intelligent creatures, in that order and manner which he then established, and we now call the laws of nature? You may call this a *relative*, or *hypothetical existence* if you please. But, so long as it supplies us with the most natural, obvious, and literal sense of the Mosaic history of the creation; so long as it answers all the religious ends of that great article; in a word, so long as you can assign no other sense or meaning in its stead; why should we reject this? Is it to comply with a ridiculous sceptical humour of making everything nonsense and unintelligible? I am sure you cannot say it is for the glory of God. For, allowing it to be a thing possible and conceivable that the corporeal world should have an absolute existence extrinsic to the mind of God, as well as to the minds of all created spirits; yet how could this set forth either the immensity or omniscience of the Deity, or the necessary and immediate dependence of all things on him? Nay, would it not rather seem to derogate from those attributes?

HYLAS: Well, but as to this decree of God's, for making things perceptible, what say you, Philonous? Is it not plain, God did either execute that decree from all eternity or at some certain time began to will what he had not actually willed before, but only designed to will? If the former, then there could be no creation, or beginning of existence, in finite things. If the latter, then we must acknowledge something new to befall the Deity; which implies a sort of change: and all change argues imperfection.

PHILONOUS: Pray consider what you are doing. Is it not evident this objection concludes equally against a creation in any sense; nay, against every other act of the Deity, discoverable by the light of nature? None of which can we conceive, otherwise than as performed in time, and having a beginning. God is a being of transcendent and unlimited perfections: His nature, therefore, is incomprehensible to finite spirits. It is not, therefore, to be expected that any man, whether *materialist* or *immaterialist*, should have exactly just notions of the Deity, His attributes, and ways of operation. If then you would infer anything against me, your difficulty must not be drawn from the inadequateness of our conceptions of the divine nature, which is unavoidable on any scheme; but from the denial of matter, of which there is not one word, directly or indirectly, in what you have now objected.

HYLAS: I must acknowledge the difficulties you are concerned to clear are such only as arise from the non-existence of matter, and are peculiar to that notion. So far you are in the right. But I cannot by any means bring myself to think there is no such peculiar repugnancy between the creation and your opinion; though indeed where to fix it, I do not distinctly know.

PHILONOUS: What would you have? Do I not acknowledge a twofold state of things—the one ectypal or natural, the other archetypal and eternal? The former was created in time; the latter existed from everlasting in the mind of God. Is not this agreeable to the common notions of divines? or, is any more than this necessary in order to conceive the creation? But you suspect some peculiar repugnancy, though you know not where it lies. To take away all possibility of scruple in the case, do but consider this one point. Either you are not able to conceive the creation on any hypothesis whatsoever; and, if so, there is no ground for dislike or complaint against any particular opinion on

that score: or you are able to conceive it; and, if so, why not on my principles, since thereby nothing conceivable is taken away? You have all along been allowed the full scope of sense, imagination, and reason. Whatever, therefore, you could before apprehend, either immediately or mediately by your senses, or by ratiocination from your senses; whatever you could perceive, imagine, or understand, remains still with you. If, therefore, the notion you have of the creation by other principles be intelligible, you have it still upon mine; if it be not intelligible, I conceive it to be no notion at all; and so there is no loss of it. And indeed it seems to me very plain that the supposition of matter, that is a thing perfectly unknown and inconceivable, cannot serve to make us conceive anything. And, I hope it need not be proved to you that if the existence of matter does not make the creation conceivable, the creation's being without it inconceivable can be no objection against its non-existence.

HYLAS: I confess, Philonous, you have almost satisfied me in this point of the creation.

PHILONOUS: I would fain know why you are not quite satisfied. You tell me indeed of a repugnancy between the Mosaic history and immaterialism: but you know not where it lies. Is this reasonable, Hylas? Can you expect I should solve a difficulty without knowing what it is? But, to pass by all that, would not a man think you were assured there is no repugnancy between the received notions of materialists and the inspired writings?

HYLAS: And so I am.

PHILONOUS: Ought the historical part of Scripture to be understood in a plain obvious sense, or in a sense which is metaphysical and out of the way?

HYLAS: In the plain sense, doubtless.

PHILONOUS: When Moses speaks of herbs, earth, water, &c. as having been created by God; think you not the sensible things commonly signified by those words are suggested to every unphilosophical reader?

HYLAS: I cannot help thinking so.

PHILONOUS: And are not all ideas, or things perceived by sense, to be denied a real existence by the doctrine of the materialist?

HYLAS: This I have already acknowledged.

PHILONOUS: The creation, therefore, according to them, was not the creation of things sensible, which have only a relative being, but of certain unknown natures, which have an absolute being, wherein creation might terminate?

HYLAS: True.

PHILONOUS: Is it not therefore evident the assertors of matter destroy the plain obvious sense of Moses, with which their notions are utterly inconsistent; and instead of it obtrude on us I know not what; something equally unintelligible to themselves and me?

HYLAS: I cannot contradict you.

PHILONOUS: Moses tells us of a creation. A creation of what? of unknown quiddities, of occasions, or *substratum*? No, certainly; but of things obvious to the senses. You must first reconcile this with your notions, if you expect I should be reconciled to them.

HYLAS: I see you can assault me with my own weapons.

PHILONOUS: Then as to *absolute existence*; was there ever known a more jejune notion than that? Something it is so abstracted and unintelligible that you have frankly owned you could not conceive it, much less explain anything by it. But allowing matter to exist, and the notion of absolute existence to be clear as light; yet, was this ever known to make the creation more credible? Nay, hath it not furnished the atheists and infidels of all ages with the most plausible arguments against a creation? That a corporeal

substance, which hath an absolute existence without the minds of spirits, should be produced out of nothing, by the mere will of a spirit, hath been looked upon as a thing so contrary to all reason, so impossible and absurd, that not only the most celebrated among the ancients, but even divers modern and Christian philosophers have thought matter co-eternal with the Deity. Lay these things together, and then judge you whether materialism disposes men to believe the creation of things.

HYLAS: I own, Philonous, I think it does not. This of the *creation* is the last objection I can think of; and I must needs own it hath been sufficiently answered as well as the rest. Nothing now remains to be overcome but a sort of unaccountable backwardness that I find in myself towards your notions.

PHILONOUS: When a man is swayed, he knows not why, to one side of the question, can this, think you, be anything else but the effect of prejudice, which never fails to attend old and rooted notions? And indeed in this respect I cannot deny the belief of matter to have very much the advantage over the contrary opinion, with men of a learned education.

HYLAS: I confess it seems to be as you say.

PHILONOUS: As a balance, therefore, to this weight of prejudice, let us throw into the scale the great advantages that arise from the belief of immaterialism, both in regard to religion and human learning. The being of a God, and incorruptibility of the soul, those great articles of religion, are they not proved with the clearest and most immediate evidence? When I say the being of a *God*, I do not mean an obscure general cause of things, whereof we have no conception, but *God*, in the strict and proper sense of the word. A being whose spirituality, omnipresence, providence, omniscience, infinite power and goodness, are as conspicuous as the existence of sensible things, of which (notwithstanding the fallacious pretences and affected scruples of *sceptics*) there is no more reason to doubt than of our own being. Then, with relation to human sciences. In natural philosophy, what intricacies, what obscurities, what contradictions hath the belief of matter led men into! To say nothing of the numberless disputes about its extent, continuity, homogeneity, gravity, divisibility, &c.—do they not pretend to explain all things by bodies operating on bodies, according to the laws of motion? And yet, are they able to comprehend how one body should move another? Nay, admitting there was no difficulty in reconciling the notion of an inert being with a cause, or in conceiving how an accident might pass from one body to another; yet, by all their strained thoughts and extravagant suppositions, have they been able to reach the mechanical production of any one animal or vegetable body? Can they account, by the laws of motion, for sounds, tastes, smells, or colours; or for the regular course of things? Have they accounted, by physical principles, for the aptitude and contrivance even of the most inconsiderable parts of the universe? But, laying aside matter and corporeal causes, and admitting only the efficiency of an all-perfect mind, are not all the effects of nature easy and intelligible? If the *phenomena* are nothing else but *ideas*; God is a *spirit*, but matter an unintelligent, unperceiving being. If they demonstrate an unlimited power in their cause; God is active and omnipotent, but matter an inert mass. If the order regularity, and usefulness of them can never be sufficiently admired; God is infinitely wise and provident, but matter destitute of all contrivance and design. These surely are great advantages in *physics*. Not to mention that the apprehension of a distant Deity naturally disposes men to a negligence in their *moral* actions; which they would be more cautious of, in case they thought him immediately present, and acting on their minds, without the interposition of matter, or unthinking second causes. Then in *metaphysics*: what difficulties concerning entity in abstract, substantial forms, hylarchic principles, plastic natures, substance and accident,

principle of individuation, possibility of matter's thinking, origin of ideas, the manner how two independent substances so widely different as *spirit* and *matter*, should mutually operate on each other? What difficulties, I say, and endless disquisitions, concerning these and innumerable other the like points, do we escape, by supposing only spirits and ideas? Even the *mathematics* themselves, if we take away the absolute existence of extended things, become much more clear and easy; the most shocking paradoxes and intricate speculations in those sciences depending on the infinite divisibility of finite extension; which depends on that supposition. But what need is there to insist on the particular sciences? Is not that opposition to all science whatsoever, that frenzy of the ancient and modern *sceptics*, built on the same foundation? Or can you produce so much as one argument against the reality of corporeal things, or in behalf of that avowed utter ignorance of their natures, which does not suppose their reality to consist in an external absolute existence? Upon this supposition, indeed, the objections from the change of colours in a pigeon's neck, or the appearance of the broken oar in the water, must be allowed to have weight. But these and the like objections vanish, if we do not maintain the being of absolute external originals, but place the reality of things in ideas, fleeting indeed, and changeable; however, not changed at random, but according to the fixed order of nature. For, herein consists that constancy and truth of things which secures all the concerns of life, and distinguishes that which is *real* from the irregular visions of the fancy.

HYLAS: I agree to all you have now said, and must own that nothing can incline me to embrace your opinion more than the advantages I see it is attended with. I am by nature lazy; and this would be a mighty abridgment in knowledge. What doubts, what hypotheses, what labyrinths of amusement, what fields of disputation, what an ocean of false learning, may be avoided by that single notion of *immaterialism*!

PHILONOUS: After all, is there anything farther remaining to be done? You may remember you promised to embrace that opinion which upon examination should appear most agreeable to common sense and remote from *scepticism*. This, by your own confession, is that which denies matter, or the absolute existence of corporeal things. Nor is this all; the same notion has been proved several ways, viewed in different lights, pursued in its consequences, and all objections against it cleared. Can there be a greater evidence of its truth? Or is it possible it should have all the marks of a true opinion and yet be false?

HYLAS: I own myself entirely satisfied for the present in all respects. But, what security can I have that I shall still continue the same full assent to your opinion, and that no unthought-of objection or difficulty will occur hereafter?

PHILONOUS: Pray, Hylas, do you in other cases, when a point is once evidently proved, withhold your consent on account of objections or difficulties it may be liable to? Are the difficulties that attend the doctrine of incommensurable quantities, of the angle of contact, of the asymptotes to curves, or the like, sufficient to make you hold out against mathematical demonstration? Or will you disbelieve the Providence of God, because there may be some particular things which you know not how to reconcile with it? If there are difficulties attending *immaterialism*, there are at the same time direct and evident proofs of it. But for the existence of matter there is not one proof, and far more numerous and insurmountable objections lie against it. But where are those mighty difficulties you insist on? Alas! you know not where or what they are; something which may possibly occur hereafter. If this be a sufficient pretence for withholding your full assent, you should never yield it to any proposition, how free soever from exceptions, how clearly and solidly soever demonstrated.

HYLAS: You have satisfied me, Philonous.

PHILONOUS: But, to arm you against all future objections, do but consider: That which bears equally hard on two contradictory opinions can be proof against neither. Whenever, therefore, any difficulty occurs, try if you can find a solution for it on the hypothesis of the *materialists*. Be not deceived by words; but sound your own thoughts. And in case you cannot conceive it easier by the help of *materialism*, it is plain it can be no objection against *immaterialism*. Had you proceeded all along by this rule, you would probably have spared yourself abundance of trouble in objecting; since of all your difficulties I challenge you to show one that is explained by matter: nay, which is not more unintelligible with than without that supposition; and consequently makes rather *against* than *for* it. You should consider, in each particular, whether the difficulty arises from the *non-existence of matter*. If it does not, you might as well argue from the infinite divisibility of extension against the divine prescience, as from such a difficulty against *immaterialism*. And yet, upon recollection, I believe you will find this to have been often, if not always, the case. You should likewise take heed not to argue on a *petitio principii*. One is apt to say, the unknown substances ought to be esteemed real things, rather than the ideas in our minds: and who can tell but the unthinking external substance may concur, as a cause or instrument, in the productions of our ideas? But is not this proceeding on a supposition that there are such external substances? And to suppose this is it not begging the question? But, above all things, you should beware of imposing on yourself by that vulgar sophism which is called *ignoratio elenchi*. You talked often as if you thought I maintained the non-existence of Sensible Things. Whereas in truth no one can be more thoroughly assured of their existence than I am. And it is you who doubt; I should have said, positively deny it. Everything that is seen, felt, heard, or any way perceived by the senses, is, on the principles I embrace, a real being; but not on yours. Remember, the matter you contend for is an unknown somewhat (if indeed it may be termed *somewhat*), which is quite stripped of all sensible qualities, and can neither be perceived by sense, nor apprehended by the mind. Remember I say, that it is not any object which is hard or soft, hot or cold, blue or white, round or square, &c. For all these things I affirm do exist. Though indeed I deny they have an existence distinct from being perceived; or that they exist out of all minds whatsoever. Think on these points; let them be attentively considered and still kept in view. Otherwise you will not comprehend the state of the question; without which your objections will always be wide of the mark, and, instead of mine, may possibly be directed (as more than once they have been) against your own notions.

HYLAS: I must needs own, Philonous, nothing seems to have kept me from agreeing with you more than this same *mistaking the question*. In denying matter, at first glimpse I am tempted to imagine you deny the things we see and feel: but, upon reflexion, find there is no ground for it. What think you, therefore, of retaining the name *matter*; and applying it to sensible things? This may be done without any change in your sentiments: and, believe me, it would be a means of reconciling them to some persons who may be more shocked at an innovation in words than in opinion.

PHILONOUS: With all my heart: retain the word *matter*; and apply it to the objects of sense, if you please; provided you do not attribute to them any subsistence distinct from their being perceived. I shall never quarrel with you for an expression. *Matter*; or *material substance*, are terms introduced by philosophers; and, as used by them, imply a sort of independency, or a subsistence distinct from being perceived by a mind: but are never used by common people; or, if ever, it is to signify the immediate objects of sense. One would think, therefore, so long as the names of all particular things, with the terms

sensible, substance, body, stuff, and the like, are retained, the word *matter* should be never missed in common talk. And in philosophical discourses it seems the best way to leave it quite out: since there is not, perhaps, any one thing that hath more favoured and strengthened the depraved bent of the mind towards Atheism than the use of that general confused term.

HYLAS: Well but, Philonous, since I am content to give up the notion of an unthinking substance exterior to the mind, I think you ought not to deny me the privilege of using the word *matter* as I please, and annexing it to a collection of sensible qualities subsisting only in the mind. I freely own there is no other substance, in a strict sense, than *spirit*. But I have been so long accustomed to the term *matter* that I know not how to part with it: to say, there is no matter in the world, is still shocking to me. Whereas to say, there is no *matter*, if by that term be meant an unthinking substance existing without the mind; but if by matter is meant some sensible thing, whose existence consists in being perceived, then there is matter: this distinction gives it quite another turn; and men will come into your notions with small difficulty, when they are proposed in that manner. For, after all, the controversy about *matter* in the strict acceptation of it, lies altogether between you and the philosophers: whose principles, I acknowledge, are not near so natural, or so agreeable to the common sense of mankind, and Holy Scripture, as yours. There is nothing we either desire or shun but as it makes, or is apprehended to make, some part of our happiness or misery. But what has happiness or misery, joy or grief, pleasure or pain, to do with absolute existence; or with unknown entities, abstracted from all relation to us? It is evident, things regard us only as they are pleasing or displeasing: and they can please or displease only so far forth as they are perceived. Farther, therefore, we are not concerned, and thus far you leave things as you found them. Yet still there is something new in this doctrine. It is plain, I do not now think with the philosophers; nor yet altogether with the vulgar. I would know how the case stands in that respect; precisely, what you have added to, or altered in my former notions.

PHILONOUS: I do not pretend to be a setter-up of new notions. My endeavours tend only to unite, and place in a clearer light, that truth which was before shared between the vulgar and the philosophers:—the former being of opinion, that *those things they immediately perceive are the real things*; and the latter, that *the things immediately perceived are ideas, which exist only in the mind*. Which two notions put together, do, in effect, constitute the substance of what I advance.

HYLAS: I have been a long time distrusting my senses: methought I saw things by a dim light and through false glasses. Now the glasses are removed and a new light breaks in upon my understanding. I am clearly convinced that I see things in their native forms, and am no longer in pain about their *unknown natures* or *absolute existence*. This is the state I find myself in at present; though, indeed, the course that brought me to it I do not yet thoroughly comprehend. You set out upon the same principles that Academics, Cartesians, and the like sects usually do; and for a long time it looked as if you were advancing their philosophical *scepticism*: but, in the end, your conclusions are directly opposite to theirs.

PHILONOUS: You see, Hylas, the water of yonder fountain, how it is forced upwards, in a round column, to a certain height; at which it breaks, and falls back into the basin from whence it rose: its ascent, as well as descent, proceeding from the same uniform law or principle of *gravitation*. Just so, the same principles which, at first view, lead to *scepticism*, pursued to a certain point, bring men back to common sense.

DAVID HUME

1711–1776

David Hume was born in Edinburgh, Scotland, in 1711. His father, a lawyer, died before David was 2 years old. He was raised by his mother, a deeply religious woman, on a pleasant, but modest, family estate at Ninewells, near Berwick in southern Scotland. Young David was very religious as a boy, often making lists of his sins so that he could seek forgiveness. But shortly after beginning his studies at the University of Edinburgh, at age 12, he seems to have lost his faith.

Although the family was not poor, there was not enough wealth to provide a comfortable life of study for David, the youngest child. His family decided, therefore, that Hume should follow his father into law. This was not to be, however, for as Hume later wrote, “I found an unsurmountable aversion to everything but the pursuit of philosophy and general learning.”

In 1729, when he was only 18, Hume had a breakthrough, discovering what he called “a new Science of Thought.” He gave up all pretense of becoming a lawyer and applied his energies to his new insight. To conserve his limited finances, he moved to a small town in France, La Flèche, where Descartes had studied. There he completed his first work, *A Treatise of Human Nature, Being an Attempt to Introduce the Experimental Method of Reasoning into Moral Subjects*, published in 1739 and 1740. Hume hoped this work would give him his “love of literary fame”—while putting him in a more comfortable financial situation. But, as he later said, the work “fell dead-born from the press, without reaching such distinction as even to excite a murmur among the zealots.”

For the next thirteen years, Hume held a variety of positions, including tutor to a mad marquess and secretary to a general. During this time, he wrote and published his *Essays, Moral and Political* (1741–1742). The success of this work led him to rewrite Book I of his earlier *Treatise*, this time titled as *An Enquiry Concerning Human Understanding* (1748). He added chapters on miracles, free will, and the

argument from design, which he had left out of the earlier work, and he omitted many of his psychological speculations. This book enjoyed some success, though its antireligious nature may have contributed to Hume's rejected applications for two different chairs of philosophy. In 1751, he also recast Book III of the earlier *Treatise*, under the title *Enquiry Concerning the Principles of Morals*.

Hume was appointed Librarian to the Faculty of Advocates in Edinburgh in 1752. In this post, he wrote a multivolume history of England. He also managed to infuriate the library curators with his selections, and in 1757 he was forced to resign when he refused to remove books the curators considered obscene. In the same year, he published *Four Dissertations*, including "The Natural History of Religion," "Of the Passions" (a truncated version of Book II of the *Treatise*), "Of Tragedy," and "Of the Standard of Taste." By now, Hume's works had become well known on the Continent, and when he returned to France in 1763 as part of the British ambassador's staff, he was lionized by French intellectual society. Hume was a favorite at French soirées: Sociable and witty, he was called "le bon David" by his French friends.

When Hume returned to England in 1766, he found that his works had finally brought him the literary fame at home that he had so long desired. In 1767, he took another government post, but two years later he resigned and retired to Edinburgh. There he spent his last years quietly, until his death, probably from cancer, in 1776. His *Dialogues Concerning Natural Religion*, written in the 1750s, was published posthumously in 1779.

* * *

Hume's philosophy, as developed in the *Enquiry*, begins with a rejection of the "abstruse speculations" and "superstitions" of contemporary thought. With Locke, Hume agrees that there are no such things as innate ideas; all knowledge comes through sensory experience. Yet as he worked out the implications of these convictions, he came to conclusions quite different from those of his predecessor.

According to Hume, all the perceptions of the mind may be divided into "impressions" and "ideas." Using an empirical distinction, Hume believes impressions to be "more lively" than ideas. These impressions and ideas are then divided into simple and complex, impressions of sensation and impressions of reflection, and so on. The source of impressions cannot be known empirically, so Hume does not address this question. Simple ideas, on the other hand, must come from impressions. In fact, for an idea to have any meaning whatever, it must be derived from an impression or from a combination of impressions. If I have the idea of a gold mountain, for instance, it is because I have previously had impressions that gave rise to the ideas of "gold" and "mountain" that I am now associating. Using this empirical criterion of meaning, it becomes clear that ideas such as "substance," "God," or even "the self" are without a clear meaning. So according to Hume, Locke's idea of an eternal world of "substances" and Berkeley's idea of an all-perceiving God are without meaning.

Hume then considers the association between ideas and argues that there are "only three principles of connexion among ideas, namely, *Resemblance*, *Contiguity* in time or place, and *Cause or Effect*." These associations of ideas are really nothing more than habit or "custom" and so do not necessarily reflect the "real world." Take causality, for example. One could imagine Pavlov's dogs hearing the bell, getting

the food, hearing the bell, getting the food, hearing the bell . . . and after a period of time concluding, “bells cause food.” But there is obviously no necessary relation between cause and effect in this case. There is no logical reason why the bell might not sound and yet no food appears. Hume argues that all supposed instances of cause and effect are of this kind. We get so used to seeing two events joined that we conclude that one caused the other. Thus, according to Hume, Locke’s claim that the “external world” causes sensations and the Thomistic First-Cause argument for God’s existence are without empirical foundation. It also means that the “laws of nature” are founded only on past experience and that we have no *a priori* evidence that tomorrow will be the same as today.

The remainder of the *Enquiry* develops the implications of Hume’s radical empiricism and deals with the skepticism arising from it. He acknowledges that his own practice does not always reflect his philosophical position. Hume recognizes that despite his causal skepticism, it would not be wise to “throw himself out at the window.” As he wrote early on in this work, we must “be modest in our pretensions; and even to discover the difficulty ourselves before it is objected to us. By this means, we may make a kind of merit of our very ignorance.”

Philosophers differ in their appraisals of Hume’s two greatest works, the *Treatise* and its reworking, the *Enquiry*. Many consider the *Enquiry* more mature; others think the *Treatise* more brilliant. Hume himself said that the *Enquiry*, not the *Treatise*, contained his “philosophical sentiments and principles.” The *Enquiry* is reprinted here complete.

Owen, ed., *Hume: General Philosophy* (New York: Ashgate, 2000).

AN ENQUIRY CONCERNING HUMAN UNDERSTANDING

SECTION I. OF THE DIFFERENT SPECIES OF PHILOSOPHY

Moral philosophy, or the science of human nature, may be treated after two different manners; each of which has its peculiar merit, and may contribute to the entertainment, instruction, and reformation of mankind. The one considers man chiefly as born for action; and as influenced in his measures by taste and sentiment; pursuing one object, and avoiding another, according to the value which these objects seem to possess, and according to the light in which they present themselves. As virtue, of all objects, is allowed to be the most valuable, this species of philosophers paint her in the most amiable colours; borrowing all helps from poetry and eloquence, and treating their subject in an easy and obvious manner, and such as is best fitted to please the imagination, and engage the affections. They select the most striking observations and instances from common life; place opposite characters in a proper contrast; and alluring us into the paths of virtue by the views of glory and happiness, direct our steps in these paths by the soundest precepts and most illustrious examples. They make us *feel* the difference between vice and virtue; they excite and regulate our sentiments; and so they can but

bend our hearts to the love of probity and true honour, they think, that they have fully attained the end of all their labours.

The other species of philosophers consider man in the light of a reasonable rather than an active being, and endeavour to form his understanding more than cultivate his manners. They regard human nature as a subject of speculation; and with a narrow scrutiny examine it, in order to find those principles, which regulate our understanding, excite our sentiments, and make us to approve or blame any particular object, action, or behaviour. They think it a reproach to all literature, that philosophy should not yet have fixed, beyond controversy, the foundation of morals, reasoning, and criticism; and should for ever talk of truth and falsehood, vice and virtue, beauty and deformity, without being able to determine the source of these distinctions. While they attempt this arduous task, they are deterred by no difficulties; but proceeding from particular instances to general principles, they still push on their enquiries to principles more general, and rest not satisfied till they arrive at those original principles, by which, in every science, all human curiosity must be bounded. Though their speculations seem abstract, and even unintelligible to common readers, they aim at the approbation of the learned and the wise; and think themselves sufficiently compensated for the labour of their whole lives, if they can discover some hidden truths, which may contribute to the instruction of posterity.

It is certain that the easy and obvious philosophy will always, with the generality of mankind, have the preference above the accurate and abstruse; and by many will be recommended, not only as more agreeable, but more useful than the other. It enters more into common life; moulds the heart and affections; and, by touching those principles which actuate men, reforms their conduct, and brings them nearer to that model of perfection which it describes. On the contrary, the abstruse philosophy, being founded on a turn of mind, which cannot enter into business and action, vanishes when the philosopher leaves the shade, and comes into open day; nor can its principles easily retain any influence over our conduct and behaviour. The feelings of our heart, the agitation of our passions, the vehemence of our affections, dissipate all its conclusions, and reduce the profound philosopher to a mere plebeian.

This also must be confessed, that the most durable, as well as justest fame, has been acquired by the easy philosophy, and that abstract reasoners seem hitherto to have enjoyed only a momentary reputation, from the caprice or ignorance of their own age, but have not been able to support their renown with more equitable posterity. It is easy for a profound philosopher to commit a mistake in his subtle reasonings; and one mistake is the necessary parent of another, while he pushes on his consequences, and is not deterred from embracing any conclusion, by its unusual appearance, or its contradiction to popular opinion. But a philosopher, who purposes only to represent the common sense of mankind in more beautiful and more engaging colours, if by accident he falls into error, goes not farther; but renewing his appeal to common sense, and the natural sentiments of the mind, returns into the right path, and secures himself from any dangerous illusions. The fame of Cicero flourishes at present; but that of Aristotle is utterly decayed. La Bruyere passes the seas, and still maintains his reputation: But the glory of Malebranche is confined to his own nation, and to his own age. And Addison, perhaps, will be read with pleasure, when Locke shall be entirely forgotten.

The mere philosopher is a character, which is commonly but little acceptable in the world, as being supposed to contribute nothing either to the advantage or pleasure of society; while he lives remote from communication with mankind, and is wrapped up in principles and notions equally remote from their comprehension. On the other hand, the mere ignorant is still more despised; nor is any thing deemed a surer sign of an illiberal

genius in an age and nation where the sciences flourish, than to be entirely destitute of all relish for those noble entertainments. The most perfect character is supposed to lie between those extremes; retaining an equal ability and taste for books, company, and business; preserving in conversation that discernment and delicacy which arise from polite letters; and in business, that probity and accuracy which are the natural result of a just philosophy. In order to diffuse and cultivate so accomplished a character, nothing can be more useful than compositions of the easy style and manner, which draw not too much from life, require no deep application or retreat to be comprehended, and send back the student among mankind full of noble sentiments and wise precepts, applicable to every exigence of human life. By means of such compositions, virtue becomes amiable, science agreeable, company instructive, and retirement entertaining.

Man is a reasonable being; and as such, receives from science his proper food and nourishment: But so narrow are the bounds of human understanding, that little satisfaction can be hoped for in this particular, either from the extent or security of his acquisitions. Man is a sociable, no less than a reasonable being: But neither can he always enjoy company agreeable and amusing, or preserve the proper relish for them. Man is also an active being; and from that disposition, as well as from the various necessities of human life, must submit to business and occupation: But the mind requires some relaxation, and cannot always support its bent to care and industry. It seems, then, that nature has pointed out a mixed kind of life as most suitable to the human race, and secretly admonished them to allow none of these biases to draw too much, so as to incapacitate them for other occupations and entertainments. Indulge your passion for science, says she, but let your science be human, and such as may have a direct reference to action and society. Abstruse thought and profound researches I prohibit, and will severely punish, by the pensive melancholy which they introduce, by the endless uncertainty in which they involve you, and by the cold reception which your pretended discoveries shall meet with, when communicated. Be a philosopher; but, amidst all your philosophy, be still a man.

Were the generality of mankind contented to prefer the easy philosophy to the abstract and profound, without throwing any blame or contempt on the latter, it might not be improper, perhaps, to comply with this general opinion, and allow every man to enjoy, without opposition, his own taste and sentiment. But as the matter is often carried farther, even to the absolute rejecting of all profound reasonings, or what is commonly called *metaphysics*, we shall now proceed to consider what can reasonably be pleaded in their behalf.

We may begin with observing, that one considerable advantage, which results from the accurate and abstract philosophy, is, its subserviency to the easy and humane, which, without the former, can never attain a sufficient degree of exactness in its sentiments, precepts, or reasonings. All polite letters are nothing but pictures of human life in various attitudes and situations; and inspire us with different sentiments, of praise or blame, admiration or ridicule, according to the qualities of the object, which they set before us. An artist must be better qualified to succeed in this undertaking, who, besides a delicate taste and a quick apprehension, possesses an accurate knowledge of the internal fabric, the operations of the understanding, the workings of the passions, and the various species of sentiment which discriminate vice and virtue. How painful soever this inward search or enquiry may appear, it becomes, in some measure, requisite to those, who would describe with success the obvious and outward appearances of life and manners. The anatomist presents to the eye the most hideous and disagreeable objects; but his science is useful to the painter in delineating even a Venus or an Helen. While the latter employs all the richest colours of his art, and gives his figures the most

An Experiment on a Bird in the Air Pump, ca. 1767–1768, by Joseph Wright of Derby (1734–1797). The artist is showing the interplay between rational analysis and human emotion, between reason and feeling. The scientist in the center is demonstrating that a bird cannot fly in a vacuum. In doing so he is also killing the bird—a fact not lost on the little girls to the right. (Tate Gallery, London/© National Gallery, London)

graceful and engaging airs; he must still carry his attention to the inward structure of the human body, the position of the muscles, the fabric of the bones, and the use and figure of every part or organ. Accuracy is, in every case, advantageous to beauty and just reasoning to delicate sentiment. In vain would we exalt the one by depreciating the other.

Besides, we may observe, in every art or profession, even those which most concern life or action, that a spirit of accuracy, however acquired, carries all of them nearer their perfection, and renders them more subservient to the interests of society. And though a philosopher may live remote from business, the genius of philosophy, if carefully cultivated by several, must gradually diffuse itself throughout the whole society, and bestow a similar correctness on every art and calling. The politician will acquire greater foresight and subtlety, in the subdividing and balancing of power; the lawyer more method and finer principles in his reasonings; and the general more regularity in his discipline, and more caution in his plans and operations. The stability of modern governments above the ancient, and the accuracy of modern philosophy, have improved, and probably will still improve, by similar gradations.

Were there no advantage to be reaped from these studies, beyond the gratification of an innocent curiosity, yet ought not even this to be despised; as being one accession to those few safe and harmless pleasures, which are bestowed on the human race. The sweetest and most inoffensive path of life leads through the avenues of science and learning; and whoever can either remove any obstructions in this way, or open up any

new prospect, ought so far to be esteemed a benefactor to mankind. And though these researches may appear painful and fatiguing, it is with some minds as with some bodies, which being endowed with vigorous and florid health, require severe exercise, and reap a pleasure from what, to the generality of mankind, may seem burdensome and laborious. Obscurity, indeed, is painful to the mind as well as to the eye; but to bring light from obscurity, by whatever labour, must needs be delightful and rejoicing.

But this obscurity in the profound and abstract philosophy, is objected to, not only as painful and fatiguing, but as the inevitable source of uncertainty and error. Here indeed lies the justest and most plausible objection against a considerable part of metaphysics, that they are not properly a science; but arise either from the fruitless efforts of human vanity, which would penetrate into subjects utterly inaccessible to the understanding, or from the craft of popular superstitions, which, being unable to defend themselves on fair ground, raise these entangling brambles to cover and protect their weakness. Chased from the open country, these robbers fly into the forest, and lie in wait to break in upon every unguarded avenue of the mind, and overwhelm it with religious fears and prejudices. The stoutest antagonist, if he remit his watch a moment, is oppressed. And many, through cowardice and folly, open the gates to the enemies, and willingly receive them with reverence and submission, as their legal sovereigns.

But is this a sufficient reason, why philosophers should desist from such researches, and leave superstition still in possession of her retreat? Is it not proper to draw an opposite conclusion, and perceive the necessity of carrying the war into the most secret recesses of the enemy? In vain do we hope, that men, from frequent disappointment, will at last abandon such airy sciences, and discover the proper province of human reason. For, besides, that many persons find too sensible an interest in perpetually recalling such topics; besides this, I say, the motive of blind despair can never reasonably have place in the sciences; since, however unsuccessful former attempts may have proved, there is still room to hope, that the industry, good fortune, or improved sagacity of succeeding generations may reach discoveries unknown to former ages. Each adventurous genius will leap at the arduous prize, and find himself stimulated, rather than discouraged, by the failures of his predecessors; while he hopes that the glory of achieving so hard an adventure is reserved for him alone. The only method of freeing learning, at once, from these abstruse questions, is to enquire seriously into the nature of human understanding, and show, from an exact analysis of its powers and capacity, that it is by no means fitted for such remote and abstruse subjects. We must submit to this fatigue, in order to live at ease ever after: And must cultivate true metaphysics with some care, in order to destroy the false and adulterate. Indolence, which, to some persons, affords a safeguard against this deceitful philosophy, is, with others, overbalanced by curiosity; and despair, which, at some moments, prevails, may give place afterwards to sanguine hopes and expectations. Accurate and just reasoning is the only catholic remedy, fitted for all persons and all dispositions; and is alone able to subvert that abstruse philosophy and metaphysical jargon, which, being mixed up with popular superstition, renders it in a manner impenetrable to careless reasoners, and gives it the air of science and wisdom.

Besides this advantage of rejecting, after deliberate enquiry, the most uncertain and disagreeable part of learning, there are many positive advantages, which result from an accurate scrutiny into the powers and faculties of human nature. It is remarkable concerning the operations of the mind, that, though most intimately present to us, yet, whenever they become the object of reflection, they seem involved in obscurity; nor can the eye readily find those lines and boundaries, which discriminate and distinguish them. The objects are too fine to remain long in the same aspect or situation; and must

be apprehended in an instant, by a superior penetration, derived from nature, and improved by habit and reflection. It becomes, therefore, no inconsiderable part of science barely to know the different operations of the mind, to separate them from each other, to class them under their proper heads, and to correct all that seeming disorder, in which they lie involved, when made the object of reflection and enquiry. This talk of ordering and distinguishing, which has no merit, when performed with regard to external bodies, the objects of our senses, rises in its value, when directed towards the operations of the mind, in proportion to the difficulty and labour, which we meet with in performing it. And if we can go no farther than this mental geography, or delineation of the distinct parts and powers of the mind, it is at least a satisfaction to go so far; and the more obvious this science may appear (and it is by no means obvious) the more contemptible still must the ignorance of it be esteemed, in all pretenders to learning and philosophy.

Nor can there remain any suspicion, that this science is uncertain and chimerical; unless we should entertain such a scepticism as is entirely subversive of all speculation, and even action. It cannot be doubted, that the mind is endowed with several powers and faculties, that these powers are distinct from each other, that what is really distinct to the immediate perception may be distinguished by reflection; and consequently, that there is a truth and falsehood in all propositions on this subject, and a truth and falsehood, which lie not beyond the compass of human understanding. There are many obvious distinctions of this kind, such as those between the will and understanding, the imagination and passions, which fall within the comprehension of every human creature; and the finer and more philosophical distinctions are no less real and certain, though more difficult to be comprehended. Some instances, especially late ones, of success in these enquiries, may give us a juster notion of the certainty and solidity of this branch of learning. And shall we esteem it worthy the labour of a philosopher to give us a true system of the planets, and adjust the position and order of those remote bodies; while we affect to overlook those, who, with so much success, delineate the parts of the mind, in which we are so intimately concerned?

But may we not hope, that philosophy, if cultivated with care, and encouraged by the attention of the public, may carry its researches still farther, and discover, at least in some degree, the secret springs and principles, by which the human mind is actuated in its operations? Astronomers had long contented themselves with proving, from the phenomena, the true motions, order, and magnitude of the heavenly bodies: Till a philosopher, at last, arose, who seems, from the happiest reasoning, to have also determined the laws and forces, by which the revolutions of the planets are governed and directed. The like has been performed with regard to other parts of nature. And there is no reason to despair of equal success in our enquiries concerning the mental powers and economy, if prosecuted with equal capacity and caution. It is probable, that one operation and principle of the mind depends on another; which, again, may be resolved into one more general and universal: And how far these researches may possibly be carried, it will be difficult for us, before, or even after, a careful trial, exactly to determine. This is certain, that attempts of this kind are every day made even by those who philosophize the most negligently: And nothing can be more requisite than to enter upon the enterprize with thorough care and attention; that, if it lie within the compass of human understanding, it may at last be happily achieved; if not, it may, however, be rejected with some confidence and security. This last conclusion, surely, is not desirable; nor ought it to be embraced too rashly. For how much must we diminish from the beauty and value of this species of philosophy, upon such a supposition? Moralists have hitherto been accustomed, when they considered

the vast multitude and diversity of those actions that excite our approbation or dislike, to search for some common principle, on which this variety of sentiments might depend. And though they have sometimes carried the matter too far, by their passion for some one general principle; it must, however, be confessed, that they are excusable in expecting to find some general principles, into which all the vices and virtues were justly to be resolved. The like has been the endeavour of critics, logicians, and even politicians: Nor have their attempts been wholly unsuccessful; though perhaps longer time, greater accuracy, and more ardent application may bring these sciences still nearer their perfection. To throw up at once all pretensions of this kind may justly be deemed more rash, precipitate, and dogmatical, than even the boldest and most affirmative philosophy, that has ever attempted to impose its crude dictates and principles on mankind.

What though these reasonings concerning human nature seem abstract, and of difficult comprehension? This affords no presumption of their falsehood. On the contrary, it seems impossible, that what has hitherto escaped so many wise and profound philosophers can be very obvious and easy. And whatever pains these researches may cost us, we may think ourselves sufficiently rewarded, not only in point of profit but of pleasure, if, by that means, we can make any addition to our stock of knowledge, in subjects of such unspeakable importance.

But as, after all, the abstractedness of these speculations is no recommendation, but rather a disadvantage to them, and as this difficulty may perhaps be surmounted by care and art, and the avoiding of all unnecessary detail, we have, in the following enquiry, attempted to throw some light upon subjects, from which uncertainty has hitherto deterred the wise, and obscurity the ignorant. Happy, if we can unite the boundaries of the different species of philosophy, by reconciling profound enquiry with clearness, and truth with novelty! And still more happy, if reasoning in this easy manner, we can undermine the foundations of an abstruse philosophy, which seems to have hitherto served only as a shelter to superstition, and a cover to absurdity and error!

SECTION II. OF THE ORIGIN OF IDEAS

Every one will readily allow, that there is a considerable difference between the perceptions of the mind, when a man feels the pain of excessive heat, or the pleasure of moderate warmth, and when he afterwards recalls to his memory this sensation, or anticipates it by his imagination. These faculties may mimic or copy the perceptions of the senses; but they never can entirely reach the force and vivacity of the original sentiment. The utmost we say of them, even when they operate with greatest vigour, is, that they represent their object in so lively a manner, that we could almost say we feel or see it: But, except the mind be disordered by disease or madness, they never can arrive at such a pitch of vivacity, as to render these perceptions altogether undistinguishable. All the colours of poetry, however splendid, can never paint natural objects in such a manner as to make the description be taken for a real landscape. The most lively thought is still inferior to the dullest sensation.

We may observe a like distinction to run through all the other perceptions of the mind. A man in a fit of anger, is actuated in a very different manner from one who only thinks of that emotion. If you tell me, that any person is in love, I easily understand your meaning, and form a just conception of his situation; but never can mistake that conception for the real disorders and agitations of the passion. When we reflect on our past

sentiments and affections, our thought is a faithful mirror, and copies its objects truly; but the colours which it employs are faint and dull, in comparison of those in which our original perceptions were clothed. It requires no nice discernment or metaphysical head to mark the distinction between them.

Here therefore we may divide all the perceptions of the mind into two classes or species, which are distinguished by their different degrees of force and vivacity. The less forcible and lively are commonly denominated *Thoughts* or *Ideas*. The other species want a name in our language, and in most others; I suppose, because it was not requisite for any, but philosophical purposes, to rank them under a general term or appellation. Let us, therefore, use a little freedom, and call them *Impressions*; employing that word in a sense somewhat different from the usual. By the term impression, then, I mean all our more lively perceptions, when we hear, or see, or feel, or love, or hate, or desire, or will. And *impressions* are distinguished from ideas which are the less lively perceptions, of which we are conscious, when we reflect on any of those sensations or movements above mentioned.

Nothing, at first view, may seem more unbounded than the thought of man, which not only escapes all human power and authority, but is not even restrained within the limits of nature and reality. To form monsters, and join incongruous shapes and appearances, costs the imagination no more trouble than to conceive the most natural and familiar objects. And while the body is confined to one planet, along which it creeps with pain and difficulty; the thought can in an instant transport us into the most distant regions of the universe; or even beyond the universe, into the unbounded chaos, where nature is supposed to lie in total confusion. What never was seen, or heard of, may yet be conceived; nor is any thing beyond the power of thought, except what implies an absolute contradiction.

But though our thought seems to possess this unbounded liberty, we shall find, upon a nearer examination, that it is really confined within very narrow limits, and that all this creative power of the mind amounts to no more than the faculty of compounding, transposing, augmenting, or diminishing the materials afforded us by the senses and experience. When we think of a golden mountain, we only join two consistent ideas, *gold* and *mountain*, with which we were formerly acquainted. A virtuous horse we can conceive; because, from our own feeling, we can conceive virtue; and this we may unite to the figure and shape of a horse, which is an animal familiar to us. In short, all the materials of thinking are derived either from our outward or inward sentiment: the mixture and composition of these belongs alone to the mind and will. Or, to express myself in philosophical language, all our ideas or more feeble perceptions are copies of our impressions or more lively ones.

To prove this, the two following arguments will, I hope, be sufficient. First, when we analyze our thoughts or ideas, however compounded or sublime, we always find that they resolve themselves into such simple ideas as were copied from a precedent feeling or sentiment. Even those ideas, which, at first view, seem the most wide of this origin, are found, upon a nearer scrutiny, to be derived from it. The idea of God, as meaning an infinitely intelligent, wise, and good Being, arises from reflecting on the operations of our own mind, and augmenting, without limit, those qualities of goodness and wisdom. We may prosecute this enquiry to what length we please; where we shall always find, that every idea which we examine is copied from a similar impression. Those who would assert that this position is not universally true nor without exception, have only one, and that an easy method of refuting it; by producing that idea, which, in their opinion, is not derived from this source. It will then be incumbent on us, if we would maintain our doctrine, to produce the impression, or lively perception, which corresponds to it.

Secondly. If it happens, from a defect of the organ, that a man is not susceptible of any species of sensation, we always find that he is as little susceptible of the correspondent ideas. A blind man can form no notion of colours; a deaf man of sounds. Restore either of them that sense in which he is deficient; by opening this new inlet for his sensations, you also open an inlet for the ideas; and he finds no difficulty in conceiving these objects. The case is the same, if the object, proper for exciting any sensation, has never been applied to the organ. A Laplander or Negro has no notion of the relish of wine. And though there are few or no instances of a like deficiency in the mind, where a person has never felt or is wholly incapable of a sentiment or passion that belongs to his species; yet we find the same observation to take place in a less degree. A man of mild manners can form no idea of inveterate revenge or cruelty; nor can a selfish heart easily conceive the heights of friendship and generosity. It is readily allowed, that other beings may possess many senses of which we can have no conception, because the ideas of them have never been introduced to us in the only manner by which an idea can have access to the mind, to wit, by the actual feeling and sensation.

There is, however, one contradictory phenomenon, which may prove that it is not absolutely impossible for ideas to arise, independent of their correspondent impressions. I believe it will readily be allowed, that the several distinct ideas of colour, which enter by the eye, or those of sound, which are conveyed by the ear, are really different from each other; though, at the same time, resembling. Now if this be true of different colours, it must be no less so of the different shades of the same colour; and each shade produces a distinct idea, independent of the rest. For if this should be denied, it is possible, by the continual gradation of shades, to run a colour insensibly into what is most remote from it; and if you will not allow any of the means to be different, you cannot, without absurdity, deny the extremes to be the same. Suppose, therefore, a person to have enjoyed his sight for thirty years, and to have become perfectly acquainted with colours of all kinds except one particular shade of blue, for instance, which it never has been his fortune to meet with. Let all the different shades of that colour, except that single one, be placed before him, descending gradually from the deepest to lightest; it is plain that he will perceive a blank, where that shade is wanting, and will be sensible that there is a greater distance in that place between the contiguous colours than in any other. Now I ask, whether it be possible for him, from his own imagination, to supply this deficiency, and raise up to himself the idea of that particular shade, though it had never been conveyed to him by his senses? I believe there are few but will be of opinion that he can: and this may serve as a proof that the simple ideas are not always, in every instance, derived from the correspondent impressions; though this instance is so singular, that it is scarcely worth our observing, and does not merit that for it alone we should alter our general maxim.

Here, therefore, is a proposition, which not only seems, in itself, simple and intelligible; but, if a proper use were made of it, might render every dispute equally intelligible, and banish all that jargon, which has so long taken possession of metaphysical reasonings, and drawn disgrace upon them. All ideas, especially abstract ones, are naturally faint and obscure: the mind has but a slender hold of them: they are apt to be confounded with other resembling ideas; and when we have often employed any term, though without a distinct meaning, we are apt to imagine it has a determinate idea annexed to it. On the contrary, all impressions, that is, all sensations, either outward or inward, are strong and vivid: the limits between them are more exactly determined: nor is it easy to fall into any error or mistake with regard to them. When we entertain, therefore, any suspicion that a philosophical term

is employed without any meaning or idea (as is but too frequent), we need but enquire, *from what impressions is that supposed idea derived?* And if it be impossible to assign any, this will serve to confirm our suspicion.* By bringing ideas into so clear a light we may reasonably hope to remove all dispute, which may arise, concerning their nature and reality.

SECTION III. OF THE ASSOCIATION OF IDEAS

It is evident that there is a principle of connexion between the different thoughts or ideas of the mind, and that, in their appearance to the memory or imagination, they introduce each other with a certain degree of method and regularity. In our more serious thinking or discourse this is so observable that any particular thought, which breaks in upon the regular tract or chain of ideas, is immediately remarked and rejected. And even in our wildest and most wandering reveries, nay in our very dreams, we shall find, if we reflect, that the imagination ran not altogether at adventures, but that there was still a connexion upheld among the different ideas, which succeeded each other. Were the loosest and freest conversation to be transcribed, there would immediately be observed something which connected it in all its transitions. Or where this is wanting, the person who broke the thread of discourse might still inform you, that there had secretly revolved in his mind a succession of thought, which had gradually led him from the subject of conversation. Among different languages, even where we cannot suspect the least connexion or communication, it is found, that the words, expressive of ideas, the most compounded, do yet nearly correspond to each other: a certain proof that the simple ideas, comprehended in the compound ones, were bound together by some universal principle, which had an equal influence on all mankind.

Though it be too obvious to escape observation, that different ideas are connected together; I do not find that any philosopher has attempted to enumerate or class all the principles of association; a subject, however, that seems worthy of curiosity. To me, there appear to be only three principles of connexion among ideas, namely, *Resemblance*, *Contiguity* in time or place, and *Cause or Effect*.

*It is probable that no more was meant by those, who denied innate ideas, than that all ideas were copies of our impressions; though it must be confessed, that the terms, which they employed, were not chosen with such caution, nor so exactly defined, as to prevent all mistakes about their doctrine. For what is meant by *innate*? If innate be equivalent to natural, then all the perceptions and ideas of the mind must be allowed to be innate or natural, in whatever sense we take the latter word, whether in opposition to what is uncommon, artificial, or miraculous. If by innate be meant, contemporary to our birth, the dispute seems to be frivolous; nor is it worth while to enquire at what time thinking begins, whether before, at, or after our birth. Again, the word idea, seems to be commonly taken in a very loose sense, by LOCKE and others; as standing for any of our perceptions, our sensations and passions, as well as thoughts. Now in this sense, I should desire to know, what can be meant by asserting, that self-love, or resentment of injuries, or the passion between the sexes is not innate?

But admitting these terms, *impressions* and *ideas*, in the sense above explained, and understanding by *innate*, what is original or copied from no precedent perception, then may we assert that all our impressions are innate and our ideas not innate.

To be ingenuous, I must own it to be my opinion, that LOCKE was betrayed into this question by the schoolmen, who, making use of undefined terms, draw out their disputes to a tedious length, without ever touching the point in question. A like ambiguity and circumlocution seem to run through that philosopher's reasonings on this as well as most other subjects.

That these principles serve to connect ideas will not, I believe, be much doubted. A picture naturally leads our thoughts to the original:* the mention of one apartment in a building naturally introduces an enquiry or discourse concerning the others:** and if we think of a wound, we can scarcely forbear reflecting on the pain which follows it.*** But that this enumeration is complete, and that there are no other principles of association except these, may be difficult to prove to the satisfaction of the reader, or even to a man's own satisfaction. All we can do, in such cases, is to run over several instances, and examine carefully the principle which binds the different thoughts to each other, never stopping till we render the principle as general as possible.† The more instances we examine, and the more care we employ, the more assurance shall we acquire, that the enumeration, which we form from the whole, is complete and entire.

SECTION IV. SCEPTICAL DOUBTS CONCERNING THE OPERATIONS OF THE UNDERSTANDING

PART I

All the objects of human reason or enquiry may naturally be divided into two kinds, to wit, *Relations of Ideas*, and *Matters of Fact*. Of the first kind are the sciences of Geometry, Algebra, and Arithmetic; and in short, every affirmation which is either intuitively or demonstratively certain. *That the square of the hypotenuse is equal to the squares of the two sides*, is a proposition which expresses a relation between these figures. *That three times five is equal to the half of thirty*, expresses a relation between these numbers. Propositions of this kind are discoverable by the mere operation of thought, without dependence on what is anywhere existent in the universe. Though there never were a circle or triangle in nature, the truths demonstrated by Euclid would for ever retain their certainty and evidence.

Matters of fact, which are the second objects of human reason, are not ascertained in the same manner; nor is our evidence of their truth however great, of a like nature with the foregoing. The contrary of every matter of fact is still possible; because it can never imply a contradiction, and is conceived by the mind with the same facility and distinctness, as if ever so conformable to reality. *That the sun will not rise tomorrow* is no less intelligible a proposition, and implies no more contradiction than the affirmation, *that it will rise*. We should in vain, therefore, attempt to demonstrate its falsehood. Were it demonstratively false, it would imply a contradiction, and could never be distinctly conceived by the mind.

It may, therefore, be a subject worthy of curiosity, to enquire what is the nature of that evidence which assures us of any real existence and matter of fact, beyond the present testimony of our senses, or the records of our memory. This part of philosophy, it is

*Resemblance.

**Contiguity.

***Cause and effect.

†For instance, Contrast or Contrariety is also a connexion among Ideas but it may, perhaps, be considered as a mixture of *Causation* and *Resemblance*. Where two objects are contrary, the one destroys the other; that is, the cause of its annihilation, and the idea of the annihilation of an object implies the idea of its former existence.

observable, has been little cultivated, either by the ancients or moderns; and therefore our doubts and errors, in the prosecution of so important an enquiry, may be the more excusable; while we march through such difficult paths without any guide or direction. They may even prove useful, by exciting curiosity, and destroying that implicit faith and security, which is the bane of all reasoning and free enquiry. The discovery of defects in the common philosophy, if any such there be, will not, I presume, be a discouragement, but rather an incitement, as is usual, to attempt something more full and satisfactory than has yet been proposed to the public.

All reasonings concerning matter of fact seem to be founded on the relation of *Cause* and *Effect*. By means of that relation alone we can go beyond the evidence of our memory and senses. If you were to ask a man, why he believes any matter of fact, which is absent; for instance, that his friend is in the country, or in France; he would give you a reason; and this reason would be some other fact; as a letter received from him, or the knowledge of his former resolutions and promises. A man finding a watch or any other machine in a desert island, would conclude that there had once been men in that island. All our reasonings concerning fact are of the same nature. And here it is constantly supposed that there is a connexion between the present fact and that which is inferred from it. Were there nothing to bind them together, the inference would be entirely precarious. The hearing of an articulate voice and rational discourse in the dark assures us of the presence of some person: Why? because these are the effects of the human make and fabric, and closely connected with it. If we anatomize all the other reasonings of this nature, we shall find that they are founded on the relation of cause and effect, and that this relation is either near or remote, direct or collateral. Heat and light are collateral effects of fire, and the one effect may justly be inferred from the other.

If we would satisfy ourselves, therefore, concerning the nature of that evidence, which assures us of matters of fact, we must enquire how we arrive at the knowledge of cause and effect.

I shall venture to affirm, as a general proposition, which admits of no exception, that the knowledge of this relation is not, in any instance, attained by reasonings *a priori*; but arises entirely from experience, when we find that any particular objects are constantly conjoined with each other. Let an object be presented to a man of ever so strong natural reason and abilities; if that object be entirely new to him, he will not be able, by the most accurate examination of its sensible qualities, to discover any of its causes or effects. Adam, though his rational faculties be supposed, at the very first, entirely perfect, could not have inferred from the fluidity and transparency of water that it would suffocate him, or from the light and warmth of fire that it would consume him. No object ever discovers, by the qualities which appear to the senses, either the causes which produced it, or the effects which will arise from it; nor can our reason, unassisted by experience, ever draw any inference concerning real existence and matter of fact.

This proposition, *that causes and effects are discoverable, not by reason but by experience*, will readily be admitted with regard to such objects, as we remember to have once been altogether unknown to us; since we must be conscious of the utter inability, which we then lay under, of foretelling what would arise from them. Present two smooth pieces of marble to a man who has no tincture of natural philosophy; he will never discover that they will adhere together in such a manner as to require great force to separate them in a direct line, while they make so small a resistance to a lateral pressure. Such events, as bear little analogy to the common course of nature, are also readily confessed to be known only by experience; nor does any man imagine that the explosion of gunpowder, or the attraction of a loadstone, could ever be discovered by

arguments *a priori*. In like manner, when an effect is supposed to depend upon an intricate machinery or secret structure of parts, we make no difficulty in attributing all our knowledge of it to experience. Who will assert that he can give the ultimate reason, why milk or bread is proper nourishment for a man, not for a lion or a tiger?

But the same truth may not appear, at first sight, to have the same evidence with regard to events, which have become familiar to us from our first appearance in the world, which bear a close analogy to the whole course of nature, and which are supposed to depend on the simple qualities of objects, without any secret structure of parts. We are apt to imagine that we could discover these effects by the mere operation of our reason, without experience. We fancy, that were we brought on a sudden into this world, we could at first have inferred that one Billiard-ball would communicate motion to another upon impulse; and that we needed not to have waited for the event, in order to pronounce with certainty concerning it. Such is the influence of custom, that, where it is strongest, it not only covers our natural ignorance, but even conceals itself, and seems not to take place, merely because it is found in the highest degree.

But to convince us that all the laws of nature, and all the operations of bodies without exception, are known only by experience, the following reflections may, perhaps, suffice. Were any object presented to us, and were we required to pronounce concerning the effect, which will result from it, without consulting past observation; after what manner, I beseech you, must the mind proceed in this operation? It must invent or imagine some event, which it ascribes to the object as its effect; and it is plain that this invention must be entirely arbitrary. The mind can never possibly find the effect in the supposed cause, by the most accurate scrutiny and examination. For the effect is totally different from the cause, and consequently can never be discovered in it. Motion in the second Billiard-ball is a quite distinct event from motion in the first: nor is there anything in the one to suggest the smallest hint of the other. A stone or piece of metal raised into the air, and left without any support, immediately falls: but to consider the matter *a priori*, is there anything we discover in this situation which can beget the idea of a downward, rather than an upward, or any other motion, in the stone or metal?

And as the first imagination or invention of a particular effect, in all natural operations, is arbitrary, where we consult not experience; so must we also esteem the supposed tie or connexion between the cause and effect, which binds them together, and renders it impossible that any other effect could result from the operation of that cause. When I see, for instance, a Billiard-ball moving in a straight line towards another; even suppose motion in the second ball should by accident be suggested to me, as the result of their contact or impulse; may I not conceive, that a hundred different events might as well follow from that cause? May not both these balls remain at absolute rest? May not the first ball return in a straight line, or leap off from the second in any line or direction? All these suppositions are consistent and conceivable. Why then should we give the preference to one, which is no more consistent or conceivable than the rest? All our reasonings *a priori* will never be able to show us any foundation for this preference.

In a word, then, every effect is a distinct event from its cause. It could not, therefore, be discovered in the cause, and the first invention or conception of it, *a priori*, must be entirely arbitrary. And even after it is suggested, the conjunction of it with the cause must appear equally arbitrary; since there are always many other effects, which, to reason, must seem fully as consistent and natural. In vain, therefore, should we pretend to determine any single event, or infer any cause or effect, without the assistance of observation and experience.

Hence we may discover the reason why no philosopher, who is rational and modest, has ever pretended to assign the ultimate cause of any natural operation, or to show distinctly the action of that power, which produces any single effect in the universe. It is confessed, that the utmost effort of human reason is to reduce the principles, productive of natural phenomena, to a greater simplicity, and to resolve the many particular effects into a few general causes, by means of reasonings from analogy, experience, and observation. But as to the causes of these general causes, we should in vain attempt their discovery; nor shall we ever be able to satisfy ourselves, by any particular explication of them. These ultimate springs and principles are totally shut up from human curiosity and enquiry. Elasticity, gravity, cohesion of parts, communication of motion by impulse; these are probably the ultimate causes and principles which we ever discover in nature; and we may esteem ourselves sufficiently happy, if, by accurate inquiry and reasoning, we can trace up the particular phenomena to, or near to, these general principles. The most perfect philosophy of the natural kind only staves off our ignorance a little longer: as perhaps the most perfect philosophy of the moral or metaphysical kind serves only to discover larger portions of it. Thus the observation of human blindness and weakness is the result of all philosophy, and meets us at every turn, in spite of our endeavours to elude or avoid it.

Nor is geometry, when taken into the assistance of natural philosophy, ever able to remedy this defect, or lead us into the knowledge of ultimate causes, by all that accuracy of reasoning for which it is so justly celebrated. Every part of mixed mathematics proceeds upon the supposition that certain laws are established by nature in her operations; and abstract reasonings are employed, either to assist experience in the discovery of these laws, or to determine their influence in particular instances, where it depends upon any precise degree of distance and quantity. Thus, it is a law of motion, discovered by experience, that the movement or force of any body in motion is in the compound ratio or proportion of its solid contents and its velocity; and consequently, that a small force may remove the greatest obstacle or raise the greatest weight, if, by any contrivance or machinery, we can increase the velocity of that force, so as to make it an overmatch for its antagonist. Geometry assists us in the application of this law, by giving us the just dimensions of all the parts and figures which can enter into any species of machines; but still the discovery of the law itself is owing merely to experience, and all the abstract reasonings in the world could never lead us one step towards the knowledge of it. When we reason *a priori*, and consider merely any object or cause, as it appears to the mind, independent of all observation, it never could suggest to us the notion of any distinct object, such as its effect; much less, show us the inseparable and inviolable connexion between them. A man must be very sagacious who could discover by reasoning that crystal is the effect of heat, and ice of cold, without being previously acquainted with the operation of these qualities.

PART II

But we have not yet attained any tolerable satisfaction with regard to the question first proposed. Each solution still gives rise to a new question as difficult as the foregoing, and leads us on to farther enquiries. When it is asked, *What is the nature of all our reasonings concerning matter of fact?* the proper answer seems to be, that they are founded on the relation of cause and effect. When again it is asked, *What is the foundation of all our reasonings and conclusions concerning that relation?* it may be replied in one word, Experience. But if we still carry on our sifting humour, and ask,

What is the foundation of all conclusions from experience? this implies a new question, which may be of more difficult solution and explication. Philosophers, that give themselves airs of superior wisdom and sufficiency, have a hard task when they encounter persons of inquisitive dispositions, who push them from every corner to which they retreat, and who are sure at last to bring them to some dangerous dilemma. The best expedient to prevent this confusion, is to be modest in our pretensions; and even to discover the difficulty ourselves before it is objected to us. By this means, we may make a kind of merit of our very ignorance.

I shall content myself, in this section, with an easy task, and shall pretend only to give a negative answer to the question here proposed. I say then, that, even after we have experience of the operations of cause and effect, our conclusions from that experience are not founded on reasoning, or any process of the understanding. This answer we must endeavour both to explain and to defend.

It must certainly be allowed, that nature has kept us at a great distance from all her secrets, and has afforded us only the knowledge of a few superficial qualities of objects; while she conceals from us those powers and principles on which the influence of those objects entirely depends. Our senses inform us of the colour, weight, and consistence of bread; but neither sense nor reason can ever inform us of those qualities which fit it for the nourishment and support of a human body. Sight or feeling conveys an idea of the actual motion of bodies; but as to that wonderful force or power, which would carry on a moving body for ever in a continued change of place, and which bodies never lose but by communicating it to others; of this we cannot form the most distant conception. But notwithstanding this ignorance of natural powers* and principles, we always presume, when we see like sensible qualities, that they have like secret powers, and expect that effects, similar to those which we have experienced, will follow from them. If a body of like colour and consistence with that bread, which we have formerly eat, be presented to us, we make no scruple of repeating the experiment, and foresee, with certainty, like nourishment and support. Now this is a process of the mind or thought, of which I would willingly know the foundation. It is allowed on all hands that there is no known connexion between the sensible qualities and the secret powers; and consequently, that the mind is not led to form such a conclusion concerning their constant and regular conjunction, by anything which it knows of their nature. As to past Experience, it can be allowed to give direct and certain information of those precise objects only, and that precise period of time, which fell under its cognizance: but why this experience should be extended to future times, and to other objects, which, for aught we know, may be only in appearance similar; this is the main question on which I would insist. The bread, which I formerly eat, nourished me; that is, a body of such sensible qualities was, at that time, endued with such secret powers: but does it follow, that other bread must also nourish me at another time, and that like sensible qualities must always be attended with like secret powers? The consequence seems nowise necessary. At least, it must be acknowledged that there is here a consequence drawn by the mind; that there is a certain step taken; a process of thought, and an inference, which wants to be explained. These two propositions are far from being the same, *I have found that such an object has always been attended with such an effect, and I foresee, that other objects, which are, in appearance, similar, will be attended with similar effects.* I shall allow, if you please, that the one proposition may justly be inferred from the other; I know, in fact, that it

*The word, Power, is here used in a loose and popular sense. The most accurate explication of it would give additional evidence to this argument. See Sec. 7.

always is inferred. But if you insist that the inference is made by a chain of reasoning, I desire you to produce that reasoning. The connexion between these propositions is not intuitive. There is required a medium, which may enable the mind to draw such an inference, if indeed it be drawn by reasoning and argument. What that medium is, I must confess, passes my comprehension; and it is incumbent on those to produce it, who assert that it really exists, and is the origin of all our conclusions concerning matter of fact.

This negative argument must certainly, in process of time, become altogether convincing, if many penetrating and able philosophers shall turn their enquiries this way and no one be ever able to discover any connecting proposition or intermediate step, which supports the understanding in this conclusion. But as the question is yet new, every reader may not trust so far to his own penetration, as to conclude, because an argument escapes his enquiry, that therefore it does not really exist. For this reason it may be requisite to venture upon a more difficult task; and enumerating all the branches of human knowledge, endeavour to show that none of them can afford such an argument.

All reasonings may be divided into two kinds, namely, demonstrative reasoning, or that concerning relations of ideas, and moral reasoning, or that concerning matter of fact and existence. That there are no demonstrative arguments in the case seems evident; since it implies no contradiction that the course of nature may change, and that an object, seemingly like those which we have experienced, may be attended with different or contrary effects. May I not clearly and distinctly conceive that a body, falling from the clouds, and which, in all other respects, resembles snow, has yet the taste of salt or feeling of fire? Is there any more intelligible proposition than to affirm, that all the trees will flourish in December and January, and decay in May and June? Now whatever is intelligible, and can be distinctly conceived, implies no contradiction, and can never be proved false by any demonstrative argument or abstract reasoning *a priori*.

If we be, therefore, engaged by arguments to put trust in past experience, and make it the standard of our future judgement, these arguments must be probable only, or such as regard matter of fact and real existence, according to the division above mentioned. But that there is no argument of this kind, must appear, if our explication of that species of reasoning be admitted as solid and satisfactory. We have said that all arguments concerning existence are founded on the relation of cause and effect; that our knowledge of that relation is derived entirely from experience; and that all our experimental conclusions proceed upon the supposition that the future will be conformable to the past. To endeavour, therefore, the proof of this last supposition by probable arguments, or arguments regarding existence, must be evidently going in a circle, and taking that for granted, which is the very point in question.

In reality, all arguments from experience are founded on the similarity which we discover among natural objects, and by which we are induced to expect effects similar to those which we have found to follow from such objects. And though none but a fool or madman will ever pretend to dispute the authority of experience, or to reject that great guide of human life, it may surely be allowed a philosopher to have so much curiosity at least as to examine the principle of human nature, which gives this mighty authority to experience, and makes us draw advantage from that similarity which nature has placed among different objects. From causes which appear similar we expect similar effects. This is the sum of all our experimental conclusions. Now it seems evident that, if this conclusion were formed by reason, it would be as perfect at first, and upon one instance, as after ever so long a course of experience. But the case

is far otherwise. Nothing so like as eggs; yet no one, on account of this appearing similarity, expects the same taste and relish in all of them. It is only after a long course of uniform experiments in any kind, that we attain a firm reliance and security with regard to a particular event. Now where is that process of reasoning which, from one instance, draws a conclusion, so different from that which it infers from a hundred instances that are nowise different from that single one? This question I propose as much for the sake of information, as with an intention of raising difficulties. I cannot find, I cannot imagine any such reasoning. But I keep my mind still open to instruction, if any one will vouchsafe to bestow it on me.

Should it be said that, from a number of uniform experiments, we *infer* a connexion between the sensible qualities and the secret powers; this, I must confess, seems the same difficulty, couched in different terms. The question still recurs, on what process of argument this *inference* is founded? Where is the medium, the interposing ideas, which join propositions so very wide of each other? It is confessed that the colour, consistence, and other sensible qualities of bread appear not, of themselves, to have any connexion with the secret powers of nourishment and support. For otherwise we could infer these secret powers from the first appearance of these sensible qualities, without the aid of experience; contrary to the sentiment of all philosophers, and contrary to plain matter of fact. Here, then, is our natural state of ignorance with regard to the powers and influence of all objects. How is this remedied by experience? It only shows us a number of uniform effects, resulting from certain objects, and teaches us that those particular objects, at that particular time, were endowed with such powers and forces. When a new object, endowed with similar sensible qualities, is produced, we expect similar powers and forces, and look for a like effect. From a body of like colour and consistence with bread we expect like nourishment and support. But this surely is a step or progress of the mind, which wants to be explained. When a man says, *I have found, in all past instances, such sensible qualities conjoined with such secret powers*: And when he says, *Similar sensible qualities will always be conjoined with similar secret powers*, he is not guilty of a tautology, nor are these propositions in any respect the same. You say that the one proposition is an inference from the other. But you must confess that the inference is not intuitive; neither is it demonstrative: Of what nature is it, then? To say it is experimental, is begging the question. For all inferences from experience suppose, as their foundation, that the future will resemble the past, and that similar powers will be conjoined with similar sensible qualities. If there be any suspicion that the course of nature may change, and that the past may be no rule for the future, all experience becomes useless, and can give rise to no inference or conclusion. It is impossible, therefore, that any arguments from experience can prove this resemblance of the past to the future: since all these arguments are founded on the supposition of that resemblance. Let the course of things be allowed hitherto ever so regular; that alone, without some new argument or inference, proves not that, for the future, it will continue so. In vain do you pretend to have learned the nature of bodies from your past experience. Their secret nature, and consequently all their effects and influence, may change, without any change in their sensible qualities. This happens sometimes, and with regard to some objects: Why may it not happen always, and with regard to all objects? What logic, what process of argument secures you against this supposition? My practice, you say, refutes my doubts. But you mistake the purport of my question. As an agent, I am quite satisfied in the point; but as a philosopher, who has some share of curiosity, I will not say scepticism, I want to learn the foundation of this inference. No reading, no enquiry has yet been able to remove my difficulty, or

give me satisfaction in a matter of such importance. Can I do better than propose the difficulty to the public, even though, perhaps, I have small hopes of obtaining a solution? We shall, at least, by this means, be sensible of our ignorance, if we do not augment our knowledge.

I must confess that a man is guilty of unpardonable arrogance who concludes, because an argument has escaped his own investigation, that therefore it does not really exist. I must also confess that, though all the learned, for several ages, should have employed themselves in fruitless search upon any subject, it may still, perhaps, be rash to conclude positively that the subject must, therefore, pass all human comprehension. Even though we examine all the sources of our knowledge, and conclude them unfit for such a subject, there may still remain a suspicion, that the enumeration is not complete, or the examination not accurate. But with regard to the present subject, there are some considerations which seem to remove all this accusation of arrogance or suspicion of mistake.

It is certain that the most ignorant and stupid peasants—nay infants, nay even brute beasts—improve by experience, and learn the qualities of natural objects, by observing the effects which result from them. When a child has felt the sensation of pain from touching the flame of a candle, he will be careful not to put his hand near any candle; but will expect a similar effect from a cause which is similar in its sensible qualities and appearance. If you assert, therefore, that the understanding of the child is led into this conclusion by any process of argument or ratiocination, I may justly require you to produce that argument; nor have you any pretense to refuse so equitable a demand. You cannot say that the argument is abstruse, and may possibly escape your enquiry; since you confess that it is obvious to the capacity of a mere infant. If you hesitate, therefore, a moment, or if, after reflection, you produce any intricate or profound argument, you, in a manner, give up the question, and confess that it is not reasoning which engages us to suppose the past resembling the future, and to expect similar effects from causes which are, to appearance, similar. This is the proposition which I intended to enforce in the present section. If I be right, I pretend not to have made any mighty discovery. And if I be wrong, I must acknowledge myself to be indeed a very backward scholar; since I cannot now discover an argument which, it seems, was perfectly familiar to me long before I was out of my cradle.

SECTION V. SCEPTICAL SOLUTION OF THESE DOUBTS

PART I

The passion for philosophy, like that for religion, seems liable to this inconvenience, that, though it aims at the correction of our manners, and extirpation of our vices, it may only serve, by imprudent management, to foster a predominant inclination, and push the mind, with more determined resolution, towards that side which already *draws* too much, by the bias and propensity of the natural temper. It is certain that, while we aspire to the magnanimous firmness of the philosophic sage, and endeavour to confine our pleasures altogether within our own minds, we may, at last, render our philosophy like that of Epictetus, and other *Stoics*, only a more refined system of selfishness, and reason

ourselves out of all virtue as well as social enjoyment. While we study with attention the vanity of human life, and turn all our thoughts towards the empty and transitory nature of riches and honours, we are, perhaps, all the while flattering our natural indolence, which, hating the bustle of the world, and drudgery of business, seeks a pretence of reason to give itself a full and uncontrolled indulgence. There is, however, one species of philosophy which seems little liable to this inconvenience, and that because it strikes in with no disorderly passion of the human mind, nor can mingle itself with any natural affection or propensity; and that is the Academic or Sceptical philosophy. The academics always talk of doubt and suspense of judgement, of danger in hasty determinations, of confining to very narrow bounds the enquiries of the understanding, and of renouncing all speculations which lie not within the limits of common life and practice. Nothing, therefore, can be more contrary than such a philosophy to the supine indolence of the mind, its rash arrogance, its lofty pretensions, and its superstitious credulity. Every passion is mortified by it, except the love of truth; and that passion never is, nor can be, carried to too high a degree. It is surprising, therefore, that this philosophy, which, in almost every instance, must be harmless and innocent, should be the subject of so much groundless reproach and obloquy. But, perhaps, the very circumstance which renders it so innocent is what chiefly exposes it to the public hatred and resentment. By flattering no irregular passion, it gains few partizans: By opposing so many vices and follies, it raises to itself abundance of enemies, who stigmatize it as libertine, profane, and irreligious.

Nor need we fear that this philosophy, while it endeavours to limit our enquiries to common life, should ever undermine the reasonings of common life, and carry its doubts so far as to destroy all action, as well as speculation. Nature will always maintain her rights, and prevail in the end over any abstract reasoning whatsoever. Though we should conclude, for instance, as in the foregoing section, that, in all reasonings from experience, there is a step taken by the mind which is not supported by any argument or process of the understanding; there is no danger that these reasonings, on which almost all knowledge depends, will ever be affected by such a discovery. If the mind be not engaged by argument to make this step, it must be induced by some other principle of equal weight and authority; and that principle will preserve its influence as long as human nature remains the same. What that principle is may well be worth the pains of enquiry.

Suppose a person, though endowed with the strongest faculties of reason and reflection, to be brought on a sudden into this world; he would, indeed, immediately observe a continual succession of objects, and one event following another; but he would not be able to discover anything farther. He would not, at first, by any reasoning, be able to reach the idea of cause and effect; since the particular powers, by which all natural operations are performed, never appear to the senses; nor is it reasonable to conclude, merely because one event, in one instance, precedes another, that therefore the one is the cause, the other the effect. Their conjunction may be arbitrary and casual. There may be no reason to infer the existence of one from the appearance of the other. And in a word, such a person, without more experience, could never employ his conjecture or reasoning concerning any matter of fact, or be assured of anything beyond what was immediately present to his memory and senses.

Suppose, again, that he has acquired more experience, and has lived so long in the world as to have observed familiar objects or events to be constantly conjoined together; what is the consequence of this experience? He immediately infers the existence of one object from the appearance of the other. Yet he has not, by all his experience, acquired any idea or knowledge of the secret power by which the one

object produces the other; nor is it, by any process of reasoning, he is engaged to draw this inference. But still he finds himself determined to draw it: And though he should be convinced that his understanding has no part in the operation, he would nevertheless continue in the same course of thinking. There is some other principle which determines him to form such a conclusion.

This principle is Custom or Habit. For wherever the repetition of any particular act or operation produces a propensity to renew the same act or operation, without being impelled by any reasoning or process of the understanding, we always say, that this propensity is the effect of *Custom*. By employing that word, we pretend not to have given the ultimate reason of such a propensity. We only point out a principle of human nature, which is universally acknowledged, and which is well known by its effects. Perhaps we can push our enquiries no farther, or pretend to give the cause of this cause; but must rest contented with it as the ultimate principle, which we can assign, of all our conclusions from experience. It is sufficient satisfaction, that we can go so far, without repining at the narrowness of our faculties because they will carry us no farther. And it is certain we here advance a very intelligible proposition at least, if not a true one, when we assert that, after the constant conjunction of two objects—heat and flame, for instance, weight and solidity—we are determined by custom alone to expect the one from the appearance of the other. This hypothesis seems even the only one which explains the difficulty, why we draw, from a thousand instances, an inference which we are not able to draw from one instance, that is, in no respect, different from them. Reason is incapable of any such variation. The conclusions which it draws from considering one circle are the same which it would form upon surveying all the circles in the universe. But no man, having seen only one body move after being impelled by another, could infer that every other body will move after a like impulse. All inferences from experience, therefore, are effects of custom, not of reasoning.*

*Nothing is more useful than for writers, even, on *moral*, *political*, or *physical* subjects to distinguish between *reason* and *experience*, and to suppose, that these species of argumentation are entirely different from each other. The former are taken for the mere result of our intellectual faculties, which, by considering *a priori* the nature of things, and examining the effects that must follow from their operation, establish particular principles of science and philosophy. The latter are supposed to be derived entirely from sense and observation, by which we learn what has actually resulted from the operation of particular objects, and are thence able to infer, what will, for the future, result from them. Thus, for instance, the limitations and restraints of civil government, and a legal constitution, may be defended, either from *reason*, which reflecting on the great frailty and corruption of human nature, teaches, that no man can safely be trusted with unlimited authority; or from *experience* and history which inform us of the enormous abuses, that ambition, in every age and country, has been found to make of so imprudent a confidence.

The same distribution between reason and experience is maintained in all our deliberations concerning the conduct of life; while the experienced statesman, general, physician, or merchant is trusted and followed; and the unpractised novice, with whatever natural talents endowed, neglected and despised. Though it be allowed, that reason may form very plausible conjectures with regard to the consequences of such a particular conduct in such the assistance of experience, which is alone able to give stability and certainty to the maxims, derived from study and reflection.

But notwithstanding that this distinction be thus universally received, both in the active speculative scenes of life, I shall not scruple to pronounce, that it is, at bottom, erroneous, at least, superficial.

If we examine those arguments, which, in any of the sciences above mentioned, are supposed to be the mere effects of reasoning and reflection, they will be found to terminate at last, in some general principle or conclusion, for which we can assign no reason but observation and experience. The only difference between them and those maxims, which are vulgarly esteemed the result of pure experience, is, that the former cannot be established without some process of thought, and some reflection on what we have observed, in order to distinguish its circumstances, and trace its consequences: Whereas in the latter, the experienced event is exactly and fully familiar to that which we infer as the result of any particular situation. The history of a Tiberius or a Nero makes us dread a like tyranny, were our monarchs freed from the restraints of laws and

Custom, then, is the great guide of human life. It is that principle alone which renders our experience useful to us, and makes us expect, for the future, a similar train of events with those which have appeared in the past. Without the influence of custom, we should be entirely ignorant of every matter of fact beyond what is immediately present to the memory and senses. We should never know to adjust means to ends, or to employ our natural powers in the production of any effect. There would be an end at once of all action, as well as of the chief part of speculation.

But here it may be proper to remark, that though our conclusions from experience carry us beyond our memory and senses, and assure us of matters of fact which happened in the most distant places and most remote ages, yet some fact must always be present to the senses or memory, from which we may first proceed in drawing these conclusions. A man, who should find in a desert country the remains of pompous buildings, would conclude that the country had, in ancient times, been cultivated by civilized inhabitants; but did nothing of this nature occur to him, he could never form such an inference. We learn the events of former ages from history; but then we must peruse the volumes in which this instruction is contained, and thence carry up our inferences from one testimony to another, till we arrive at the eyewitnesses and spectators of these distant events. In a word, if we proceed not upon some fact, present to the memory or senses, our reasonings would be merely hypothetical; and however the particular links might be connected with each other, the whole chain of inferences would have nothing to support it, nor could we ever, by its means, arrive at the knowledge of any real existence. If I ask why you believe any particular matter of fact, which you relate, you must tell me some reason; and this reason will be some other fact, connected with it. But as you cannot proceed after this manner, *in infinitum*, you must at last terminate in some fact, which is present to your memory or senses; or must allow that your belief is entirely without foundation.

What, then, is the conclusion of the whole matter? A simple one; though, it must be confessed, pretty remote from the common theories of philosophy. All belief of matter of fact or real existence is derived merely from some object, present to the memory or senses, and a customary conjunction between that and some other object. Or in other words; having found in many instances, that any two kinds of objects—flame and heat, snow and cold—have always been conjoined together; if flame or snow be presented anew to the senses, the mind is carried by custom to expect heat or cold, and to *believe* that such a quality does exist, and will discover itself upon a nearer approach. This belief is the necessary result of placing the mind in such circumstances. It is an operation of the soul, when we are so situated, as unavoidable as to feel the passion of love, when we

senates. But the observation of any fraud or cruelty in private life is sufficient, with the aid of a little thought, to give us the same apprehension; while it serves as an instance of the general corruption of human nature, and shows us the danger which we must incur by reposing an entire confidence in mankind. In both cases, it is experience which is ultimately the foundation of our inference and conclusion.

There is no man so young and experienced, as not to have formed, from observation, many general and just maxims concerning human affairs and the conduct of life; but it must be confessed, that, when a man comes to put these in practice, he will be extremely liable to error, till time and farther experience both enlarge these maxims, and teach him their proper use and application. In every situation or incident, there are many particular and seemingly minute circumstances, which the man of greatest talent is, at first, apt to overlook, though on them the justness of his conclusions, and consequently the prudence of his conduct, entirely depend. Not to mention, that, to a young beginner, the general observations and maxims occur not always on the proper occasions, nor can be immediately applied with due calmness and distinction. The truth is, an unexperienced reasoner could be no reasoner at all, were he absolutely unexperienced; and when we assign that character to any one, we mean it only in a comparative sense, and suppose him possessed of experience, in a smaller and more imperfect degree.

receive benefits; or hatred, when we meet with injuries. All these operations are a species of natural instincts, which no reasoning or process of the thought and understanding is able either to produce or to prevent.

At this point, it would be very allowable for us to stop our philosophical researches. In most questions we can never make a single step farther; and in all questions we must terminate here at last, after our most restless and curious enquiries. But still our curiosity will be pardonable, perhaps commendable, if it carry us on to still farther researches, and make us examine more accurately the nature of this belief, and of the *customary conjunction*, whence it is derived. By this means we may meet with some explications and analogies that will give satisfaction; at least to such as love the abstract sciences, and can be entertained with speculations, which, however accurate, may still retain a degree of doubt and uncertainty. As to readers of a different taste; the remaining part of this section is not calculated for them, and the following enquiries may well be understood, though it be neglected.

PART II

Nothing is more free than the imagination of man; and though it cannot exceed that original stock of ideas furnished by the internal and external senses, it has unlimited power of mixing, compounding, separating, and dividing these ideas, in all the varieties of fiction and vision. It can feign a train of events, with all the appearance of reality, ascribe to them a particular time and place, conceive them as existent, and paint them out to itself with every circumstance, that belongs to any historical fact, which it believes with the greatest certainty. Wherein, therefore, consists the difference between such a *fiction* and *belief*? It lies not merely in any peculiar idea, which is annexed to such a conception as commands our assent, and which is wanting to every known fiction. For as the mind has authority over all its ideas, it could voluntarily annex this particular idea to any fiction, and consequently be able to believe whatever it pleases; contrary to what we find by daily experience. We can, in our conception, join the head of a man to the body of a horse; but it is not in our power to believe that such an animal has ever really existed.

It follows, therefore, that the difference between fiction and belief lies in some sentiment or feeling, which is annexed to the latter, not to the former, and which depends not on the will, nor can be commanded at pleasure. It must be excited by nature, like all other sentiments; and must arise from the particular situation, in which the mind is placed at any particular juncture. Whenever any object is presented to the memory or senses, it immediately, by the force of custom, carries the imagination to conceive that object, which is usually conjoined to it; and this conception is attended with a feeling or sentiment, different from the loose reveries of the fancy. In this consists the whole nature of belief. For as there is no matter of fact which we believe so firmly that we cannot conceive the contrary, there would be no difference between the conception assented to and that which is rejected, were it not for some sentiment which distinguishes the one from the other. If I see a Billiard-ball moving towards another, on a smooth table, I can easily conceive it to stop upon contact. This conception implies no contradiction; but still it feels very differently from that conception by which I represent to myself the impulse and the communication of motion from one ball to another.

Were we to attempt a *definition* of this sentiment, we should, perhaps, find it a very difficult, if not an impossible task; in the same manner as if we should endeavour to define the feeling of cold or passion of anger, to a creature who never had any experience of these

sentiments. Belief is the true and proper name of this feeling; and no one is ever at a loss to know the meaning of that term; because every man is every moment conscious of the sentiment represented by it. It may not, however, be improper to attempt a *description* of this sentiment; in hopes we may, by that means, arrive at some analogies, which may afford a more perfect explication of it. I say, then, that belief is nothing but a more vivid, lively, forcible, firm, steady conception of an object, than what the imagination alone is ever able to attain. This variety of terms, which may seem so unphilosophical, is intended only to express that act of the mind, which renders realities, or what is taken for such, more present to us than fictions, causes them to weigh more in the thought, and gives them a superior influence on the passions and imagination. Provided we agree about the thing, it is needless to dispute about the terms. The imagination has the command over all its ideas, and can join and mix and vary them, in all the ways possible. It may conceive fictitious objects with all the circumstances of place and time. It may set them, in a manner, before our eyes, in their true colours, just as they might have existed. But as it is impossible that this faculty of imagination can ever, of itself, reach belief, it is evident that belief consists not in the peculiar nature or order of ideas, but in the *manner* of their conception, and in their *feeling* to the mind. I confess, that it is impossible perfectly to explain this feeling or manner of conception. We may make use of words which express something near it. But its true and proper name, as we observed before, is *belief*; which is a term that every one sufficiently understands in common life. And in philosophy, we can go no farther than assert, that *belief* is something felt by the mind, which distinguishes the ideas of the judgement from the fictions of the imagination. It gives them more weight and influence; makes them appear of greater importance; enforces them in the mind; and renders them the governing principle of our actions. I hear at present, for instance, a person's voice, with whom I am acquainted; and the sound comes as from the next room. This impression of my senses immediately conveys my thought to the person, together with all the surrounding objects. I paint them out to myself as existing at present, with the same qualities and relations, of which I formerly knew them possessed. These ideas take faster hold of my mind than ideas of an enchanted castle. They are very different to the feeling, and have a much greater influence of every kind, either to give pleasure or pain, joy or sorrow.

Let us, then, take in the whole compass of this doctrine, and allow, that the sentiment of belief is nothing but a conception more intense and steady than what attends the mere fictions of the imagination, and that this manner of conception arises from a customary conjunction of the object with something present to the memory or senses: I believe that it will not be difficult, upon these suppositions, to find other operations of the mind analogous to it, and to trace up these phenomena to principles still more general.

We have already observed that nature has established connexions among particular ideas, and that no sooner one idea occurs to our thoughts than it introduces its correlative, and carries our attention towards it, by a gentle and insensible movement. These principles of connexion or association we have reduced to three, namely, *Resemblance*, *Contiguity* and *Causation*; which are the only bonds that unite our thoughts together, and beget that regular train of reflection or discourse, which, in a greater or less degree, takes place among mankind. Now here arises a question, on which the solution of the present difficulty will depend. Does it happen, in all these relations, that, when one of the objects is presented to the senses or memory the mind is not only carried to the conception of the correlative, but reaches a steadier and stronger conception of it than what otherwise it would have been able to attain? This seems to be the case with that belief which arises from the relation of cause and effect. And if the

case be the same with the other relations or principles of associations, this may be established as a general law, which takes place in all the operations of the mind.

We may, therefore, observe, as the first experiment to our present purpose, that, upon the appearance of the picture of an absent friend, our idea of him is evidently enlivened by the *resemblance*, and that every passion, which that idea occasions, whether of joy or sorrow, acquires new force and vigour. In producing this effect, there concur both a relation and a present impression. Where the picture bears him no resemblance, at least was not intended for him, it never so much as conveys our thought to him: And where it is absent, as well as the person, though the mind may pass from the thought of the one to that of the other, it feels its idea to be rather weakened than enlivened by that transition. We take a pleasure in viewing the picture of a friend, when it is set before us; but when it is removed, rather choose to consider him directly than by reflection in an image, which is equally distant and obscure.

The ceremonies of the Roman Catholic religion may be considered as instances of the same nature. The devotees of that superstition usually plead in excuse for the mummeries, with which they were upbraided, that they feel the good effect of those external motions, and postures, and actions, in enlivening their devotion and quickening their fervour, which otherwise would decay, if directed entirely to distant and immaterial objects. We shadow out the objects of our faith, say they, in sensible types and images, and render them more present to us by the immediate presence of these types, than it is possible for us to do merely by an intellectual view and contemplation. Sensible objects have always a greater influence on the fancy than any other; and this influence they readily convey to those ideas to which they are related, and which they resemble. I shall only infer from these practices, and reasoning, that the effect of resemblance in enlivening the ideas is very common; and as in every case a resemblance and a present impression must concur, we are abundantly supplied with experiments to prove the reality of the foregoing principle.

We may add force to these experiments by others of a different kind, in considering the effects of *contiguity* as well as of *resemblance*. It is certain that distance diminishes the force of every idea, and that, upon our approach to any object; though it does not discover itself to our senses; it operates upon the mind with an influence, which imitates an immediate impression. The thinking on any object readily transports the mind to what is contiguous; but it is only the actual presence of an object, that transports it with a superior vivacity. When I am a few miles from home, whatever relates to it touches me more nearly than when I am two hundred leagues distant; though even at that distance the reflecting on any thing in the neighbourhood of my friends or family naturally produces an idea of them. But as in this latter case, both the objects of the mind are ideas; notwithstanding there is an easy transition between them; that transition alone is not able to give a superior vivacity to any of the ideas, for want of some immediate impression.* No one can doubt but causation has the same influence as the other two relations of resemblance and contiguity. Superstitious people are fond of the relics

*“Should I call it our nature or some error that leads us to feel more deeply moved upon seeing places where memorable men are said to have spent much time than we feel when hearing of their deeds or reading their writings? Thus I feel deeply moved now. For Plato comes to my mind, who is said to have been the first philosopher to have made a practice of holding discussions here; and his little garden nearby not only stirs memories but makes me all but see him in the flesh. Here is Speusippus, here Xenocrates, here his student Polemo; it was his seat that we see before us. Even looking at our senate building—that of Hostilius, not the new building which looks smaller to me since it was made larger—made me think of Scipio, Cato, Laelius, and above all my grandfather. Such power of stirring recollection resides in places: no wonder that the training of the memory is based on them.” Cicero, *De Finibus*, Book V. [Hume’s footnote is in Latin, translation by W.K.]

of saints and holy men, for the same reason, that they seek after types or images, in order to enliven their devotion, and give them a more intimate and strong conception of those exemplary lives, which they desire to imitate. Now it is evident, that one of the best relics, which a devotee could procure, would be the handywork of a saint; and if his clothes and furniture are ever to be considered in this light, it is because they were once at his disposal, and were moved and affected by him; in which respect they are to be considered as imperfect effects, and as connected with him by a shorter chain of consequences than any of those, by which we learn the reality of his existence.

Suppose, that the son of a friend, who had been long dead or absent, were presented to us; it is evident, that this object would instantly revive its correlative idea, and recall to our thoughts all past intimacies and familiarities, in more lively colours than they would otherwise have appeared to us. This is another phenomenon, which seems to prove the principle above mentioned.

We may observe, that, in these phenomena, the belief of the correlative object is always presupposed; without which the relation could have no effect. The influence of the picture supposes, that we *believe* our friend to have once existed. Contiguity to home can never excite our ideas of home, unless we *believe* that it really exists. Now I assert, that this belief, where it reaches beyond the memory or senses, is of a similar nature, and arises from similar causes, with the transition of thought and vivacity of conception here explained. When I throw a piece of dry wood into a fire, my mind is immediately carried to conceive, that it augments, not extinguishes the flame. This transition of thought from the cause to the effect proceeds not from reason. It derives its origin altogether from custom and experience. And as it first begins from an object, present to the senses, it renders the idea or conception of flame more strong and lively than any loose, floating reverie of the imagination. That idea arises immediately. The thought moves instantly towards it, and conveys to it all that force of conception, which is derived from the impression present to the senses. When a sword is levelled at my breast, does not the idea of wound and pain strike me more strongly, than when a glass of wine is presented to me, even though by accident this idea should occur after the appearance of the latter object? But what is there in this whole matter to cause such a strong conception, except only a present object and a customary transition to the idea of another object, which we have been accustomed to conjoin with the former? This is the whole operation of the mind, in all our conclusions concerning matter of fact and existence; and it is a satisfaction to find some analogies, by which it may be explained. The transition from a present object does in all cases give strength and solidity to the related idea.

Here, then, is a kind of pre-established harmony between the course of nature and the succession of our ideas; and though the powers and forces, by which the former is governed, be wholly unknown to us; yet our thoughts and conceptions have still, we find, gone on in the same train with the other work of nature. Custom is that principle, by which this correspondence has been effected; so necessary to the subsistence of our species, and the regulation of our conduct, in every circumstance and occurrence of human life. Had not the presence of an object, instantly excited the idea of those objects, commonly conjoined with it, all our knowledge must have been limited to the narrow sphere of our memory and senses; and we should never have been able to adjust means to ends, or employ our natural powers, either to the producing of good, or avoiding of evil. Those, who delight in the discovery and contemplation of *final causes*, have here ample subject to employ their wonder and admiration.

I shall add, for a further confirmation of the foregoing theory, that, as this operation of the mind, by which we infer like effects from like causes, and *vice versa*, is so essential

The North-East View of Edinburgh Castle, 1675, by John Slezer (1650?–1714). David Hume was born and raised in Edinburgh and, apart from his time in France, spent most of his adult life there. (National Library of Scotland)

to the subsistence of all human creatures, it is not probable, that it could be trusted to the fallacious deductions of our reason, which is slow in its operations; appears not, in any degree, during the first years of infancy; and at best is, in every age and period of human life, extremely liable to error and mistake. It is more conformable to the ordinary wisdom of nature to secure so necessary an act of the mind, by some instinct or mechanical tendency, which may be infallible in its operations, may discover itself at the first appearance of life and thought, and may be independent of all the laboured deductions of the understanding. As nature has taught us the use of our limbs, without giving us the knowledge of the muscles and nerves, by which they are actuated; so has she implanted in us an instinct, which carries forward the thought in a correspondent course to that which she has established among external objects; though we are ignorant of those powers and forces, on which this regular course and succession of objects totally depends.

SECTION VI. OF PROBABILITY*

Though there be no such thing as *Chance* in the world; our ignorance of the real cause of any event has the same influence on the understanding, and begets a like species of belief or opinion.

There is certainly a probability, which arises from a superiority of chances on any side; and according as this superiority increases, and surpasses the opposite chances,

*Mr. Locke divides all arguments into demonstrative and probable. In this view, we must say, that it is only probable all men must die, or that the sun will rise tomorrow. But to conform our language more to common use, we ought to divide arguments into *demonstrations*, *proofs*, and *probabilities*. By proofs meaning such arguments from experience as leave no room for doubt or opposition.

the probability receives a proportionable increase, and begets still a higher degree of belief or assent to that side, in which we discover the superiority. If a dye were marked with one figure or number of spots on four sides, and with another figure or number of spots on the two remaining sides, it would be more probable, that the former would turn up than the latter; though, if it had a thousand sides marked in the same manner, and only one side different, the probability would be much higher, and our belief or expectation of the event more steady and secure. This process of the thought or reasoning may seem trivial and obvious; but to those who consider it more narrowly, it may, perhaps, afford matter for curious speculation.

It seems evident, that, when the mind looks forward to discover the event, which may result from the throw of such a dye, it considers the turning up of each particular side as alike probable; and this is the very nature of chance, to render all the particular events, comprehended in it, entirely equal. But finding a greater number of sides concur in the one event than in the other, the mind is carried more frequently to that event, and meets it oftener, in revolving the various possibilities or chances, on which the ultimate result depends. This concurrence of several views in one particular event begets immediately, by an inexplicable contrivance of nature, the sentiment of belief, and gives that event the advantage over its antagonist, which is supported by a smaller number of views, and recurs less frequently to the mind. If we allow, that belief is nothing but a firmer and stronger conception of an object than what attends the mere fictions of the imagination, this operation may, perhaps, in some measure, be accounted for. The concurrence of these several views or glimpses imprints the idea more strongly on the imagination; gives it superior force and vigour; renders its influence on the passions and affections more sensible; and in a word, begets that reliance or security, which constitutes the nature of belief and opinion.

The case is the same with the probability of causes, as with that of chance. There are some causes, which are entirely uniform and constant in producing a particular effect; and no instance has ever yet been found of any failure or irregularity in their operation. Fire has always burned, and water suffocated every human creature: The production of motion by impulse and gravity is an universal law, which has hitherto admitted of no exception. But there are other causes which have been found more irregular and uncertain; nor has rhubarb always proved a purge, or opium a soporific to every one, who has taken these medicines. It is true, when any cause fails of producing its usual effect, philosophers ascribe not this to any irregularity in nature; but suppose, that some secret causes, in the particular structure of parts, have prevented the operation. Our reasonings, however, and conclusions concerning the event are the same as if this principle had no place. Being determined by custom to transfer the past to the future, in all our inferences; where the past has been entirely regular and uniform, we expect the event with the greatest assurance, and leave no room for any contrary supposition. But where different effects have been found to follow from causes, which are to *appearance* exactly similar, all these various effects must occur to the mind in transferring the past to the future, and enter into our consideration, when we determine the probability of the event. Though we give the preference to that which has been found most usual, and believe that this effect will exist, we must not overlook the other effects, but must assign to each of them a particular weight and authority, in proportion as we have found it to be more or less frequent. It is more probable, in almost every country of Europe, that there will be frost sometime in January, than that the weather will continue open throughout the whole month; though this probability varies according to the different climates, and approaches to a certainty in the more northern kingdoms. Here then it seems evident, that, when we transfer the past to the future, in order to determine the effect, which will result from any cause, we transfer all

the different events, in the same proportion as they have appeared in the past, and conceive one to have existed a hundred times, for instance, another ten times, and another once. As a great number of views do here concur in one event, they fortify and confirm it to the imagination, beget that sentiment which we call *belief*, and give its object the preference above the contrary event, which is not supported by an equal number of experiments, and recurs not so frequently to the thought in transferring the past to the future. Let any one try to account for this operation of the mind upon any of the received systems of philosophy, and he will be sensible of the difficulty. For my part, I shall think it sufficient, if the present hints excite the curiosity of philosophers, and make them sensible how defective all common theories are in treating of such curious and such sublime subjects.

SECTION VII. OF THE IDEA OF NECESSARY CONNEXION

PART I

The great advantage of the mathematical sciences above the moral consists in this, that the ideas of the former, being sensible, are always clear and determinate, the smallest distinction between them is immediately perceptible, and the same terms are still expressive of the same ideas, without ambiguity or variation. An oval is never mistaken for a circle, nor an hyperbola for an ellipsis. The isosceles and scalenum are distinguished by boundaries more exact than vice and virtue, right and wrong. If any term be defined in geometry, the mind readily, of itself, substitutes, on all occasions, the definition for the term defined: Or even when no definition is employed, the object itself may be presented to the senses, and by that means be steadily and clearly apprehended. But the finer sentiments of the mind, the operations of the understanding, the various agitations of the passions, though really in themselves distinct, easily escape us, when surveyed by reflection; nor is it in our power to recall the original object, as often as we have occasion to contemplate it. Ambiguity, by this means, is gradually introduced into our reasonings: Similar objects are readily taken to be the same: And the conclusion becomes at last very wide of the premises.

One may safely, however, affirm, that, if we consider these sciences in a proper light, their advantages and disadvantages nearly compensate each other, and reduce both of them to a state of equality. If the mind, with greater facility, retains the ideas of geometry clear and determinate, it must carry on a much longer and more intricate chain of reasoning, and compare ideas much wider of each other, in order to reach the abstruser truths of that science. And if moral ideas are apt, without extreme care, to fall into obscurity and confusion, the inferences are always much shorter in these disquisitions, and the intermediate steps, which lead to the conclusion, much fewer than in the sciences which treat of quantity and number. In reality, there is scarcely a proposition in Euclid so simple, as not to consist of more parts, than are to be found in any moral reasoning which runs not into chimera and conceit. Where we trace the principles of the human mind through a few steps, we may be very well satisfied with our progress; considering how soon nature throws a bar to all our enquiries concerning causes, and reduces us to an acknowledgment of our ignorance. The chief obstacle, therefore, to our improvement in the moral or metaphysical sciences is the obscurity of the ideas, and ambiguity of the terms. The principal difficulty in the mathematics is the length of inferences and compass of thought, requisite to the forming of any conclusion. And, perhaps, our progress in

natural philosophy is chiefly retarded by the want of proper experiments and phenomena, which are often discovered by chance, and cannot always be found, when requisite, even by the most diligent and prudent enquiry. As moral philosophy seems hitherto to have received less improvement than either geometry or physics, we may conclude, that, if there be any difference in this respect among these sciences, the difficulties, which obstruct the progress of the former, require superior care and capacity to be surmounted.

There are no ideas, which occur in metaphysics, more obscure and uncertain, than those of *power, force, energy* or *necessary connexion*, of which it is every moment necessary for us to treat in all our disquisitions. We shall, therefore, endeavour, in this section, to fix, if possible, the precise meaning of these terms, and thereby remove some part of that obscurity, which is so much complained of in this species of philosophy.

It seems a proposition, which will not admit of much dispute, that all our ideas are nothing but copies of our impressions, or, in other words, that it is impossible for us to *think* of any thing, which we have not antecedently *felt*, either by our external or internal senses. I have endeavoured* to explain and prove this proposition, and have expressed my hopes, that, by a proper application of it, men may reach a greater clearness and precision in philosophical reasonings, than what they have hitherto been able to attain. Complex ideas may, perhaps, be well known by definition, which is nothing but an enumeration of those parts or simple ideas, that compose them. But when we have pushed up definitions to the most simple ideas, and find still some ambiguity and obscurity; what resource are we then possessed of? By what invention can we throw light upon these ideas, and render them altogether precise and determinate to our intellectual view? Produce the impressions or original sentiments, from which the ideas are copied. These impressions are all strong and sensible. They admit not of ambiguity. They are not only placed in a full light themselves, but may throw light on their correspondent ideas, which lie in obscurity. And by this means, we may, perhaps, attain a new microscope or species of optics, by which, in the moral sciences, the most minute, and most simple ideas may be so enlarged as to fall readily under our apprehension, and be equally known with the grossest and most sensible ideas, that can be the object of our enquiry.

To be fully acquainted, therefore, with the idea of power or necessary connexion, let us examine its impression; and in order to find the impression with greater certainty, let us search for it in all the sources, from which it may possibly be derived.

When we look about us towards external objects, and consider the operation of causes, we are never able, in a single instance, to discover any power or necessary connexion; and quality, which binds the effect to the cause, and renders the one an infallible consequence of the other. We only find, that the one does actually, in fact, follow the other. The impulse of one Billiard-ball is attended with motion in the second. This is the whole that appears to the *outward senses*. The mind feels no sentiment or *inward* impression from this succession of objects: Consequently there is not, in any single, particular instance of cause and effect, any thing which can suggest the idea of power or necessary connexion.

From the first appearance of an object, we never can conjecture what effect will result from it. But were the power or energy of any cause discoverable by the mind, we could foresee the effect, even without experience; and might, at first, pronounce with certainty concerning it, by mere dint of thought and reasoning.

In reality, there is no part of matter, that does ever, by its sensible qualities, discover any power or energy, or give us ground to imagine, that it could produce any thing, or be followed by any other object, which we could denominate its effect. Solidity, extension,

*Section II.

motion; these qualities are all complete in themselves, and never point out any other event which may result from them. The scenes of the universe are continually shifting, and one object follows another in an uninterrupted succession; but the power of force, which actuates the whole machine, is entirely concealed from us, and never discovers itself in any of the sensible qualities of body. We know, that, in fact, heat is a constant attendant of flame; but what is the connexion between them, we have no room so much as to conjecture or imagine. It is impossible, therefore, that the idea of power can be derived from the contemplation of bodies, in single instances of their operation; because no bodies ever discover any power, which can be the original of this idea.*

Since, therefore, external objects as they appear to the senses, give us no idea of power or necessary connexion, by their operation in particular instances, let us see, whether this idea be derived from reflection on the operations of our own minds, and be copied from any internal impression. It may be said, that we are every moment conscious of internal power; while we feel, that, by the simple command of our will, we can move the organs of our body, or direct the faculties of our mind. An act of volition produces motion in our limbs, or raises a new idea in our imagination. This influence of the will we know by consciousness. Hence we acquire the idea of power or energy; and are certain, that we ourselves and all other intelligent beings are possessed of power. This idea, then, is an idea of reflection, since it arises from reflecting on the operations of our own mind, and on the command which is exercised by will, both over the organs of the body and faculties of the soul.

We shall proceed to examine this pretension; and first with regard to the influence of volition over the organs of the body. This influence, we may observe, is a fact, which, like all other natural events, can be known only by experience, and can never be foreseen from any apparent energy or power in the cause, which connects it with the effect, and renders the one an infallible consequence of the other. The motion of our body follows upon the command of our will. Of this we are every moment conscious. But the means, by which this is effected; the energy, by which the will performs so extraordinary an operation; of this we are so far from being immediately conscious, that it must for ever escape our most diligent enquiry.

For *first*; is there any principle in all nature more mysterious than the union of soul with body; by which a supposed spiritual substance acquires such an influence over a material one, that the most refined thought is able to actuate the grossest matter? Were we empowered, by a secret wish, to remove mountains, or control the planets in their orbit; this extensive authority would not be more extraordinary, nor more beyond our comprehension. But if by consciousness we perceived any power or energy in the will, we must know this power; we must know its connexion with the effect; we must know the secret union of soul and body, and the nature of both these substances; by which the one is able to operate, in so many instances, upon the other.

Secondly, We are not able to move all the organs of the body with a like authority; though we cannot assign any reason besides experience, for so remarkable a difference between one and the other. Why has the will an influence over the tongue and fingers, not over the heart and liver? This question would never embarrass us, were we conscious of a power in the former case, not in the latter. We should then perceive, independent of experience, why the authority of will over the organs of the body is circumscribed within such particular limits. Being in that case fully acquainted with the power or force, by

*Mr. Locke, in his chapter of power, says, that, finding from experience, that there are several new productions in matter, and concluding that there must somewhere be a power capable of producing them, we arrive at last by this reasoning at the idea of power. But no reasoning can ever give us a new, original, simple idea; as this philosopher himself confesses. This, therefore, can never be the origin of that idea.

which it operates, we should also know, why its influence reaches precisely to such boundaries, and no farther.

A man, suddenly struck with palsy in the leg or arm, or who had newly lost those members, frequently endeavours, at first to move them, and employ them in their usual offices. Here he is as much conscious of power to command such limbs, as a man in perfect health is conscious of power to actuate any member which remains in its natural state and condition. But consciousness never deceives. Consequently, neither in the one case nor in the other, are we ever conscious of any power. We learn the influence of our will from experience alone. And experience only teaches us, how one event constantly follows another; without instructing us in the secret connexion, which binds them together, and renders them inseparable.

Thirdly, We learn from anatomy, that the immediate object of power in voluntary motion, is not the member itself which is moved, but certain muscles, and nerves, and animal spirits, and, perhaps, something still more minute and more unknown, through which the motion is successfully propagated, ere it reach the member itself whose motion is the immediate object of volition. Can there be a more certain proof that the power, by which this whole operation is performed, so far from being directly and fully known by an inward sentiment or consciousness, is, to the last degree, mysterious and unintelligible? Here the mind wills a certain event: Immediately another event, unknown to ourselves, and totally different from the one intended, is produced: This event produces another, equally unknown: Till at last, through a long succession, the desired event is produced. But if the original power were felt, it must be known: Were it known, its effect also must be known; since all power is relative to its effect. And *vice versa*, if the effect be not known, the power cannot be known nor felt. How indeed can we be conscious of a power to move our limbs, when we have no such power; but only that to move certain animal spirits, which, though they produce at last the motion of our limbs, yet operate in such a manner as is wholly beyond our comprehension?

We may, therefore, conclude from the whole, I hope, without any temerity, though with assurance; that our idea of power is not copied from any sentiment or consciousness of power within ourselves, when we give rise to animal motion, or apply our limbs, to their proper use and office. That their motion follows the command of the will is a matter of common experience, like other natural events: But the power or energy by which this is effected, like that in other natural events, is unknown and inconceivable.*

Shall we then assert, that we are conscious of a power or energy in our own minds, when, by an act or command of our will, we raise up a new idea, fix the mind to the contemplation of it, turn it on all sides, and at last dismiss it for some other idea, when we think that we have surveyed it with sufficient accuracy? I believe the same arguments will prove, that even this command of the will gives us no real idea of force or energy.

*It may be pretended, that the resistance which we meet with in bodies, obliging us frequently to exert our force, and call up all our power, this gives us the idea of force and power. It is this *nisus*, or strong endeavour, of which we are conscious, that is the original impression from which this idea is copied. But, *first*, we attribute power to a vast number of objects, where we never can suppose this resistance or exertion of force to take place, to the Supreme Being, who never meets with any resistance; to the mind in its command over its ideas and limbs, in common thinking and motion, where the effect follows immediately upon the will, without any exertion or summoning up of force, to inanimate matter, which is not capable of this sentiment. *Secondly*, This sentiment of an endeavour to overcome resistance has no known connexion with any event: What follows it we know by experience; but could not know it *a priori*. It must, however, be confessed that the animal *nisus*, which we experience though it can afford no accurate precise idea of power, enters very much into that vulgar, inaccurate idea, which is formed of it.

First, It must be allowed, that, when we know a power, we know that very circumstance is the cause, by which it is enabled to produce the effect: For these are supposed to be synonymous. We must, therefore, know both the cause and effect, and the relation between them. But do we pretend to be acquainted with the nature of the human soul and the nature of an idea, or the aptitude of the one to produce the other? This is a real creation; a production of something out of nothing: Which implies a power so great, that it may seem, at first sight, beyond the reach of any being, less than infinite. At least it must be owned, that such a power is not felt, nor known, nor even conceivable by the mind. We only feel the event, namely, the existence of an idea, consequent to a command of the will: But the manner, in which this operation is performed, the power by which it is produced, is entirely beyond our comprehension.

Secondly, The command of the mind over itself is limited, as well as its command over the body; and these limits are not known by reason, or any acquaintance with the nature of cause and effect, but only by experience and observation, as in all other natural events and in the operation of external objects. Our authority over our sentiments and passions is much weaker than that over our ideas; and even the latter authority is circumscribed within very narrow boundaries, or show why the power is deficient in one case, not in another.

Thirdly, This self-command is very different at different times. A man in health possesses more of it than one languishing with sickness. We are more master of our thoughts in the morning than in the evening: Fasting, than after a full meal. Can we give any reason for these variations, except experience? Where then is the power, of which we pretend to be conscious? Is there not here, either in a spiritual or material substance, or both, some secret mechanism or structure of parts, upon which the effect depends, and which, being entirely unknown to us, renders the power or energy of the will equally unknown and incomprehensible?

Volition is surely an act of the mind, with which we are sufficiently acquainted. Reflect upon it. Consider it on all sides. Do you find anything in it like this creative power, by which it raises from nothing a new idea, and with a kind of *Fiat*, imitates the omnipotence of its Maker, if I may be allowed so to speak, who called forth into existence all the various scenes of nature? So far from being conscious of this energy in the will, it requires as certain experience as that of which we are possessed, to convince us that such extraordinary effects do ever result from a simple act of volition.

The generality of mankind never find any difficulty in accounting for the more common and familiar operations of nature—such as the descent of heavy bodies, the growth of plants, the generation of animals, or the nourishment of bodies by food: But suppose that, in all these cases, they perceive the very force or energy of the cause, by which it is connected with its effect, and is for ever infallible in its operation. They acquire, by long habit, such a turn of mind, that, upon the appearance of the cause, they immediately expect with assurance its usual attendant, and hardly conceive it possible that any other event could result from it. It is only on the discovery of extraordinary phenomena, such as earthquakes, pestilence, and prodigies of any kind, that they find themselves at a loss to assign a proper cause, and to explain the manner in which the effect is produced by it. It is usual for men, in such difficulties, to have recourse to some invisible intelligent principle as the Immediate cause of that event which surprises them, and which, they think, cannot be accounted for from the common powers of nature. But philosophers, who carry their scrutiny a little farther, immediately perceive that, even in the most familiar events, the energy of the cause is as unintelligible as in the most unusual, and that we only learn by experience the frequent *Conjunction* of objects, without being ever able to comprehend anything like *Connexion* between them. Here, then, many philosophers think themselves

obliged by reason to have recourse, on all occasions, to the same principle, which the vulgar never appeal to but in cases that appear miraculous and supernatural. They acknowledge mind and intelligence to be, not only the ultimate and original cause of all things, but the immediate and sole cause of every event which appears in nature. They pretend that those objects which are commonly denominated *causes*, are in reality nothing but *occasions*; and that the true and direct principle of every effect is not any power or force in nature, but a volition of the Supreme Being, who wills that such particular objects should for ever be conjoined with each other. Instead of saying that one Billiard-ball moves another by a force which it has derived from the author of nature, it is the Deity himself, they say, who, by a particular volition, moves the second ball, being determined to this operation by the impulse of the first ball, in consequence of those general laws which he has laid down to himself in the government of the universe. But philosophers advancing still in their inquiries, discover that, as we are totally ignorant of the power on which depends the mutual operation of bodies, we are no less ignorant of that power on which depends the operation of mind on body, or of body on mind; nor are we able, either from our sense or consciousness, to assign the ultimate principle in one case more than in the other. The same ignorance, therefore, reduces them to the same conclusion. They assert that the Deity is the immediate cause of the union between soul and body; and that they are not the organs of sense, which, being agitated by external objects, produce sensations in the mind; but that it is a particular volition of our omnipotent Maker, which excites such a sensation, in consequence of such a motion in the organ. In like manner, it is not any energy in the will that produces local motion in our members: It is God himself, who is pleased to second our will, in itself important, and to command that motion which we erroneously attribute to our own power and efficacy. Nor do philosophers stop at this conclusion. They sometimes extend the same inference to the mind itself, in its internal operations. Our mental vision or conception of ideas is nothing but a revelation made to us by our Maker. When we voluntarily turn our thoughts to any object, and raise up its image in the fancy, it is not the will which creates that idea: It is the universal Creator, who discovers it to the mind, and renders it present to us.

Thus, according to these philosophers, every thing is full of God. Not content with the principle, that nothing exists but by his will, that nothing possesses any power but by his concession: They rob nature, and all created beings, of every power, in order to render their dependence on the Deity still more sensible and immediate. They consider not that, by this theory, they diminish, instead of magnifying, the grandeur of those attributes, which they affect so much to celebrate. It argues surely more power in the Deity to delegate a certain degree of power to inferior creatures, than to produce every thing by his own immediate volition. It argues more wisdom to contrive at first the fabric of the world with such perfect foresight that, of itself, and by its proper operation, it may serve all the purposes of providence, than if the great Creator were obliged every moment to adjust its parts, and animate by his breath all the wheels of that stupendous machine.

But if we would have a more philosophical confutation of this theory, perhaps the two following reflections may suffice.

First, It seems to me that this theory of the universal energy and operation of the Supreme Being is too bold ever to carry conviction with it to a man, sufficiently apprized of the weakness of human reason, and the narrow limits to which it is confined in all its operations. Though the chain of arguments which conduct to it were ever so logical, there must arise a strong suspicion, if not an absolute assurance, that it has carried us quite beyond the reach of our faculties, when it leads to conclusions so extraordinary, and so remote from common life and experience. We are got into fairy land, long ere we have reached the last steps of our theory; and *there* we have no reason to

trust our common methods of argument, or to think that our usual analogies and probabilities have any authority. Our line is too short to fathom such immense abysses. And however we may flatter ourselves that we are guided, in every step which we take, by a kind of verisimilitude and experience, we may be assured that this fancied experience has no authority when we thus apply it to subjects that lie entirely out of the sphere of experience. But on this we shall have occasion to touch afterwards.*

Secondly, I cannot perceive any force in the arguments on which this theory is founded. We are ignorant, it is true, of the manner in which bodies operate on each other: Their force or energy is entirely incomprehensible: But are we not equally ignorant of the manner of force by which a mind, even the supreme mind, operates either on itself or on body? Whence, I beseech you, do we acquire any idea of it? We have no sentiment or consciousness of this power in ourselves. We have no idea of the Supreme Being but what we learn from reflection on our own faculties. Were our ignorance, therefore, a good reason for rejecting any thing, we should be led into that principle of denying all energy in the Supreme Being as much as in the grossest matter. We surely comprehend as little the operations of one as of the other. Is it more difficult to conceive that motion may arise from impulse than that it may arise from volition? All we know is our profound ignorance in both cases.**

PART II

But to hasten to a conclusion of this argument, which is already drawn out to too great a length: We have sought in vain for an idea of power or necessary connexion in all the sources from which we could suppose it to be derived. It appears that, in single instances of the operation of bodies, we never can, by our utmost scrutiny, discover any thing but one event following another, without being able to comprehend any force or power by which the cause operates, or any connexion between it and its supposed effect. The same difficulty occurs in contemplating the operations of mind on body—where we observe the motion of the latter to follow upon the volition of the former, but are not able to observe or conceive the tie which binds together the motion and volition, or the energy by which the mind produces this effect. The authority of the will over its own faculties and ideas is not a whit more comprehensible: So that, upon the whole, there appears not, throughout all nature, any one instance of connexion which is conceivable by us. All events seem entirely loose and separate. One event follows another; but we never can observe any tie between them. They seem *conjoined*, but never connected. And as we can have no idea of any thing which never appeared to our outward

*Section XII.

**I need not examine at length the *vis inertiae* [force of inertia] which is so much talked of in the new philosophy, and which is ascribed to matter. We find by experience, that a body at rest or in motion continues for ever in its present state, till put from it by some new cause; and that a body impelled takes as much motion from the impelling body as it acquires itself. These are facts. When we call this a *vis inertiae*, we only mark these facts, without pretending to have any idea of the inert power; in the same manner as, when we talk of gravity, we mean certain effects without comprehending that active power. It was never the meaning of SIR ISAAC NEWTON to rob second causes of all forces of energy though some of his followers have endeavoured to establish that theory upon his authority. On the contrary, that great philosopher had recourse to an ethereal active fluid to explain his universal attraction; though he was so cautious and modest as to allow that it was a mere hypothesis, not to be insisted on, without more experiments. I must confess, that there is something in the fate of opinions a little extraordinary. DESCARTES insinuated that doctrine of the universal and sole efficacy of the Deity, without insisting on it. MALEBRANCHE and other CARTESIANS made it the foundation of all their philosophy. It had, however, no authority in England. LOCKE, CLARKE, and CUDWORTH, never so much as take notice of it, but suppose all along, that matter has a real, though subordinate and derived power. By what means has it become so prevalent among our modern metaphysicians?

sense or inward sentiment, the necessary conclusion *seems* to be that we have no idea of connexion or power at all, and that these words are absolutely without any meaning, when employed either in philosophical reasonings or common life.

But there still remains one method of avoiding this conclusion, and one source which we have not yet examined. When any natural object or event is presented, it is impossible for us, by any sagacity or penetration, to discover, or even conjecture, without experience, what event will result from it, or to carry our foresight beyond that object which is immediately present to the memory and senses. Even after one instance or experiment where we have observed a particular event to follow upon another, we are not entitled to form a general rule, or foretell what will happen in like cases; it being justly esteemed an unpardonable temerity to judge of the whole course of nature from one single experiment, however accurate or certain. But when one particular species of event has always, in all instances, been conjoined with another, we make no longer any scruple of foretelling one upon the appearance of the other, and of employing that reasoning which can alone assure us of any matter of fact or existence. We then call the one object, *Cause*; the other, *Effect*. We suppose that there is some connexion between them; some power in the one, by which it infallibly produces the other, and operates with the greatest certainty and strongest necessity.

It appears, then, that this idea of a necessary connexion among events arises from a number of similar instances which occur of the constant conjunction of these events; nor can that idea ever be suggested by any one of these instances, surveyed in all possible lights and positions. But there is nothing in a number of instances, different from every single instance, which is supposed to be exactly similar; except only, that after a repetition of similar instances, the mind is carried by habit, upon the appearance of one event, to expect its usual attendant, and to believe that it will exist. This connexion, therefore, which we *feel* in the mind, this customary transition of the imagination from one object to its usual attendant, is the sentiment or impression from which we form the idea of power or necessary connexion. Nothing farther is in the case. Contemplate the subject on all sides; you will never find any other origin of that idea. This is the sole difference between one instance, from which we can never receive the idea of connexion, and a number of similar instances, by which it is suggested. The first time a man saw the communication of motion by impulse, as by the shock of two Billiard-balls, he could not pronounce that the one event was *connected*: but only that it was *conjoined* with the other. After he has observed several instances of this nature, he then pronounces them to be *connected*. What alteration has happened to give rise to this new idea of connexion? Nothing but that he now *feels* these events to be *connected* in his imagination, and can readily foretell the existence of one from the appearance of the other. When we say, therefore, that one object is connected with another, we mean only that they have acquired a connexion in our thought, and give rise to this inference, by which they become proofs of each other's existence: A conclusion which is somewhat extraordinary, but which seems founded on sufficient evidence. Nor will its evidence be weakened by any general diffidence of the understanding, or sceptical suspicion concerning every conclusion which is new and extraordinary. No conclusions can be more agreeable to scepticism than such as make discoveries concerning the weakness and narrow limits of human reason and capacity.

And what stronger instance can be produced of the surprising ignorance and weakness of the understanding than the present? For surely, if there be any relation among objects which it imports to us to know perfectly, it is that of cause and effect. On this are founded all our reasonings concerning matter of fact or existence. By means of it alone we attain any assurance concerning objects which are removed from the present testimony of our memory and senses. The only immediate utility of all sciences, is to teach us, how to control and regulate future events by their causes. Our thoughts and

enquiries are, therefore, every moment, employed about this relation: Yet so imperfect are the ideas which we form concerning it, that it is impossible to give any just definition of cause, except what is drawn from something extraneous and foreign to it. Similar objects are always conjoined with similar. Of this we have experience. Suitably to this experience, therefore, we may define a cause to be *an object, followed by another, and where all the objects similar to the first are followed by objects similar to the second. Or in other words where, if the first object had not been, the second never had existed.* The appearance of a cause always conveys the mind, by a customary transition, to the idea of the effect. Of this also we have experience. We may, therefore, suitably to this experience, form another definition of cause, and call it, *an object followed by another and whose appearance always conveys the thought to that other.* But though both these definitions be drawn from circumstances foreign to the cause, we cannot remedy this inconvenience, or attain any more perfect definition, which may point out that circumstance in the cause, which gives it a connexion with its effect. We have no idea of this connexion, nor even any distinct notion what it is we desire to know, when we endeavour at a conception of it. We say, for instance, that the vibration of this string is the cause of this particular sound. But what do we mean by that affirmation? We either mean *that this vibration is followed by this sound, and that all similar vibrations have been followed by similar sounds:* Or, that this vibration is followed by this sound, and that upon the appearance of one the mind anticipates the senses, and forms immediately an idea of the other. We may consider the relation of cause and effect in either of these two lights; but beyond these, we have no idea of it.*

To recapitulate, therefore, the reasonings of this section: Every idea is copied from some preceding impression or sentiment; and where we cannot find any impression, we may be certain that there is no idea. In all single instances of the operation of bodies or minds, there is nothing that produces any impression, nor consequently can suggest any idea of power or necessary connexion. But when many uniform instances appear, and the same object is always followed by the same event; we then begin to entertain the notion of cause and connexion. We then *feel* a new sentiment or impression, to wit, a customary connexion in the thought or imagination between one object and its usual attendant; and this sentiment is the original of that idea which we seek for. For as this idea arises from a number of similar instances, and not from any single instance, it must arise from that circumstance, in which the number of instances differ from every individual instance. But this customary connexion or transition of the

*According to these explanations and definitions, the idea of *power* is relative as much as that of cause; and both have a reference to an effect, or some other event constantly conjoined with the former. When we consider the *unknown* circumstance of an object, by which the degree of quantity of its effect is fixed and determined, we call that its power: And accordingly, it is allowed by all philosophers, that the effect is the measure of the power. But if they had any idea of power, as it is in itself, why could not they measure it in itself? The dispute whether the force of a body in motion be as its velocity, or the square of its velocity; this dispute, I say, need not be decided by comparing its effects in equal or unequal times; but by a direct mensuration and comparison.

As to the frequent use of the words, Force, Power, Energy, etc., which every where occur in common conversation, as well as in philosophy; that is no proof, that we are acquainted, in any instance, with the connecting principle between cause and effect or can account ultimately for the production of one thing to another. These words, as commonly used, have very loose meanings annexed to them; and their ideas in motion without the sentiment of a *nisus* or endeavour; and every animal has a sentiment or feeling from the stroke or blow of an external object, that is in motion. These sensations, which are merely animal, and from which we can *a priori* draw no inference, we are apt to transfer to inanimate objects, and to suppose, that they have some such feelings, whenever they transfer or receive motion. With regard to energies, which are exerted, without our annexing to them any idea of communicated motion, we consider only the constant experienced conjunction of the events; and as we *feel* a customary connexion between the ideas, we transfer that feeling to the objects; as nothing is more usual than to apply to external bodies every internal sensation which they occasion.

imagination is the only circumstance in which they differ. In every other particular they are alike. The first instance which we saw of motion communicated by the shock of two Billiard-balls (to return to this obvious illustration) is exactly similar to any instance that may, at present, occur to us; except only, that we could not, at first, *infer* one event from the other; which we are enabled to do at present, after so long a course of uniform experience. I know not whether the reader will readily apprehend this reasoning. I am afraid that, should I multiply words about it, or throw it into a greater variety of lights, it would only become more obscure and intricate. In all abstract reasonings there is one point of view which, if we can happily hit, we shall go farther towards illustrating the subject than by all the eloquence in the world. This point of view we should endeavour to reach, and reserve the flowers of rhetoric for subjects which are more adapted to them.

SECTION VIII. OF LIBERTY AND NECESSITY

PART I

It might reasonably be expected in questions which have been canvassed and disputed with great eagerness, since the first origin of science and philosophy, that the meaning of all the terms, at least, should have been agreed upon among the disputants; and our enquiries, in the course of two thousand years, been able to pass from words to the true and real subject of the controversy. For how easy may it seem to give exact definitions of the terms employed in reasoning, and make these definitions, not the mere sound of words, the object of future scrutiny and examination? But if we consider the matter more narrowly, we shall be apt to draw a quite opposite conclusion. From this circumstance alone, that a controversy has been long kept on foot, and remains still undecided, we may presume that there is some ambiguity in the expression, and that the disputants affix different ideas to the terms employed in the controversy. For as the faculties of the mind are supposed to be naturally alike in every individual; otherwise nothing could be more fruitless than to reason or dispute together; it were impossible, if men affix the same ideas to their terms, that they could so long form different opinions of the same subject; especially when they communicate their views, and each party turn themselves on all sides, in search of arguments which may give them the victory over their antagonists. It is true, if men attempt the discussion of questions which lie entirely beyond the reach of human capacity, such as those concerning the origin of worlds, or the economy of the intellectual system or region of spirits, they may long beat the air in their fruitless contests, and never arrive at any determinate conclusion. But if the question regard any subject of common life and experience, nothing, one would think, could preserve the dispute so long undecided but some ambiguous expressions, which keep the antagonists still at a distance, and hinder them from grappling with each other.

This has been the case in the long disputed question concerning liberty and necessity; and to so remarkable a degree that, if I be not much mistaken, we shall find, that all mankind, both learned and ignorant, have always been of the same opinion with regard to this subject, and that a few intelligible definitions would immediately have put an end to the whole controversy. I own that this dispute has been so much canvassed on all hands, and has led philosophers into such a labyrinth of obscure sophistry, that it is no

wonder, if a sensible reader indulge his ease so far as to turn a deaf ear to the proposal of such a question, from which he can expect neither instruction nor entertainment. But the state of the argument here proposed may, perhaps, serve to renew his attention; as it has more novelty, promises at least some decision of the controversy, and will not much disturb his ease by any intricate or obscure reasoning.

I hope, therefore, to make it appear that all men have ever agreed in the doctrine both of necessity and of liberty, according to any reasonable sense, which can be put on these terms; and that the whole controversy has hitherto turned merely upon words. We shall begin with examining the doctrine of necessity.

It is universally allowed that matter, in all its operations, is actuated by a necessary force, and that every natural effect is so precisely determined by the energy of its cause that no other effect, in such particular circumstances, could possibly have resulted from it. The degree and direction of every motion is, by the laws of nature, prescribed with such exactness that a living creature may as soon arise from the shock of two bodies as motion in any other degree or direction than what is actually produced by it. Would we, therefore, form a just and precise idea of *necessity* we must consider whence that idea arises when we apply it to the operation of bodies.

It seems evident that, if all the scenes of nature were continually shifted in such a manner that no two events bore any resemblance to each other, but every object was entirely new, without any similitude to whatever had been seen before, we should never, in that case, have attained the least idea of necessity, or of a connexion among these objects. We might say, upon such a supposition, that one object or event has followed another; not that one was produced by the other. The relation of cause and effect must be utterly unknown to mankind. Inference and reasoning concerning the operations of nature would, from that moment, be at an end; and the memory and senses remain the only canals, by which the knowledge of any real existence could possibly have access to the mind. Our idea, therefore, of necessity and causation arises entirely from the uniformity observable in the operations of nature, where similar objects are constantly conjoined together, and the mind is determined by custom to infer the one from the appearance of the other. These two circumstances form the whole of that necessity, which we ascribe to matter. Beyond the constant conjunction of similar objects, and the consequent *inference* from one to the other, we have no notion of any necessity or connexion.

If it appear, therefore, that all mankind have ever allowed, without any doubt or hesitation, that these two circumstances take place in the voluntary actions of men, and in the operations of mind; it must follow, that all mankind have ever agreed in the doctrine of necessity, and that they have hitherto disputed, merely for not understanding each other.

As to the first circumstance, the constant and regular conjunction of similar events, we may possibly satisfy ourselves by the following considerations. It is universally acknowledged that there is a great uniformity among the actions of men, in all nations and ages, and that human nature remains still the same, in its principles and operations. The same motives always produce the same actions: The same events follow from the same causes. Ambition, avarice, self-love, vanity, friendship, generosity, public spirit: these passions, mixed in various degrees, and distributed through society, have been, from the beginning of the world, and still are, the source of all the actions and enterprises, which have ever been observed among mankind. Would you know the sentiments, inclinations, and course of life of the Greeks and Romans? Study well the temper and actions of the French and English: You cannot be much mistaken in transferring to the former *most* of the observations which you have made with regard to the

latter. Mankind are so much the same, in all times and places, that history informs us of nothing new or strange in this particular. Its chief use is only to discover the constant and universal principles of human nature, by showing men in all varieties of circumstances and situations, and furnishing us with materials from which we may form our observations and become acquainted with the regular springs of human action and behaviour. These records of wars, intrigues, factions, and revolutions, are so many collections of experiments, by which the politician or moral philosopher fixes the principles of his science, in the same manner as the physician or natural philosopher becomes acquainted with the nature of plants, minerals, and other external objects, by the experiments which he forms concerning them. Nor are the earth, water, and other elements, examined by Aristotle, and Hippocrates, more like to those which at present lie under our observation than the men described by Polybius and Tacitus are to those who now govern the world.

Should a traveller, returning from a far country, bring us an account of men, wholly different from any with whom we were ever acquainted; men, who were entirely divested of avarice, ambition, or revenge; who knew no pleasure but friendship, generosity, and public spirit; we should immediately, from these circumstances, detect the falsehood, and prove him a liar, with the same certainty as if he had stuffed his narration with stories of centaurs and dragons, miracles and prodigies. And if we would explode any forgery in history, we cannot make use of a more convincing argument, than to prove, that the actions ascribed to any person are directly contrary to the course of nature, and that no human motives, in such circumstances, could ever induce him to such a conduct. The veracity of Quintus Curtius is as much to be suspected, when he describes the supernatural courage of Alexander, by which he was hurried on singly to attack multitudes, as when he describes his supernatural force and activity, by which he was able to resist them. So readily and universally do we acknowledge a uniformity in human motives and actions as well as in the operations of body.

Hence likewise the benefit of that experience, acquired by long life and a variety of business and company, in order to instruct us in the principles of human nature, and regulate our future conduct, as well as speculation. By means of this guide, we mount up to the knowledge of men's inclinations and motives, from their actions, expressions, and even gestures; and again descend to the interpretation of their actions from our knowledge of their motives and inclinations. The general observations treasured up by a course of experience, give us the clue of human nature, and teach us to unravel all its intricacies. Pretexts and appearances no longer deceive us. Public declarations pass for the specious colouring of a cause. And though virtue and honour be allowed their proper weight and authority, that perfect disinterestedness, so often pretended to, is never expected in multitudes and parties; seldom in their leaders; and scarcely even in individuals of any rank or station. But were there no uniformity in human actions, and were every experiment which we could form of this kind irregular and anomalous, it were impossible to collect any general observations concerning mankind; and no experience, however accurately digested by reflection, would ever serve to any purpose. Why is the aged husbandman more skilful in his calling than the young beginner but because there is a certain uniformity in the operation of the sun, rain, and earth towards the production of vegetables; and experience teaches the old practitioner the rules by which this operation is governed and directed.

We must not, however, expect that this uniformity of human actions should be carried to such a length as that all men, in the same circumstances, will always act precisely in the same manner, without making any allowance for the diversity of

characters, prejudices, and opinions. Such a uniformity in every particular, is found in no part of nature. On the contrary, from observing the variety of conduct in different men, we are enabled to form a greater variety of maxims, which still suppose a degree of uniformity and regularity.

Are the manners of men different in different ages and countries? We learn thence the great force of custom and education, which mould the human mind from its infancy and form it into a fixed and established character. Is the behaviour and conduct of the one sex very unlike that of the other? Is it thence we become acquainted with the different characters which nature has impressed upon the sexes, and which she preserves with constancy and regularity? Are the actions of the same person much diversified in the different periods of his life, from infancy to old age? This affords room for many general observations concerning the gradual change of our sentiments and inclinations, and the different maxims which prevail in the different ages of human creatures. Even the characters, which are peculiar to each individual, have a uniformity in their influence; otherwise our acquaintance with the persons and our observation of their conduct could never teach us their dispositions, or serve to direct our behaviour with regard to them.

I grant it possible to find some actions, which seem to have no regular connexion with any known motives, and are exceptions to all the measures of conduct which have ever been established for the government of men. But if we would willingly know what judgement should be formed of such irregular and extraordinary actions, we may consider the sentiments commonly entertained with regard to those irregular events which appear in the course of nature, and the operations of external objects. All causes are not conjoined to their usual effects with like uniformity. An artificer, who handles only dead matter, may be disappointed of his aim, as well as the politician, who directs the conduct of sensible and intelligent agents.

The vulgar, who take things according to their first appearance, attribute the uncertainty of events to such an uncertainty in the causes as makes the latter often fail of their usual influence; though they meet with no impediment in their operation. But philosophers, observing that, almost in every part of nature, there is contained a vast variety of springs and principles, which are hid, by reason of their minuteness or remoteness, find, that it is at least possible the contrariety of events may not proceed from any contingency in the cause, but from the secret operation of contrary causes. This possibility is converted into certainty by farther observation, when they remark that, upon an exact scrutiny, a contrariety of effects always betrays a contrariety of causes, and proceeds from their mutual opposition. A peasant can give no better reason for the stopping of any clock or watch than to say that it does not commonly go right: But an artist easily perceives that the same force in the spring or pendulum has always the same influence on the wheels; but fails of its usual effect, perhaps by reason of a grain of dust, which puts a stop to the whole movement. From the observation of several parallel instances, philosophers form a maxim that the connexion between all causes and effects is equally necessary, and that its seeming uncertainty in some instances proceeds from the secret opposition of contrary causes.

Thus, for instance, in the human body, when the usual symptoms of health or sickness disappoint our expectation; when medicines operate not with their wonted powers; when irregular events follow from any particular cause; the philosopher and physician are not surprised at the matter, nor are ever tempted to deny, in general, the necessity and uniformity of those principles by which the animal economy is conducted. They know that a human body is a mighty complicated machine: That many secret powers lurk in it, which are altogether beyond our comprehension: That to us it

must often appear very uncertain in its operations: And that therefore the irregular events, which outwardly discover themselves, can be no proof that the laws of nature are not observed with the greatest regularity in its internal operations and government.

The philosopher, if he be consistent, must apply the same reasoning to the actions and volitions of intelligent agents. The most irregular and unexpected resolutions of men may frequently be accounted for by those who know every particular circumstance of their character and situation. A person of an obliging disposition gives a peevish answer: But he has the toothache, or has not dined. A stupid fellow discovers an uncommon alacrity in his carriage: But he has met with a sudden piece of good fortune. Or even when an action, as sometimes happens, cannot be particularly accounted for, either by the person himself or by others; we know, in general, that the characters of men are, to a certain degree, inconstant and irregular. This is, in a manner, the constant character of human nature; though it be applicable, in a more particular manner, to some persons who have no fixed rule for their conduct, but proceed in a continued course of caprice and inconstancy. The internal principles and motives may operate in a uniform manner, notwithstanding these seeming irregularities; in the same manner as the winds, rain, clouds, and other variations of the weather are supposed to be governed by steady principles; though not easily discoverable by human sagacity and enquiry.

Thus it appears, not only that the conjunction between motives and voluntary actions is as regular and uniform as that between the cause and effect in any part of nature; but also that this regular conjunction has been universally acknowledged among mankind, and has never been the subject of dispute, either in philosophy or common life. Now, as it is from past experience that we draw all inferences concerning the future, and as we conclude that objects will always be conjoined together which we find to have always been conjoined; it may seem superfluous to prove that this experienced uniformity in human actions is a source whence we draw *inferences* concerning them. But in order to throw the argument into a greater variety of lights we shall also insist, though briefly, on this latter topic.

The mutual dependence of men is so great in all societies that scarce any human action is entirely complete in itself, or is performed without some reference to the actions of others, which are requisite to make it answer fully the intention of the agent. The poorest artificer, who labours alone, expects at least the protection of the magistrate, to ensure him the enjoyment of the fruits of his labour. He also expects that, when he carries his goods to market, and offers them at a reasonable price, he shall find purchasers, and shall be able, by the money he acquires, to engage others to supply him with those commodities which are requisite for his subsistence. In proportion as men extend their dealings, and render their intercourse with others more complicated, they always comprehend, in their schemes of life, a greater variety of voluntary actions, which they expect, from the proper motives, to co-operate with their own. In all these conclusions they take their measures from past experience, in the same manner as in their reasonings concerning external objects; and firmly believe that men, as well as all the elements, are to continue, in their operations, the same that they have ever found them. A manufacturer reckons upon the labour of his servants for the execution of any work as much as upon the tools which he employs, and would be equally surprised were his expectations disappointed. In short, this experimental inference and reasoning concerning the actions of others enters so much into human life, that no man, while awake, is ever a moment without employing it. Have we not reason, therefore, to affirm that all mankind have always agreed in the doctrine of necessity according to the foregoing definition and explication of it?

Nor have philosophers ever entertained a different opinion from the people in this particular. For, not to mention that almost every action of their life supposes that opinion, there are even few of the speculative parts of learning to which it is not essential. What would become of *history*, had we not a dependence on the veracity of the historian according to the experience which we have had of mankind? How could *politics* be a science, if laws and forms of government had not a uniform influence upon society? Where would be the foundation of *morals*, if particular characters had no certain or determinate power to produce particular sentiments, and if these sentiments had no constant operation on actions? And with what pretence could we employ our *criticism* upon any poet or polite author, if we could not pronounce the conduct and sentiments of his actors either natural or unnatural to such characters, and in such circumstances? It seems almost impossible, therefore, to engage either in science or action of any kind without acknowledging the doctrine of necessity, and this *inference* from motive to voluntary actions, from characters to conduct.

And indeed, when we consider how aptly *natural* and *moral* evidence link together, and form only one chain of argument, we shall make no scruple to allow that they are of the same nature, and derived from the same principles. A prisoner who has neither money nor interest, discovers the impossibility of his escape, as well when he considers the obstinacy of the gaoler, as the walls and bars with which he is surrounded; and, in all attempts for his freedom, chooses rather to work upon the stone and iron of the one, than upon the inflexible nature of the other. The same prisoner, when conducted to the scaffold, foresees his death as certainly from the constancy and fidelity of his guards, as from the operation of the axe or wheel. His mind runs along a certain train of ideas: The refusal of the soldiers to consent to his escape; the action of the executioner; the separation of the head and body; bleeding, convulsive motions, and death. Here is a connected chain of natural causes and voluntary actions; but the mind feels no difference between them in passing from one link to another: Nor is less certain of the future event than if it were connected with the objects present to the memory or senses, by a train of causes, cemented together by what we are pleased to call a *physical* necessity. The same experienced union has the same effect on the mind, whether the united objects be motives, volition, and actions; or figure and motion. We may change the name of things; but their nature and their operation on the understanding never change.

Were a man, whom I know to be honest and opulent, and with whom I live in intimate friendship, to come into my house, where I am surrounded with my servants, I rest assured that he is not to stab me before he leaves it in order to rob me of my silver standish; and I no more suspect this event than the falling of the house itself, which is new, and solidly built and founded.—*But he may have been seized with a sudden and unknown frenzy.*—So may a sudden earthquake arise, and shake and tumble my house about my ears. I shall therefore change the suppositions. I shall say that I know with certainty that he is not to put his hand into the fire and hold it there till it be consumed: And this event I think I can foretell with the same assurance, as that, if he throw himself out at the window, and meet with no obstruction, he will not remain a moment suspended in the air. No suspicion of an unknown frenzy can give the least possibility to the former event, which is so contrary to all the known principles of human nature. A man who at noon leaves his purse full of gold on the pavement at Charing-Cross, may as well expect that it will fly away like a feather, as that he will find it untouched an hour after. Above one half of human reasonings contain inferences of a similar nature, attended with more or less degrees of certainty proportioned to our experience of the usual conduct of mankind in such particular situations.

I have frequently considered, what could possibly be the reason why all mankind, though they have ever, without hesitation, acknowledged the doctrine of necessity in their whole practice and reasoning, have yet not discovered such a reluctance to acknowledge it in words, and have rather shown a propensity, in all ages, to profess the contrary opinion. The matter, I think, may be accounted for after the following manner. If we examine the operations of body, and the production of effects from their causes, we shall find that all our faculties can never carry us farther in our knowledge of this relation than barely to observe that particular objects are *constantly conjoined* together, and that the mind is carried, by a *customary transition*, from the appearance of one to the belief of the other. But though this conclusion concerning human ignorance be the result of the strictest scrutiny of this subject, men still entertain a strong propensity to believe that they penetrate farther into the powers of nature, and perceive something like a necessary connexion between the cause and the effect. When again they turn their reflections towards the operations of their own minds, and *feel* no such connexion of the motive and the action; they are thence apt to suppose, that there is a difference between the effects which result from material force, and those which arise from thought and intelligence. But being once convinced that we know nothing farther of causation of any kind than merely the *constant conjunction* of objects, and the consequent *inference* of the mind from one to another, and finding that these two circumstances are universally allowed to have place in voluntary actions; we may be more easily led to own the same necessity common to all causes. And though this reasoning may contradict the systems of many philosophers, in ascribing necessity to the determinations of the will, we shall find, upon reflection, that they dissent from it in words only, not in their real sentiment. Necessity, according to the sense in which it is here taken, has never yet been rejected, nor can ever, I think, be rejected by any philosopher. It may only, perhaps, be pretended that the mind can perceive, in the operations of matter, some farther connexion between the cause and effect; and connexion that has no place in voluntary actions of intelligent beings. Now whether it be so or not, can only appear upon examination; and it is incumbent on these philosophers to make good their assertion, by defining or describing that necessity, and pointing it out to us in the operations of material causes.

It would seem, indeed, that men begin at the wrong end of this question concerning liberty and necessity, when they enter upon it by examining the faculties of the soul, the influence of the understanding, and the operations of the will. Let them first discuss a more simple question, namely, the operations of body and of brute unintelligent matter; and try whether they can there form any idea of causation and necessity, except that of a constant conjunction of objects, and subsequent inference of the mind from one to another. If these circumstances form, in reality, the whole of that necessity, which we conceive in matter, and if these circumstances be also universally acknowledged to take place in the operations of the mind, the dispute is at an end; at least, must be owned to be thenceforth merely verbal. But as long as we will rashly suppose, that we have some farther idea of necessity and causation in the operations of external objects; at the same time, that we can find nothing farther in the voluntary actions of the mind; there is no possibility of bringing the question to any determinate issue, while we proceed upon so erroneous a supposition. The only method of undeceiving us is to mount up higher; to examine the narrow extent of science when applied to material causes; and to convince ourselves that all we know of them is the constant conjunction and inference above mentioned. We may, perhaps, find that it is with difficulty we are induced to fix such narrow limits to human understanding: But we can afterwards find no difficulty when we come to apply this doctrine to the actions of the will. For as it is evident that these

have a regular conjunction with motives and circumstances and characters, and as we always draw inferences from one to the other, we must be obliged to acknowledge in words that necessity, which we have already avowed, in every deliberation of our lives, and in every step of our conduct and behaviour.*

But to proceed in this reconciling project with regard to the question of liberty and necessity; the most contentious question of metaphysics, the most contentious science; it will not require many words to prove, that all mankind have ever agreed in the doctrine of liberty as well as in that of necessity, and that the whole dispute, in this respect also, has been hitherto merely verbal. For what is meant by liberty, when applied to voluntary actions? We cannot surely mean that actions have so little connexion with motives, inclinations, and circumstances, that one does not follow with a certain degree of uniformity from the other, and that one affords no inference by which we can conclude the existence of the other. For these are plain and acknowledged matters of fact. By liberty, then, we can only mean *a power of acting or not acting, according to the determinations of the will*; that is, if we choose to remain at rest, we may; if we choose to move, we also may. Now this hypothetical liberty is universally allowed to belong to every one who is not a prisoner and in chains. Here, then, is no subject of dispute.

Whatever definition we may give of liberty, we should be careful to observe two requisite circumstances; *first*, that it be consistent with plain matter of fact; *secondly*, that it be consistent with itself. If we observe these circumstances, and render our definition intelligible, I am persuaded that all mankind will be found of one opinion with regard to it.

It is universally allowed that nothing exists without a cause of its existence, and that chance, when strictly examined, is a mere negative word, and means not any real power which has anywhere a being in nature. But it is pretended that some causes are necessary, some not necessary. Here then is the advantage of definitions. Let any one *define* a cause, without comprehending, as a part of the definition, a *necessary connexion* with its effect; and let him show distinctly the origin of the idea, expressed by the definition; and I shall readily give up the whole controversy. But if the foregoing explication

*The prevalence of the doctrine of liberty may be accounted for, from another cause viz. a false sensation or seeming experience which we have, or may have, of liberty or indifference, in many of our actions. The necessity of any action, whether of matter or of mind, is not, properly speaking, a quality in the agent, but in any thinking or intelligent being, who may consider the action; and it consists chiefly in the determination of his thoughts to infer the existence of that action from some preceding objects; as liberty, when opposed to necessity, is nothing but the want of that determination, and a certain looseness or indifference, which we feel, in passing or not passing, from the idea of one object to that of any succeeding one. Now we may observe, that, though, in *reflecting* on human actions, we seldom feel such a looseness, or indifference, but are commonly able to infer them with considerable certainty from their motives, and from the dispositions of the agent; yet it frequently happens, that, in *performing* the actions themselves, we are sensible of something like it: And as all resembling objects are readily taken for each other, this has been employed as a demonstrative and even intuitive proof of human liberty. We feel, that our actions are subject to our will, on most occasions; and imagine we feel, that the will itself is subject to nothing, because, when by a denial of it we are provoked to try, we feel, that it moves easily every way, and produces an image of itself (or a *Velleïty*, as it is called in the schools) even on that side, on which it did not settle. This image, or faint motion, we persuade ourselves, could, at that time, have been completed into the thing itself; because, should that be denied, we find, upon a second trial, that, at present it can. We consider not that the fantastical desire of showing liberty, is here the motive of our actions. And it seems certain, that, however, we may imagine we feel a liberty within ourselves, a spectator can commonly infer our actions from our motives and character, and even where he cannot, he concludes in general, that he might, were he perfectly acquainted with every circumstance of our situation and temper, and the most secret springs of our complexion and disposition. Now this is the very essence of necessity, according to the foregoing doctrine.

of the matter be received, this must be absolutely impracticable. Had not objects a regular conjunction with each other, we should never have entertained any notion of cause and effect; and this regular conjunction produces that inference of the understanding, which is the only connexion, that we can have any comprehension of. Whoever attempts a definition of cause, exclusive of these circumstances, will be obliged either to employ unintelligible terms or such as are synonymous to the term which he endeavours to define.* And if the definition above mentioned be admitted; liberty, when opposed to necessity, not to constraint, is the same thing with chance; which is universally allowed to have no existence.

PART II

There is no method of reasoning more common, and yet none more blameable, than, in philosophical disputes, to endeavour the refutation of any hypothesis, by a pretence of its dangerous consequences to religion and morality. When any opinion leads to absurdities, it is certainly false; but it is not certain that an opinion is false, because it is of dangerous consequence. Such topics, therefore, ought entirely to be forborne; as serving nothing to the discovery of truth, but only to make the person of an antagonist odious. This I observe in general, without pretending to draw any advantage from it. I frankly submit to an examination of this kind, and shall venture to affirm that the doctrines, both of necessity and of liberty, as above explained, are not only consistent with morality, but are absolutely essential to its support.

Necessity may be defined two ways, conformably to the two definitions of *cause*, of which it makes an essential part. It consists either in the constant conjunction of like objects, or in the inference of the understanding from one object to another. Now necessity, in both these senses, (which, indeed, are at bottom the same) has universally, though tacitly, in the schools, in the pulpit, and in common life, been allowed to belong to the will of man; and no one has ever pretended to deny that we can draw inferences concerning human actions, and that those inferences are founded on the experienced union of like actions, with like motives, inclinations, and circumstances. The only particular in which any one can differ, is, that either, perhaps, he will refuse to give the name of necessity to this property of human actions: But as long as the meaning is understood, I hope the word can do no harm: Or that he will maintain it possible to discover something farther in the operations of matter. But this, it must be acknowledged, can be of no consequence to morality or religion, whatever it may be to natural philosophy or metaphysics. We may here be mistaken in asserting that there is no idea of any other necessity or connexion in the actions of body: But surely we ascribe nothing to the actions of the mind, but what everyone does, and must readily allow of. We change no circumstance in the received orthodox system with regard to the will, but only in that with regard to material objects and causes. Nothing, therefore, can be more innocent, at least, than this doctrine.

All laws being founded on rewards and punishments, it is supposed as a fundamental principle, that these motives have a regular and uniform influence on the mind, and both

*Thus, if a cause be defined, *that which produces any thing*; it is easy to observe, that *producing* is synonymous to *causing*. In like manner, if a cause be defined, *that by which any thing exists*; this is liable to the same objection. For what is meant by these words, *by which*? Had it been said, that a cause is *that* after which *any thing constantly exists*; we should have understood the terms. For this is, indeed, all we know of the matter. And this constancy forms the very essence of necessity, nor have we any other idea of it.

produce the good and prevent the evil actions. We may give to this influence what name we please; but, as it is usually conjoined with the action, it must be esteemed a *cause*, and be looked upon as an instance of that necessity, which we would here establish.

The only proper object of hatred or vengeance is a person or creature, endowed with thought and consciousness; and when any criminal or injurious actions excite that passion, it is only by their relation to the person, or connexion with him. Actions are, by their very nature, temporary and perishing; and where they proceed not from some cause in the character and disposition of the person who performed them, they can neither redound to his honour, if good; nor infamy, if evil. The actions themselves may be blameable; they may be contrary to all the rules of morality and religion: But the person is not answerable for them; and as they proceeded from nothing in him that is durable and constant, and leave nothing of that nature behind them, it is impossible he can, upon their account, become the object of punishment or vengeance. According to the principle, therefore, which denies necessity, and consequently causes, a man is as pure and untainted, after having committed the most horrid crime, as at the first moment of his birth, nor is his character anywise concerned in his actions, since they are not derived from it, and the wickedness of the one can never be used as a proof of the depravity of the other.

Men are not blamed for such actions as they perform ignorantly and casually, whatever may be the consequences. Why? but because the principles of these actions are only momentary, and terminate in them alone. Men are less blamed for such actions as they perform hastily and unpremeditatedly than for such as proceed from deliberation. For what reason? but because a hasty temper, though a constant cause or principle in the mind, operates only by intervals, and infects not the whole character. Again, repentance wipes off every crime, if attended with a reformation of life and manners. How is this to be accounted for? but by asserting that actions render a person criminal merely as they are proofs of criminal principles in the mind; and when, by an alteration of these principles, they cease to be just proofs, they likewise cease to be criminal. But, except upon the doctrine of necessity, they never were just proofs, and consequently never were criminal.

It will be equally easy to prove, and from the same arguments, that *liberty*, according to that definition above mentioned, in which all men agree, is also essential to morality, and that no human actions, where it is wanting, are susceptible of any moral qualities, or can be the objects either of approbation or dislike. For as actions are objects of our moral sentiment, so far only as they are indications of the internal character, passions, and affections; it is impossible that they can give rise either to praise or blame, where they proceed not from these principles, but are derived altogether from external violence.

I pretend not to have obviated or removed all objections to this theory, with regard to necessity and liberty. I can foresee other objections, derived from topics which have not here been treated of. It may be said, for instance, that, if voluntary actions be subjected to the same laws of necessity with the operations of matter, there is a continued chain of necessary causes, pre-ordained and pre-determined, reaching from the original cause of all to every single volition of every human creature. No contingency anywhere in the universe; no indifference; no liberty. While we act, we are, at the same time, acted upon. The ultimate Author of all our volitions is the Creator of the world, who first bestowed motion on this immense machine, and placed all beings in that particular position, whence every subsequent event, by an inevitable necessity, must result. Human actions, therefore, either can have no moral turpitude at all, as proceeding from so good a cause; or if they have any turpitude, they must involve our Creator in the same guilt, while he is acknowledged to be their ultimate cause and author. For as a man, who fired a mine, is answerable for all the consequences whether the train he employed be

long or short; so wherever a continued chain of necessary causes is fixed, that Being, either finite or infinite, who produces the first, is likewise the author of all the rest, and must both bear the blame and acquire the praise which belong to them. Our clear and unalterable ideas of morality establish this rule, upon unquestionable reasons, when we examine the consequences of any human action; and these reasons must still have greater force when applied to the volitions and intentions of a Being infinitely wise and powerful. Ignorance or impotence may be pleaded for so limited a creature as man; but those imperfections have no place in our Creator. He foresaw, he ordained, he intended all those actions of men, which we so rashly pronounce criminal. And we must therefore conclude, either that they are not criminal, or that the Deity, not man, is accountable for them. But as either of these positions is absurd and impious, it follows, that the doctrine from which they are deduced cannot possibly be true, as being liable to all the same objections. An absurd consequence, if necessary, proves the original doctrine to be absurd in the same manner as criminal actions render criminal the original cause, if the connexion between them be necessary and inevitable.

This objection consists of two parts, which we shall examine separately; *First*, that, if human actions can be traced up, by a necessary chain, to the Deity, they can never be criminal; on account of the infinite perfection of that Being from whom they are derived, and who can intend nothing but what is altogether good and laudable. Or, *Secondly*, if they be criminal, we must retract the attribute of perfection, which we ascribe to the Deity, and must acknowledge him to be the ultimate author of guilt and moral turpitude in all his creatures.

The answer to the first objection seems obvious and convincing. There are many philosophers who, after an exact scrutiny of all the phenomena of nature, conclude, that the *WHOLE*, considered as one system is, in every period of its existence, ordered with perfect benevolence; and that the utmost possible happiness will, in the end, result to all created beings, without any mixture of positive or absolute ill or misery. Every physical ill, say they, makes an essential part of this benevolent system, and could not possibly be removed, even by the Deity himself, considered as a wise agent, without giving entrance to greater ill, or excluding greater good, which will result from it. From this theory, some philosophers, and the ancient *Stoics* among the rest, derived a topic of consolation under all afflictions, while they taught their pupils that those ills under which they laboured were, in reality, goods to the universe; and that to an enlarged view, which could comprehend the whole system of nature, every event became an object of joy and exultation. But though this topic be specious and sublime, it was soon found in practice weak and ineffectual. You would surely more irritate than appease a man lying under the racking pains of the gout by preaching up to him the rectitude of those general laws, which produced the malignant humours in his body, and led them through the proper canals, to the sinews and nerves, where they now excite such acute torments. These enlarged views may, for a moment, please the imagination of a speculative man, who is placed in ease and security; but neither can they dwell with constancy on his mind, even though undisturbed by the emotions of pain or passion; much less can they maintain their ground when attacked by such powerful antagonists. The affections take a narrower and more natural survey of their object; and by an economy, more suitable to the infirmity of human minds, regard alone the beings around us, and are actuated by such events as appear good or ill to the private system.

The case is the same with *moral* as with *physical* ill. It cannot reasonably be supposed, that those remote considerations, which are found of so little efficacy with regard to one, will have a more powerful influence with regard to the other. The

mind of man is so formed by nature that, upon the appearance of certain characters, dispositions, and actions, it immediately feels the sentiment of approbation or blame; nor are there any emotions more essential to its frame and constitution. The characters which engage our approbation are chiefly such as contribute to the peace and security of human society; as the characters which excite blame are chiefly such as tend to public detriment and disturbance: Whence it may reasonably be presumed, that the moral sentiments arise, either mediately or immediately, from a reflection of these opposite interests. What though philosophical meditations establish a different opinion or conjecture; that everything is right with regard to the WHOLE, and that the qualities, which disturb society, are, in the main, as beneficial, and are as suitable to the primary intention of nature as those which more directly promote its happiness and welfare? Are such remote and uncertain speculations able to counterbalance the sentiments which arise from the natural and immediate view of the objects? A man who is robbed of a considerable sum; does he find his vexation for the loss anywise diminished by these sublime reflections? Why then should his moral resentment against the crime be supposed incompatible with them? Or why should not the acknowledgment of a real distinction between vice and virtue be reconcileable to all speculative systems of philosophy, as well as that of a real distinction between personal beauty and deformity? Both these distinctions are founded in the natural sentiments of the human mind: And these sentiments are not to be controlled or altered by any philosophical theory or speculation whatsoever.

A chemist's laboratory from Denis Diderot's *Encyclopédie* (1751–1772) illustrates the state of empirical science during Hume's lifetime. The symbols below are an early periodic table of elements. (©DeAgostini/Getty Images)

The *second* objection admits not of so easy and satisfactory an answer; nor is it possible to explain distinctly, how the Deity can be the mediate cause of all the actions of men, without being the author of sin and moral turpitude. These are mysteries, which mere natural and unassisted reason is very unfit to handle; and whatever system she embraces, she must find herself involved in inextricable difficulties, and even contradictions, at every step which she takes with regard to such subjects. To reconcile the indifference and contingency of human actions with prescience; or to defend absolute decrees, and yet free the Deity from being the author of sin, has been found hitherto to exceed all the power of philosophy. Happy, if she be thence sensible of her temerity, when she pries into these sublime mysteries; and leaving a scene so full of obscurities and perplexities, return, with suitable modesty, to her true and proper province, the examination of common life; where she will find difficulties enough to employ her enquiries, without launching into so boundless an ocean of doubt, uncertainty, and contradiction!

SECTION IX. OF THE REASON OF ANIMALS

All our reasonings concerning matter of fact are founded on a species of Analogy, which leads us to expect from any cause the same events, which we have observed to result from similar causes. Where the causes are entirely similar, the analogy is perfect, and the inference, drawn from it, is regarded as certain and conclusive: nor does any man ever entertain a doubt, when he sees a piece of iron, that it will have weight and cohesion of parts; as in all other instances, which have ever fallen under his observation. But where the objects have not so exact a similarity, the analogy is less perfect, and the inference is less conclusive; though still it has some force, in proportion to the degree of similarity and resemblance. The anatomical observations, formed upon one animal, are, by this species of reasoning, extended to all animals; and it is certain, that when the circulation of the blood for instance, is clearly proved to have place in one creature, as a frog, or fish, it forms a strong presumption, that the same principle has place in all. These analogical observations may be carried farther, even to this science, of which we are now treating; and any theory, by which we explain the operations of the understanding, or the origin and connexion of the passions in man, will acquire additional authority, if we find, that the same theory is requisite to explain the same phenomena in all other animals. We shall make trial of this, with regard to the hypothesis, by which we have, in the foregoing discourse, endeavoured to account for all experimental reasonings; and it is hoped, that this new point of view will serve to confirm all our former observations.

First, It seems evident, that animals as well as men learn many things from experience, and infer, that the same events will always follow from the same causes. By this principle they become acquainted with the more obvious properties of external objects, and gradually, from their birth, treasure up a knowledge of the nature of fire, water, earth, stones, heights, depths, etc., and of the effects which result from their operation. The ignorance and inexperience of the young are here plainly distinguishable from the cunning and sagacity of the old, who have learned, by long observation, to avoid what hurt them, and to pursue what gave ease or pleasure. A horse, that has been accustomed to the field, becomes acquainted with the proper height which he can leap, and will never attempt what exceeds his force and ability. An old greyhound will trust the more

fatiguing part of the chase to the younger, and will place himself so as to meet the hare in her doubles; nor are the conjectures, which he forms on this occasion, founded in any thing but his observation and experience.

This is still more evident from the effects of discipline and education on animals, who, by the proper application of rewards and punishments, may be taught any course of action, and most contrary to their natural instincts and propensities. Is it not experience, which renders a dog apprehensive of pain, when you menace him, or lift up the whip to beat him? Is it not even experience, which makes him answer to his name, and infer, from such an arbitrary sound, that you mean him rather than any of his fellows, and intend to call him, when you pronounce it in a certain manner, and with a certain tone and accent?

In all these cases, we may observe, that the animal infers some fact beyond what immediately strikes his senses; and that this inference is altogether founded on past experience, while the creature expects from the present object the same consequences, which it has always found in its observation to result from similar objects.

Secondly, It is impossible, that this inference of the animal can be founded on any process of argument or reasoning, by which he concludes, that like events must follow like objects, and that the course of nature will always be regular in its operations. For if there be in reality any arguments of this nature, they surely lie too abstruse for the observation of such imperfect understandings; since it may well employ the utmost care and attention of a philosophic genius to discover and observe them. Animals, therefore, are not guided in these inferences by reasoning: Neither are children: Neither are the generality of mankind, in their ordinary actions and conclusions: Neither are philosophers themselves, who, in all the active parts of life, are, in the main, the same with the vulgar, and are governed by the same maxims. Nature must have provided some other principle, of more ready, and more general use and application; nor can an operation of such immense consequence in life, as that of inferring effects from causes, be trusted to the uncertain process of reasoning and argumentation. Were this doubtful with regard to men, it seems to admit of no question with regard to the brute creation; and the conclusion being once firmly established in the one, we have a strong presumption, from all the rules of analogy, that it ought to be universally admitted, without any exception or reserve. It is custom alone, which engages animals, from every object, that strikes their senses, to infer its usual attendant, and carries their imagination, from the appearance of the one, to conceive the other, in that particular manner, which we denominate *belief*. No other explication can be given of this operation, in all the higher, as well as lower classes of sensitive beings, which fall under our notice and observation.*

But though animals learn many parts of their knowledge from observation, there are also many parts of it, which they derive from the original hand of nature; which much exceed the share of capacity they possess on ordinary occasions; and in which they improve, little or nothing, by the longest practice and experience. These we denominate *Instincts*, and are so apt to admire as something very extraordinary, and inexplicable by all the disquisitions of human understanding. But our wonder will, perhaps, cease or diminish, when we consider, that the experimental reasoning itself,

*Since all reasonings concerning facts or causes is derived merely from custom, it may be asked how it happens, that men so much surpass animals in reasoning, and one man so much surpasses another? Has not the same custom the same influence on all?

We shall here endeavour briefly to explain the great difference in human understandings: After which the reason of the difference between men and animals will easily be comprehended.

which we possess in common with beasts, and on which the whole conduct of life depends, is nothing but a species of instinct or mechanical power, that acts in us unknown to ourselves; and in its chief operations, is not directed by any such relations or comparisons of ideas, as are the proper objects of our intellectual faculties. Though the instinct be different, yet still it is an instinct, which teaches a man to avoid the fire; as much as that, which teaches a bird, with such exactness, the art of incubation, and the whole economy and order of its nursery.

SECTION X. OF MIRACLES*

PART I

There is, in Dr. Tillotson's writings, an argument against the *real presence*, which is as concise, and elegant, and strong as any argument can possibly be supposed against a doctrine, so little worthy of a serious refutation. It is acknowledged on all hands, says that learned prelate, that the authority, either of the scripture or of tradition, is founded merely in the testimony of the apostles, who were eye-witnesses to those miracles of our Saviour, by which he proved his divine mission. Our evidence, then, for the truth of the *Christian* religion is less than the evidence for the truth of our senses; because, even in the first authors of our religion, it was no greater; and it is evident it must diminish in passing from them to their disciples; nor can any one rest such confidence in their testimony, as in the immediate object of his senses. But a weaker evidence can never destroy a stronger; and therefore, were the doctrine of the real presence ever so clearly revealed in scripture, it were directly contrary to the rules of just reasoning to give our assent to it. It contradicts sense, though both the scripture and tradition, on which it is supposed to be built, carry not such evidence with them as sense, when they are considered

*1. When we have lived any time, and have been accustomed to the uniformity of nature we acquire a general habit, by which we always transfer the known to the unknown, and conceive the latter to resemble the former. By means of this general habitual principle, we regard even one experiment as the foundation of reasoning, and expect a similar event with some degree of certainty, where the experiment has been made accurately, and free from all foreign circumstances. It is therefore considered as a matter of great importance to observe the consequences of things; and as one man may very much surpass another in attention and memory and observation, this will make a very great difference in their reasoning.

2. Where there is a complication of causes to produce any effect, one mind may be much larger than another, and better able to comprehend the whole system of objects, and to infer justly their consequences.

3. One man is able to carry on a chain of consequences to a greater length than another.

4. Few men can think long without running into a confusion of ideas, and mistaking one for another; and there are various degrees of this infirmity.

5. The circumstance, on which the effect depends, is frequently involved in other circumstances, which are foreign and extrinsic. The separation of it often requires great attention, accuracy, and subtilty.

6. The forming of general maxims from particular observation is a very nice operation; and nothing is more usual, from haste or narrowness of mind which sees not on all sides than to commit mistakes in this particular.

7. When we reason from analogies, the man, who has the greater experience of the greater promptitude of suggesting analogies, will be the better reasoner.

8. Biases from prejudice, education, passion, party, etc., hang more upon one mind than another.

9. After we have acquired a confidence in human testimony, books and conversation enlarge much more the sphere of one man's experience and thought than those of another.

It would be easy to discover many other circumstances that make a difference in the understandings of men.

merely as external evidences, and are not brought home to every one's breast, by the immediate operation of the Holy Spirit.

Nothing is so convenient as a decisive argument of this kind, which must at least *silence* the most arrogant bigotry and superstition, and free us from their impertinent solicitations. I flatter myself, that I have discovered an argument of a like nature, which, if just, will, with the wise and learned, be an everlasting check to all kinds of superstitious delusion, and consequently, will be useful as long as the world endures; for so long, I presume, will the accounts of miracles and prodigies be found in all history, sacred and profane.

Though experience be our only guide in reasoning concerning matters of fact; it must be acknowledged, that this guide is not altogether infallible, but in some cases is apt to lead us into errors. One, who in our climate, should expect better weather in any week of June than in one of December, would reason justly, and conformably to experience; but it is certain, that he may happen, in the event, to find himself mistaken. However, we may observe, that, in such a case, he would have no cause to complain of experience; because it commonly informs us beforehand of the uncertainty, by that contrariety of events, which we may learn from a diligent observation. All effects follow not with like certainty from their supposed causes. Some events are found, in all countries and all ages, to have been constantly conjoined together: Others are found to have been more variable, and sometimes to disappoint our expectations; so that, in our reasonings concerning matter of fact, there are all imaginable degrees of assurance, from the highest certainty to the lowest species of moral evidence.

A wise man, therefore, proportions his belief to the evidence. In such conclusions as are founded on an infallible experience, he expects the event with the last degree of assurance, and regards his past experience as a full *proof* of the future existence of that event. In other cases, he proceeds with more caution: He weighs the opposite experiments: He considers which side is supported by the greater number of experiments: to that side he inclines, with doubt and hesitation; and when at last he fixes his judgement, the evidence exceeds not what we properly call *probability*. All probability, then, supposes an opposition of experiments and observations, where the one side is found to overbalance the other, and to produce a degree of evidence, proportioned to the superiority. A hundred instances or experiments on one side, and fifty on another, afford a doubtful expectation of any event; though a hundred uniform experiments, with only one that is contradictory, reasonably begets a pretty strong degree of assurance. In all cases, we must balance the opposite experiments, where they are opposite, and deduct the smaller number from the greater, in order to know the exact force of the superior evidence.

To apply these principles to a particular instance; we may observe, that there is no species of reasoning more common, more useful, and even necessary to human life, than that which is derived from the testimony of men, and the reports of eye-witnesses and spectators. This species of reasoning, perhaps, one may deny to be founded on the relation of cause and effect. I shall not dispute about a word. It will be sufficient to observe that our assurance in any argument of this kind is derived from no other principle than our observation of the veracity of human testimony, and of the usual conformity of facts to the reports of witnesses. It being a general maxim, that no objects have any discoverable connexion together, and that all the inferences, which we can draw from one to another, are founded merely on our experience of their constant and regular conjunction; it is evident, that we ought not to make an exception to this maxim in favour of human testimony, whose connexion with any event seems, in itself, as little necessary as any other. Were not the memory tenacious to a certain degree; had not men

commonly an inclination to truth and a principle of probity, were they not sensible to shame, when detected in a falsehood: Were not these, I say, discovered by *experience* to be qualities, inherent in human nature, we should never repose the least confidence in human testimony. A man delirious, or noted for falsehood and villainy, has no manner of authority with us.

And as the evidence, derived from witnesses and human testimony, is founded on past experience, so it varies with the experience, and is regarded either as *proof* or a *probability*, according as the conjunction between any particular kind of report and any kind of object has been found to be constant or variable. There are a number of circumstances to be taken into consideration in all judgements of this kind; and the ultimate standard, by which we determine all disputes, that may arise concerning them, is always derived from experience and observation. Where this experience is not entirely uniform on any side, it is attended with an unavoidable contrariety in our judgements, and with the same opposition and mutual destruction of argument as in every other kind of evidence. We frequently hesitate concerning the reports of others. We balance the opposite circumstances, which cause any doubt or uncertainty; and when we discover a superiority on one side, we incline to it; but still with a diminution of assurance, in proportion to the force of its antagonist.

This contrariety of evidence, in the present case, may be derived from several different causes; from the opposition of contrary testimony; from the character or number of the witnesses; from the manner of their delivering their testimony; or from the union of all these circumstances. We entertain a suspicion concerning any matter of fact, when the witnesses contradict each other; when they are but few, or of a doubtful character; when they have an interest in what they affirm; when they deliver their testimony with hesitation, or on the contrary, with too violent asseverations. There are many other particulars of the same kind, which may diminish or destroy the force of any argument, derived from human testimony.

Suppose, for instance, that the fact, which the testimony endeavours to establish, partakes of the extraordinary and the marvellous; in that case, the evidence, resulting from the testimony, admits of a diminution, greater or less, in proportion as the fact is more or less unusual. The reason why we place any credit in witnesses and historians, is not derived from any *connexion*, which we perceive *a priori*, between testimony and reality, but because we are accustomed to find a conformity between them. But when the fact attested is such a one as has seldom fallen under our observation, here is a contest of two opposite experiences; of which the one destroys the other, as far as its force goes, and the superior can only operate on the mind by the force, which remains. The very same principle of experience, which gives us a certain degree of assurance in the testimony of witnesses, gives us also, in this case, another degree of assurance against the fact, which they endeavour to establish; from which contradiction there necessarily arises a counterpoise, and mutual destruction of belief and authority.

I should not believe such a story were it told me by Cato, was a proverbial saying in Rome, even during the lifetime of that philosophical patriot.* The incredibility of a fact, it was allowed, might invalidate so great an authority.

The Indian prince, who refused to believe the first relations concerning the effects of frost, reasoned justly; and it naturally required very strong testimony to engage his assent to facts, that arose from a state of nature, with which he was unacquainted, and which bore so

*Plutarch, *Marcus Cato* [*The Life of Cato*].

little analogy to those events, of which he had had constant and uniform experience. Though they were not contrary to his experience, they were not conformable to it.*

But in order to increase the probability against the testimony of witnesses, let us suppose, that the fact, which they affirm, instead of being only marvellous, is really miraculous; and suppose also, that the testimony considered apart and in itself, amounts to an entire proof; in that case, there is proof against proof, of which the strongest must prevail, but still with a diminution of its force, in proportion to that of its antagonist.

A miracle is a violation of the laws of nature; and as a firm and unalterable experience has established these laws, the proof against a miracle, from the very nature of the fact, is as entire as any argument from experience can possibly be imagined. Why is it more than probable, that all men must die; that lead cannot, of itself, remain suspended in the air; that fire consumes wood, and is extinguished by water; unless it be, that these events are found agreeable to the laws of nature, and there is required a violation of these laws, or in other words, a miracle to prevent them? Nothing is esteemed a miracle, if it ever happen in the common course of nature. It is no miracle that a man, seemingly in good health, should die on a sudden: because such a kind of death, though more unusual than any other, has yet been frequently observed to happen. But it is a miracle, that a dead man should come to life; because that has never been observed in any age or country. There must, therefore, be a uniform experience against every miraculous event, otherwise the event would not merit that appellation. And as a uniform experience amounts to a proof, there is here a direct and full *proof*, from the nature of the fact, against the existence of any miracle; nor can such a proof be destroyed, or the miracle rendered credible, but by an opposite proof, which is superior.**

The plain consequence is (and it is a general maxim worthy of our attention), “That no testimony is sufficient to establish a miracle, unless the testimony be of such a kind, that its falsehood would be more miraculous, than the fact, which it endeavours

*No Indian, it is evident, could have experienced that water did not freeze in cold climates. This is placing nature in a situation quite unknown to him; and it is impossible for him to tell *a priori* what will result from it. It is making a new experiment, the consequence of which is always uncertain. One may sometimes conjecture from analogy what will follow; but still this is but conjecture. And it must be confessed, that, in the present case of freezing, the event follows contrary to the rules of analogy, and is such as a rational Indian would not look for. The operations of cold upon water are not gradual according to the degrees of cold; but whenever it comes to the freezing point, the water passes in a moment, from the utmost liquidity to perfect hardness. Such an event, therefore, may be denominated *extraordinary*, and requires a pretty strong testimony, to render it credible to people in a warm climate: But still it is not *miraculous*, nor contrary to uniform experience of the course of nature in cases where all the circumstances are the same. The inhabitants of Sumatra have always seen water fluid in their own climate, and the freezing of their rivers ought to be deemed a prodigy: But they never saw water in Muscovy during the winter, and therefore they cannot reasonably be positive what would there be the consequence.

**Sometimes an event may not, *in itself*, seem to be contrary to the laws of nature, and yet, if it were real, it might, by reason of some circumstances, be denominated a miracle, because, *in fact*, it is contrary to these laws. Thus if a person, claiming a divine authority, should command a sick person to be well, a healthful man to fall down dead, the clouds to pour rain, the winds to blow, in short, should order many natural events, which immediately follow upon his command; these might justly be esteemed miracles, because they are really, in this case, contrary to the laws of nature. For if any suspicion remain, that the event and command concurred by accident, there is no miracle and no transgression of the laws of nature. If this suspicion be removed, there is evidently a miracle, and a transgression of these laws; because nothing can be more contrary to nature than that the voice or command of a man should have such an influence. A miracle may be accurately defined, *a transgression of a law of nature by a particular volition of the Deity, or by the interposition of some invisible agent*. A miracle may either be discovered by men or not. This alters not its nature and essence. The raising of a house or ship into the air is a visible miracle. The raising of a feather, when the wind wants ever so little of a force requisite for that purpose, is as real a miracle, though not so sensible with regard to us.

to establish; and even in that case there is a mutual destruction of arguments, and the superior only gives us an assurance suitable to that degree of force, which remains, after deducting the inferior." When anyone tells me, that he saw a dead man restored to life, I immediately consider with myself, whether it be more probable, that this person should either deceive or be deceived, or that the fact, which he relates, should really have happened. I weigh the one miracle against the other; and according to the superiority, which I discover, I pronounce my decision, and always reject the greater miracle. If the falsehood of his testimony would be more miraculous, than the event which he relates; then, and not till then, can he pretend to command my belief or opinion.

PART II

In the foregoing reasoning we have supposed, that the testimony, upon which a miracle is founded, may possibly amount to an entire proof, and that the falsehood of that testimony would be a real prodigy: But it is easy to shew, that we have been a great deal too liberal in our concession, and that there never was a miraculous event established on so full an evidence.

For *first*, there is not to be found, in all history, any miracle attested by a sufficient number of men, of such unquestioned good-sense, education, and learning, as to secure us against all delusion in themselves; of such undoubted integrity, as to place them beyond all suspicion of any design to deceive others; of such credit and reputation in the eyes of mankind, as to have a great deal to lose in case of their being detected in any falsehood; and at the same time, attesting facts performed in such a public manner and in so celebrated a part of the world, as to render the detection unavoidable: All which circumstances are requisite to give us a full assurance in the testimony of men.

Secondly, We may observe in human nature a principle which, if strictly examined, will be found to diminish extremely the assurance, which we might, from human testimony, have, in any kind of prodigy. The maxim, by which we commonly conduct ourselves in our reasonings, is, that the objects, of which we have no experience, resemble those, of which we have; that what we have found to be most usual is always most probable; and that where there is an opposition of arguments, we ought to give the preference to such as are founded on the greatest number of past observations. But though, in proceeding by this rule, we readily reject any fact which is unusual and incredible in an ordinary degree; yet in advancing farther, the mind observes not always the same rule; but when anything is affirmed utterly absurd and miraculous, it rather the more readily admits of such a fact, upon account of that very circumstance, which ought to destroy all its authority. The passion of *surprise* and *wonder*, arising from miracles, being an agreeable emotion, gives a sensible tendency towards the belief of those events, from which it is derived. And this goes so far, that even those who cannot enjoy this pleasure immediately, nor can believe those miraculous events, of which they are informed, yet love to partake of the satisfaction at second-hand or by rebound, and place a pride and delight in exciting the admiration of others.

With what greediness are the miraculous accounts of travellers received, their descriptions of sea and land monsters, their relations of wonderful adventures, strange men, and uncouth manners? But if the spirit of religion join itself to the love of wonder, there is an end of common sense; and human testimony, in these circumstances, loses all pretensions to authority. A religionist may be an enthusiast, and imagine he sees what has no reality: he may know his narrative to be false, and yet persevere in it, with the best intentions in the world, for the sake of promoting so holy a cause: or even where this delusion has no place, vanity, excited by so strong a temptation, operates on

him more powerfully than on the rest of mankind in any other circumstances; and self-interest with equal force. His auditors may not have, and commonly have not, sufficient judgement to canvass his evidence: what judgement they have, they renounce by principle, in these sublime and mysterious subjects: or if they were ever so willing to employ it, passion and a heated imagination disturb the regularity of its operations. Their credulity increases his impudence: and his impudence overpowers their credulity.

Eloquence, when at its highest pitch, leaves little room for reason or reflection; but addressing itself entirely to the fancy or the affections, captivates the willing hearers, and subdues their understanding. Happily, this pitch it seldom attains. But what a Tully or a Demosthenes could scarcely effect over a Roman or Athenian audience, every *Capuchin*, every itinerant or stationary teacher can perform over the generality of mankind, and in a higher degree, by touching such gross and vulgar passions.

The many instances of forged miracles, and prophecies, and supernatural events, which, in all ages, have either been detected by contrary evidence, or which detect themselves by their absurdity, prove sufficiently the strong propensity of mankind to the extraordinary and the marvellous, and ought reasonably to beget a suspicion against all relations of this kind. This is our natural way of thinking, even with regard to the most common and most credible events. For instance: There is no kind of report which rises so easily, and spreads so quickly, especially in country places and provincial towns, as those concerning marriages; insomuch that two young persons of equal condition never see each other twice, but the whole neighbourhood immediately join them together. The pleasure of telling a piece of news so interesting, of propagating it, and of being the first reporters of it, spreads the intelligence. And this is so well known, that no man of sense gives attention to these reports, till he find them confirmed by some greater evidence. Do not the same passions, and others still stronger, incline the generality of mankind to believe and report, with the greatest vehemence and assurance, all religious miracles?

Thirdly, It forms a strong presumption against all supernatural and miraculous relations, that they are observed chiefly to abound among ignorant and barbarous nations; or if a civilized people has ever given admission to any of them, that people will be found to have received them from ignorant and barbarous ancestors, who transmitted them with that inviolable sanction and authority, which always attend received opinions. When we peruse the first histories of all nations, we are apt to imagine ourselves transported into some new world; where the whole frame of nature is disjointed, and every element performs its operations in a different manner, from what it does at present. Battles, revolutions, pestilence, famine and death, are never the effect of those natural causes, which we experience. Prodigies, omens, oracles, judgements, quite obscure the few natural events, that are intermingled with them. But as the former grow thinner every page, in proportion as we advance nearer the enlightened ages, we soon learn, that there is nothing mysterious or super-natural in the case, but that all proceeds from the usual propensity of mankind towards the marvellous, and that, though this inclination may at intervals receive a check from sense and learning, it can never be thoroughly extirpated from human nature.

It is strange, a judicious reader is apt to say, upon the perusal of these wonderful historians, *that such prodigious events never happen in our days*. But it is nothing strange, I hope, that men should lie in all ages. You must surely have seen instances enough of that frailty. You have yourself heard many such marvellous relations started, which, being treated with scorn by all the wise and judicious, have at last been abandoned even by the vulgar. Be assured, that those renowned lies, which have spread and flourished to such a monstrous height, arose from like beginnings; but being sown in a more proper soil, shot up at last into prodigies almost equal to those which they relate.

It was a wise policy in that false prophet, Alexander, who though now forgotten, was once so famous, to lay the first scene of his impostures in Paphlagonia, where, as Lucian tells us, the people were extremely ignorant and stupid, and ready to swallow even the grossest delusion. People at a distance, who are weak enough to think the matter at all worth enquiry, have no opportunity of receiving better information. The stories come magnified to them by a hundred circumstances. Fools are industrious in propagating the imposture; while the wise and learned are contented, in general, to deride its absurdity, without informing themselves of the particular facts, by which it may be distinctly refuted. And thus the impostor above mentioned was enabled to proceed, from his ignorant Paphlagonians, to the enlisting of votaries, even among the Grecian philosophers, and men of the most eminent rank and distinction in Rome: nay, could engage the attention of that sage emperor Marcus Aurelius; so far as to make him trust the success of a military expedition to his delusive prophecies.

The advantages are so great, of starting an imposture among an ignorant people, that, even though the delusion should be too gross to impose on the generality of them (*which, though seldom, is sometimes the case*) it has a much better chance for succeeding in remote countries, than if the first scene had been laid in a city renowned for arts and knowledge. The most ignorant and barbarous of these barbarians carry the report abroad. None of their countrymen have a large correspondence, or sufficient credit and authority to contradict and beat down the delusion. Men's inclination to the marvellous has full opportunity to display itself. And thus a story, which is universally exploded in the place where it was first started, shall pass for certain at a thousand miles distance. But had Alexander fixed his residence at Athens, the philosophers of that renowned mart of learning had immediately spread, throughout the whole Roman empire, their sense of the matter; which, being supported by so great authority, and displayed by all the force of reason and eloquence, had entirely opened the eyes of mankind. It is true; Lucian, passing by chance through Paphlagonia, had an opportunity of performing this good office. But, though much to be wished, it does not always happen, that every Alexander meets with a Lucian, ready to expose and detect his impostures.

I may add as a *fourth* reason, which diminishes the authority of prodigies, that there is no testimony for any, even those which have not been expressly detected, that is not opposed by an infinite number of witnesses; so that not only the miracle destroys the credit of testimony, but the testimony destroys itself. To make this the better understood, let us consider, that, in matters of religion, whatever is different is contrary; and that it is impossible the religions of ancient Rome, of Turkey, of Siam, and of China should, all of them, be established on any solid foundation. Every miracle, therefore, pretended to have been wrought in any of these religions (and all of them abound in miracles), as its direct scope is to establish the particular system to which it is attributed; so has it the same force, though more indirectly, to overthrow every other system. In destroying a rival system, it likewise destroys the credit of those miracles, on which that system was established; so that all the prodigies of different religions are to be regarded as contrary facts, and the evidences of these prodigies, whether weak or strong, as opposite to each other. According to this method of reasoning, when we believe any miracle of Mahomet or his successors, we have for our warrant the testimony of a few barbarous Arabians: And on the other hand, we are to regard the authority of Titus Livius, Plutarch, Tacitus, and, in short, of all the authors and witnesses, Grecian, Chinese, and Roman Catholic, who have related any miracle in their particular religion; I say, we are to regard their testimony in the same light as if they had mentioned that Mahometan miracle, and had in express terms contradicted it, with the same certainty as they have

for the miracle they relate. This argument may appear over subtle and refined; but is not in reality different from the reasoning of a judge, who supposes, that the credit of two witnesses, maintaining a crime against any one, is destroyed by the testimony of two others, who affirm him to have been two hundred leagues distant, at the same instant when the crime is said to have been committed.

One of the best attested miracles in all profane history, is that which Tacitus reports of Vespasian, who cured a blind man in Alexandria, by means of his spittle, and a lame man by the mere touch of his foot; in obedience to a vision of the god Serapis, who had enjoined them to have recourse to the Emperor, for these miraculous cures. The story may be seen in that fine historian;* where every circumstance seems to add weight to the testimony, and might be displayed at large with all the force of argument and eloquence, if any one were now concerned to enforce the evidence of that exploded and idolatrous superstition. The gravity, solidity, age, and probity of so great an emperor, who, through the whole course of his life, conversed in a familiar manner with his friends and courtiers, and never affected those extraordinary airs of divinity assumed by Alexander and Demetrius. The historian, a contemporary writer, noted for candour and veracity, and withal, the greatest and most penetrating genius, perhaps, of all antiquity; and so free from any tendency to credulity, that he even lies under the contrary imputation, of atheism and profaneness: The persons, from whose authority he related the miracle, of established character for judgement and veracity, as we may well presume; eye-witnesses of the fact, and confirming their testimony, after the Flavian family was despoiled of the empire, and could no longer give any reward, as the price of a lie. *Utrumque, qui interfuere, nunc quoque memorant, postquam nullum mendacio pretium.*** To which if we add the public nature of the facts, as related, it will appear, that no evidence can well be supposed stronger for so gross and so palpable a falsehood.

There is also a memorable story related by Cardinal de Retz, which may well deserve our consideration. When that intriguing politician fled into Spain, to avoid the persecution of his enemies, he passed through Saragossa, the capital of Arragon, where he was shown, in the cathedral, a man, who had served seven years as a doorkeeper, and was well known to every body in town, that had ever paid his devotions at that church. He had been seen, for so long a time, wanting a leg; but recovered that limb by the rubbing of holy oil upon the stump; and the cardinal assures us that he saw him with two legs. This miracle was vouched by all the canons of the church; and the whole company in town were appealed to for a confirmation of the fact; whom the cardinal found, by their zealous devotion, to be thorough believers of the miracle. Here the relater was also contemporary to the supposed prodigy, of an incredulous and libertine character, as well as of great genius; the miracle of so *singular* a nature as could scarcely admit of a counterfeit, and the witnesses very numerous, and all of them, in a manner, spectators of the fact, to which they gave their testimony. And what adds mightily to the force of the evidence, and may double our surprise on this occasion, is, that the cardinal himself, who relates the story, seems not to give any credit to it, and consequently cannot be suspected of any concurrence in the holy fraud. He considered justly, that it was not requisite, in order to reject a fact of this nature, to be able accurately to disprove the testimony, and to trace its falsehood, through all the circumstances of knavery and credulity which produced it. He knew, that, as this was commonly altogether impossible at any small distance of time and place; so was it extremely difficult, even where one

*Histories, iv. 81. Suetonius gives nearly the same account, *Lives of the Caesars* (Vespasian).

**[Those who were present recount both even now that a lie is no longer rewarded.]

was immediately present, by reason of the bigotry, ignorance, cunning, and roguery of a great part of mankind. He therefore concluded, like a just reasoner, that such an evidence carried falsehood upon the very face of it, and that a miracle, supported by any human testimony, was more properly a subject of derision than of argument.

There surely never was a greater number of miracles ascribed to one person, than those, which were lately said to have been wrought in France upon the tomb of Abbe Paris, the famous Jansenist, with whose sanctity the people were so long deluded. The curing of the sick, giving hearing to the deaf, and sight to the blind, were every where talked of as the usual effects of that holy sepulchre. But what is more extraordinary; many of the miracles were immediately proved upon the spot, before judges of unquestioned integrity, attested by witnesses of credit and distinction, in a learned age, and on the most eminent theatre that is now in the world. Nor is this all: a relation of them was published and dispersed everywhere; nor were the *Jesuits*, though a learned body, supported by the civil magistrate, and determined enemies to those opinions, in whose favour the miracles were said to have been wrought, ever able distinctly to refute or detect them. Where shall we find such a number of circumstances, agreeing to the corroboration of one fact? And what have we to oppose to such a cloud of witnesses, but the absolute impossibility or miraculous nature of the events, which they relate? And this surely, in the eyes of all reasonable people, will alone be regarded as a sufficient refutation.

Is the consequence just, because some human testimony has the utmost force and authority in some cases, when it relates the battle of Philippi or Pharsalia for instance; that therefore all kinds of testimony must, in all cases, have equal force and authority? Suppose that the Caesarean and Pompeian factions had, each of them, claimed the victory in these battles, and that the historians of each party had uniformly ascribed the advantage to their own side; how could mankind, at this distance, have been able to determine between them? The contrariety is equally strong between the miracles related by Herodotus or Plutarch, and those delivered by Mariana, Bede, or any monkish historian.

The wise lend a very academic faith to every report which favours the passion of the reporter; whether it magnifies his country, his family, or himself, or in any other way strikes in with his natural inclinations and propensities. But what greater temptation than to appear a missionary, a prophet, an ambassador from heaven? Who would not encounter many dangers and difficulties, in order to attain so sublime a character? Or if, by the help of vanity and a heated imagination, a man has first made a convert of himself, and entered seriously into the delusion; who ever scruples to make use of pious frauds, in support of so holy and meritorious a cause?

The smallest spark may here kindle into the greatest flame; because the materials are always prepared for it. The *avidum genus auricularum*,* the gazing populace, receive greedily, without examination, whatever soothes superstition, and promotes wonder.

How many stories of this nature have, in all ages, been detected and exploded in their infancy? How many more have been celebrated for a time, and have afterwards sunk into neglect and oblivion? Where such reports, therefore, fly about, the solution of the phenomenon is obvious; and we judge in conformity to regular experience and observation, when we account for it by the known and natural principles of credulity and delusion. And shall we, rather than have a recourse to so natural a solution, allow of a miraculous violation of the most established laws of nature?

*[a genus hungry for gossip] Lucretius, *De Rerum Natura*, iv.

I need not mention the difficulty of detecting, a falsehood in any private or even public history, at the place, where it is said to happen; much more when the scene is removed to ever so small a distance. Even a court of judicature, with all the authority, accuracy, and judgement, which they can employ, find themselves often at a loss to distinguish between truth and falsehood in the most recent actions. But the matter never comes to any issue, if trusted to the common method of altercations and debate and flying rumours; especially when men's passions have taken part on either side.

In the infancy of new religions, the wise and learned commonly esteem the matter too inconsiderable to deserve their attention or regard. And when afterwards they would willingly detect the cheat, in order to undeceive the deluded multitude, the season is now past, and the records and witnesses, which might clear up the matter, have perished beyond recovery.

No means of detection remain, but those which must be drawn from the very testimony itself of the reporters: and these, though always sufficient with the judicious and knowing, are commonly too fine to fall under the comprehension of the vulgar.

Upon the whole, then, it appears, that no testimony for any kind of miracle has ever amounted to a probability, much less to a proof; and that, even supposing it amounted to a proof, it would be opposed by another proof; derived from the very nature of the fact, which it would endeavour to establish. It is experience only, which gives authority to human testimony; and it is the same experience, which assures us of the laws of nature. When, therefore, these two kinds of experience are contrary, we have nothing to do but subtract the one from the other, and embrace an opinion, either on one side or the other, with that assurance which arises from the remainder. But according to the principle here explained, this substraction, with regard to all popular religions, amounts to an entire annihilation; and therefore we may establish it as a maxim, that no human testimony can have such force as to prove a miracle, and make it a just foundation for any such system of religion.

I beg the limitations here made may be remarked, when I say, that a miracle can never be proved, so as to be the foundation of a system of religion. For I own, that otherwise, there may possibly be miracles, or violations of the usual course of nature, of such a kind as to admit of proof from human testimony; though, perhaps, it will be impossible to find any such in all the records of history. Thus, suppose, all authors, in all languages, agree, that, from the first of January 1600, there was a total darkness over the whole earth for eight days: suppose that the tradition of this extraordinary event is still strong and lively among the people: that all travellers, who return from foreign countries, bring us accounts of the same tradition, without the least variation or contradiction: it is evident, that our present philosophers, instead of doubting the fact, ought to receive it as certain, and ought to search for the causes whence it might be derived. The decay, corruption, and dissolution of nature, is an event rendered probable by so many analogies, that any phenomenon, which seems to have a tendency towards that catastrophe, comes within the reach of human testimony, if that testimony be very extensive and uniform.

But suppose, that all the historians who treat of England, should agree, that, on the first of January 1600, Queen Elizabeth died; that both before and after her death she was seen by her physicians and the whole court, as is usual with persons of her rank; that her successor was acknowledged and proclaimed by the parliament; and that, after being interred a month, she again appeared, resumed the throne, and governed England for three years: I must confess that I should be surprised at the concurrence of so many odd circumstances, but should not have the least inclination to believe so miraculous an

event. I should not doubt of her pretended death, and of those other public circumstances that followed it: I should only assert it to have been pretended, and that it neither was, nor possibly could be real. You would in vain object to me the difficulty, and almost impossibility of deceiving the world in an affair of such consequence; the wisdom and solid judgement of that renowned queen; with the little or no advantage which she could reap from so poor an artifice: All this might astonish me; but I would still reply, that the knavery and folly of men are such common phenomena, that I should rather believe the most extraordinary events to arise from their concurrence, then admit of so signal a violation of the laws of nature.

But should this miracle be ascribed to any new system of religion; men, in all ages, have been so much imposed on by ridiculous stories of that kind, that this very circumstance would be a full proof of a cheat, and sufficient, with all men of sense, not only to make them reject the fact, but even reject it without farther examination. Though the Being to whom the miracle is ascribed, be, in this case, Almighty, it does not, upon that account, become a whit more probable; since it is impossible for us to know the attributes or actions of such a Being, otherwise than from the experience which we have of his productions, in the usual course of nature. This still reduces us to past observation, and obliges us to compare the instances of the violation of truth in the testimony of men, with those of the violation of the laws of nature by miracles, in order to judge which of them is most likely and probable. As the violations of truth are more common in the testimony concerning religious miracles, than in that concerning any other matter of fact; this must diminish very much the authority of the former testimony, and make us form a general resolution, never to lend any attention to it, with whatever specious pretence it may be covered.

Lord Bacon seems to have embraced the same principles of reasoning. "We ought," says he, "to make a collection or particular history of all monsters and prodigious births or productions, and in a word of every thing new, rare, and extraordinary in nature. But this must be done with the most severe scrutiny, lest we depart from truth. Above all, every relation must be considered as suspicious, which depends in any degree upon religion, as the prodigies of Livy: And no less so, every thing that is to be found in the writers of natural magic or alchemy, or such authors, who seem, all of them, to have an unconquerable appetite for falsehood and fable.*

I am the better pleased with the method of reasoning here delivered, as I think it may serve to confound those dangerous friends or disguised enemies to the *Christian Religion*, who have undertaken to defend it by the principles of human reason. Our most holy religion is founded on *Faith*, not on reason; and it is a sure method of exposing it to put it to such a trial as it is, by no means, fitted to endure. To make this more evident, let us examine those miracles, related in scripture; and not to lose ourselves in too wide a field, let us confine ourselves to such as we find in the *Pentateuch*, which we shall examine, according to the principles of these pretended Christians, not as the word or testimony of God himself, but as the production of a mere human writer and historian. Here then we are first to consider a book, presented to us by a barbarous and ignorant people, written in an age when they were still more barbarous, and in all probability long after the facts which it relates, corroborated by no concurring testimony, and resembling those fabulous accounts, which every nation gives of its origin. Upon reading this book, we find it full of prodigies and miracles. It gives an account of a state of the world and of human nature entirely different from the present: Of our fall from that state: Of the age of man, extended to near a thousand years: Of the destruction of the world by a deluge: Of the arbitrary choice of one

**Novum Organum*, II, aphorism 29.

people, as the favourites of heaven; and that people the countrymen of the author: Of their deliverance from bondage by prodigies the most astonishing imaginable: I desire any one to lay his hand upon his heart, and after a serious consideration declare, whether he thinks that the falsehood of such a book, supported by such a testimony, would be more extraordinary and miraculous than all the miracles it relates; which is, however, necessary to make it be received, according to the measures of probability above established.

What we have said of miracles may be applied, without any variation, to prophecies; and indeed, all prophecies are real miracles, and as such only, can be admitted as proofs of any revelation. If it did not exceed the capacity of human nature to foretell future events, it would be absurd to employ any prophecy as an argument for a divine mission or authority from heaven. So that, upon the whole, we may conclude, that the *Christian Religion* not only was at first attended with miracles, but even at this day cannot be believed by any reasonable person without one. Mere reason is insufficient to convince us of its veracity: And whoever is moved by *Faith* to assent to it, is conscious of a continued miracle in his own person, which subverts all the principles of his understanding, and gives him a determination to believe what is most contrary to custom and experience.

SECTION XI. OF A PARTICULAR PROVIDENCE AND OF A FUTURE STATE

I was lately engaged in conversation with a friend who loves sceptical paradoxes; where, though he advanced many principles, of which I can by no means approve, yet as they seem to be curious, and to bear some relation to the chain of reasoning carried on throughout this enquiry, I shall here copy them from my memory as accurately as I can, in order to submit them to the judgement of the reader.

Our conversation began with my admiring the singular good fortune of philosophy, which, as it requires entire liberty above all other privileges, and chiefly flourishes from the free opposition of sentiments and argumentation, received its first birth in an age and country of freedom and toleration, and was never cramped, even in its most extravagant principles, by any creeds, confessions, or penal statutes. For, except the banishment of Protagoras, and the death of Socrates, which last event proceeded partly from other motives, there are scarcely any instances to be met with, in ancient history, of this bigoted jealousy, with which the present age is so much infested. Epicurus lived at Athens to an advanced age, in peace and tranquillity: Epicureans were even admitted to receive the sacerdotal character, and to officiate at the altar, in the most sacred rites of the established religion: And the public encouragement of pensions and salaries was afforded equally, by the wisest of all the Roman emperors, to the professors of every sect of philosophy. How requisite such kind of treatment was to philosophy, in her early youth, will easily be conceived, if we reflect, that, even at present, when she may be supposed more hardy and robust, she bears with much difficulty the inclemency of the seasons, and those harsh winds of calumny and persecution, which blow upon her.

You admire, says my friend, as the singular good fortune of philosophy, what seems to result from the natural course of things, and to be unavoidable in every age and nation. This pertinacious bigotry, of which you complain, as so fatal to philosophy, is really her offspring, who, after allying with superstition, separates himself entirely from the interest of his parent, and becomes her most inveterate enemy and persecutor.

Speculative dogmas of religion, the present occasions of such furious dispute, could not possibly be conceived or admitted in the early ages of the world; when mankind, being wholly illiterate, formed an idea of religion more suitable to their weak apprehension, and composed their sacred tenets of such tales chiefly as were the objects of traditional belief, more than of argument or disputation. After the first alarm, therefore, was over, which arose from the new paradoxes and principles of the philosophers; these teachers seem ever after, during the ages of antiquity, to have lived in great harmony with the established superstition, and to have made a fair partition of mankind between them; the former claiming all the learned and wise, the latter possessing all the vulgar and illiterate.

It seems then, say I, that you leave politics entirely out of the question, and never suppose, that a wise magistrate can justly be jealous of certain tenets of philosophy, such as those of Epicurus, which, denying a divine existence, and consequently a providence and a future state, seem to loosen, in a great measure, the ties of morality, and may be supposed, for that reason, pernicious to the peace of civil society.

I know, replied he, that in fact these persecutions never, in any age, proceeded from calm reason, or from experience of the pernicious consequences of philosophy; but arose entirely from passion and prejudice. But what if I should advance farther, and assert, that if Epicurus had been accused before the people, by any of the *sycophants* or informers of those days, he could easily have defended his cause, and proved his principles of philosophy to be as salutary as those of his adversaries, who endeavoured, with such zeal, to expose him to the public hatred and jealousy?

I wish, said I, you would try your eloquence upon so extraordinary a topic, and make a speech for Epicurus, which might satisfy, not the mob of Athens, if you will allow that ancient and polite city to have contained any mob, but the more philosophical part of his audience, such as might be supposed capable of comprehending his arguments.

The matter would not be difficult, upon such conditions, replied he: And if you please, I shall suppose myself Epicurus for a moment, and make you stand for the Athenian people, and shall deliver you such an harangue as will fill all the urn with white beans, and leave not a black one to gratify the malice of my adversaries.

Very well: Pray proceed upon these suppositions.

I come hither, O ye Athenians, to justify in your assembly what I maintained in my school, and I find myself impeached by furious antagonists, instead of reasoning with calm and dispassionate enquirers. Your deliberations, which of right should be directed to questions of public good, and the interest of the commonwealth, are diverted to the disquisitions of speculative philosophy; and these magnificent, but perhaps fruitless enquiries, take place of your more familiar but more useful occupations. But so far as in me lies, I will prevent this abuse. We shall not here dispute concerning the origin and government of worlds. We shall only enquire how far such questions concern the public interest. And if I can persuade you, that they are entirely indifferent to the peace of society and security of government, I hope that you will presently send us back to our schools, there to examine, at leisure, the question the most sublime, but at the same time, the most speculative of all philosophy.

The religious philosophers, not satisfied with the tradition of your forefathers, and doctrine of your priests (in which I willingly acquiesce), indulge a rash curiosity, in trying how far they can establish religion upon the principles of reason; and they thereby excite, instead of satisfying, the doubts, which naturally arise from a diligent and scrupulous enquiry. They paint, in the most magnificent colours, the order, beauty, and wise arrangement of the universe; and then ask, if such a glorious display of intelligence could proceed from the fortuitous concourse of atoms, or if

chance could produce what the greatest genius can never sufficiently admire. I shall not examine the justness of this argument. I shall allow it to be as solid as my antagonists and accusers can desire. It is sufficient, if I can prove, from this very reasoning, that the question is entirely speculative, and that, when, in my philosophical disquisitions, I deny a providence and a future state, I undermine not the foundations of society, but advance principles, which they themselves, upon their own topics, if they argue consistently, must allow to be solid and satisfactory.

You then, who are my accusers, have acknowledged, that the chief or sole argument for a divine existence (which I never questioned) is derived from the order of nature; where there appear such marks of intelligence and design, that you think it extravagant to assign for its cause, either chance, or the blind and unguided force of matter. You allow, that this is an argument drawn from effects to causes. From the order of the work, you infer, that there must have been project and forethought in the workman. If you cannot make out this point, you allow, that your conclusion fails; and you pretend not to establish the conclusion in a greater latitude than the phenomena of nature will justify. These are your concessions. I desire you to mark the consequences.

When we infer any particular cause from an effect, we must proportion the one to the other, and can never be allowed to ascribe to the cause any qualities, but what are exactly sufficient to produce the effect. A body of ten ounces raised in any scale may serve as a proof, that the counterbalancing weight exceeds ten ounces; but can never afford a reason that it exceeds a hundred. If the cause, assigned for any effect, be not sufficient to produce it, we must either reject that cause, or add to it such qualities as will give it a just proportion to the effect. But if we ascribe to it further qualities, or affirm it capable of producing other effects, we can only indulge the licence of conjecture, and arbitrarily suppose the existence of qualities and energies, without reason or authority.

The same rule holds, whether the cause assigned be brute unconscious matter, or a rational intelligent being. If the cause be known only by the effect, we never ought to ascribe to it any qualities, beyond what are precisely requisite to produce the effect: Nor can we, by any rules of just reasoning, return back from the cause, and infer other effects from it, beyond those by which alone it is known to us. No one, merely from the sight of one of Zeuxis's pictures, could know, that he was also a statuary or architect, and was an artist no less skilful in stone and marble than in colours. The talents and taste, displayed in the particular work before us; these we may safely conclude the workmen to be possessed of. The cause must be proportioned to the effect; and if we exactly and precisely proportion it, we shall never find in it any qualities, that point farther, or afford an inference concerning any other design or performance. Such qualities must be somewhat beyond what is merely requisite for producing the effect, which we examine.

Allowing, therefore, the gods to be the authors of the existence or order of the universe; it follows, that they possess that precise degree of power, intelligence, and benevolence, which appears in their workmanship; but nothing farther can ever be proved, except we call in the assistance of exaggeration and flattery to supply the defects of argument and reasoning. So far as the traces of any attributes, at present, appear, so far may we conclude these attributes to exist. The supposition of farther attributes is mere hypothesis; much more the supposition, that, in distant regions of space or periods of time, there has been, or will be, a more magnificent display of these attributes, and a scheme of administration more suitable to such imaginary virtues. We can never be allowed to mount up from the universe, the effect, to Jupiter, the cause; and then descend downwards, to infer any new effect from that cause; as if the present effects alone were not entirely worthy of the glorious attributes, which we ascribe to

that deity. The knowledge of the cause being derived solely from the effect, they must be exactly adjusted to each other; and the one can never refer to anything farther, or be the foundation of any new inference and conclusion.

You find certain phenomena in nature. You seek a cause or author. You imagine that you have found him. You afterwards become so enamoured of this offspring of your brain, that you imagine it impossible, but he must produce something greater and more perfect than the present scene of things, which is so full of ill and disorder. You forget, that this superlative intelligence and benevolence are entirely imaginary, or, at least, without any foundation in reason; and that you have no ground to ascribe to him any qualities, but what you see he has actually exerted and displayed in his productions. Let your gods, therefore, O philosophers, be suited to the present appearances of nature: and presume not to alter these appearances by arbitrary suppositions, in order to suit them to the attributes, which you so fondly ascribe to your deities.

When priests and poets, supported by your authority, O Athenians, talk of a golden or silver age, which preceded the present state of vice and misery, I hear them with attention and with reverence. But when philosophers, who pretend to neglect authority, and to cultivate reason, hold the same discourse, I pay them not, I own, the same obsequious submission and pious deference. I ask, who carried them into the celestial regions, who admitted them into the councils of the gods, who opened to them the book of fate, that they thus rashly affirm, that their deities have executed, or will execute, any purpose beyond what has actually appeared? If they tell me, that they have mounted on the steps or by the gradual ascent of reason, and by drawing inferences from effects to causes, I still insist, that they have aided the ascent of reason by the wings of imagination; otherwise they could not thus change their manner of inference, and argue from causes to effects; presuming, that a more perfect production than the present world would be more suitable to such perfect beings as the gods, and forgetting that they have no reason to ascribe to these celestial beings any perfection or any attribute, but what can be found in the present world.

Hence all the fruitless industry to account for the ill appearance of nature, and save the honour of the gods; while we must acknowledge the reality of that evil and disorder, with which the world so much abounds. The obstinate and intractable qualities of matter, we are told, or the observance of general laws, or some such reason, is the sole cause, which controlled the power and benevolence of Jupiter, and obliged him to create mankind and every sensible creature so imperfect and so unhappy. These attributes then, are, it seems, beforehand, taken for granted, in their greatest latitude. And upon that supposition, I own that such conjectures may, perhaps, be admitted as plausible solutions of the ill phenomena. But still I ask, Why take these attributes for granted, or why ascribe to the cause any qualities but what actually appear in the effect? Why torture your brain to justify the course of nature upon suppositions, which, for aught you know, may be entirely imaginary, and of which there are to be found no traces in the course of nature?

The religious hypothesis, therefore, must be considered only as a particular method of accounting for the visible phenomena of the universe: but no just reasoner will ever presume to infer from it any single fact, and alter or add to the phenomena, in any single particular. If you think, that the appearances of things prove such causes, it is allowable for you to draw an inference concerning the existence of these causes. In such complicated and sublime subjects, every one should be indulged in the liberty of conjecture and argument. But here you ought to rest. If you come backward, and arguing from your inferred causes, conclude, that any other fact has existed, or will exist, in the course of nature, which may serve as a fuller display of particular attributes; I must

admonish you, that you have departed from the method of reasoning, attached to the present subject, and have certainly added something to the attributes of the cause, beyond what appears in the effect; otherwise you could never, with tolerable sense or propriety, add anything to the effect, in order to render it more worthy of the cause.

Where, then, is the odiousness of that doctrine, which I teach in my school, or rather, which I examine in my gardens? Or what do you find in this whole question, wherein the security of good morals, or the peace and order of society, is in the least concerned?

I deny a providence, you say, and supreme governor of the world, who guides the course of events, and punishes the vicious with infamy and disappointment, and rewards the virtuous with honour and success, in all their undertakings. But surely, I deny not the course itself of events, which lies open to every one's inquiry and examination. I acknowledge, that, in the present order of things, virtue is attended with more peace of mind than vice, and meets with a more favour able reception from the world. I am sensible, that, according to the past experience of mankind, friendship is the chief joy of human life, and moderation the only source of tranquillity and happiness. I never balance between the virtuous and the vicious course of life; but am sensible, that, to a well-disposed mind, every advantage is on the side of the former. And what can you say more, allowing all your suppositions and reasonings? You tell me, indeed, that this disposition of things proceeds from intelligence and design. But whatever it proceeds from, the disposition itself, on which depends our happiness or misery, and consequently our conduct and deportment in life is still the same. It is still open for me, as well as you, to regulate my behaviour, by my experience of past events. And if you affirm, that, while a divine providence is allowed, and a supreme distributive justice in the universe, I ought to expect some more particular reward of the good, and punishment of the bad, beyond the ordinary course of events; I here find the same fallacy, which I have before endeavoured to detect. You persist in imagining, that, if we grant that divine existence, for which you so earnestly contend, you may safely infer consequences from it, and add something to the experienced order of nature, by arguing from the attributes which you ascribe to your gods. You seem not to remember, that all your reasonings on this subject can only be drawn from effects to causes; and that every argument, deducted from causes to effects, must of necessity be a gross sophism; since it is impossible for you to know anything of the cause, but what you have antecedently, not inferred, but discovered to the full, in the effect.

But what must a philosopher think of those vain reasoners, who, instead of regarding the present scene of things as the sole object of their contemplation, so far reverse the whole course of nature, as to render this life merely a passage to something farther; a porch, which leads to a greater, and vastly different building; a prologue, which serves only to introduce the piece, and give it more grace and propriety? Whence, do you think, can such philosophers derive their idea of the gods? From their own conceit and imagination surely. For if they derived it from the present phenomena, it would never point to anything farther, but must be exactly adjusted to them. That the divinity may *possibly* be endowed with attributes, which we have never seen exerted, may be governed by principles of action, which we cannot discover to be satisfied: all this will freely be allowed. But still this is mere *possibility* and hypothesis. We never can have reason to *infer* any attributes, or any principles of action in him, but so far as we know them to have been exerted and satisfied.

Are there *any marks of a distributive justice in the world*? If you answer in the affirmative, I conclude, that, since justice here exerts itself, it is satisfied. If you reply in the negative, I conclude, that you have then no reason to ascribe justice, in our sense of it, to the gods. If you hold a medium between affirmation and negation, by saying, that the justice of

the gods, at present, exerts itself in part, but not in its full extent; I answer, that you have no reason to give it any particular extent, but only so far as you see it, *at present*, exert itself.

Thus I bring the dispute, O Athenians, to a short issue with my antagonists. The course of nature lies open to my contemplation as well as to theirs. The experienced train of events is the great standard, by which we all regulate our conduct. Nothing else can be appealed to in the field, or in the senate. Nothing else ought ever to be heard of in the schools, or in the closet. In vain would our limited understanding break through those boundaries, which are too narrow for our fond imagination. While we argue from the course of nature, and infer a particular intelligent cause, which first bestowed, and still preserves order in the universe, we embrace a principle, which is both uncertain and useless. It is uncertain; because the subject lies entirely beyond the reach of human experience. It is useless; because our knowledge of this cause being derived entirely from the course of nature, we can never, according to the rules of just reasoning, return back from the cause with any new inference, or making additions to the common and experienced course of nature, establish any new principles of conduct and behaviour.

I observe (said I, finding he had finished his harangue) that you neglect not the artifice of the demagogues of old; and as you were pleased to make me stand for the people, you insinuate yourself into my favour by embracing those principles, to which, you know, I have always expressed a particular attachment. But allowing you to make experience (as indeed I think you ought) the only standard of our judgement concerning this, and all other questions of fact; I doubt not but, from the very same experience, to which you appeal, it may be possible to refute this reasoning, which you have put into the mouth of Epicurus. If you saw, for instance, a half-finished building, surrounded with heaps of brick and stone and mortar, and all the instruments of masonry; could you not *infer* from the effect, that it was a work of design and contrivance? And could you not return again, from this inferred cause, to infer new additions to the effect, and conclude, that the building would soon be finished, and receive all the further improvements, which art could bestow upon it? If you saw upon the sea-shore the print of one human foot, you would conclude, that a man had passed that way, and that he had also left the traces of the other foot, though effaced by the rolling of the sands or inundation of the waters. Why then do you refuse to admit the same method of reasoning with regard to the order of nature? Consider the world and the present life only as an imperfect building, from which you can infer a superior intelligence; and arguing from that superior intelligence, which can leave nothing imperfect; why may you not infer a more finished scheme or plan, which will receive its completion in some distant point of space or time? Are not these methods of reasoning exactly similar? And under what pretence can you embrace the one, while you reject the other?

The infinite difference of the subjects, replied he, is a sufficient foundation for this difference in my conclusions. In works of *human* art and contrivance, it is allowable to advance from the effect to the cause, and returning back from the cause, to form new inferences concerning the effect, and examine the alterations, which it has probably undergone, or may still undergo. But what is the foundation of this method of reasoning? Plainly this: that man is a being, whom we know by experience, whose motives and designs we are acquainted with, and whose projects and inclinations have a certain connexion and coherence, according to the laws which nature has established for the government of such a creature. When, therefore, we find, that any work has proceeded from the skill and industry of man; as we are otherwise acquainted with the nature of the animal, we can draw a hundred inferences concerning what may be expected from

him; and these inferences will all be founded in experience and observation. But did we know man only from the single work or production which we examine, it were impossible for us to argue in this manner; because our knowledge of all the qualities, which we ascribe to him, being in that case derived from the production, it is impossible they could point to anything further, or be the foundation of any new inference. The print of a foot in the sand can only prove, when considered alone, that there was some figure adapted to it, by which it was produced: but the print of a human foot proves likewise, from our other experience, that there was probably another foot, which also left its impression, though effaced by time or other accidents. Here we mount from the effect to the cause; and descending again from the cause, infer alterations in the effect; but this is not a continuation of the same simple chain of reasoning. We comprehend in this case a hundred other experiences and observations, concerning the *usual* figure and members of that species of animal, without which this method of argument must be considered as fallacious and sophistical.

The case is not the same with our reasonings from the works of nature. The Deity is known to us only by his productions, and is a single being in the universe, not comprehended under any species or genus, from whose experienced attributes or qualities, we can, by analogy, infer any attribute or quality in him. As the universe shows wisdom and goodness, we infer wisdom and goodness. As it shows a particular degree of these perfections, we infer a particular degree of them, precisely adapted to the effect which we examine. But further attributes or further degrees of the same attributes, we can never be authorized to infer or suppose, by any rules of just reasoning. Now, without some such license of supposition, it is impossible for us to argue from the cause, or infer any alteration in the effect, beyond what has immediately fallen under our observation. Greater good produced by this Being must still prove a greater degree of goodness: a more impartial distribution of rewards and punishments must proceed from a greater regard to justice and equity. Every supposed addition to the works of nature makes an addition to the attributes of the Author of nature; and consequently, being entirely unsupported by any reason or argument, can never be admitted but as mere conjecture and hypothesis.*

The great source of our mistake in this subject, and of the unbounded licence of conjecture, which we indulge, is, that we tacitly consider ourselves, as in the place of the Supreme Being, and conclude, that he will, on every occasion, observe the same conduct, which we ourselves, in his situation, would have embraced as reasonable and eligible. But, besides that the ordinary course of nature may convince us, that almost everything is regulated by principles and maxims very different from ours; besides, this, I say, it must evidently appear contrary to all rules of analogy to reason, from the intentions and projects of men, to those of a Being so different, and so much superior. In human nature, there is a certain experienced coherence of designs and inclinations; so that when, from

*In general, it may, I think, be established as a maxim, that where any cause is known only by its particular effects, it must be impossible to infer any new effects from that cause; since the qualities, which are requisite to produce these new effects along with the former, must either be different, or superior, or of more extensive operation, than those which simply produced the effect, whence alone the cause is supposed to be known to us. We can never, therefore, have any reason to suppose the existence of these qualities. To say, that the new effects proceed only from a continuation of the same energy, which is already known from the first effects, will not remove the difficulty. For even granting this to be the case (which can seldom be supposed), the very continuation and exertion of a like energy (for it is impossible it can be absolutely the same), I say, this exertion of a like energy, in a different period of space and time, is a very arbitrary supposition, and what there cannot possibly be any traces of in the effects, from which all our knowledge of the cause is originally derived. Let the *inferred* cause be exactly proportioned (as it should be) to the known effect; and it is impossible that it can possess any qualities, from which new or different effects can be *inferred*.

any fact, we have discovered one intention of any man, it may often be reasonable, from experience, to infer another, and draw a long chain of conclusions concerning his past or future conduct. But this method of reasoning can never have place with regard to a Being, so remote and incomprehensible, who bears much less analogy to any other being in the universe than the sun to a waxen taper, and who discovers himself only by some faint traces or outlines, beyond which we have no authority to ascribe to him any attribute or perfection. What we imagine to be a superior perfection, may really be a defect. Or were it ever so much a perfection, the ascribing of it to the Supreme Being, where it appears not to have been really exerted, to the full, in his works, savours more of flattery and panegyric, than of just reasoning and sound philosophy. All the philosophy, therefore, in the world, and all the religion, which is nothing but a species of philosophy, will never be able to carry us beyond the usual course of experience, or give us measures of conduct and behaviour different from those which are furnished by reflections on common life. No new fact can ever be inferred from the religious hypothesis; no event foreseen or foretold: no reward or punishment expected or dreaded, beyond what is already known by practice and observation. So that my apology for Epicurus will still appear solid and satisfactory; nor have the political interests of society any connexion with the philosophical disputes concerning metaphysics and religion.

There is still one circumstance, replied I, which you seem to have overlooked. Though I should allow your premises, I must deny your conclusion. You conclude, that religious doctrines and reasonings *can* have no influence on life, because they *ought* to have no influence; never considering, that men reason not in the same manner you do, but draw many consequences from the belief of a divine Existence, and suppose that the Deity will inflict punishments on vice, and bestow rewards on virtue, beyond what appear in the ordinary course of nature. Whether this reasoning of theirs be just or not, is no matter. Its influence on their life and conduct must still be the same. And, those, who attempt to disabuse them of such prejudices, may, for aught I know, be good reasoners, but I cannot allow them to be good citizens and politicians; since they free men from one restraint upon their passions, and make the infringement of the laws of society, in one respect, more easy and secure.

After all, I may, perhaps, agree to your general conclusion in favour of liberty, though upon different premises from those, on which you endeavour to found it. I think, that the state ought to tolerate every principle of philosophy; nor is there an instance, that any government has suffered in its political interests by such indulgence. There is no enthusiasm among philosophers; their doctrines are not very alluring to the people; and no restraint can be put upon their reasonings, but what must be of dangerous consequences to the sciences, and even to the state, by paving the way for persecution and oppression in points, where the generality of mankind are more deeply interested and concerned.

But there occurs to me (continued I) with regard to your main topic, a difficulty, which I shall just propose to you without insisting on it; lest it lead into reasonings of too nice and delicate a nature. In a word, I much doubt whether it be possible for a cause to be known only by its effect (as you have all along supposed) or to be of so singular and particular a nature as to have no parallel and no similarity with any other cause or object, that has ever fallen under our observation. It is only when two *species* of objects are found to be constantly conjoined, that we can infer the one from the other; and were an effect presented, which was entirely singular, and could not be comprehended under any known species, I do not see, that we could form any conjecture or inference at all concerning its cause. If experience and observation and analogy be, indeed, the only guides which we can reasonably follow in inferences of this nature; both the effect and

cause must bear a similarity and resemblance to other effects and causes, which we know, and which we have found, in many instances, to be conjoined with each other. I leave it to your own reflection to pursue the consequences of this principle. I shall just observe, that, as the antagonists of Epicurus always suppose the universe, an effect quite singular and unparalleled, to be the proof of a Deity, a cause no less singular and unparalleled; your reasonings, upon that supposition, seem, at least, to merit our attention. There is, I own, some difficulty, how we can ever return from the cause to the effect, and, reasoning from our ideas of the former, infer any alteration on the latter, or any addition to it.

SECTION XII. OF THE ACADEMICAL OR SCEPTICAL PHILOSOPHY

PART I

There is not a greater number of philosophical reasonings, displayed upon any subject, than those, which prove the existence of a Deity, and refute the fallacies of *Atheists*; and yet the most religious philosophers still dispute whether any man can be so blinded as to be a speculative atheist. How shall we reconcile these contradictions? The knightserrant, who wandered about to clear the world of dragons and giants, never entertained the least doubt with regard to the existence of these monsters.

The *Sceptic* is another enemy of religion, who naturally provokes the indignation of all divines and graver philosophers; though it is certain, that no man ever met with any such absurd creature, or conversed with a man, who had no opinion or principle concerning any subject, either of action or speculation. This begets a very natural question; What is meant by a sceptic? And how far is it possible to push these philosophical principles of doubt and uncertainty?

There is a species of scepticism, *antecedent* to all study and philosophy, which is much inculcated by Des Cartes and others, as a sovereign preservative against error and precipitate judgement. It recommends an universal doubt, not only of all our former opinions and principles, but also of our very faculties; of whose veracity, say they, we must assure ourselves, by a chain of reasoning, deduced from some original principle, which cannot possibly be fallacious or deceitful. But neither is there any such original principle, which has a prerogative above others, that are self-evident and convincing; or if there were, could we advance a step beyond it, but by the use of those very faculties, of which we are supposed to be already diffident. The Cartesian doubt, therefore, were it ever possible to be attained by any human creature (as it plainly is not) would be entirely incurable; and no reasoning could ever bring us to a state of assurance and conviction upon any subject.

It must, however, be confessed, that this species of scepticism, when more moderate, may be understood in a very reasonable sense, and is a necessary preparative to the study of philosophy, by preserving a proper impartiality in our judgements, and weaning our mind from all those prejudices, which we may have imbibed from education or rash opinion. To begin with clear and self-evident principles, to advance by timorous and sure steps, to review frequently our conclusions, and examine accurately all their consequences; though

by these means we shall make both a slow and a short progress in our systems; are the only methods, by which we can ever hope to reach truth, and attain a proper stability and certainty in our determinations.

There is another species of scepticism, *consequent* to science and enquiry, when men are supposed to have discovered either the absolute fallaciousness of their mental faculties, or their unfitness to reach any fixed determination in all those curious subjects of speculation, about which they are commonly employed. Even our very senses are brought into dispute, by a certain species of philosophers; and the maxims of common life are subjected to the same doubt as the most profound principles or conclusions of metaphysics and theology. As these paradoxical tenets (if they may be called tenets) are to be met with in some philosophers, and the refutation of them in several, they naturally excite our curiosity, and make us enquire into the arguments, on which they may be founded.

I need not insist upon the more trite topics, employed by the sceptics in all ages, against the evidence of *sense*; such as those which are derived from the imperfection and fallaciousness of our organs, on numberless occasions; the crooked appearance of an oar in water; the various aspects of objects, according to their different distances; the double images which arise from the pressing one eye; with many other appearances of a like nature. These sceptical topics, indeed, are only sufficient to prove, that the senses alone are not implicitly to be depended on; but that we must correct their evidence by reason, and by considerations, derived from the nature of the medium, the distance of the object, and the disposition of the organ, in order to render them, without their sphere, the proper *criteria* of truth and falsehood. There are other more profound arguments against the senses, which admit not of so easy a solution.

It seems evident, that men are carried, by a natural instinct or prepossession, to repose faith in their senses; and that, without any reasoning, or even almost before the use of reason, we always suppose an external universe, which depends not on our perception, but would exist, though we and every sensible creature were absent or annihilated. Even the animal creations are governed by a like opinion, and preserve this belief of external objects, in all their thoughts, designs, and actions.

It seems also evident, that, when men follow this blind and powerful instinct of nature, they always suppose the very images, presented by the senses, to be the external objects, and never entertain any suspicion, that the one are nothing but representations of the other. This very table, which we see white, and which we feel hard, is believed to exist, independent of our perception, and to be something external to our mind, which perceives it. Our presence bestows not being on it: our absence does not annihilate it. It preserves its existence uniform and entire, independent of the situation of intelligent beings, who perceive or contemplate it.

But this universal and primary opinion of all men is soon destroyed by the slightest philosophy, which teaches us, that nothing can ever be present to the mind but an image or perception, and that the senses are only the inlets, through which these images are conveyed, without being able to produce any immediate intercourse between the mind and the object. The table, which we see, seems to diminish, as we remove farther from it: but the real table, which exists independent of us, suffers no alteration: it was, therefore, nothing but its image, which was present to the mind. These are the obvious dictates of reason; and no man, who reflects, ever doubted, that the existences, which we consider, when we say, *this house* and *that tree*, are nothing but perceptions in the mind, and fleeting copies or representations of other existences, which remain uniform and independent.

So far, then, are we necessitated by reasoning to contradict or depart from the primary instincts of nature, and to embrace a new system with regard to the evidence of

our senses. But here philosophy finds herself extremely embarrassed, when she would justify this new system, and obviate the cavils and objections of the sceptics. She can no longer plead the infallible and irresistible instinct of nature: for that led us to a quite different system, which is acknowledged fallible and even erroneous. And to justify this pretended philosophical system, by a chain of clear and convincing argument, or even any appearance of argument, exceeds the power of all human capacity.

By what argument can it be proved, that the perceptions of the mind must be caused by external objects, entirely different from them, though resembling them (if that be possible) and could not arise either from the energy of the mind itself, or from the suggestion of some invisible and unknown spirit, or from some other cause still more unknown to us? It is acknowledged, that, in fact, many of these perceptions arise not from anything external, as in dreams, madness, and other diseases. And nothing can be more inexplicable than the manner, in which body should so operate upon mind as ever to convey an image of itself to a substance, supposed of so different, and even contrary a nature.

It is a question of fact, whether the perceptions of the senses be produced by external objects, resembling them: how shall this question be determined? By experience surely; as all other questions of a like nature. But here experience is, and must be entirely silent. The mind has never anything present to it but the perceptions, and cannot possibly reach any experience of their connexion with objects. The supposition of such a connexion is, therefore, without any foundation in reasoning.

To have recourse to the veracity of the Supreme Being, in order to prove the veracity of our senses, is surely making a very unexpected circuit. If his veracity were at all concerned in this matter, our senses would be entirely infallible; because it is not possible that he can ever deceive. Not to mention, that, if the external world be once called in question, we shall be at a loss to find arguments, by which we may prove the existence of that Being or any of his attributes.

This is a topic, therefore, in which the profounder and more philosophical sceptics will always triumph, when they endeavour to introduce an universal doubt into all subjects of human knowledge and enquiry. Do you follow the instincts and propensities of nature, may they say, in assenting to the veracity of sense? But these lead you to believe that the very perception or sensible image is the external object. Do you disclaim this principle, in order to embrace a more rational opinion, that the perceptions are only representations of something external? You here depart from your natural propensities and more obvious sentiments; and yet are not able to satisfy your reason, which can never find any convincing argument from experience to prove, that the perceptions are connected with any external objects.

There is another sceptical topic of a like nature, derived from the most profound philosophy, which might merit our attention, were it requisite to dive so deep, in order to discover arguments and reasonings, which can so little serve to any serious purpose. It is universally allowed by modern enquirers, that all the sensible qualities of objects, such as hard, soft, hot, cold, white, black, etc. are merely secondary, and exist not in the objects themselves, but are perceptions of the mind, without any external archetype or model, which they represent. If this be allowed, with regard to secondary qualities, it must also follow, with regard to the supposed primary qualities of extension and solidity; nor can the latter be any more entitled to that denomination than the former. The idea of extension is entirely acquired from the senses of sight and feeling; and if all the qualities, perceived by the senses, be in the mind, not in the object, the same conclusion must reach the idea of extension, which is wholly dependent on the sensible ideas or the ideas of secondary

qualities. Nothing can save us from this conclusion, but the asserting, that the ideas of those primary qualities are attained by *Abstraction*, an opinion, which, if we examine it accurately, we shall find to be unintelligible, and even absurd. An extension, that is neither tangible nor visible, cannot possibly be conceived: and a tangible or visible extension, which is neither hard nor soft, black or white, is equally beyond the reach of human conception. Let any man try to conceive a triangle in general, which is neither *Isosceles* nor *Scalenum*, nor has any particular length or proportion of sides; and he will soon perceive the absurdity of all the scholastic notions with regard to abstraction and general ideas.*

Thus the first philosophical objection to the evidence of sense or to the opinion of external existence consists in this, that such an opinion, if rested on natural instinct, is contrary to reason, and if referred to reason, is contrary to natural instinct, and at the same time carries no rational evidence with it, to convince an impartial enquirer. The second objection goes farther, and represents this opinion as contrary to reason: at least, if it be a principle of reason, that all sensible qualities are in the mind, not in the object. Bereave matter of all its intelligible qualities, both primary and secondary, you in a manner annihilate it, and leave only a certain unknown, inexplicable *something*, as the cause of our perceptions; a notion so imperfect, that no sceptic will think it worth while to contend against it.

PART II

It may seem a very extravagant attempt of the sceptics to *destroy* reason by argument and ratiocination; yet is this the grand scope of all their enquiries and disputes. They endeavour to find objections, both to our abstract reasonings, and to those which regard matter of fact and existence.

The chief objection against all *abstract* reasonings is derived from the ideas of space and time; ideas, which, in common life and to a careless view, are very clear and intelligible, but when they pass through the scrutiny of the profound sciences (and they are the chief object of these sciences) afford principles, which seem full of absurdity and contradiction. No priestly *dogmas*, invented on purpose to tame and subdue the rebellious reason of mankind, ever shocked common sense more than the doctrine of the infinite divisibility of extension, with its consequences; as they are pompously displayed by all geometricians and metaphysicians, with a kind of triumph and exultation. A real quantity, infinitely less than any finite quantity, containing quantities infinitely less than itself, and so on *in infinitum*; this is an edifice so bold and prodigious, that it is too weighty for any pretended demonstration to support, because it shocks the clearest and most natural principles of human reason.** But what renders the matter more

*This argument is drawn from Dr. Berkeley; and indeed most of the writings of that very ingenious author form the best lessons of scepticism, which are to be found either among the ancient or modern philosophers. Bayle not excepted. He professes, however, in his title-page (and undoubtedly with great truth) to have composed his book against the sceptics as well as against the atheists and freethinkers. But that all his arguments, though otherwise intended, are, in reality, merely sceptical, appears from this, that *they admit of no answer and produce no conviction*. Their only effect is to cause that momentary amazement and irresolution and confusion, which is the result of scepticism.

**Whatever disputes there may be about mathematical points, we must allow that there are physical points; that is, parts of extension which cannot be divided or lessened, either by the eye or imagination. These images, then, which are present to the fancy or senses, are absolutely indivisible, and consequently must be allowed by mathematicians to be infinitely less than any real part of extension; and yet nothing appears more certain to reason, than that an infinite number of them composes an infinite extension. How much more an infinite number of those infinitely small parts of extension, which are still supposed infinitely divisible. It seems to

extraordinary, is, that these seemingly absurd opinions are supported by a chain of reasoning, the clearest and most natural; nor is it possible for us to allow the premises without admitting the consequences. Nothing can be more convincing and satisfactory than all the conclusions concerning the properties of circles and triangles; and yet, when these are once received, how can we deny, that the angle of contact between a circle and its tangent is infinitely less than any rectilineal angle, that as you may increase the diameter of the circle *in infinitum*, this angle of contact becomes still less, even *in infinitum*, and that the angle of contact between other curves and their tangents may be infinitely less than those between any circle and its tangent, and so on, *in infinitum*? The demonstration of these principles seems as unexceptionable as that which proves the three angles of a triangle to be equal to two right ones, though the latter opinion be natural and easy, and the former big with contradiction and absurdity. Reason here seems to be thrown into a kind of amazement and suspense, which, without the suggestions of any sceptic, gives her a diffidence of herself, and of the ground on which she treads. She sees a full light, which illuminates certain places; but that light borders upon the most profound darkness. And between these she is so dazzled and confounded, that she scarcely can pronounce with certainty and assurance concerning any one object.

The absurdity of these bold determinations of the abstract sciences seems to become, if possible, still more palpable with regard to time than extension. An infinite number of real parts of time, passing in succession, and exhausted one after another, appears so evident a contradiction, that no man, one should think, whose judgment is not corrupted, instead of being improved, by the sciences, would ever be able to admit of it.

Yet still reason must remain restless, and unquiet, even with regard to that scepticism, to which she is driven by these seeming absurdities and contradictions. How any clear, distinct idea can contain circumstances, contradictory to itself, or to any other clear, distinct idea, is absolutely incomprehensible; and is, perhaps, as absurd as any proposition, which can be formed. So that nothing can be more sceptical, or more full of doubt and hesitation, than this scepticism itself, which arises from some of the paradoxical conclusions of geometry or the science of quantity.*

me not impossible to avoid these absurdities and contradictions, if it be admitted, that there is no such thing as abstract or general ideas, properly speaking; but that all general ideas are, in reality, particular ones, attached to a general term, which recalls, upon occasion, other particular ones that resemble, in certain circumstances, the idea, present to the mind. Thus when the term Horse is pronounced, we immediately figure to ourselves the idea of a black or a white animal, of a particular size or figure: But as that term is also usually applied to animals of other colours, figures and sizes these ideas, though not actually present to the imagination, are easily recalled, and our reasoning and conclusion proceed in the same way, as if they were actually present. If this be admitted (as seems reasonable) it follows that all the ideas of quantity, upon which mathematicians reason, are nothing but particular, and such as are suggested by the senses and imagination, and consequently, cannot be infinitely divisible. It is sufficient to have dropped this hint at present, without prosecuting it any farther. It certainly concerns all lovers of science not to expose themselves to the ridicule and contempt of the ignorant by their conclusions; and this seems the readiest solution of these difficulties.

*It seems to me not impossible to avoid these absurdities and contradictions, if it be admitted, that there is no such thing as abstract or general ideas, properly speaking; but that all general ideas are, in reality, particular ones, attached to a general term, which recalls, upon occasion, other particular ones that resemble, in certain circumstances, the idea, present to the mind. Thus when the term Horse is pronounced, we immediately figure to ourselves the idea of a black or a white animal, of a particular size or figure: But as that term is also usually applied to animals of other colours, figures and sizes these ideas, though not actually present to the imagination, are easily recalled, and our reasoning and conclusion proceed in the same way, as if they were actually present. If this be admitted (as seems reasonable) it follows that all the ideas of quantity, upon which mathematicians reason, are nothing but particular, and such as are suggested

The sceptical objections to *moral* evidence, or to the reasonings concerning matter of fact, are either *popular* or *philosophical*. The popular objections are derived from the natural weakness of human understanding; the contradictory opinions, which have been entertained in different ages and nations; the variations of our judgement in sickness and health, youth and old age, prosperity and adversity; the perpetual contradiction of each particular man's opinions and sentiments; with many other topics of that kind. It is needless to insist farther on this head. These objections are but weak. For as, in common life, we reason every moment concerning fact and existence, and cannot possibly subsist, without continually employing this species of argument, any popular objections, derived from thence, must be insufficient to destroy that evidence. The great subverter of *Pyrrhonism* or the excessive principles of scepticism is action, and employment, and the occupations of common life. These principles may flourish and triumph in the schools; where it is, indeed, difficult, if not impossible, to refute them. But as soon as they leave the shade, and by the presence of the real objects, which actuate our passions and sentiments, are put in opposition to the more powerful principles of our nature, they vanish like smoke, and leave the most determined sceptic in the same condition as other mortals.

The sceptic, therefore, had better keep within his proper sphere, and display those *philosophical* objections, which arise from more profound researches. Here he seems to have ample matter of triumph; while he justly insists, that all our evidence for any matter of fact, which lies beyond the testimony of sense or memory, is derived entirely from the relation of cause and effect; that we have no other idea of this relation than that of two objects, which have been frequently *conjoined* together; that we have no argument to convince us, that objects, which have, in our experience, been frequently conjoined, will likewise, in other instances, be conjoined in the same manner; and that nothing leads us to this inference but custom or a certain instinct of our nature; which it is indeed difficult to resist, but which, like other instincts, may be fallacious and deceitful. While the sceptic insists upon these topics, he shows his force, or rather, indeed, his own and our weakness; and seems, for the time at least, to destroy all assurance and conviction. These arguments might be displayed at greater length, if any durable good or benefit to society could ever be expected to result from them.

For here is the chief and most confounding objection to *excessive* scepticism, that no durable good can ever result from it; while it remains in its full force and vigour. We need only ask a sceptic, *What his meaning is? And what he proposes by all these curious researches?* He is immediately at a loss, and knows not what to answer. A Copernican or Ptolemaic, who supports each his different system of astronomy, may hope to produce a conviction, which will remain constant and durable, with his audience. A Stoic or Epicurean displays principles, which may not be durable, but which have an effect on conduct and behaviour. But a Pyrrhonian cannot expect, that his philosophy will have any constant influence on the mind: or if it had, that its influence would be beneficial to society. On the contrary, he must acknowledge, if he will acknowledge anything, that all human life must perish, were his principles universally and steadily to prevail. All discourse, all action would immediately cease; and men remain in a total lethargy, till the necessities of nature, unsatisfied, put an end to their miserable existence. It is true; so fatal an event is very little to be dreaded. Nature is always too strong for principle. And though a Pyrrhonian may throw himself or others into a momentary amazement and confusion by

by the senses and imagination, and consequently, cannot be infinitely divisible. It is sufficient to have dropped this hint at present, without prosecuting it any farther. It certainly concerns all lovers of science not to expose themselves to the ridicule and contempt of the ignorant by their conclusions; and this seems the readiest solution of these difficulties.

his profound reasonings; the first and most trivial event in life will put to flight all his doubts and scruples, and leave him the same, in every point of action and speculation, with the philosophers of every other sect, or with those who never concerned themselves in any philosophical researches. When he awakes from his dream, he will be the first to join in the laugh against himself, and to confess, that all his objections are mere amusement, and can have no other tendency than to show the whimsical condition of mankind, who must act and reason and believe; though they are not able, by their most diligent enquiry, to satisfy themselves concerning the foundation of these operations, or to remove the objections, which may be raised against them.

PART III

There is, indeed, a more *mitigated* scepticism or *academical* philosophy, which may be both durable and useful, and which may, in part, be the result of this Pyrrhonism, or excessive scepticism, when its undistinguished doubts are, in some measure, corrected by common sense and reflection. The greater part of mankind are naturally apt to be affirmative and dogmatical in their opinions; and while they see objects only on one side, and have no idea of any counterpoising argument, they throw themselves precipitately into the principles, to which they are inclined; nor have they any indulgence for those who entertain opposite sentiments. To hesitate or balance perplexes their understanding, checks their passion, and suspends their action. They are, therefore, impatient till they escape from a state, which to them is so uneasy: and they think, that they could never remove themselves far enough from it, by the violence of their affirmations and obstinacy of their belief. But could such dogmatical reasoners become sensible of the strange infirmities of human understanding, even in its most perfect state, and when most accurate and cautious in its determination; such a reflection would naturally inspire them with more modesty and reserve, and diminish their fond opinion of themselves, and their prejudice against antagonists. The illiterate may reflect on the disposition of the learned, who, amidst all the advantages of study and reflection, are commonly still diffident in their determinations: and if any of the learned be inclined, from their natural temper, to haughtiness and obstinacy, a small tincture of Pyrrhonism might abate their pride, by showing them, that the few advantages, which they may have attained over their fellows, are but inconsiderable, if compared with the universal perplexity and confusion, which is inherent in human nature. In general, there is a degree of doubt, and caution, and modesty, which, in all kinds of scrutiny and decision, ought for ever to accompany a just reasoner.

Another species of *mitigated* scepticism which may be of advantage to man-kind, and which may be the natural result of the Pyrrhonian doubts and scruples, is the limitation of our enquiries to such subjects as are best adapted to the narrow capacity of human understanding. The *imagination* of man is naturally sublime, delighted with whatever is remote and extraordinary, and running, without control, into the most distant parts of space and time in order to avoid the objects, which custom has rendered too familiar to it. A correct *judgement* observes a contrary method, and avoiding all distant and high enquiries, confines itself to common life, and to such subjects as fall under daily practice and experience; leaving the more sublime topics to the embellishment of poets and orators, or to the arts of priests and politicians. To bring us to so salutary a determination, nothing can be more serviceable, than to be once thoroughly convinced of the force of the Pyrrhonian doubt, and of the impossibility, that anything, but the strong power of natural instinct, could free us from it. Those who have a propensity to philosophy, will still continue their researches; because they reflect, that, besides the immediate pleasure, attending such an occupation,

philosophical decisions are nothing but the reflections of common life, methodized and corrected. But they will never be tempted to go beyond common life, so long as they consider the imperfection of those faculties which they employ, their narrow reach, and their inaccurate operations. While we cannot give a satisfactory reason, why we believe, after a thousand experiments, that a stone will fall, or fire burn; can we ever satisfy ourselves concerning any determination, which we may form, with regard to the origin of worlds, and the situation of nature, from, and to eternity?

This narrow limitation, indeed, of our enquiries, is, in every respect, so reasonable, that it suffices to make the slightest examination into the natural powers of the human mind and to compare them with their objects, in order to recommend it to us. We shall then find what are the proper subjects of science and enquiry.

It seems to me, that the only objects of the abstract science or of demonstration are quantity and number, and that all attempts to extend this more perfect species of knowledge beyond these bounds are mere sophistry and illusion. As the component parts of quantity and number are entirely similar, their relations become intricate and involved; and nothing can be more curious, as well as useful, than to trace, by a variety of mediums their equality or inequality, through their different appearances. But as all other ideas are clearly distinct and different from each other, we can never advance farther, by our utmost scrutiny, than to observe this diversity, and, by an obvious reflection, pronounce one thing not to be another. Or if there be any difficulty in these decisions, it proceeds entirely from the undeterminate meaning of words, which is corrected by juster definitions. That *the square of the hypotenuse is equal to the square of the other two sides*, cannot be known,

Ninewells, the Hume family estate, near Berwick in southern Scotland. David Hume lived here until age twelve when he went to the University of Edinburgh. (Culver Pictures, Inc.)

let the terms be ever so exactly defined, without a train of reasoning and enquiry. But to convince us of this proposition, *that where there is no property, there can be no injustice*, it is only necessary to define the terms, and explain injustice to be a violation of property. This proposition is, indeed, nothing but a more imperfect definition. It is the same case with all those pretended syllogistical reasonings, which may be found in every other branch of learning, except the sciences of quantity and number and these may safely, I think, be pronounced the only proper objects of knowledge and demonstration.

All other enquiries of men regard only matter of fact and existence; and these are evidently incapable of demonstration. Whatever *is* may *not be*. No negation of a fact can involve a contradiction. The non-existence of any being, without exception, is as clear and distinct an idea as its existence. The proposition, which affirms it not to be, however false, is no less conceivable and intelligible, than that which affirms it to be. The case is different with the sciences, properly so called. Every proposition, which is not true, is there confused and unintelligible. That the cube root of 64 is equal to the half of 10, is a false proposition, and can never be distinctly conceived. But that Caesar, or the angel Gabriel, or any being never existed, may be a false proposition, but still is perfectly conceivable, and implies no contradiction.

The existence, therefore, of any being can only be proved by arguments from its cause or its effect; and these arguments are founded entirely on experience. If we reason *a priori*, anything may appear able to produce anything. The falling of a pebble may, for aught we know, extinguish the sun; or the wish of a man control the planets in their orbits. It is only experience, which teaches us the nature and bounds of cause and effect, and enables us to infer the existence of one object from that of another.* Such is the foundation of moral reasoning, which forms the greater part of human knowledge, and is the source of all human action and behaviour.

Moral reasonings are either concerning particular or general facts. All deliberations in life regard the former; as also all disquisitions in history, chronology, geography, and astronomy.

The sciences, which treat of general facts, are politics, natural philosophy, physic, chemistry, etc. where the qualities, causes and effects of a whole species of objects are enquired into.

Divinity or Theology, as it proves the existence of a Deity, and the immortality of souls, is composed partly of reasonings concerning particular, partly concerning general facts. It has a foundation in *reason*, so far as it is supported by experience. But its best and most solid foundation is *faith* and divine revelation.

Morals and criticism are not so properly objects of the understanding as of taste and sentiment. Beauty, whether moral or natural, is felt, more properly than perceived. Or if we reason concerning it, and endeavour to fix its standard, we regard a new fact, to wit, the general tastes of mankind, or some such fact, which may be the object of reasoning and enquiry.

When we run over libraries, persuaded of these principles, what havoc must we make? If we take in our hand any volume; of divinity or school metaphysics, for instance; let us ask, *Does it contain any abstract reasoning concerning quantity or number?* No. *Does it contain any experimental reasoning concerning matter of fact and existence?* No. Commit it then to the flames: for it can contain nothing but sophistry and illusion.

*That impious maxim of the ancient philosophy, *Ex nihilo, nihil fit* [From nothing, nothing issues], by which the creation of matter was excluded, ceases to be a maxim according to this philosophy. Not only the will of the supreme Being may create matter; but, for aught we know *a priori*, the will of any other being might create it, of any other cause, that the most whimsical imagination can assign.

JEAN-JACQUES ROUSSEAU

1712–1778

Jean-Jacques Rousseau was born in 1712 in the independent city-state of Geneva. His mother, Suzanne Bernard, was a member of the city's elite, while his father, Isaac Rousseau, was a working-class watchmaker. Within a week of his birth, his mother died and with her death young Jean-Jacques and his father lost their place in high society.

The Rousseaus' position fell even further when Isaac was exiled from Geneva for challenging a superior to a duel. Jean-Jacques was taken from his father and became a ward of his mother's brother, sent with his cousin to live outside the walls of Geneva. As he reached the age to take on a career, Rousseau was apprenticed to a low-class engraver. The situation was so intolerable that Rousseau fled to Italy and eventually ended up in the household of the Baroness de Warens, a slightly disreputable but generous woman. Under the protection of the baroness, Rousseau was able to develop his intellectual gifts.

At the age of 27, Rousseau left Italy for France where he developed friendships with the leading philosophers of the French Enlightenment such as Diderot and Voltaire. The next ten years were spent working as a secretary in Italy and France and writing articles for Diderot's *Encyclopedia*—the premiere work of the Enlightenment. Rousseau might well have continued working in a similar vein had he not had what he later called his “illumination.” While walking to Vincennes to visit Diderot, Rousseau saw a notice of an essay competition on the question “Has the revival of the arts and sciences done more to corrupt or to purify morals?” Contrary to the prevailing belief of the time—and the dominant view of his *Encyclopedia* colleagues—Rousseau realized in a flash that far from saving humankind, the arts and sciences were bringing ruin. The more sophisticated and learned society became, the less happy, less virtuous, and more corrupt the people became. In fact, the rationalism of his age was destroying the spontaneous feelings

that liberate the individual. Moreover, the arts and sciences neither rise from nor lead to morality. As Rousseau put it,

Astronomy was born of superstition, eloquence of ambition, hatred, falsehood, and flattery; geometry of avarice; physics of an idle curiosity; and moral philosophy, like all the rest, of human pride. Thus the arts and sciences owe their birth to our vices.*

Rousseau not only won the prize, but the publication of his essay, *Discourse on the Sciences and Arts* (1750), brought him instant fame. Applying his genius next to music, Rousseau wrote the opera *Le Devin de Village* (1752), a work that glorified the Italian themes of melody and simplicity in its stories of ordinary people (in contrast to the French operatic tradition of sophisticated and complex music with stories of kings and gods). Returning to Geneva, Rousseau worked out the implications of his prize essay in his *Discourse on the Origin of Inequality* (1755), which explained the loss of the “state of nature.” Contrary to Thomas Hobbes, Rousseau claimed that virtually all unpleasantness in life are the result of society and that in a true state of nature humans are, as Hobbes claimed, solitary, but they are also happy, free, and good. In his novel *The New Heloise* (1761), Rousseau fictionalized the value of simple life. In *Emile* (1762), he applied his insights to education, appealing for the protection of the unspoiled child from the grind of traditional education. *The Social Contract* (1762) most clearly and forcefully laid out Rousseau’s political ideals and became one of the most influential books of all time.

Rousseau’s advocacy of the simple, natural life and the importance of emotion over reason was an important contribution to the early Romantic movement. But it also led to a break with his Enlightenment friends. (For example, after receiving a copy of *Discourse on the Origin of Inequality*, Voltaire wrote Rousseau to thank him for “your new book against the human race.”) Furthermore, Rousseau’s often implicit—and occasionally explicit—condemnation of government authorities eventually led to a warrant for his arrest. Unwelcome in France and Geneva, Rousseau took refuge in England with David Hume. However, by now Rousseau was becoming paranoid. He began to accuse Hume of conspiring with his enemies. The quarrel was publicized and Rousseau’s reputation suffered. He eventually returned to France, but the authorities—as well as the public—were no longer very interested in him. He spent his last years wandering France before dying obscure and penniless in 1778. His *Confessions* began to be published posthumously in 1782.

* * *

Whereas Rousseau’s *Discourse on the Origin of Inequality* gives a description of how the freedom and happiness of the state of nature were lost, his magnum opus, *The Social Contract*, offers a prescription for human reclamation. Rousseau begins *The Social Contract* with the bold assertion, “Man was born free, and everywhere he is in chains.” But Rousseau does not think the answer lies in a kind

*Jean-Jacques Rousseau, *Discourse on the Sciences and the Arts* in *Rousseau: Selections*, edited by Maurice Cranston (New York: Macmillan, 1988), p. 52.

of anarchy. The “fundamental problem” as Rousseau sees it, is to find an association that both defends the “person and property of every associate” and yet still allows for freedom.

The solution, claims Rousseau, is to be found in the social contract. But such a contract is not a Hobbesian exchange of rights for peace. As Rousseau points out, in our selection (translated by Maurice Cranston), tranquility is not really the goal: “Men live tranquilly also in dungeons; is that enough to make them contented there?” Instead of submitting to some tyrant in exchange for peace, Rousseau saw the social contract as an agreement among free individuals to give up their rights to the “general will.” Such an agreement creates a sovereign, but not the sovereignty of a king. Instead, the sovereign is the expression of the general will, which alone is sacred and absolute.

But such an understanding of the social contract does not make Rousseau a democrat. In the first place, the general will is not necessarily the will of the majority. A few farsighted individuals may understand the general will better than the majority. Furthermore, what is to be done if a given individual does not properly understand the general will, or if that individual’s own will is in conflict with the general will? According to Rousseau, “whoever refuses to obey the general will shall be constrained to do so by the whole body.” In short, that person “shall be forced to be free.”

It is not difficult to see how both the glories and horrors of the French Revolution found resources in Rousseau’s work. The early revolutionary call to move past the divine right of kings to liberty, fraternity, and equality has its intellectual roots in *The Social Contract*. So too does the bloody suppression of dissent in the later years of the Terror as Robespierre and others claimed to be promoting the general will while they “forced [the people] to be free.”

* * *

The best general introduction to Rousseau is still Ronald Grimsley, *The Philosophy of Rousseau* (London: Oxford University Press, 1973). Other general studies include Harald Høffding, *Jean Jacques Rousseau and His Philosophy*, translated by William Richards and Leo E. Saidla (New Haven, CT: Yale University Press, 1930); Charles William Hendel, *Jean-Jacques Rousseau, Moralists* (Indianapolis, IN: Bobbs Merrill, 1934); Nicholas Dent, *Rousseau* (London: Routledge, 2005); and Matthew Simpson, *Rousseau: A Guide for the Perplexed* (London: Continuum, 2007). Irving Babbitt, *Rousseau and Romanticism* (Boston: Houghton Mifflin, 1919) is the classic work on Rousseau’s historical context while N.J.H. Dent, *Rousseau: An Introduction to His Psychological, Social and Political Theory* (Oxford: Basil Blackwell, 1988) is a more recent study. For biographies, see Frederick Charles Green, *Jean-Jacques Rousseau: A Critical Study of His Life and Writings* (Cambridge: Cambridge University Press, 1955); Jean Guéhenno, *Jean-Jacques Rousseau*, translated by John and Doreen Weightman (London: Routledge and Keegan Paul, 1966); and J. H. Huizinga, *Rousseau: The Self-Made Saint* (New York: Grossman, 1976).

For general studies of Rousseau’s political philosophy, see John C. Hall, *Rousseau: An Introduction to His Political Philosophy* (Cambridge, MA: Schenkman 1973); Merle L. Perkins, *Jean-Jacques Rousseau on the Individual and Society* (Lexington, KY: University Press of Kentucky, 1974); Ramon M.

Lemos, *Rousseau's Political Philosophy: An Exposition and Interpretation* (Athens, GA: University of Georgia Press, 1977); and James Miller, *Rousseau and Democracy* (New Haven, CT: Yale University Press, 1984). Lester G. Crocker, *Rousseau's Social Contract: An Interpretive Essay* (Cleveland, OH: Case Western Reserve University Press, 1968); Hilail Gildin, *Rousseau's Social Contract: The Design of the Argument* (Chicago: University of Chicago Press, 1983); and Christopher Bertram, *Rousseau and the Social Contract* (London: Routledge, 2003) focus specifically on our selection, while N.J.H. Dent, *The Rousseau Dictionary* (Oxford: Blackwell, 1992) provides a useful resource. THE SOCIAL CONTRACT (in part)

INTRODUCTORY NOTE

I wish to enquire whether, taking men as they are and laws as they can be made, it is possible to establish some just and certain rule of administration in civil affairs. In this investigation I shall always strive to reconcile what right permits with what interest prescribes, so that justice and utility may not be severed.

BOOK ONE

1. *The subject of Book One.* Man was born free, and everywhere he is in chains. Many a one believes himself the master of others, and yet he is a greater slave than they. How has this change come about? I do not know. What can render it legitimate? I believe that I can settle this question.

If I considered only force and the results that proceed from it, I should say that so long as a people is compelled to obey and does obey, it does well; but that, so soon as it can shake off the yoke and does shake it off, it does better; for, if men recover their freedom by virtue of the same right by which it was taken away, either they are justified in resuming it, or there was no justification for depriving them of it. But the social order is a sacred right which serves as a foundation for all others. This right, however, does not come from nature. It is therefore based on conventions. The question is to know what these conventions are. Before coming to that, I must establish what I have just laid down.

Jean-Jacques Rousseau, "The Social Contract" from *Rousseau: Selections*, edited by Maurice Cranston (New York: Macmillan, 1988).

2. *The first societies.* The earliest of all societies, and the only natural one, is the family; yet children remain attached to their father only so long as they have need of him for their own preservation. As soon as this need ceases, the natural bond is dissolved. The children being freed from the obedience which they owed to their father, and the father from the cares which he owed to his children, become equally independent. If they remain united, it is no longer naturally but voluntarily; and the family itself is kept together only by convention.

This common liberty is a consequence of man's nature. His first law is to attend to his own preservation, his first cares are those which he owes to himself; and as soon as he comes to years of discretion, being sole judge of the means adapted for his own preservation, he becomes his own master.

The family is, then, if you will, the primitive model of political societies; the chief is the analogue of the father, while the people represent the children; and all, being born free and equal, alienate their liberty only for their own advantage. The whole difference is that, in the family, the father's love for his children repays him for the care that he bestows upon them; while, in the State, the pleasure of ruling makes up for the chief's lack of love for his people.

Grotius denies that all human authority is established for the benefit of the governed, and he cites slavery as an instance. His invariable mode of reasoning is to establish right by fact.* A juster method might be employed, but none more favorable to tyrants.

It is doubtful, then, according to Grotius, whether the human race belongs to a hundred men, or whether these hundred men belong to the human race; and he appears throughout his book to incline to the former opinion, which is also that of Hobbes. In this way we have mankind divided like herds of cattle, each of which has a master, who looks after it in order to devour it.

Just as a herdsman is superior in nature to his herd, so chiefs, who are the herdsmen of men, are superior in nature to their people. Thus, according to Philo's account, the Emperor Caligula reasoned, inferring truly enough from this analogy that kings are gods, or that men are brutes.

The reasoning of Caligula is tantamount to that of Hobbes and Grotius. Aristotle, before them all, had likewise said that men are not naturally equal, but that some are born for slavery and others for dominion.

Aristotle was right, but he mistook the effect for the cause. Every man born in slavery is born for slavery; nothing is more certain. Slaves lose everything in their bonds, even the desire to escape from them; they love their servitude as the companions of Ulysses loved their brutishness.** If, then, there are slaves by nature, it is because there have been slaves contrary to nature. The first slaves were made such by force; their cowardice kept them in bondage.

I have said nothing about King Adam nor about Emperor Noah, the father of three great monarchs who shared the universe, like the children of Saturn with whom they are supposed to be identical. I hope that my moderation will give satisfaction; for, as I am a direct descendant of one of these princes, and perhaps of the eldest branch, how do I know whether, by examination of titles, I might not find myself the lawful

*"Learned researches in public law are often nothing but the history of ancient abuses; and to devote much labor to studying them is misplaced pertinacity" (*Treatise on the Interests of France in relation to her Neighbours*, by the Marquis d'Argenson). That is exactly what Grotius did.

**See a small treatise by Plutarch entitled *That Brutes employ Reason*.

king of the human race? Be that as it may, it cannot be denied that Adam was sovereign of the world, as Robinson was of his island, so long as he was its sole inhabitant; and it was an agreeable feature of that empire that the monarch, secure on his throne, had nothing to fear from rebellions, or wars, or conspirators.

3. *The rights of the strongest.* The strongest man is never strong enough to be always master, unless he transforms his power into right, and obedience into duty. Hence the right of the strongest—a right apparently assumed in irony, and really established in principle. But will this phrase never be explained to us? Force is a physical power; I do not see what morality can result from its effects. To yield to force is an act of necessity, not of will; it is at most an act of prudence. In what sense can it be a duty?

Let us assume for a moment this pretended right. I say that nothing results from it but inexplicable nonsense; for if force constitutes right, the effect changes with the cause, and any force which overcomes the first succeeds to its rights. As soon as men can disobey with impunity, they may do so legitimately; and since the strongest is always in the right, the only thing is to act in such a way that one may be the strongest. But what sort of a right is it that perishes when force ceases? If it is necessary to obey by compulsion, there is no need to obey from duty; and if men are no longer forced to obey, obligation is at an end. We see, then, that this word right adds nothing to force; it here means nothing at all.

Obey the powers that be. If that means, Yield to force, the precept is good but superfluous; I reply that it will never be violated. All power comes from God, I admit; but every disease comes from him too; does it follow that we are prohibited from calling in a physician? If a brigand should surprise me in the recesses of a wood, am I bound not only to give up my purse when forced, but am I also morally bound to do so when I might conceal it? For, in effect, the pistol which he holds is a superior force.

Let us agree, then, that might does not make right, and that we are bound to obey none but lawful authorities. Thus my original question ever recurs.

4. *Slavery.* Since no man has any natural authority over his fellow-men, and since force is not the source of right, conventions remain as the basis of all lawful authority among men.

If an individual, says Grotius, can alienate his liberty and become the slave of a master, why should not a whole people be able to alienate theirs, and become subject to a king? In this there are many equivocal terms requiring explanation; but let us confine ourselves to the word alienate. To alienate is to give or sell. Now, a man who becomes another's slave does not give himself, he sells himself at the very least for his subsistence. But why does a nation sell itself? So far from a king supplying his subjects with their subsistence, he draws his from them; and, according to Rabelais, a king does not live on a little. Do subjects, then, give up their persons on condition that their property also shall be taken? I do not see what is left for them to keep.

It will be said that the despot secures to his subjects civil peace. Be it so; but what do they gain by that, if the wars which his ambition brings upon them, together with his insatiable greed and the vexations of his administration, harass them more than their own dissensions would? What do they gain by it? If this tranquillity is itself one of their miseries? Men live tranquilly also in dungeons; is that enough to make them contented there? The Greeks confined in the cave of the Cyclops lived peacefully until their turn came to be devoured.

To say that a man gives himself for nothing is to say what is absurd and inconceivable; such an act is illegitimate and invalid, for the simple reason that he who performs it is not in his right mind. To say the same thing of a whole nation is to suppose a nation of fools; and madness does not confer rights.

Even if each person could alienate himself, he could not alienate his children; they are born free men; their liberty belongs to them, and no one has a right to dispose of it except themselves. Before they have come to years of discretion, the father can, in their name, stipulate conditions for their preservation and welfare, but not surrender them irrevocably and unconditionally; for such a gift is contrary to the ends of nature, and exceeds the rights of paternity. In order, then, that an arbitrary government might be legitimate, it would be necessary that the people in each generation should have the option of accepting or rejecting it; but in that case such a government would no longer be arbitrary.

To renounce one's liberty is to renounce one's quality as a man, the rights and also the duties of humanity. For him who renounces everything there is no possible compensation. Such a renunciation is incompatible with man's nature, for to take away all freedom from his will is to take away all morality from his actions. In short, a convention which stipulates absolute authority on the one side and unlimited obedience on the other is vain and contradictory. Is it not clear that we are under no obligations whatsoever towards a man from whom we have a right to demand everything? And does not this single condition, without equivalent, without exchange, involve the nullity of the act? For what right would my slave have against me, since all that he has belongs to me? His rights being mine, this right of me against myself is a meaningless phrase.

Grotius and others derive from war another origin for the pretended right of slavery. The victor having, according to them, the right of slaying the vanquished, the latter may purchase his life at the cost of his freedom; an agreement so much the more legitimate that it turns to the advantage of both.

But it is manifest that this pretended right of slaying the vanquished in no way results from the state of war. Men are not naturally enemies, if only for the reason that, living in their primitive independence, they have no mutual relations sufficiently durable to constitute a state of peace or a state of war. It is the relation of things and not of men which constitutes war; and since the state of war cannot arise from simple personal relations, but only from real relations, private war—war between man and man—cannot exist either in the state of nature, where there is no settled ownership, or in the social state, where everything is under the authority of the laws.

Private combats, duels, and encounters are acts which do not constitute a state of war; and with regard to the private wars authorized by the Establishments of Louis IX, King of France, and suspended by the Peace of God, they were abuses of the feudal government, an absurd system if ever there was one, contrary both to the principles of natural right and to all sound government.

War, then, is not a relation between man and man, but a relation between State and State, in which individuals are enemies only by accident, not as men, nor even as citizens,* but as soldiers; not as members of the fatherland, but as its defenders. In

*The Romans, who understood and respected the rights of war better than any nation in the world, carried their scruples so far in this respect that no citizen was allowed to serve as a volunteer without enlisting expressly against the enemy, and by name against a certain enemy. A legion in which Cato the Younger made his first campaign under Popilius having been re-formed, Cato the Elder wrote to Popilius that, if he consented to his son's continuing to serve under him, it was necessary that he should take a new military oath, because, the first being annulled, he could no longer bear arms against the enemy (Cicero, *De Officiis* I., 11). And Cato also wrote to his son to abstain from appearing in battle until he had taken this new oath. I know that it will be possible to urge against me the siege of Clusium and other particular cases; but I cite laws and customs (Livy, V. 35–37). No nation has transgressed its laws less frequently than the Romans, and no nation has had laws so admirable.

short, each State can have as enemies only other States and not individual men, inasmuch as it is impossible to fix any true relation between things of different kinds.

This principle is also conformable to the established maxims of all ages and to the invariable practice of all civilized nations. Declarations of war are not so much warnings to the powers as to their subjects. The foreigner, whether king, or nation, or private person, that robs, slays, or detains subjects without declaring war against the government, is not an enemy, but a brigand. Even in open war, a just prince, while he rightly takes possession of all that belongs to the State in an enemy's country, respects the person and property of individuals; he respects the rights on which his own are based. The aim of war being the destruction of the hostile State, we have a right to slay its defenders so long as they have arms in their hands; but as soon as they lay them down and surrender, ceasing to be enemies or instruments of the enemy, they become again simply men, and no one has any further right over their lives. Sometimes it is possible to destroy the State without killing a single one of its members; but war confers no right except what is necessary to its end. These are not the principles of Grotius; they are not based on the authority of poets, but are derived from the nature of things, and are founded on reason.

With regard to the right of conquest, it has no other foundation than the law of the strongest. If war does not confer on the victor the right of slaying the vanquished, this right, which he does not possess, cannot be the foundation of a right to enslave them. If we have a right to slay an enemy only when it is impossible to enslave him, the right to enslave him is not derived from the right to kill him; it is, therefore, an iniquitous bargain to make him purchase his life, over which the victor has no right, at the cost of his liberty. In establishing the right of life and death upon the right of slavery, and the right of slavery upon the right of life and death, is it not manifest that one falls into a vicious circle?

Even if we grant this terrible right of killing everybody, I say that a slave made in war, or a conquered nation, is under no obligation at all to a master, except to obey him so far as compelled. In taking an equivalent for his life the victor has conferred no favor on the slave; instead of killing him unprofitably, he has destroyed him for his own advantage. Far, then, from having acquired over him any authority in addition to that of force, the state of war subsists between them as before, their relation even is the effect of it; and the exercise of the rights of war supposes that there is no treaty of peace. They have made a convention. Be it so; but this convention, far from terminating the state of war, supposes its continuance.

Thus, in whatever way we regard things, the right of slavery is invalid, not only because it is illegitimate, but because it is absurd and meaningless. These terms, *slavery* and *right*, are contradictory and mutually exclusive. Whether addressed by a man to a man, or by a man to a nation, such a speech as this will always be equally foolish: "I make an agreement with you wholly at your expense and wholly for my benefit, and I shall observe it as long as I please, while you also shall observe it as long as I please."

5. *That it is always necessary to go back to a first contract.* If I should concede all that I have so far refuted, those who favor despotism would be no farther advanced. There will always be a great difference between subduing a multitude and ruling a society. When isolated men, however numerous they may be, are subjected one after another to a single person, this seems to me only a case of master and slaves, not of a nation and its chief; they form, if you will, an aggregation, but not an association, for they have neither public property nor a body politic. Such a man, had he enslaved half the world, is never anything but an individual; his interest, separated from that of the rest, is never anything but a

private interest. If he dies, his empire after him is left disconnected and disunited, as an oak dissolves and becomes a heap of ashes after the fire has consumed it.

A nation, says Grotius, can give itself to a king. According to Grotius, then, a nation is a nation before it gives itself to a king. This gift itself is a civil act, and presupposes a public resolution. Consequently, before examining the act by which a nation elects a king, it would be proper to examine the act by which a nation becomes a nation; for this act, being necessarily anterior to the other, is the real foundation of the society.

In fact, if there were no anterior contract, where, unless the election were unanimous, would be the obligation upon the minority to submit to the decision of the majority? And whence do the hundred who desire a master derive the right to vote on behalf of ten who do not desire one? The law of the plurality of votes is itself established by convention, and presupposes unanimity once at least.

6. *The social contract.* I assume that men have reached a point at which the obstacles that endanger their preservation in the state of nature overcome, by their resistance, the forces which each individual can exert with a view to maintaining himself in that state. Then this primitive condition can no longer subsist, and the human race would perish unless it changed its mode of existence.

Now, as men cannot create any new forces, but only combine and direct those that exist, they have no other means of self-preservation than to form by aggregation a sum of forces which may overcome the resistance, to put them in action by a single motive power, and to make them work in concert.

This sum of forces can be produced only by the combination of many; but the strength and freedom of each man being the chief instruments of his preservation, how can he pledge them without injuring himself, and without neglecting the cares which he owes to himself? This difficulty, applied to my subject, may be expressed in these terms: "To find a form of association which may defend and protect with the whole force of the community the person and property of every associate, and by means of which each, coalescing with all, may nevertheless obey only himself, and remain as free as before." Such is the fundamental problem of which the social contract furnishes the solution.

The clauses of this contract are so determined by the nature of the act that the slightest modification would render them vain and ineffectual; so that, although they have never perhaps been formally enunciated, they are everywhere the same, everywhere tacitly admitted and recognized, until, the social pact being violated, each man regains his original rights and recovers his natural liberty, whilst losing the conventional liberty for which he renounced it.

These clauses, rightly understood, are reducible to one only, viz. the total alienation to the whole community of each associate with all his rights; for, in the first place, since each gives himself up entirely, the conditions are equal for all; and, the conditions being equal for all, no one has any interest in making them burdensome to others.

Further, the alienation being made without reserve, the union is as perfect as it can be, and an individual associate can no longer claim anything; for, if any rights were left to individuals, since there would be no common superior who could judge between them and the public, each, being on some point his own judge, would soon claim to be so on all; the state of nature would still subsist, and the association would necessarily become tyrannical or useless.

In short, each giving himself to all, gives himself to nobody; and as there is not one associate over whom we do not acquire the same rights which we concede to him

over ourselves, we gain the equivalent of all that we lose, and more power to preserve what we have.

If, then, we set aside what is not of the essence of the social contract, we shall find that it is reducible to the following terms: "Each of us puts in common his person and his whole power under the supreme direction of the general will; and in return we receive every member as an indivisible part of the whole."

Forthwith, instead of the individual personalities of all the contracting parties, this act of association produces a moral and collective body, which is composed of as many members as the assembly has voices, and which receives from this same act its unity, its common self (*moi*), its life, and its will. This public person, which is thus formed by the union of all the individual members, formerly took the name of city, and now takes that of *republic* or *body politic*, which is called by its members State when it is passive, *sovereign* when it is active, *power* when it is compared to similar bodies. With regard to the associates, they take collectively the name of *people*, and are called individually, *citizens*, as participating in the sovereign power, and *subjects*, as subjected to the laws of the State. But these terms are often confused and are mistaken one for another; it is sufficient to know how to distinguish them when they are used with complete precision.

7. *The sovereign.* We see from this formula that the act of association contains a reciprocal engagement between the public and individuals, and that every individual, contracting so to speak with himself, is engaged in a double relation, viz. as a member of the sovereign towards individuals, and as a member of the State towards the sovereign. But we cannot apply here the maxim of civil law that no one is bound by engagements made with himself; for there is a great difference between being bound to oneself and to a whole of which one forms part.

We must further observe that the public resolution which can bind all subjects to the sovereign in consequence of the two different relations under which each of them is regarded cannot, for a contrary reason, bind the sovereign to itself, and that accordingly it is contrary to the nature of the body politic for the sovereign to impose on itself a law which it cannot transgress. As it can only be considered under one and the same relation, it is in the position of an individual contracting with himself; whence we see that there is not, nor can be, any kind of fundamental law binding upon the body of the people, not even the social contract. This does not imply that such a body cannot perfectly well enter into engagements with others in what does not derogate from this contract; for, with regard to foreigners, it becomes a simple being, an individual.

But the body politic or sovereign, deriving its existence only from the sanctity of the contract, can never bind itself, even to others, in anything that derogates from the original act, such as alienation of some portion of itself, or submission to another sovereign. To violate the act by which it exists would be to annihilate itself, and what is nothing produces nothing.

So soon as the multitude is thus united in one body, it is impossible to injure one of the members without attacking the body, still less to injure the body without the members feeling the effects. Thus duty and interest alike oblige the two contracting parties to give mutual assistance; and the men themselves should seek to combine in this twofold relationship all the advantages which are attendant on it.

Now, the sovereign, being formed only of the individuals that compose it, neither has nor can have any interest contrary to theirs; consequently the sovereign power needs no guarantee towards its subjects, because it is impossible that the body should wish to

injure all its members; and we shall see hereafter that it can injure no one as an individual. The sovereign, for the simple reason that it is so, is always everything that it ought to be.

But this is not the case as regards the relation of subjects to the sovereign, which, notwithstanding the common interest, would have no security for the performance of their engagements, unless it found means to ensure their fidelity.

Indeed, every individual may, as a man, have a particular will contrary to, or divergent from, the general will which he has as a citizen; his private interest may prompt him quite differently from the common interest; his absolute and naturally independent existence may make him regard what he owes to the common cause as a gratuitous contribution, the loss of which will be less harmful to others than the payment of it will be burdensome to him; and, regarding the moral person that constitutes the State as an imaginary being because it is not a man, he would be willing to enjoy the rights of a citizen without being willing to fulfill the duties of a subject. The progress of such injustice would bring about the ruin of the body politic.

In order, then, that the social pact may not be a vain formulary, it tacitly includes this engagement, which can alone give force to the others—that whoever refuses to obey the general will shall be constrained to do so by the whole body; which means nothing else than that he shall be forced to be free; for such is the condition which, uniting every citizen to his native land, guarantees him from all personal dependence, a condition that ensures the control and working of the political machine, and alone renders legitimate civil engagements, which, without it, would be absurd and tyrannical, and subject to the most enormous abuses.

8. *The civil state.* The passage from the state of nature to the civil state produces in man a very remarkable change, by substituting in his conduct justice for instinct, and by giving his actions the moral quality that they previously lacked. It is only when the voice of duty succeeds physical impulse, and law succeeds appetite, that man, who till then had regarded only himself, sees that he is obliged to act on other principles, and to consult his reason before listening to his inclinations. Although, in this state, he is deprived of many advantages that he derives from nature, he acquires equally great ones in return; his faculties are exercised and developed; his ideas are expanded; his feelings are ennobled; his whole soul is exalted to such a degree that, if the abuses of this new condition did not often degrade him below that from which he has emerged, he ought to bless without ceasing the happy moment that released him from it for ever, and transformed him from a stupid and ignorant animal into an intelligent being and a man.

Let us reduce this whole balance to terms easy to compare. What man loses by the social contract is his natural liberty and an unlimited right to anything which tempts him and which he is able to attain; what he gains is civil liberty and property in all that he possesses. In order that we may not be mistaken about these compensations, we must clearly distinguish natural liberty, which is limited only by the powers of the individual, from civil liberty, which is limited by the general will; and possession, which is nothing but the result of force or the right of first occupancy, from property, which can be based only on a positive title.

Besides the preceding, we might add to the acquisitions of the civil state moral freedom, which alone renders man truly master of himself; for the impulse of mere appetite is slavery, while obedience to a self-prescribed law is liberty. But I have already said too much on this head, and the philosophical meaning of the term *liberty* does not belong to my present subject.

9. *The real domain.* Every member of the community at the moment of its formation gives himself up to it, just as he actually is, himself and all his powers, of which the

property that he possesses forms part. By this act, possession does not change its nature when it changes hands, and become property in those of the sovereign; but, as the powers of the State (*cité*) are incomparably greater than those of an individual, public possession is also, in fact, more secure and more irrevocable, without being more legitimate, at least in respect of foreigners; for the State, with regard to its members, is owner of all their property by the social contract, which, in the State, serves as the basis of all rights; but with regard to other powers, it is owner only by the right of first occupancy which it derives from individuals.

The right of first occupancy, although more real than that of the strongest, becomes a true right only after the establishment of that of property. Every man has by nature a right to all that is necessary to him; but the positive act which makes him a proprietor of certain property excludes him from all the residue. His portion having been allotted, he ought to confine himself to it, and he has no further right to the undivided property. That is why the right of first occupancy, so weak in the state of nature, is respected by every member of a State. In this right men regard not so much what belongs to others as what does not belong to themselves.

In order to legalize the right of first occupancy over any domain whatsoever, the following conditions are, in general, necessary; first, the land must not yet be inhabited by any one; secondly, a man must occupy only the area required for his subsistence; thirdly, he must take possession of it, not by an empty ceremony, but by labor and cultivation, the only mark of ownership which, in default of legal title, ought to be respected by others.

Indeed, if we accord the right of first occupancy to necessity and labor, do we not extend it as far as it can go? Is it impossible to assign limits to this right? Will the mere setting foot on common ground be sufficient to give an immediate claim to the ownership of it? Will the power of driving away other men from it for a moment suffice to deprive them for ever of the right of returning to it? How can a man or a people take possession of an immense territory and rob the whole human race of it except by a punishable usurpation, since other men are deprived of the place of residence and the sustenance which nature gives to them in common? When Nuñez Balboa on the seashore took possession of the Pacific Ocean and of the whole of South America in the name of the crown of Castille, was this sufficient to dispossess all the inhabitants, and exclude from it all the princes in the world? On this supposition, such ceremonies might have been multiplied vainly enough; and the Catholic king in his cabinet might, by a single stroke, have taken possession of the whole world, only cutting off afterwards from his empire what was previously occupied by other princes.

We perceive how the lands of individuals, united and contiguous, become public territory, and how the right of sovereignty, extending itself from the subjects to the land which they occupy, becomes at once real and personal; which places the possessors in greater dependence, and makes their own powers a guarantee for their fidelity—an advantage which ancient monarchs do not appear to have clearly perceived, for, calling themselves only kings of the Persians or Scythians or Macedonians, they seem to have regarded themselves as chiefs of men rather than as owners of countries. Monarchs of today call themselves more cleverly kings of France, Spain, England, etc.; in thus holding the land they are quite sure of holding its inhabitants.

The peculiarity of this alienation is that the community, in receiving the property of individuals, so far from robbing them of it, only assures them lawful possession, and changes usurpation into true right, enjoyment into ownership. Also, the possessors; being considered as depositaries of the public property, and their rights being respected by all

the members of the State, as well as maintained by all its power against foreigners, they have, as it were, by a transfer advantageous to the public and still more to themselves, acquired all that they have given up—a paradox which is easily explained by distinguishing between the rights which the sovereign and the proprietor have over the same property, as we shall see hereafter.

It may also happen that men begin to unite before they possess anything, and that afterwards occupying territory sufficient for all, they enjoy it in common or share it among themselves, either equally or in proportions fixed by the sovereign. In whatever way this acquisition is made, the right which every individual has over his property is always subordinate to the right which the community has over all; otherwise there would be no stability in the social union, and no real force in the exercise of sovereignty.

I shall close this chapter and this book with a remark which ought to serve as a basis for the whole social system; it is that instead of destroying natural equality, the fundamental pact, on the contrary, substitutes a moral and lawful equality for the physical inequality which nature imposed upon men, so that, although unequal in strength or intellect, they all become equal by convention and legal right.*

*Under bad governments this equality is only apparent and illusory; it serves only to keep the poor in their misery and the rich in their usurpations. In fact, laws are always useful to those who possess and injurious to those that have nothing; whence it follows that the social state is advantageous to men only so far as they all have something, and none of them has too much.

IMMANUEL KANT

1724–1804

Whereas most modern philosophers (such as Descartes, Berkeley, and Hume) arrived at their basic philosophical positions early in life, Immanuel Kant did not work out his views until well into middle age. Whereas the earlier thinkers wrote major works when still young, Kant's important pieces were written between the ages of 57 and 67. Whereas the others' works were written for a broad general audience and are relatively accessible to educated readers, Kant wrote in an academic style that is notoriously difficult to follow. Whereas most of the earlier philosophers traveled widely, Kant never left the provincial city in which he was born. Unlike his predecessors, who held many different positions and practiced philosophy on the side, Kant earned his living as a professor of philosophy. Yet Kant is the most important and influential of all modern philosophers.

Kant was born, raised, lived, and died in the town of Königsberg in East Prussia. His parents were lower middle-class, hard-working, simple folk. They belonged to the Lutheran Pietist movement, which cultivated high moral standards and personal devotion to God in Christ. Like Hume, who had a similar religious upbringing (Calvinist Presbyterian), Kant was later critical of his background. But unlike Hume, he remained a deeply religious man.

Through the intervention of his mother's favorite preacher, who was also a professor at the University of Königsberg, young Immanuel gained admittance to a local high school. There he received a solid Pietist education and a firm grounding in the classics. At 16, Kant was admitted to the university, where he planned to study the classics. But under the influence of a strong teacher, Martin Knutzen, Kant moved into philosophy and was attracted to the comprehensive scholasticism of Christian Wolff (1679–1754), who had developed Leibniz's philosophy into a rationalistic system.

Following his university studies, Kant worked as a private tutor to wealthy families. By 1755, he was back in the university, where he was employed as an unsalaried lecturer for the next fifteen years. (Given the difficulty of his writing, it is worth noting that his lectures were very popular.) His early lectures focused on the external world, dealing with issues in physics and physical geography. He published an important early work, *Universal History of Nature and Theory of the Heavens* (1755), which explained the structure of the universe in terms of Newtonian physics, without reference to God. During this period, Kant's focus began to shift to the inner world of the mind and the nature of morality. At this time, he also encountered the writings of Hume, which challenged the rationalism he had imbibed from Wolff. He later said that Hume "interrupted my dogmatic slumber, and gave my investigations in the field of speculative philosophy quite a new direction."

In 1770, Kant was given what he had long desired—the chair of logic and metaphysics at the University of Königsberg. In his inaugural address, *Dissertation on the Form and Principles of Sensible and Intelligible Worlds*, Kant declared his intention to reconstruct philosophy. Over the next ten years, he carefully and quietly thought through all his ideas. Finally he wrote his major work, *Critique of Pure Reason*. He wrote it, as he later told a friend, "within four or five months, with the utmost attention to the contents, but with less concern for the presentation or for making things easy for the reader." Unfortunately, when the book appeared, his indifference to readers left most people lost. In 1783, he restated his main points in a work "for the benefit of teachers," the *Prolegomena to Any Future Metaphysics*, and in 1787 he rewrote the *Critique* itself.

Kant's first major work on ethics, *Foundations of the Metaphysics of Morals*, was published in 1785. A further development of his moral views, *Critique of Practical Reason*, appeared in 1788. In 1790, Kant published his third and last critique, the *Critique of Judgment*, which deals with aesthetic judgments and the question of purpose in nature. Kant's other important works include *Metaphysical Foundations of Natural Science* (1786), *Religion Within the Limits of Reason Alone* (1793), *Toward Eternal Peace* (1795), and *Foundations of the Metaphysics of Morals* (1797).

Whereas Kant's writings revolutionized the philosophical world, his personal life was quiet, almost boring. With one minor exception late in life, he was never involved in any scandals or controversies. He never traveled more than a few miles outside Königsberg. A lifelong bachelor, he is said to have awakened and gone to bed at exactly the same time each day. His daily walks were reportedly so regular that people could set their clocks by his approach. A rather frail man, he so carefully guarded his health that he lived a long, productive life. Yet he was also a delightful conversationalist and host, and he had many friends and admirers. At his death in 1804, he was the best-known philosopher in Germany, read, if not understood, throughout Europe.

* * *

Responding to the skeptical empiricism of Hume, Kant argued that the mind is not simply a repository of impressions and ideas but it is actively involved in knowing the objects it experiences. Prior to Kant, most thinkers believed that the mind, in knowing, conformed to objects: that the ideas of the mind took on the

“shape” of the world outside the mind. Kant argued instead that objects conform to the mind: that how one experiences the world is a result of the way the mind operates. Knowledge is a result of human understanding applied to sense experience.

Space and time are two ways the mind operates. They are not “objects” in the world, derived from sense experience; rather, they are the precondition for our having sense-experience at all: They are the *a priori* (meaning “known independently of sense perceptions,” “indubitable”) foundations of sensibility. Space and time must be presupposed in order to have experience at all.

Kant goes on to consider the *a priori* foundations of human understanding. He argues that there must be categories of the mind, such as causality and substance, that unify our perceptions. These categories are not found in sense experience; they are innate structures of the mind and the necessary conditions for having any knowledge at all. Without these categories, the world of experience would be utterly chaotic and unknowable.

Of course, this knowledge is only a knowledge of things as we experience them in the “phenomenal world.” The way things really are, apart from our experience of them, the “noumenal world” of the “things-in-themselves,” is not available to us by pure reason. This, according to Kant, means that we cannot have knowledge of God, the world, or even the substantial self. But rather than letting this end in Humean skepticism, Kant suggests that these three “ideas of reason” (God, world, self) stimulate and unify knowledge. They point beyond themselves to possibilities in the noumenal world that pure reason cannot reach. As long as we do not think that we have real knowledge of their objects, these three ideas of reason serve a useful purpose.

Turning to moral theory, Kant develops a “deontological,” or “duty-based,” theory of morality. An action is good not because it produces consequences such as pleasure or happiness, but because it is done out of duty by a good will. To establish what a person’s duty is, Kant develops the “categorical imperative.” In the *Foundations of the Metaphysics of Morals*, Kant discusses several versions of this imperative, the most important of which is this: “Act only on that maxim whereby you can at the same time will that it should become a universal law.” The short essay, “On a Supposed Right to Lie From Altruistic Motives,” shows some of the implications of Kant’s deontological moral theory.

Although Kant is best known for his work in epistemology and ethics, he wrote on many topics. His earlier essay “Idea for a Universal History with Cosmopolitan Intent” (1784) is an example of Kant at his nontechnical best. Here the Königsberg recluse shows himself as a brilliant citizen of the world when he introduces the idea of a League of Nations:

By means of wars and the high tension of never relaxed armaments for these wars, and by means of the distress which every nation must thus suffer, even during times of peace, [Nature] drives man at first to imperfect attempts, but finally, after many devastations and disturbances and even exhaustion of all powers, she drives toward a situation which reason might have anticipated without so many sad experiences: Men leave the lawless state of savages and enter a League of Nations. Thus every state, including the smallest, can find a guarantee for its security and its rights, not in its own power or in its own views of what is just, but in this great League of Nations.

Kant's condensation of the *Critique*, the *Prolegomena to Any Future Metaphysics*, his *Foundations of the Metaphysics of Morals*, and the essay, "On a Supposed Right to Lie From Altruistic Motives," are all given here (complete) in the Lewis White Beck translations. The marginal page numbers are those of all scholarly editions.

Among the many available books on Kant, Stephen Körner, *Kant* (Baltimore, MD: Penguin Books, 1955) is almost universally accepted as the best introduction. John Kemp, *The Philosophy of Kant* (Oxford: Oxford University Press, 1968); Ralph C.S. Walker, *Kant: The Arguments of the Philosophers* (London: Routledge & Kegan Paul, 1978); C.D. Broad, *Kant: An Introduction* (Cambridge: Cambridge University Press, 1978); Ernst Cassirer, *Kant's Life and Thought*, translated by James Haden (New Haven, CT: Yale University Press, 1982); Ermanno Bencivenga, *Kant's Copernican Revolution* (Oxford: Oxford University Press, 1987); Otfried Höffe, *Immanuel Kant*, translated by Marshall Farrier (Albany, NY: SUNY Press, 1994); Ralph Walker, *Kant* (London: Routledge, 1999); Manfred Kuehn, *Kant: A Biography* (Cambridge: Cambridge University Press, 2001); Allen W. Wood, *Kant* (Oxford: Blackwell, 2005); Paul Guyer, *Kant* (Abbingdon, UK: Routledge, 2006); and T.K. Seung, *Kant: A Guide for the Perplexed* (London: Continuum, 2007) are also helpful. Justus Hartnack, *Kant's Theory of Knowledge* (Indianapolis, IN: Hackett, 2001); Georges Dicker, *Kant's Theory of Knowledge: An Analytical Introduction* (Oxford: Oxford University Press, 2004); and Wayne Waxman, *Kant and the Empiricists: Understanding Understanding* (Oxford: Oxford University Press, 2005) provide help with Kant's epistemology. For works on Kant's moral theory, see W.D. Ross, *Kant's Ethical Theory: A Commentary on the Grundlegung zur Metaphysik der Sitten* [Foundations of the Metaphysics of Morals] (Oxford: Clarendon Press, 1954); H.J. Paton, *The Categorical Imperative* (London: 1947; reprinted, New York: Harper & Row, 1967); Roger Sullivan, *An Introduction to Kant's Ethics* (Cambridge: Cambridge University Press, 1994); Marcia W. Baron, *Kantian Ethics Almost Without Apology* (Ithaca, NY: Cornell University Press, 1999); Allen W. Wood, *Kant's Ethical Thought* (Cambridge: Cambridge University Press, 1999); Paul Guyer, *Kant's Groundwork for the Metaphysics of Morals: A Reader's Guide* (London: Continuum, 2007); and Jens Timmermann, *Kant's Groundwork of the Metaphysics of Morals: A Commentary* (Cambridge: Cambridge University Press, 2007). Howard Caygill, *A Kant Dictionary* (Oxford: Basil Blackwell, 1995) provides a useful reference work. Walker, ed., *Kant on Pure Reason* (Oxford: Oxford University Press, 1982); Beryl Logan, ed., *Immanuel Kant's Prolegomena to Any Future Metaphysics in Focus* (Oxford: Routledge, 1996); Robin May Schott, ed., *Feminist Interpretations of Kant* (College Park, PA: Pennsylvania State University Press, 1997); Heiner Klemme, ed., *Immanuel Kant*, 2 volumes (New York: Ashgate, 1999); Paul Guyer, ed., *The Cambridge Companion to Kant and Modern Philosophy* (Cambridge: Cambridge University Press, 2006); and Daniel Garber and Beatrice Longuenesse, eds., *Kant and the Early Moderns* (Princeton: Princeton University Press, 2008).

PROLEGOMENA TO ANY FUTURE METAPHYSICS

INTRODUCTION

These *Prolegomena* are for the use, not of mere learners, but of future teachers, and even the latter should not expect that they will be serviceable for the systematic exposition of a ready-made science, but merely for the discovery of the science itself. 255

There are scholarly men to whom the history of philosophy (both ancient and modern) is philosophy itself; for these the present *Prolegomena* are not written. They must wait till those who endeavor to draw from the fountain of reason itself have completed their work; it will then be the turn of these scholars to inform the world of what has been done. Unfortunately, nothing can be said which, in their opinion, has not been said before, and truly the same prophecy applies to all future time; for since the human reason has for many centuries speculated upon innumerable objects in various ways, it is hardly to be expected that we should not be able to discover analogies for every new idea among the old sayings of past ages.

My purpose is to persuade all those who think metaphysics worth studying that it is absolutely necessary to pause a moment and, regarding all that has been done as though undone, to propose first the preliminary question, "Whether such a thing as metaphysics be even possible at all?"

If it be science, how is it that it cannot, like other sciences, obtain universal and lasting recognition? If not, how can it maintain its pretensions and keep the human mind in suspense with hopes never ceasing, yet never fulfilled? Whether then we demonstrate our knowledge or our ignorance in this field, we must come once for all to a definite conclusion respecting the nature of this so-called science, which cannot possibly remain on its present footing. It seems almost ridiculous, while every other science is continually advancing, that in this, which pretends to be wisdom incarnate, for whose oracle everyone inquires, we should constantly move round the same spot, without gaining a single step. And so its votaries having melted away, we do not find men confident of their ability to shine in other sciences venturing their reputation here, where everybody, however ignorant in other matters, presumes to deliver a final verdict, because in this domain there is actually as yet no standard weight and measure to distinguish sound knowledge from shallow talk. 256

After all it is nothing extraordinary in the elaboration of a science that, when men begin to wonder how far it has advanced, the question should at last occur whether and how such a science is possible at all. Human reason so delights building that it has several times built up a tower and then razed it to see how the foundation was laid. It is never too late to become reasonable and wise; but if the knowledge comes late, there is always more difficulty in starting a reform.

The question whether a science be possible presupposes a doubt as to its actuality. But such a doubt offends the men whose whole fortune consists of this supposed

jewel; hence he who raises the doubt must expect opposition from all sides. Some, in the proud consciousness of their possessions, which are ancient and therefore considered legitimate, will take their metaphysical compendia in their hands and look down on him with contempt; others, who never see anything except it be identical with what they have elsewhere seen before, will not understand him, and everything will remain for a time as if nothing had happened to excite the concern or the hope for an impending change.

257 Nevertheless, I venture to predict that the independent reader of these *Prolegomena* will not only doubt his previous science, but ultimately be fully persuaded that it cannot exist unless the demands here stated on which its possibility depends be satisfied; and, as this has never been done, that there is, as yet, no such thing as metaphysics. But as it can never cease to be in demand*—since the interest of common sense are so intimately interwoven with it—he must confess that a radical reform, or rather a new birth of the science, after a new plan, is unavoidable, however men may struggle against it for a while.

Since the *Essays* of Locke and Leibniz, or rather since the origin of metaphysics so far as we know its history, nothing has ever happened which could have been more decisive to its fate than the attack made upon it by David Hume. He threw no light on this species of knowledge, but he certainly struck a spark by which light might have been kindled had it caught some inflammable substance and had its smouldering fire been carefully nursed and developed.

Hume started chiefly from a single but important concept in metaphysics, namely, that of the connection of cause and effect (including its derivatives force and action, and so on). He challenged reason, which pretends to have given birth to this concept of herself, to answer him by what right she thinks anything could be so constituted that if that thing be posited, something else also must necessarily be posited; for this is the meaning of the concept of cause. He demonstrated irrefutably that it was perfectly impossible for reason to think *a priori* and by means of concepts such a combination, for it implies necessity. We cannot at all see why, in consequence of the existence of one thing, another must necessarily exist or how the concept of such a combination can arise *a priori*. Hence he inferred that reason was altogether deluded with reference to this concept, which she erroneously considered as one of her own children, whereas in reality it was nothing but a bastard of imagination, 258 impregnated by experience, which subsumed certain representations under the law of association and mistook a subjective necessity (habit) for an objective necessity arising from insight. Hence he inferred that reason had no power to think such combinations, even in general, because her concepts would then be purely fictitious and all her pretended *a priori* cognitions nothing but common experiences marked with a

*Says Horace:

*Rusticus expectat, dum defluat amnis, at ille
Labitur et labetur in omne volubilis aevum.*

[“A rustic fellow waiteth on the shore
For the river to flow away,
But the river flows, and flows on as before,
And it flows forever and aye.”]

Epistle I, 2, 42f.

false stamp. In plain language, this means that there is not and cannot be any such thing as metaphysics at all.*

However hasty and mistaken Hume's inference may appear, it was at least founded upon investigation, and this investigation deserved the concentrated attention of the brighter spirits of his day as well as determined efforts on their part to discover, if possible, a happier solution of the problem in the sense proposed by him, all of which would have speedily resulted in a complete reform of the science.

But Hume suffered the usual misfortune of metaphysicians, of not being understood. It is positively painful to see how utterly his opponents, Reid, Oswald, Beattie, and lastly Priestley, missed the point of the problem; for while they were ever taking for granted that which he doubted, and demonstrating with zeal and often with impudence that which he never thought of doubting, they so misconstrued his valuable suggestion that everything remained in its old condition, as if nothing had happened. The question was not whether the concept of cause was right, useful, and even indispensable for our knowledge of nature, for this Hume had never doubted; but whether that concept could be thought by reason *a priori*, and consequently whether it possessed an inner truth, independent of all experience, implying a perhaps more extended use not restricted merely to objects of experience. This was Hume's problem. It was solely a question concerning the *origin*, not concerning the *indispensable* need of using the concept. Were the former decided, the conditions of the use and the sphere of its valid application would have been determined as a matter of course.

259

But to satisfy the conditions of the problem, the opponents of the great thinker should have penetrated very deeply into the nature of reason, so far as it is concerned with pure thinking—a task which did not suit them. They found a more convenient method of being defiant without any insight, namely, the appeal to *common sense*. It is indeed a great gift of God to possess right or (as they now call it) plain common sense. But this common sense must be shown in action by well-considered and reasonable thoughts and words, not by appealing to it as an oracle when no rational justification for one's position can be advanced. To appeal to common sense when insight and science fail, and no sooner—this is one of the subtle discoveries of modern times, by means of which the most superficial ranter can safely enter the lists with the most thorough thinker and hold his own. But as long as a particle of insight remains, no one would think of having recourse to this subterfuge. Seen clearly, it is but an appeal to the opinion of the multitude, of whose applause the philosopher is ashamed, while the popular charlatan glories and boasts in it. I should think that Hume might fairly have laid as much claim to common sense as Beattie and, in addition, to a critical reason (such as the latter did not possess), which keeps common sense in check and prevents it from speculating, or, if speculations are under discussion, restrains the desire to decide because it cannot satisfy itself concerning its own premises. By this means alone can common sense remain sound. Chisels and hammers may suffice to work a piece of wood, but for etching we require an etcher's needle. Thus common sense and speculative understanding are each serviceable, but each in its own way: the former in judgments which apply

*Nevertheless Hume called this destructive science metaphysics and attached to it great value. "Metaphysics and morals," he declares, "are the most considerable branches of science. Mathematics and natural philosophy are not half so valuable" ["Of the Rise and Progress of the Arts and Sciences," *Essays Moral, Political, and Literary*, XIV (edited by Green and Grose, I, 187)]. But the acute man merely regarded the negative use arising from the moderation of extravagant claims of speculative reason, and the complete settlement of the many endless and troublesome controversies that mislead mankind. He overlooked the positive injury that results if reason be deprived of its most important prospects, which can alone supply to the will the highest aim for all its endeavors.

immediately to experience; the latter when we judge universally from mere concepts, as
 260 in metaphysics, where that which calls itself, in spite of the inappropriateness of the
 name, sound common sense, has no right to judge at all.

I openly confess my recollection* of David Hume was the very thing which many
 years ago first interrupted my dogmatic slumber and gave my investigations in the field
 of speculative philosophy a quite new direction. I was far from following him in the
 conclusions at which he arrived by regarding, not the whole of his problem, but a part,
 which by itself can give us no information. If we start from a well-founded, but unde-
 veloped, thought which another has bequeathed to us, we may well hope by continued
 reflection to advance farther than the acute man to whom we owe the first spark of light.

I therefore first tried whether Hume's objection could not be put into a general
 form, and soon found that the concept of the connection of cause and effect was by no
 means the only concept by which the understanding thinks the connection of things *a*
priori, but rather that metaphysics consists altogether of such concepts. I sought to
 ascertain their number; and when I had satisfactorily succeeded in this by starting from
 a single principle, I proceeded to the deduction of these concepts, which I was now
 certain were not derived from experience, as Hume had attempted to derive them, but
 sprang from the pure understanding. This deduction (which seemed impossible to my
 acute predecessor, which had never even occurred to anyone else, though no one had
 hesitated to use the concepts without investigating the basis of their objective validity)
 was the most difficult task which ever could have been undertaken in the service of
 metaphysics; and the worst was that metaphysics, such as it is, could not assist me in the
 least because this deduction alone can render metaphysics possible. But as soon as I had
 succeeded in solving Hume's problem, not merely in a particular case, but with respect
 261 to the whole faculty of pure reason, I could proceed safely, though slowly, to determine
 the whole sphere of pure reason completely and from universal principles, in its bound-
 aries as well as in its contents. This was required for metaphysics in order to construct
 its system according to a safe plan.

But I fear that the execution of Hume's problem in its widest extent (namely, my
Critique of Pure Reason) will fare as the problem itself fared when first proposed. It
 will be misjudged because it is misunderstood, and misunderstood because men
 choose to skim through the book and not to think through it—a disagreeable task,
 because the work is dry, obscure, opposed to all ordinary notions, and moreover long-
 winded. I confess, however, I did not expect to hear from philosophers complaints of
 want of popularity, entertainment, and facility when the existence of highly prized and
 indispensable knowledge is at stake, which cannot be established otherwise than by the
 strictest rules of a scholastic precision. Popularity may follow, but is inadmissible at
 the beginning. Yet as regards a certain obscurity, arising partly from the diffuseness of
 the plan, owing to which the principal points of the investigation are easily lost sight
 of, the complaint is just, and I intend to remove it by the present *Prolegomena*.

The first-mentioned work, which discusses the pure faculty of reason in its whole
 compass and bounds, will remain the foundation, to which the *Prolegomena*, as a
 preliminary exercise, refer; for critique as a science must first be established as complete
 and perfect before we can think of letting metaphysics appear on the scene or even have
 the most distant hope of attaining it.

*[*Erinnerung*. Kant had probably read Hume before 1760, but only much later (1772?) did he begin to
 follow "a new direction" under Hume's influence—L.W.B.]

We have been long accustomed to seeing antiquated knowledge produced as new by taking it out of its former context and fitting it into a systematic garment of any fancy pattern with new titles. Most readers will set out by expecting nothing else from the *Critique*; but these *Prolegomena* may persuade him that it is a perfectly new science, of which no one has ever even thought, the very idea of which was unknown, and for which nothing hitherto accomplished can be of the smallest use, except it be the suggestion of Hume's doubts. Yet even he did not suspect such a formal science, but ran his ship ashore, for safety's sake, landing on scepticism, there to let it lie and rot; whereas my object is rather to give it a pilot, who, by means of safe principles of navigation drawn from a knowledge of the globe, and provided with a complete chart and compass, may steer the ship safely whither he listeth.

262

If in a new science which is wholly isolated and unique in its kind, we started with the prejudice that we can judge of things by means of alleged knowledge previously acquired—though this is precisely what has first to be called in question—we should only fancy we saw everywhere what we had already known, because the expressions have a similar sound. But everything would appear utterly metamorphosed, senseless, and unintelligible, because we should have as a foundation our own thoughts, made by long habit a second nature, instead of the author's. But the long-windedness of the work, so far as it depends on the subject and not on the exposition, its consequent unavoidable dryness and its scholastic precision, are qualities which can only benefit the science, though they may discredit the book.

Few writers are gifted with the subtlety and, at the same time, with the grace of David Hume, or with the depth, as well as the elegance, of Moses Mendelssohn. Yet I flatter myself I might have made my own exposition popular had my object been merely to sketch out a plan and leave its completion to others, instead of having my heart in the welfare of the science to which I had devoted myself so long; in truth, it required no little constancy, and even self-denial, to postpone the sweets of an immediate success to the prospect of a slower, but more lasting, reputation.

Making plans is often the occupation of an opulent and boastful mind, which thus obtains the reputation of a creative genius by demanding what it cannot itself supply, by censuring what it cannot improve, and by proposing what it knows not where to find. And yet something more should belong to a sound plan of a general critique of pure reason than mere conjectures if this plan is to be other than the usual declamations of pious aspirations. But pure reason is a sphere so separate and self-contained that we cannot touch a part without affecting all the rest. We can do nothing without first determining the position of each part and its relation to the rest; for, as our judgment within this sphere cannot be corrected by anything without, the validity and use of every part depends upon the relation in which it stands to all the rest within the domain of reason. As in the structure of an organized body, the end of each member can only be deduced from the full conception of the whole. It may, then, be said of such a critique that it is never trustworthy except it be perfectly complete, down to the most minute elements of pure reason. In the sphere of this faculty you can determine and define either everything or nothing.

263

But although a mere sketch preceding the *Critique of Pure Reason* would be unintelligible, unreliable, and useless, it is all the more useful as a sequel. It enables us to grasp the whole, to examine in detail the chief points of importance in the science, and to improve in many respects our exposition, as compared with the first execution of the work.

With that work complete, I offer here a sketch based on an *analytical* method, while the *Critique* itself had to be executed in the *synthetical* style, in order that the science may present all its articulations, as the structure of a peculiar cognitive faculty, in their natural combination. But should any reader find this sketch, which I publish as the *Prolegomena*

to *Any Future Metaphysics*, still obscure, let him consider that not everyone is bound to study metaphysics; that many minds will succeed very well in the exact and even in deep sciences more closely allied to the empirical, while they cannot succeed in investigations
 264 dealing exclusively with abstract concepts. In such cases men should apply their talents to other subjects. But he who undertakes to judge or, still more, to construct a system of metaphysics must satisfy the demands here made, either by adopting my solution or by thoroughly refuting it and substituting another. To evade it is impossible.

In conclusion, let it be remembered that this much abused obscurity (frequently serving as a mere pretext under which people hide their own indolence or dullness) has its uses, since all who in other sciences observe a judicious silence speak authoritatively in metaphysics and make bold decisions, because their ignorance is not here contrasted with the knowledge of others. Yet it does contrast with sound critical principles, which we may therefore commend in the words of Virgil:

*Ignavum, fucos, pecus a praesepibus arcent.**

265 PROLEGOMENA

PREAMBLE ON THE PECULIARITIES OF ALL METAPHYSICAL KNOWLEDGE

§ I. Of the Sources of Metaphysics

If it becomes desirable to organize any knowledge as science, it will be necessary first to determine accurately those peculiar features which no other science has in common with it, constituting its peculiarity; otherwise the boundaries of all sciences become confused, and none of them can be treated thoroughly according to its nature.

The peculiar characteristic of a science may consist of a simple difference of object, or of the sources of knowledge, or of the kind of knowledge, or perhaps of all three conjointly. On these, therefore, depends the idea of a possible science and its territory.

First, as concerns the sources of metaphysical knowledge, its very concept implies that they cannot be empirical. Its principles (including not only its maxims but its basic notions) must never be derived from experience. It must not be physical but metaphysical knowledge, namely, knowledge lying beyond experience. It can therefore
 266 have for its basis neither external experience, which is the source of physics proper, nor internal, which is the basis of empirical psychology. It is therefore *a priori* knowledge, coming from pure understanding and pure reason.

But so far metaphysics would not be distinguishable from pure mathematics; it must therefore be called *pure philosophical* knowledge; and for the meaning of this term I refer to the *Critique of the Pure Reason*,** where the distinction between these two employments of reason is sufficiently explained. So far concerning the sources of metaphysical knowledge.

*["They defend the hives against drones, those indolent creatures"—*Georgics* IV 168.]

***Critique of Pure Reason*, "Methodology," Ch. I, Sec. 2.

§ 2. *Concerning the Kind of Knowledge
Which Can Alone Be Called Metaphysical*

a. *On the Distinction between Analytical and Synthetical Judgments in General.*—

The peculiarity of its sources demands that metaphysical knowledge must consist of nothing but *a priori* judgments. But whatever be their origin or their logical form, there is a distinction in judgments, as to their content, according to which they are either merely *explicative*, adding nothing to the content of knowledge, or *expansive*, increasing the given knowledge. The former may be called *analytical*, the latter *synthetical*, judgments.

Analytical judgments express nothing in the predicate but what has been already actually thought in the concept of the subject, though not so distinctly or with the same (full) consciousness. When I say: "All bodies are extended," I have not amplified in the least my concept of body, but have only analyzed it, as extension was really thought to belong to that concept before the judgment was made, though it was not expressed. This judgment is therefore analytical. On the contrary, this judgment, "All bodies have weight," contains in its predicate something not actually thought in the universal concept of body; it amplifies my knowledge by adding something to my concept, and must therefore be called synthetical.

267

b. *The Common Principle of All Analytical Judgments Is the Law of Contradiction.*—

All analytical judgments depend wholly on the law of contradiction, and are in their nature *a priori* cognitions, whether the concepts that supply them with matter be empirical or not. For the predicate of an affirmative analytical judgment is already contained in the concept of the subject, of which it cannot be denied without contradiction. In the same way its opposite is necessarily denied of the subject in an analytical, but negative, judgment, by the same law of contradiction. Such is the nature of the judgments: "All bodies are extended," and "No bodies are unextended (that is, simple)."

For this very reason all analytical judgments are *a priori* even when the concepts are empirical, as, for example, "Gold is a yellow metal"; for to know this I require no experience beyond my concept of gold as a yellow metal. It is, in fact, the very concept, and I need only analyze it without looking beyond it.

c. *Synthetical Judgments Require a Different Principle from the Law of Contradiction.*—There are synthetical *a posteriori* judgments of empirical origin; but there are also others which are certain *a priori*, and which spring from pure understanding and reason. Yet they both agree in this, that they cannot possibly spring from the principle of analysis, namely, the law of contradiction, alone. They require a quite different principle from which they may be deduced, subject, of course, always to the law of contradiction, which must never be violated, even though everything cannot be deduced from it. I shall first classify synthetical judgments.

1. *Judgments of Experience* are always synthetical. For it would be absurd to base an analytical judgment on experience, as our concept suffices for the purpose without requiring any testimony from experience. That body is extended is a judgment established *a priori*, and not an empirical judgment. For before appealing to experience, we already have all the conditions of the judgment in the concept, from which we have but to elicit the predicate according to the law of contradiction, and thereby to become conscious of the necessity of the judgment, which experience could not in the least teach us.

268

2. *Mathematical Judgments* are all synthetical. This fact seems hitherto to have altogether escaped the observation of those who have analyzed human reason: it even seems directly opposed to all their conjectures, though it is incontestably certain and most important in its consequences. For as it was found that the conclusions

of mathematicians all proceed according to the law of contradiction (as is demanded by all apodictic certainty), men persuaded themselves that the fundamental principles were known from the same law. This was a great mistake, for a synthetical proposition can indeed be established by the law of contradiction, but only by presupposing another synthetical proposition from which it follows, but never by that law alone.

First of all, we must observe that all strictly mathematical judgments are *a priori*, and not empirical, because they carry with them necessity, which cannot be obtained from experience. But if this be not conceded to me, very good; I shall confine my assertion to *pure mathematics*, the very notion of which implies that it contains pure *a priori* and not empirical knowledge.

It must at first be thought that the proposition $7 + 5 = 12$ is a mere analytical judgment, following from the concept of the sum of seven and five, according to the law of contradiction. But on closer examination it appears that the concept of the sum of $7 + 5$ contains merely their union in a single number, without its being at all thought what the particular number is that unites them. The concept of twelve is by no means thought by merely thinking of the combination of seven and five; and, analyze this possible sum as we may, we shall not discover twelve in the concept. We must go beyond these concepts, by calling to our aid some intuition which corresponds to one of the concepts—that is, either our five fingers or five points (as Segner has it in his *Arithmetic*)—and we must add successively the units of the five given in the intuition to the concept of seven. Hence our concept is really amplified by the proposition $7 + 5 = 12$, and we add to the first concept a second concept not thought in it. Arithmetical judgments are therefore synthetical, and the more plainly according as we take larger numbers; for in such cases it is clear that, however closely we analyze our concepts without calling intuition to our aid, we can never find the sum by such mere dissection.

Just as little is any principle of geometry analytical. That a straight line is the shortest path between two points is a synthetical proposition. For my concept of straight contains nothing of quantity, but only a quality. The concept “shortest” is therefore altogether additional and cannot be obtained by any analysis of the concept “straight line.” Here, too, intuition must come to aid us. It alone makes the synthesis possible. What usually makes us believe that the predicate of such apodictic judgments is already contained in our concept, and that the judgment is therefore analytical, is the duplicity of the expression. We must think a certain predicate as attached to a given concept, and necessity indeed belongs to the concepts. But the question is not what we must join in thought *to* the given concept, but what we actually think together with and in it, though obscurely; and so it appears that the predicate belongs to this concept necessarily indeed, yet not directly but indirectly by means of an intuition which must be present.

Some other principles, assumed by geometers, are indeed actually analytical, and depend on the law of contradiction; but they only serve, as identical propositions, as a method of concatenation, and not as principles—for example $a = a$, the whole is equal to itself, or $a + b > a$, the whole is greater than its part. And yet even these, though they are recognized as valid from mere concepts, are admitted in mathematics only because they can be represented in some intuition.

The essential and distinguishing feature of pure mathematical knowledge among all other *a priori* knowledge is that it cannot at all proceed from concepts, but only by means of the construction of concepts.* As therefore in its propositions it must proceed beyond the concept to that which its corresponding intuition contains, these

**Critique of Pure Reason*, “Methodology,” Ch. I, Sec. 1.

propositions neither can, nor ought to, arise analytically, by dissection of the concept, but are all synthetical.

I cannot refrain from pointing out the disadvantage resulting to philosophy from the neglect of this easy and apparently insignificant observation. Hume being prompted to cast his eye over the whole field of *a priori* cognitions in which human understanding claims such mighty possessions (a calling he felt worthy of a philosopher) heedlessly severed from it a whole, and indeed its most valuable, province, namely, pure mathematics; for he imagined its nature or, so to speak, the state constitution of this empire depended on totally different principles, namely, on the law of contradiction alone; and although he did not divide judgments in this manner formally and universally as I have done here, what he said was equivalent to this: that mathematics contains only analytical, but metaphysics synthetical, *a priori* propositions. In this, however, he was greatly mistaken, and the mistake had a decidedly injurious effect upon his whole conception. But for this, he would have extended his question concerning the origin of our synthetical judgments far beyond the metaphysical concept of causality and included in it the possibility of mathematics *a priori* also, for this latter he must have assumed to be equally synthetical. And then he could not have based his metaphysical propositions on mere experience without subjecting the axioms of mathematics equally to experience, a thing which he was far too acute to do. The good company into which metaphysics would thus have been brought would have saved it from the danger of a contemptuous ill-treatment, for the thrust intended for it must have reached mathematics, which was not and could not have been Hume's intention. Thus that acute man would have been led into considerations which must needs be similar to those that now occupy us, but which would have gained inestimably by his inimitably elegant style.

273

3. *Metaphysical Judgments*, properly so called, are all synthetical. We must distinguish judgments pertaining to metaphysics from metaphysical judgments properly so called. Many of the former are analytical, but they only afford the means for metaphysical judgments, which are the whole end of the science and which are always synthetical. For if there be concepts pertaining to metaphysics (as, for example, that of substance), the judgments springing from simple analysis of them also pertain to metaphysics, as, for example, substance is that which only exists as subject, etc.; and by means of several such analytical judgments we seek to approach the definition of the concepts. But as the analysis of a pure concept of the understanding (the kind of concept pertaining to metaphysics) does not proceed in any different manner from the dissection of any other, even empirical, concepts, not belonging to metaphysics (such as, air is an elastic fluid, the elasticity of which is not destroyed by any known degree of cold), it follows that the concept indeed, but not the analytical judgment, is properly metaphysical. This science has something peculiar in the production of its *a priori* cognitions, which must therefore be distinguished from the features it has in common with other rational knowledge. Thus the judgment that all the substance in things is permanent is a synthetical and properly metaphysical judgment.

If the *a priori* concepts which constitute the materials and tools of metaphysics have first been collected according to fixed principles, then their analysis will be of great value; it might be taught as a particular part (as a *philosophia definitiva*), containing nothing but analytical judgments pertaining to metaphysics, and could be treated separately from the synthetical which constitute metaphysics proper. For indeed these analyses are not of much value except in metaphysics, that is, as regards

274

the synthetical judgments which are to be generated by these previously analyzed concepts.

The conclusion drawn in this section then is that metaphysics is properly concerned with synthetical propositions *a priori*, and these alone constitute its end, for which it indeed requires various dissections of its concepts, namely, analytical judgments, but wherein the procedure is not different from that in every other kind of knowledge, in which we merely seek to render our concepts distinct by analysis. But the generation of *a priori* knowledge by intuition as well as by concepts, in fine, of synthetical propositions *a priori*, especially in philosophical knowledge, constitutes the essential subject of metaphysics.

270 § 3. *A Remark on the General Division
of Judgment into Analytical and Synthetical*

This division is indispensable, as concerns the critique of human understanding, and therefore deserves to be called classical in such critical investigation, though otherwise it is of little use. But this is the reason why dogmatic philosophers, who always seek the sources of metaphysical judgments in metaphysics itself, and not apart from it in the pure laws of reason generally, altogether neglected this apparently obvious distinction. Thus the celebrated Wolff and his acute follower Baumgarten came to seek the proof of the principle of sufficient reason, which is clearly synthetical, in the principle of contradiction. In Locke's *Essay*, however, I find an indication of my division. For in the fourth book (Chapter III, § 9, seq.), having discussed the various connections of representations in judgments, and their sources, one of which he makes "identity or contradiction" (analytical judgments) and another the coexistence of ideas in a subject (synthetical judgments), he confesses (§ 10) that our (*a priori*) knowledge of the latter is very narrow and almost nothing. But in his remarks on this species of knowledge, there is so little of what is definite and reduced to rules that we cannot wonder if no one, not even Hume, was led to make investigations concerning this sort of proposition. For such general and yet definite principles are not easily learned from other men, who have had them only obscurely in their minds. One must hit on them first by one's own reflection; then one finds them elsewhere, where one could not possibly have found them at first because the authors themselves did not know that such an idea lay at the basis of their observations. Men who never think independently have nevertheless the acuteness to discover everything, after it has been once shown them, in what was said long since, though no one was ever able to see it there before.

271 § 4. *The General Question of the Prolegomena:
Is Metaphysics at All Possible?*

Were a metaphysics which could maintain its place as a science really in existence, could we say: "Here is metaphysics; learn it and it will convince you irresistibly and irrevocably of its truth"? This question would then be useless, and there would only remain that other question (which would rather be a test of our acuteness than a proof of the existence of the thing itself): "How is the science possible, and how does reason come to attain it?" But human reason has not been so fortunate in this case. There is no single book to which you can point as you do to Euclid, and say: "This is metaphysics; here you may find the noblest objects of this science, the knowledge of a highest being and of a future existence, proved from principles of pure reason." We can be shown

indeed many propositions, demonstrably certain and never questioned; but these are all analytical, and rather concern the materials and the scaffolding for metaphysics than the extension of knowledge, which is our proper object in studying it (§ 2). Even supposing you produce synthetical judgments (such as the law of sufficient reason, which you have never proved, as you ought to, from pure reason *a priori*, though we gladly concede its truth), you lapse, when you try to employ them for your principal purpose, into such doubtful assertions that in all ages one metaphysics has contradicted another, either in its assertions or their proofs, and thus has itself destroyed its own claim to lasting assent. Nay, the very attempts to set up such a science are the main cause of the early appearance of skepticism, a mental attitude in which reason treats itself with such violence that it could never have arisen save from complete despair of ever satisfying its most important aspirations. For long before men began to inquire into nature methodically, they consulted abstract reason, which had to some extent been exercised by means of ordinary experience; for reason is ever present, while laws of nature must usually be discovered with labor. So metaphysics floated to the surface, like foam, which dissolved the moment it was scooped off. But immediately there appeared a new supply on the surface, to be ever eagerly gathered up by some; while others, instead of seeking in the depths the cause of the phenomenon, thought they showed their wisdom by ridiculing the idle labor of their neighbors.

Weary therefore of dogmatism, which teaches us nothing, and of skepticism, which 274 does not even promise us anything—even the quiet state of a contented ignorance—disquieted by the importance of knowledge so much needed, and rendered suspicious by long experience of all knowledge which we believe we possess or which offers itself in the name of pure reason, there remains but one critical question on the answer to which our future procedure depends, namely, “Is metaphysics at all possible?” But this question must be answered, not by sceptical objections to the asseverations of some actual system of metaphysics (for we do not as yet admit such a thing to exist), but from the conception, as yet only problematical, of a science of this sort.

In the *Critique of Pure Reason* I have treated this question synthetically, by making inquiries into pure reason itself and endeavoring in this source to determine the elements as well as the laws of its pure use according to principles. The task is difficult and requires a resolute reader to penetrate by degrees into a system based on no data except reason itself, and which therefore seeks, without resting upon any fact, to unfold knowledge from its original germs. The *Prolegomena*, however, are designed for preparatory exercises; they are intended to point out what we have to do in order to make a science actual if it is possible, rather than to propound it. The *Prolegomena* must therefore rest upon something already known as trustworthy, 275 from which we can set out with confidence and ascend to sources as yet unknown, the discovery of which will not only explain to us what we knew but exhibit a sphere of many cognitions which all spring from the same sources. The method of prolegomena, especially of those designed as a preparation for future metaphysics, is consequently analytical.

But it happens, fortunately, that though we cannot assume metaphysics to be an actual science, we can say with confidence that there is actually given certain pure *a priori* synthetical cognitions, pure mathematics and pure physics; for both contain propositions which are unanimously recognized, partly apodictically certain by mere reason, partly by general consent arising from experience and yet as independent of experience. We have therefore at least some uncontested synthetical knowledge *a priori* and need not ask *whether* it be possible, for it is actual, but *how*

it is possible, in order that we may deduce from the principle which makes the given knowledge possible the possibility of all the rest.

§ 5. *The General Problem: How Is
Knowledge from Pure Reason Possible?*

276 We have already learned the significant distinction between analytical and synthetical judgments. The possibility of analytical propositions was easily comprehended, being entirely founded on the law of contradiction. The possibility of synthetical *a posteriori* judgments, of those which are gathered from experience, also requires no particular explanations, for experience is nothing but a continued synthesis of perceptions. There remain therefore only synthetical propositions *a priori*, of which the possibility must be sought or investigated, because they must depend upon other principles than the law of contradiction.

But here we need not first establish the possibility of such propositions so as to ask whether they are possible. For there are enough of them which indeed are of undoubted certainty; and, as our present method is analytical, we shall start from the fact that such synthetical but purely rational knowledge actually exists; but we must now inquire into the ground of this possibility and ask *how* such knowledge is possible, in order that we may, from the principles of its possibility, be enabled to determine the conditions of its use, its sphere and its limits. The real problem upon which all depends, when expressed with scholastic precision, is therefore: "How are synthetic propositions *a priori* possible?"

For the sake of popular understanding I have above expressed this problem somewhat differently, as an inquiry into purely rational knowledge, which I could do for once without detriment to the desired insight, because, as we have only to do here with metaphysics and its sources, the reader will, I hope, after the foregoing reminders, keep in mind that when we speak of knowing by pure reason we do not mean analytical but synthetical knowledge.*

277 Metaphysics stands or falls with the solution of this problem; its very existence depends upon it. Let anyone make metaphysical assertions with ever so much plausibility, let him overwhelm us with conclusions; but if he has not previously proved able to answer this question satisfactorily, I have a right to say: This is all vain, baseless philosophy and false wisdom. You speak through pure reason and claim, as it were, to create cognitions *a priori* not only by dissecting given concepts, but also by asserting connections which do not rest upon the law of contradiction, and which you claim to conceive quite independently of all experience; how do you arrive at this, and how will you justify

*It is unavoidable that, as knowledge advances, certain expressions which have become classical after having been used since the infancy of science will be found inadequate and unsuitable, and a newer and more appropriate application of the terms will give rise to confusion. [This is the case with the term "analytical."] The analytical method, so far as it is opposed to the synthetical, is very different from one that consists of analytical propositions; it signifies only that we start from what is sought, as if it were given, and ascend to the only conditions under which it is possible. In this method we often use nothing but synthetical propositions, as in mathematical analysis, and it were better to term it the *regressive* method, in contradistinction to the *synthetic* or *progressive*. A principal part of logic too is distinguished by the name of analytic, which here signifies the logic of truth in contrast to dialectic, without considering whether the cognitions belonging to it are analytical or synthetical.

such pretensions? An appeal to the consent of the common sense of mankind cannot be allowed, for that is a witness whose authority depends merely upon rumor. Says Horace:

*Quodcunque ostendis mihi sic, incredulus odi.**

The answer to this question is as indispensable as it is difficult; and although the principal reason that it was not sought long ago is that the possibility of the question never occurred to anybody, there is yet another reason, namely, that a satisfactory answer to this one question requires a much more persistent, profound, and painstaking reflection than the most diffuse work on metaphysics, which on its first appearance promised immortal fame to its author. And every intelligent reader, when he carefully reflects what this problem requires, must at first be struck with its difficulty, and would regard it as insoluble and even impossible did there not actually exist pure synthetical cognitions *a priori*. This actually happened to David Hume, though he did not conceive the question in its entire universality as is done here and as must be done if the answer is to be decisive for all metaphysics. For how is it possible, says that acute man, that when a concept is given me I can go beyond it and connect with it another which is not contained in it, in such a manner as if the latter *necessarily* belonged to the former? Nothing but experience can furnish us with such connections (thus he concluded from the difficulty which he took to be impossibility), and all that vaunted necessity or, what is the same thing, knowledge assumed to be *a priori* is nothing but a long habit of accepting something as true, and hence of mistaking subjective necessity for objective.

Should my reader complain of the difficulty and the trouble which I shall occasion him in the solution of this problem, he is at liberty to solve it himself in an easier way. Perhaps he will then feel under obligation to the person who has undertaken for him a labor of so profound research and will rather feel some surprise at the facility with which, considering the nature of the subject, the solution has been attained. Yet it has cost years of work to solve the problem in its whole universality (using the term in the mathematical sense, namely, for that which is sufficient for all cases), and finally to exhibit it in the analytical form, as the reader will find it here. 278

All metaphysicians are therefore solemnly and legally suspended from their occupations till they shall have adequately answered the question, "How are synthetic cognitions *a priori* possible?" For the answer contains the only credentials which they must show when they have anything to offer us in the name of pure reason. But if they do not possess these credentials, they can expect nothing else of reasonable people, who have been deceived so often, than to be dismissed without further inquiry.

If they, on the other hand, desire to carry on their business, not as a science, but as an art of wholesome persuasion suitable to the common sense of man, this calling cannot in justice be denied them. They will then speak the modest language of a rational belief; they will grant that they are not allowed even to conjecture, far less to know, anything which lies beyond the bounds of all possible experience, but only to assume (not for speculative use, which they must abandon, but for practical use only) the existence of something possible and even indispensable for the guidance of the understanding and of the will in life. In this manner alone can they be called useful and wise men, and the more

*["To all that which thou provest me thus, I refuse to give credence, and hate"—*Epistle* II, 3, 188.]

279 so as they renounce the title of metaphysicians. For the latter profess to be speculative philosophers; and since, when judgments *a priori* are under discussion, poor probabilities cannot be admitted (for what is declared to be known *a priori* is thereby announced as necessary), such men cannot be permitted to play with conjectures, but their assertion must be either science or nothing at all.

It may be said that the entire transcendental philosophy, which necessarily precedes all metaphysics, is nothing but the complete solution of the problem here propounded, in systematic order and completeness, and hence we have hitherto never had any transcendental philosophy. For what goes by its name is properly a part of metaphysics, whereas the former science is intended only to constitute the possibility of the latter and must therefore precede all metaphysics. And it is not surprising that when a whole science, deprived of all help from other sciences and consequently in itself quite new, is required to answer a single question satisfactorily, we should find the answer troublesome and difficult, nay, even shrouded in obscurity.

As we now proceed to this solution according to the analytical method, in which we assume that such cognitions from pure reason actually exist, we can only appeal to two sciences of theoretical knowledge (which alone is under consideration here), namely, pure mathematics and pure natural science. For these alone can exhibit to us objects in intuition, and consequently (if there should occur in them a cognition *a priori*) can show the truth or conformity of the cognition to the object *in concreto*, that is, its actuality, from which we could proceed to the ground of its possibility by the analytical method. This facilitates our work greatly for here universal considerations are not only applied to facts, but even start from them, while in a synthetic procedure they must strictly be derived *in abstracto* from concepts.

280 But in order to rise from these actual and, at the same time, well-grounded pure cognitions *a priori* to a possible knowledge of the kind as we are seeking, namely, to metaphysics as a science, we must comprehend that which occasions it—I mean the mere natural, though in spite of its truth still suspect, cognition *a priori* which lies at the basis of that science, the elaboration of which without any critical investigation of its possibility is commonly called metaphysics. In a word, we must comprehend the natural conditions of such a science as a part of our inquiry, and thus the transcendental problem will be gradually answered by a division into four questions:

1. How is pure mathematics possible?
2. How is pure natural science possible?
3. How is metaphysics in general possible?
4. How is metaphysics as a science possible?

It may be seen that the solution of these problems, though chiefly designed to exhibit the essential matter of the *Critique*, has yet something peculiar, which for itself alone deserves attention. This is the search for the sources of given sciences in reason itself, so that its faculty of knowing something *a priori* may by its own deeds be investigated and measured. By this procedure these sciences gain, if not with regard to their contents, yet as to their proper use; and while they throw light on the higher question concerning their common origin, they give, at the same time, an occasion better to explain their own nature.

FIRST PART OF THE MAIN TRANSCENDENTAL PROBLEM

HOW IS PURE MATHEMATICS POSSIBLE?

§ 6. Here is a great and established branch of knowledge, encompassing even now a wonderfully large domain and promising an unlimited extension in the future, yet carrying with it thoroughly apodictic certainty, that is, absolute necessity, and therefore resting upon no empirical grounds. Consequently it is a pure product of reason; and, moreover, it is thoroughly synthetical. [Hence the question arises:] “How then is it possible for human reason to produce such knowledge entirely *a priori*?”

Does not this faculty [which produces mathematics], as it neither is nor can be based upon experience, presuppose some ground of knowledge *a priori*, which lies deeply hidden but which might reveal itself by these its effects if their first beginnings were but diligently ferreted out?

§ 7. But we find that all mathematical cognition has this peculiarity: it must first exhibit its concept in intuition and indeed *a priori*; therefore in an intuition which is not empirical but pure. Without this mathematics cannot take a single step; hence its judgments are always *intuitive*; whereas philosophy must be satisfied with *discursive* judgments from mere concepts, and though it may illustrate its doctrines through an intuition, can never derive them from it. This observation on the nature of mathematics gives us a clue to the first and highest condition of its possibility, which is that some pure intuition must form its basis, in which all its concepts can be exhibited or constructed, *in concreto* and yet *a priori*. If we can uncover this pure intuition and its possibility, we may thence easily explain how synthetical propositions *a priori* are possible in pure mathematics, and consequently how this science itself is possible. For just as empirical intuition [namely, sense-perception] enables us without difficulty to enlarge the concept which we frame of an object of intuition by new predicates which intuition itself presents synthetically in experience, so also pure intuition does likewise, only with this difference, that in the latter case the synthetical judgment is *a priori* certain and apodictic, in the former only *a posteriori* and empirically certain; because this latter contains only that which occurs in contingent empirical intuition, but the former that which must necessarily be discovered in pure intuition. Here intuition, being an intuition *a priori*, is inseparably joined with the concept *prior to all experience* or particular perception. 281

§ 8. But with this step our perplexity seems rather to increase than to lessen. For the question now is, “How is it possible to intuit anything *a priori*?” An intuition is such a representation as would immediately depend upon the presence of the object. Hence it seems impossible to intuit spontaneously *a priori*, because intuition would in that event have to take place without either a former or a present object to refer to, and in consequence could not be intuition. Concepts indeed are such that we can easily form some of them *a priori*, namely, such as contain nothing but the thought of an object in general; and we need not find ourselves in an immediate relation to the object. Take, for instance, the concepts of quantity, of cause, etc. But even these require, in order to be meaningful and significant, a certain concrete use—that is, an application to some intuition by which an object of them is given us. But how can the intuition of the object precede the object itself? 282

§ 9. If our intuition were of such a nature as to represent things as they are in themselves, there would not be any intuition *a priori*, but intuition would be always

empirical. For I can only know what is contained in the object in itself if it is present and given to me. It is indeed even then incomprehensible how the intuition of a present thing should make me know this thing as it is in itself, as its properties cannot migrate into my faculty of representation. But even granting this possibility, an intuition of that sort would not take place *a priori*, that is, before the object were presented to me; for without this latter fact no ground of a relation between my representation and the object can be imagined, unless it depend upon a direct implantation.

Therefore in one way only can my intuition anticipate the actuality of the object, and be a cognition *a priori*, namely: *if my intuition contains nothing but the form of sensibility, antedating in my mind all the actual impressions through which I am affected by objects.*

For that objects of sense can only be intuited according to this form of sensibility I can know *a priori*. Hence it follows that propositions which concern this form of sensuous intuition only are possible and valid for objects of the senses; as also, conversely, that intuitions which are possible *a priori* can never concern any other things than objects of our senses.

283 § 10. Accordingly, it is only the form of sensuous intuition by which we can intuit things *a priori*, but by which we can know objects only as they *appear* to us (to our senses), not as they are in themselves; and this assumption is absolutely necessary if synthetical propositions *a priori* be granted as possible or if, in case they actually occur, their possibility is to be comprehended and determined beforehand.

Now, the intuitions which pure mathematics lays at the foundation of all its cognitions and judgments which appear at once apodictic and necessary are space and time. For mathematics must first present all its concepts in intuition, and pure mathematics in pure intuition; that is, it must construct them. If it proceeded in any other way, it would be impossible to take a single step; for mathematics proceeds, not analytically by dissection of concepts, but synthetically, and if pure intuition be wanting there is nothing in which the matter for synthetical judgments *a priori* can be given. Geometry is based upon the pure intuition of space. Arithmetic achieves its concept of number by the successive addition of units in time, and pure mechanics cannot attain its concepts of motion without employing the representation of time. Both representations, however, are only intuitions; for if we omit from the empirical intuitions of bodies and their alterations (motion) everything empirical, that is, belonging to sensation, space and time still remain, which are therefore pure intuitions that lie *a priori* at the basis of the empirical. Hence they can never be omitted; but at the same time, by their being pure intuitions *a priori*, they prove that they are mere forms of our sensibility, which must precede all empirical intuition, that is, perception of actual objects, and conformably to which objects can be known *a priori*, but only as they appear to us.

284 § 11. The problem of the present section is therefore solved. Pure mathematics, as synthetical cognition *a priori*, is possible only by referring to no other objects than those of the senses. At the basis of their empirical intuition lies a pure intuition (of space and of time) which is *a priori*, because the latter intuition is nothing but the mere form of sensibility, which precedes the actual appearance of the objects, since in fact it makes them possible. Yet this faculty of intuiting *a priori* affects not the matter of the phenomenon (that is, the sensation in it, for this constitutes that which is empirical), but its form, namely, space and time. Should any man venture to doubt that these are determinations adhering not to things in themselves, but to their relation to our sensibility, I should be glad to know how he can find it possible to know *a priori* how their intuition will be characterized before we have any acquaintance with them and before they are presented to us. Such, however, is the case with space and time. But this is quite comprehensible as soon as both count for nothing more than formal conditions of our sensibility, while the

objects count merely as phenomena; for then the form of the phenomenon, that is, pure intuition, can by all means be represented as proceeding from ourselves, that is, *a priori*.

§ 12. In order to add something by way of illustration and confirmation, we need only watch the ordinary and unavoidable procedure of geometers. All proofs of the complete congruence of two given figures (where the one can in every respect be substituted for the other) come ultimately to this, that they may be made to coincide, which is evidently nothing else than a synthetical proposition resting upon immediate intuition; and this intuition must be pure or given *a priori*, otherwise the proposition could not rank as apodictically certain, but would have empirical certainty only. In that case, it could only be said that it is always found to be so and holds good only as far as our perception reaches. That everywhere space (which [in its entirety] is itself no longer the boundary of another space) has three dimensions and that space cannot in any way have more is based on the proposition that not more than three lines can intersect at right angles in one point; but this proposition cannot by any means be shown from concepts, but rests immediately on intuition, and indeed on pure and *a priori* intuition because it is apodictically certain. That we can require a line to be drawn to infinity (*in indefinitum*) or that a series of changes (for example, spaces traversed by motion) shall be infinitely continued presupposes a representation of space and time, which can only attach to intuition—namely, so far as it in itself is bounded by nothing—for from concepts it could never be inferred. Consequently, the basis of mathematics actually is pure intuitions, which make its synthetical and apodictically valid propositions possible. Hence our transcendental deduction of the notions of space and of time explains at the same time the possibility of pure mathematics. Without such a deduction and the assumption “that everything which can be given to our senses (to the external senses in space, to the internal one in time) is intuited by us as it appears to us, not as it is in itself,” the truth of pure mathematics may be granted, but its existence could by no means be understood. 285

§ 13. Those who cannot yet rid themselves of the notion that space and time are actual qualities inherent in things in themselves may exercise their acumen on the following paradox. When they have in vain attempted its solution and are free from prejudices at least for a few moments, they will suspect that the degradation of space and time to mere forms of our sensuous intuition may perhaps be well founded.

If two things are quite equal in all respects as much as can be ascertained by all means possible, quantitatively and qualitatively, it must follow that the one can in all cases and under all circumstances replace the other, and this substitution would not occasion the least perceptible difference. This in fact is true of plane figures in geometry; but some spherical figures exhibit, notwithstanding a complete internal agreement, such a difference in their external relation that the one figure cannot possibly be put in the place of the other. For instance, two spherical triangles on opposite hemispheres, which have an arc of the equator as their common base, may be quite equal, both as regards sides and angles, so that nothing is to be found in either, if it be described for itself alone and completed, that would not equally be applicable to both; and yet the one cannot be put in the place of the other (that is, upon the opposite hemisphere). Here, then, is an internal difference between the two triangles, which difference our understanding cannot describe as internal and which only manifests itself by external relations in space. But I shall adduce examples, taken from common life, that are more obvious still. 286

What can be more similar in every respect and in every part more alike to my hand and to my ear than their images in a mirror? And yet I cannot put such a hand as is seen in the glass in the place of its original; for if this is a right hand, that in the glass is a left one, and the image or reflection of the right ear is a left one, which never can take the place of the other. There are in this case no internal differences which our

understanding could determine by thinking alone. Yet the differences are internal as the senses teach, for, notwithstanding their complete equality and similarity, the left hand cannot be enclosed in the same bounds as the right one (they are not congruent); the glove of one hand cannot be used for the other. What is the solution? These objects are not representations of things as they are in themselves and as some mere* understanding would know them, but sensuous intuitions, that is, appearances whose possibility rests upon the relation of certain things unknown in themselves to something else, namely, to our sensibility. Space is the form of the external intuition of this sensibility, and the internal determination of every space is possible only by the determination of its external relation to the whole of space, of which it is a part (in other words, by its relation to the outer sense). That is to say, the part is possible only through the whole, which is never the case with things in themselves, as objects of the mere understanding, but which may well be the case with mere appearances. Hence the difference between similar and equal things which are not congruent (for instance, two symmetric helices) cannot be made intelligible by any concept, but only by the relation to the right and the left hands which immediately refers to intuition.

287 REMARK I

Pure mathematics, and especially pure geometry, can have objective reality only on condition that they refer merely to objects of sense. But in regard to the latter the principle holds good that our sense representation is not a representation of things in themselves, but of the way in which they appear to us. Hence it follows that the propositions of geometry are not the results of a mere creation of our poetic imagination, and that therefore they cannot be referred with assurance to actual objects; but rather that they are necessarily valid of space, and consequently of all that may be found in space, because space is nothing else than the form of all external appearances, and it is this form alone in which objects of sense can be given to us. Sensibility, the form of which is the basis of geometry, is that upon which the possibility of external appearance depends. Therefore these appearances can never contain anything but what geometry prescribes to them.

It would be quite otherwise if the senses were so constituted as to represent objects as they are in themselves. For then it would not by any means follow from the representation of space, which, with all its properties, serves to the geometer as an *a priori* foundation, that this foundation and everything which is thence inferred must be so in nature. The space of the geometer would be considered a mere fiction, and it would not be credited with objective validity because we cannot see how things must of necessity agree with an image of them which we make spontaneously and previous to our acquaintance with them. But if this image, or rather this formal intuition, is the essential property of our sensibility by means of which alone objects are given to us, and if this sensibility represents not things in themselves but their appearances, then we shall easily comprehend, and at the same time indisputably prove, that all external objects of our world of sense must necessarily coincide in the most rigorous way with the propositions of geometry; because sensibility, by means of its form of external intuition, namely, by space, with which the geometer is occupied, makes those objects possible as mere appearances.

*[In German, *pure*. The clause is meant ironically.—L.W.B.]

University of Königsberg (from an old postcard). Immanuel Kant attended and later taught at the University. These University buildings were destroyed in 1944 by an air raid—only the Cathedral in the background survived.

It will always remain a remarkable phenomenon in the history of philosophy that there was a time when even mathematicians who at the same time were philosophers began to doubt, not of the accuracy of their geometrical propositions so far as they concerned space, but of their objective validity and the applicability of this concept itself, and of all its corollaries, to nature. They showed much concern whether a line in nature might not consist of physical points, and consequently that true space in the object might consist of simple parts, while the space which the geometer has in his mind cannot be such. They did not recognize that this thought space renders possible the physical space, that is, the extension of matter itself; that this pure space is not at all a quality of things in themselves, but a form of our sensuous faculty of representation; and that all objects in space are mere appearances, that is, not things in themselves but representations of our sensuous intuition. But such is the case, for the space of the geometer is exactly the form of sensuous intuition which we find *a priori* in us, and contains the ground of the possibility of all external appearances (according to their form); and the latter must necessarily and most rigorously agree with the propositions of the geometer, which he draws, not from any fictitious concept, but from the subjective basis of all external appearances which is sensibility itself. In this and no other way can geometry be made secure as to the undoubted objective reality of its propositions against all the intrigues of a shallow metaphysics, which is surprised at them [the geometrical propositions] because it has not traced them to the sources of their concepts. 288

REMARK II

Whatever is given us as object must be given us in intuition. All our intuition, however, takes place by means of the senses only; the understanding intuits nothing but only reflects. And as we have just shown that the senses never and in no manner enable us to know things in themselves, but only their appearances, which are mere representations of the sensibility, we conclude that “all bodies, together with the space in which they are, must be considered nothing but mere representations in us, and exist nowhere but in our thoughts.” Is not this manifest idealism?

Idealism consists in the assertion that there are none but thinking beings, all other things which we think are perceived in intuition, being nothing but representations in the thinking beings, to which no object external to them in fact corresponds. I, on the contrary, 289

say that things as objects of our senses existing outside us are given, but we know nothing of what they may be in themselves, knowing only their appearances, that is, the representations which they cause in us by affecting our senses. Consequently I grant by all means that there are bodies without us, that is, things which, though quite unknown to us as to what they are in themselves, we yet know by the representations which their influence on our sensibility procures us. These representations we call “bodies,” a term signifying merely the appearance of the thing which is unknown to us, but not therefore less actual. Can this be termed idealism? It is the very contrary.

Long before Locke’s time, but assuredly since him, it has been generally assumed and granted without detriment to the actual existence of external things that many of their predicates may be said to belong, not to the things in themselves, but to their appearances, and to have no proper existence outside our representation. Heat, color, and taste, for instance, are of this kind. Now, if I go farther and, for weighty reasons, rank as mere appearances the remaining qualities of bodies also, which are called primary—such as extension, place, and, in general, space, with all that which belongs to it (impenetrability or materiality, shape, etc.)—no one in the least can adduce the reason of its being inadmissible. As little as the man who admits colors not to be properties of the object in itself, but only as modifications of the sense of sight, should on that account be called an idealist, so little can my thesis be named idealistic merely because I find that more, nay, *all the properties which constitute the intuition of a body belong merely to its appearance.*

The existence of the thing that appears is thereby not destroyed, as in genuine idealism, but it is only shown that we cannot possibly know it by the senses as it is in itself.

I should be glad to know what my assertions must be in order to avoid all idealism. Undoubtedly, I should say that the representation of space is not only perfectly conformable to the relation which our sensibility has to objects—that I have said—but that it is quite similar to the object—an assertion in which I can find as little meaning as if I said that the sensation of red has a similarity to the property of cinnabar which excites this sensation in me.

REMARK III

Hence we may at once dismiss an easily foreseen but futile objection, “that by admitting the ideality of space and of time the whole sensible world would be turned into mere sham.” After all philosophical insight into the nature of sensuous cognition was spoiled by making the sensibility merely a confused mode of representation, according to which we still know things as they are, but without being able to reduce everything in this our representation to a clear consciousness, I proved that sensibility consists, not in this logical distinction of clearness and obscurity, but in the genetic one of the origin of knowledge itself. For sensuous perception represents things not at all as they are, but only the mode in which they affect our senses; and consequently by sensuous perception appearances only, and not things themselves, are given to the understanding for reflection. After this necessary correction an objection rises from an unpardonable and almost intentional misconception, as if my doctrine turned all the things of the world of sense into mere illusion.

When an appearance is given us, we are still quite free as to how we should judge the matter. The appearance depends upon the senses, but the judgment upon the understanding; and the only question is whether in the determination of the object there is truth

or not. But the difference between truth and dreaming is not ascertained by the nature of the representations which are referred to objects (for they are the same in both cases), but by their connection according to those rules which determine the coherence of the representations in the concept of an object, and by ascertaining whether they can subsist together in experience or not. And it is not the fault of the appearances if our cognition takes illusion for truth, that is, if the intuition, by which an object is given us, is considered a concept of the thing or even of its existence which the understanding can only think. The senses represent to us the course of the planets as now progressive, now retrogressive; and herein is neither falsehood nor truth, because as long as we hold this to be nothing but appearance we do not judge of the objective character of their motion. But as a false judgment may easily arise when the understanding is not on its guard against this subjective mode of representation being considered objective, we say they appear to move backward; it is not the senses however which must be charged with the illusion, but the understanding, whose province alone it is to make an objective judgment from appearances. 291

Thus, even if we did not at all reflect on the origin of our representations, whenever we connect our intuitions of sense (whatever they may contain) in space and in time, according to the rules of the coherence of all knowledge in experience, illusion or truth will arise according as we are negligent or careful. It is merely a question of the use of sensuous representations in the understanding, and not of their origin. In the same way, if I consider all the representations of the senses, together with their form, space and time, to be nothing but appearances, and space and time to be a mere form of the sensibility, which is not to be met with in objects out of it, and if I make use of these representations in reference to possible experience only, there is nothing in my regarding them as appearances that can lead astray or cause illusion. For all that they can correctly cohere according to rules of truth in experience. Thus all the propositions of geometry hold good of space as well as of all the objects of the senses, consequently, of all possible experience, whether I consider space as a mere form of the sensibility or as something cleaving to the things themselves. In the former case, however, I comprehend how I can know *a priori* these propositions concerning all the objects of external intuition. Otherwise, everything else as regards all possible experience remains just as if I had not departed from the common view.

But if I venture to go beyond all possible experience with my concepts of space and time, which I cannot refrain from doing if I proclaim them characters inherent in things in themselves (for what should prevent me from letting them hold good of the same things, even though my senses might be different, and unsuited to them?), then a grave error may arise owing to an illusion, in which I proclaim to be universally valid what is merely a subjective condition of the intuition of things and certain only for all objects of senses—namely, for all possible experience; I would refer this condition to things in themselves, and not limit it to conditions of experience. 292

My doctrine of the ideality of space and of time, therefore, far from reducing the whole sensible world to mere illusion, is the only means of securing the application of one of the most important kinds of knowledge (that which mathematics propounds *a priori*) to actual objects and of preventing its being regarded as mere illusion. For without this observation it would be quite impossible to make out whether the intuitions of space and time, which we borrow from no experience and which yet lie in our representation *a priori*, are not mere phantasms of our brain to which objects do not correspond, at least not adequately; and, consequently, whether we have been able to show its unquestionable validity with regard to all the objects of the sensible world just because they are mere appearances.

Secondly, though these my principles make appearances of the representations of the senses, they are so far from turning the truth of experience into mere illusion

that they are rather the only means of preventing the transcendental illusion, by which metaphysics has hitherto been deceived and led to the childish endeavor of catching at bubbles, because appearances, which are mere representations, were taken for things in themselves. Here originated the remarkable occurrence of the antinomy of reason which I shall mention later and which is solved by the single observation that appearance, as long as it is employed in experience, produces truth; but the moment it transgresses the bounds of experience, and consequently becomes transcendent, produces nothing but illusion.

293 Inasmuch, therefore, as I leave to things as we obtain them by the senses their actuality and only limit our sensuous intuition of these things to this: that it represents in no respect, not even in the pure intuitions of space and of time, anything more than mere appearance of those things, but never their constitution in themselves, this is not a sweeping illusion invented for nature by me. My protestation, too, against all charges of idealism is so valid and clear as even to seem superfluous, were there not incompetent judges who, while they would have an old name for every deviation from their perverse though common opinion and never judge of the spirit of philosophic nomenclature, but cling to the letter only, are ready to put their own conceits in the place of well-defined notions, and thereby deform and distort them. I have myself given this my theory the name of transcendental idealism, but that cannot authorize anyone to confound it either with the empirical idealism of Descartes (indeed, his was only an insoluble problem, owing to which he thought everyone at liberty to deny the existence of the corporeal world because it could never be proved satisfactorily), or with the mystical and visionary idealism of Berkeley, against which and other similar phantasms our *Critique* contains the proper antidote. My idealism concerns not the existence of things (the doubting of which, however, constitutes idealism in the ordinary sense), since it never came into my head to doubt it, but it concerns the sensuous representation of things to which space and time especially belong. Of these [namely, space and time], consequently of all appearances in general, I have only shown that they are neither things (but mere modes of representation) nor determinations belonging to things in themselves. But the word "transcendental," which with me never means a reference of our knowledge to things, but only to the cognitive faculty, was meant to obviate this misconception. Yet rather than give further occasion to it by this word, I now retract it and desire this idealism of mine to be called "critical." But if it be really an objectionable idealism to convert actual things (not appearances) into mere representations, by what name shall we call him who conversely changes mere representations to things? It may, 294 I think, be called "dreaming idealism," in contradistinction to the former, which may be called "visionary," both of which are to be refuted by my transcendental or, better, *critical* idealism.

SECOND PART OF THE MAIN TRANSCENDENTAL PROBLEM

HOW IS PURE SCIENCE OF NATURE POSSIBLE?

§ 14. Nature is the existence of things, so far as it is determined according to universal laws. Should nature signify the existence of things in themselves, we could never know it either *a priori* or *a posteriori*. Not *a priori*, for how can we know what belongs

to things in themselves, since this never can be done by the dissection of our concepts (in analytical propositions)? For I do not want to know what is contained in my concept of a thing (for that belongs to its logical essence), but what in the actuality of the thing is superadded to my concept and by which the thing itself is determined in its existence apart from the concept. My understanding and the conditions on which alone it can connect the determination of things in their existence do not prescribe any rule to things [in] themselves; these do not conform to my understanding, but it would have to conform itself to them; they would therefore have to be first given me in order to gather these determinations from them, wherefore they would not be known *a priori*.

But knowledge of the nature of things in themselves *a posteriori* would be equally impossible. For, if experience is to teach us laws to which the existence of things is subject, these laws, if they have reference to things in themselves, would have to hold them of necessity even outside our experience. But experience teaches us what exists and how it exists, but never that it must necessarily exist so and not otherwise. Experience therefore can never teach us the nature of things in themselves.

§ 15. We nevertheless actually possess a pure science of nature in which are propounded, *a priori* and with all the necessity requisite to apodictical propositions, laws to which nature is subject. I need only call to witness that propaedeutic of natural science which, under the title of the universal science of nature, precedes all physics (which is founded upon empirical principles). In it we have mathematics applied to appearances, and also merely discursive principles (or those derived from concepts), which constitute the philosophical part of the pure knowledge of nature. But there are several things in it which are not quite pure and independent of empirical sources, such as the concept of *motion*, that of *impenetrability* (upon which the empirical concept of matter rests), that of *inertia*, and many others, which prevent its being called a perfectly pure science of nature. Besides, it only refers to objects of the outer sense, and therefore does not give an example of a universal science of nature, in the strict sense, for such a science must bring nature in general, whether it regards the object of the outer or that of the inner sense (the object of physics as well as psychology), under universal laws. But among the principles of this universal physics there are a few which actually have the required universality; for instance, the propositions that “substance is permanent,” that “every event is determined by a cause according to constant laws,” etc. These are actually universal laws of nature, which hold completely *a priori*. There is then in fact a pure science of nature, and the question arises, *How is it possible?* 295

§ 16. The word *nature* assumes yet another meaning which defines the object, whereas in the former sense it only denotes the conformity to law of the determinations of the existence of things generally. If we consider it *materialiter*, “nature is the complex of all the objects of experience.” And with this only are we now concerned, for anyhow things which can never be objects of experience, if they had to be known as to their nature, would oblige us to have recourse to concepts whose meaning could never be given *in concreto* (by any example of possible experience). Consequently we would have to form for ourselves a list of concepts of their nature, the reality whereof could never be determined. That is, we could never learn whether they actually referred to objects or were mere creations of thought. The knowledge of what cannot be an object of experience would be hyperphysical, and with things hyperphysical we are here not concerned, but only with the knowledge of nature, the actuality of which can be confirmed by experience, though this knowledge is possible *a priori* and precedes all experience. 296

§ 17. The formal aspect of nature in this narrower sense is therefore the conformity to law of all the objects of experience and, so far as it is known *a priori*, their *necessary*

conformity. But it has just been shown that the laws of nature can never be known *a priori* in objects so far as they are considered, not in reference to possible experience, but as things in themselves. And our inquiry here extends, not to things in themselves (the properties of which we pass by), but to things as objects of possible experience, and the complex of these is what we here properly designate as nature. And now I ask, when the possibility of knowledge of nature *a priori* is in question, whether it is better to arrange the problem thus: "How can we know *a priori* that things as objects of experience necessarily conform to law?" or thus: "How is it possible to know *a priori* the necessary conformity to law of experience itself as regards all its objects generally?"

Closely considered, the solution of the problem represented in either way amounts, with regard to the pure knowledge of nature (which is the point of the question at issue), entirely to the same thing. For the subjective laws, under which alone an empirical knowledge of things is possible, hold good of these things as objects of possible experience (not as things in themselves, which are not considered here). It is all the same whether I say: "A judgment of perception can never rank as experience without the law that, whenever an event is observed, it is always referred to some antecedent, which it follows according to a universal rule," or: "Everything of which experience teaches that it happens must have a cause."

297 It is, however, more suitable to choose the first formula. For we can *a priori* and prior to all given objects have a knowledge of those conditions on which alone experience of them is possible, but never of the laws to which things may in themselves be subject, without reference to possible experience. We cannot, therefore, study the nature of things *a priori* otherwise than by investigating the conditions and the universal (though subjective) laws, under which alone such a cognition as experience (as to mere form) is possible, and we determine accordingly the possibility of things as objects of experience. For if I should choose the second formula and seek the *a priori* conditions under which nature as an object of experience is possible, I might easily fall into error and fancy that I was speaking of nature as a thing in itself, and then move round in endless circles, in a vain search for laws concerning things of which nothing is given me.

Accordingly, we shall here be concerned with experience only and the universal conditions of its possibility, which are given *a priori*. Thence we shall define nature as the whole object of all possible experience. I think it will be understood that I here do not mean the rules of the observation of a nature that is already given, for these already presuppose experience. Thus I do not mean how (through experience) we can study the laws of nature, for these would not then be laws *a priori* and would yield us no pure science of nature; but [I mean to ask] how the conditions *a priori* of the possibility of experience are at the same time the sources from which all universal laws of nature must be derived.

§ 18. In the first place we must state that, while all judgments of experience are empirical (that is, have their ground in immediate sense-perception), all empirical judgments are not judgments of experience; but, besides the empirical, and in general besides what is given to the sensuous intuition, special concepts must yet be super-added—concepts which have their origin wholly *a priori* in the pure understanding, and under which every perception must be first of all subsumed and then by their means changed into experience.

298 Empirical judgments, so far as they have objective validity, are *judgments of experience*, but those which are only subjectively valid I name mere *judgments of perception*. The latter require no pure concept of the understanding, but only the logical connection of perception in a thinking subject. But the former always require, besides the representation of the sensuous intuition, special *concepts originally begotten in the understanding*, which make possible the objective validity of the judgment of experience.

All our judgments are at first merely judgments of perception; they hold good only for us (that is, for our subject), and we do not till afterward give them a new reference (to an object) and desire that they shall always hold good for us and in the same way for everybody else; for when a judgment agrees with an object, all judgments concerning the same object must likewise agree among themselves, and thus the objective validity of the judgment of experience signifies nothing else than its necessary universal validity. And conversely when we have ground for considering a judgment as necessarily having universal validity (which never depends upon perception, but upon the pure concept of the understanding under which the perception is subsumed), we must consider that it is objective also—that is, that it expresses not merely a reference of our perception to a subject, but a characteristic of the object. For there would be no reason for the judgments of other men necessarily agreeing with mine if it were not the unity of the object to which they all refer and with which they accord; hence they must all agree with one another.

§ 19. Therefore objective validity and necessary universality (for everybody) are equivalent terms, and though we do not know the object in itself, yet when we consider a judgment as universal, and hence necessary, we thereby understand it to have objective validity. By this judgment we know the object (though it remains unknown as it is in itself) by the universal and necessary connection of the given perceptions. As this is the case with all objects of sense, judgments of experience take their objective validity, not from the immediate knowledge of the object (which is impossible), but from the condition of universal validity of empirical judgments, which, as already said, never rests upon empirical or, in short, sensuous conditions, but upon a pure concept of the understanding. The object in itself always remains unknown; but when by the concept of the understanding the connection of the representations of the object, which it gives to our sensibility, is determined as universally valid, the object is determined by this relation, and the judgment is objective.

299

To illustrate the matter: when we say, “The room is warm, sugar sweet, and worm-wood bitter,”* we have only subjectively valid judgments. I do not at all expect that I or any other person shall always find it as I now do; each of these sentences only expresses a relation of two sensations to the same subject, that is, myself, and that only in my present state of perception; consequently they are not valid of the object. Such are judgments of perception. Judgments of experience are of quite a different nature. What experience teaches me under certain circumstances, it must always teach me and everybody; and its validity is not limited to the subject nor to its state at a particular time. Hence I pronounce all such judgments objectively valid. For instance, when I say the air is elastic, this judgment is as yet a judgment of perception only; I do nothing but refer two of my sensations to each other. But if I would have it called a judgment of experience, I require this connection to stand under a condition which makes it universally valid. I desire therefore that I and everybody else should always connect necessarily the same perceptions under the same circumstances.

§ 20. We must consequently analyze experience in general in order to see what is contained in this product of the senses and of the understanding, and how the judgment of experience itself is possible. The foundation is the intuition of which I become conscious, that is, perception (*perceptio*), which pertains merely to the senses. But in

300

*I freely grant that these examples do not represent such judgments of perception as ever could become judgments of experience, even though a concept of the understanding were superadded, because they refer merely to feeling, which everybody knows to be merely subjective and which of course can never be attributed to the object, and consequently never become objective. I only wished to give here an example of a judgment that is merely subjectively valid, containing no ground for necessary universal validity and thereby for a relation to the object. An example of the judgments of perception which become judgments of experience by superadded concepts of the understanding will be given in the next note.

the next place, there is judging (which belongs only to the understanding). But this judging may be twofold: first, I may merely compare perceptions and connect them in a consciousness of my particular state; or, secondly, I may connect them in consciousness in general. The former judgment is merely a judgment of perception, and hence is of subjective validity only; it is merely a connection of perceptions in my mental state, without reference to the object. Hence it does not, as is commonly imagined, suffice for experience that perceptions are compared and connected in consciousness through judgment; thence arises no universal validity and necessity by virtue of which alone consciousness can be objectively valid, that is, can be called experience.

Quite another judgment therefore is required before perception can become experience. The given intuition must be subsumed under a concept which determines the form of judging in general relatively to the intuition, connects empirical consciousness of intuition in consciousness in general, and thereby procures universal validity for empirical judgments. A concept of this nature is a pure *a priori* concept of the understanding, which does nothing but determine for an intuition the general way in which it can be used for judgments. Let the concept be that of cause; then it determines the intuition which is subsumed under it, for example, that of air, relative to judging in general—namely, the concept of air in respect to its expansion serves in the relation of antecedent to consequent in a hypothetical judgment. The concept of cause accordingly is a pure concept of the understanding, which is totally disparate from all possible perception and only serves to determine the representation subsumed under it, with respect to judging in general, and so to make a universally valid judgment possible.

301 Before, therefore, a judgment of perception can become a judgment of experience, it is requisite that the perception should be subsumed under some such concept of the understanding; for instance, air belongs under the concept of cause, which determines our judgment about it in respect to its expansion as hypothetical.* Thereby the expansion of the air is represented, not as merely belonging to the perception of the air in my present state or in several states of mine, or in the perceptual state of others, but as belonging to it necessarily. The judgment, “Air is elastic,” becomes universally valid and a judgment of experience only because certain judgments precede it which subsume the intuition of air under the concept of cause and effect; and they thereby determine the perceptions, not merely with respect to one another in me, but with respect to the form of judging in general (which is here hypothetical), and in this way they render the empirical judgment universally valid.

If all our synthetical judgments are analyzed so far as they are objectively valid, it will be found that they never consist of mere intuitions connected only (as is commonly believed) by comparison into a judgment; but that they would be impossible were not a pure concept of the understanding superadded to the concepts abstracted from intuition, under which concept these latter are subsumed and in this manner only combined into an objectively valid judgment. Even the judgments of pure mathematics in their simplest axioms are not exempt from this condition. The principle, “A straight line is the shortest distance between two points,” presupposes that the line is subsumed under the concept of magnitude, which certainly is no mere intuition, but has its seat in the

*As an easier example, we may take the following: “When the sun shines on the stone, it grows warm.” This judgment, however often I and others may have perceived it, is a mere judgment of perception and contains no necessity; perceptions are only usually conjoined in this manner. But if I say, “The sun warms the stone,” I add to the perception a concept of the understanding, namely, that of cause, which necessarily connects with the concept of sunshine that of heat, and the synthetical judgment becomes of necessity universally valid, namely, objective, and is converted from a perception into experience.

understanding alone and serves to determine the intuition (of the line) with regard to the judgments which may be made about it, in respect to their quantity, that is, to plurality (as *judicia plurativa*).* For under them it is understood that in a given intuition there is contained a plurality of homogeneous parts. 302

LOGICAL TABLE OF JUDGMENTS

1	2
<i>As to Quantity</i>	<i>As to Quality</i>
Universal	Affirmative
Particular	Negative
Singular	Infinite
3	4

PURE PHYSICAL TABLE OF THE UNIVERSAL PRINCIPLES OF THE SCIENCE OF NATURE

1	2
Axioms of Intuition	Anticipations of Perception
3	4
Analogies of Experience	Postulates of Empirical Thinking Generally

*This name seems preferable to the term *particularia*, which is used for these judgments in logic. For the latter implies the idea that they are not universal. But when I start from unity (in singular judgments) and so proceed to totality, I must not [even indirectly and negatively] imply any reference to totality. I think plurality merely without totality, and not the exception from totality. This is necessary if logical distinctions are to form the basis of the pure concepts of the understanding. However, logical usage need not be changed.

§ 21. To prove, then, the possibility of experience so far as it rests upon pure concepts of the understanding *a priori*, we must first represent what belongs to judging in general and the various functions of the understanding in a complete table. For the pure concepts of the understanding must run parallel to these functions, as such concepts are nothing more than concepts of intuitions in general, so far as these are determined by one or other of these functions of judging, in themselves, that is, necessarily and universally. Hereby also the *a priori* principles of the possibility of all experience, as objectively valid empirical knowledge, will be precisely determined. For they are nothing but propositions which subsume all perception (under certain universal conditions of intuition) under those pure concepts of the understanding.

304 § 21a. In order to comprise the whole matter in one idea, it is first necessary to remind the reader that we are discussing, not the origin of experience, but that which lies in experience. The former pertains to empirical psychology and would even then never be adequately explained without the latter, which belongs to the critique of knowledge, and particularly of the understanding.

Experience consists of intuitions, which belong to the sensibility, and of judgments, which are entirely a work of the understanding. But the judgments which the understanding forms solely from sensuous intuitions are far from being judgments of experience. For in the one case the judgment connects only the perceptions as they are given in sensuous intuition, while in the other the judgments must express what experience in general and not what the mere perception (which possesses only subjective validity) contains. The judgment of experience must therefore add to the sensuous intuition and its logical connection in a judgment (after it has been rendered universal by comparison) something that determines the synthetical judgment as necessary and therefore as universally valid. This can be nothing else than that concept which represents the intuition as determined in itself with regard to one form of judgment rather than another, namely, a concept of that synthetical unity of intuitions which can only be represented by a given logical function of judgments.

305 § 22. The sum of the matter is this: the business of the senses is to intuit, that of the understanding is to think. But thinking is uniting representations in one consciousness. This union originates either merely relative to the subject and is accidental and subjective, or takes place absolutely and is necessary or objective. The union of representations in one consciousness is judgment. Thinking, therefore, is the same as judging or referring representations to judgments in general. Hence judgments are either merely subjective, when representations are referred to a consciousness in one subject only and united in it, or objective, when they are united in consciousness in general, that is, necessarily. The logical functions of all judgments are but various modes of uniting representations in consciousness. But if they serve for concepts, they are concepts of the necessary union of representations in [any] consciousness, and so are principles of objectively valid judgments. This union in consciousness is either analytical, by identity, or synthetical, by the combination and addition of various representations one to another. Experience consists in the synthetical connection of phenomena (perceptions) in consciousness, so far as this connection is necessary. Hence the pure concepts of the understanding are those under which all perceptions must be subsumed ere they can serve for judgments of experience, in

which the synthetical unity of the perceptions is represented as necessary and universally valid.*

§ 23. Judgments, when considered merely as the condition of the union of given representations in a consciousness, are rules. These rules, so far as they represent the union as necessary, are rules *a priori*, and, insofar as they cannot be deduced from higher rules, are principles. But in regard to the possibility of all experience, merely in relation to the form of thinking in it, no conditions of judgments of experience are higher than those which bring the appearances, according to the various form of their intuition, under pure concepts of the understanding, which render the empirical judgment objectively valid. These are therefore the *a priori* principles of possible experience. 306

The principles of possible experience are then at the same time universal laws of nature, which can be known *a priori*. And thus the problem of our second question, “How is the pure science of nature possible?” is solved. For the system which is required for the form of a science is to be met with in perfection here, because, beyond the above-mentioned formal conditions of all judgments in general (and hence of all rules in general) offered in logic, no others are possible, and these constitute a logical system. The concepts grounded thereupon, which contain the *a priori* conditions of all synthetical and necessary judgments, accordingly constitute a transcendental system. Finally the principles, by means of which all phenomena are subsumed under these concepts, constitute a physical system, that is, a system of nature, which precedes all empirical knowledge of nature, and makes it possible. It may in strictness be denominated the universal and pure science of nature.

§ 24. The first of the physical principles subsumes all phenomena, as intuitions in space and time, under the concept of quantity, and is thus a principle of the application of mathematics to experience. The second one subsumes the strictly empirical element, namely, sensation, which denotes the real in intuitions, not indeed directly under the concept of quantity, because sensation is not an intuition that *contains* either space or time, though it places the respective object corresponding to it in both. But still there is between reality (sense-representation) and the zero, or total void of intuition in time, a difference which has a quantity. For between every given degree of light and of darkness, between every degree of heat and of absolute cold, between every degree of weight and of absolute lightness, between every degree of occupancy space and of totally void space, diminishing degrees can be conceived, in the same manner as between consciousness and total unconsciousness (psychological darkness) ever-diminishing degrees obtain. Hence there is no perception that can prove an absolute absence; for instance, no psychological darkness that cannot be considered as consciousness which is only outbalanced by a stronger consciousness. This occurs in all cases of sensation, and so the understanding can anticipate even sensations, which constitute the peculiar quality of empirical representations 307

*But how does the proposition that judgments of experience contain necessity in the synthesis of perceptions agree with my statement so often before inculcated that experience as cognition *a posteriori* can afford contingent judgments only? When I say that experience teaches me something, I mean only the perception that lies in experience—for example, that heat always follows the shining of the sun on a stone; consequently the proposition of experience is always so far accidental. That this heat necessarily follows the shining of the sun is contained indeed in the judgment of experience (by means of the concept of cause), yet is a fact not learned by experience; for conversely, experience is first of all generated by this addition of the concept of the understanding (of cause) to perception. How perception attains this addition may be seen by referring in the *Critique* itself to the [first] section of the “Transcendental Faculty of Judgment.”

(appearances), by means of the principle that they all have degree (and consequently that what is real in all appearance has degree). Here is the second application of mathematics (*mathesis intensorum*) to the science of nature.

§ 25. Anent the relation of appearances merely with a view to their existence, the determination of the relation is not mathematical but dynamical, and can never be objectively valid, consequently never fit for experience, if it does not come under *a priori* principles by which the empirical knowledge relative to appearances first becomes possible. Hence appearances must be subsumed under the concept of substance, which as a concept of a thing is the foundation of all determination of existence; or, secondly—so far as a succession is found among appearances, that is, an event—under the concept of an effect with reference to cause; or lastly—so far as coexistence is to be known objectively, that is, by a judgment of experience—under the concept of community (action and reaction). Thus *a priori* principles form the basis of objectively valid, though empirical, judgments—that is, of the possibility of experience so far as it must connect objects as existing in nature. These principles are the real laws of nature, which may be termed “dynamical.”

308 Finally knowledge of the agreement and connection, not only of appearances among themselves in experience, but of their relation to experience in general, belongs to the judgments of experience. This relation contains either their agreement with the formal conditions, which the understanding recognizes, or their coherence with the materials of the senses and of perception, or combines both into one concept. Consequently, their relation to experience in general entails possibility, actuality, and necessity, according to universal laws of nature. This would constitute the physical doctrine of method for distinguishing truth from hypotheses and for determining the limits of certainty of the latter.

§ 26. The third table of principles drawn by the critical method from the nature of the understanding itself shows an inherent perfection, which raises it far above every other table which has hitherto, though in vain, been tried or may yet be tried by analyzing the objects themselves dogmatically. It exhibits all synthetical *a priori* principles completely and according to one principle, namely, the faculty of judging in general, constituting the essence of experience as regards the understanding; so that we can be certain that there are no more such principles. This affords a satisfaction which can never be attained by the dogmatic method. Yet this is not all; there is a still greater merit in it.

We must carefully bear in mind the premise which shows the possibility of this cognition *a priori* and, at the same time, limits all such principles to a condition which must never be lost sight of if we desire it not to be misunderstood and extended in use beyond the original sense which the understanding attaches to it. This limit is that they contain nothing but the conditions of possible experience in general so far as it is subjected to laws *a priori*. Consequently, I do not say that things *in themselves* possess a magnitude; that their reality possesses a degree, their existence a connection of accidents in a substance, etc. This nobody can prove, because such a synthetical connection from mere concepts, without any reference to sensuous intuition on the one side or connection of it in a possible experience on the other, is absolutely impossible. The essential limitation of the concepts in these principles then is that all things *as objects of experience only* stand necessarily *a priori* under the aforementioned conditions.

309 Hence there follows, secondly, a specifically peculiar mode of proof of these principles; they are not directly referred to appearances and to their relation, but to the possibility of experience, of which appearances constitute the matter only, not the form. Thus they are referred to objectively and universally valid synthetical propositions, in

which we distinguish judgments of experience from those of perception. This takes place because appearances, as mere intuitions *occupying a part of space and time*, come under the concept of quantity, which synthetically unites their multiplicity *a priori* according to rules. Again, insofar as the perception contains, besides intuition, sensation, and between the latter and nothing (that is, the total disappearance of sensation), there is an ever-decreasing transition, it is apparent that the real within appearances must have a degree, so far as it (namely, the sensation) *does not itself occupy any part of space or of time*.^{*} Still the transition to this real from empty time or empty space is possible only in time. Consequently, although sensation, as the quality of empirical intuition specifically differentiating it from other sensations, can never be known *a priori*, yet it can, in a possible experience in general, as quantity of perception be intensively distinguished from every other similar perception. Hence the application of mathematics to nature, as regards the sensuous intuition by which nature is given to us, thus becomes possible and definite.

Above all, the reader must pay attention to the mode of proof of the principles which occur under the title of “analogies of experience.” For these do not refer to the genesis of intuitions, as do the principles of applying mathematics to natural science in general, but to the connection of their existence in an experience; and this can be nothing but the determination of their existence in time according to necessary laws, under which alone the connection is objectively valid and thus becomes experience. The proof, therefore, does not turn on the synthetical unity in the connection of things in themselves, but merely of perceptions; and of these, not in regard to their matter, but to the determination of time and of the relation of their existence in it according to universal laws. If the empirical determination in relative time is indeed to be objectively valid (that is, to be experience), these universal laws must contain the necessary determination of existence in time generally (namely, according to a rule of the understanding *a priori*). 310

As these are prolegomena I cannot here further descant on the subject, but my reader (who has probably been long accustomed to consider experience a mere empirical synthesis of perceptions, and hence has not considered that it goes much beyond them since it imparts to empirical judgments universal validity, and for that purpose requires a pure and *a priori* unity of the understanding) is recommended to pay special attention to this distinction of experience from a mere aggregate of perceptions and to judge the mode of proof from this point of view.

§ 27. Now we are prepared to remove Hume’s doubt. He justly maintains that we cannot comprehend by reason the possibility of causality, that is, of the reference of the existence of one thing to the existence of another which is necessitated by the former. I add that we comprehend just as little the concept of subsistence, that is, the necessity that at the foundation of the existence of things there lies a subject which cannot itself be a predicate of any other thing; nay, we cannot even form a notion of the possibility of such a thing (though we can point out examples of its use in experience). The very same incomprehensibility affects the community of things, as we cannot comprehend how from the

^{*}Heat and light are in a small space just as large, as to degree, as in a large one; in like manner the internal representations, pain, consciousness generally, whether they last a short or a long time, need not vary as to the degree. Hence the quantity is here in a point and in a moment just as great as in any space or time, however great. Degrees are quantities not in intuition, but in mere sensation (or the quantity of the content [*Grundes*] of an intuition). Hence they can only be estimated quantitatively by the relation of 1 to 0, namely, by their capability of decreasing by infinite intermediate degrees to disappearance, or of increasing from naught through infinite gradations to a determinate sensation in a certain time. *Quantitas qualitatis est gradus*. “The quantity of quality is degree.”

311 state of one thing an inference to the state of quite another thing beyond it, and *vice versa*, can be drawn, and how substances which have each their own separate existence should depend upon one another necessarily. But I am very far from holding these concepts to be derived merely from experience, and the necessity represented in them to be imaginary and a mere illusion produced in us by long habit. On the contrary, I have amply shown that they and the principles derived from them are firmly established *a priori* before all experience and have their undoubted objective value, though only with regard to experience.

§ 28. Although I have no notion of such a connection of things in themselves, how they can either exist as substances, or act as causes, or stand in community with others (as parts of a real whole), and I can just as little conceive such properties in appearances as such (because those concepts contain nothing that lies in the appearances, but only what the understanding alone must think), we have yet a concept of such a connection of representations in our understanding and in judgments generally. This concept is: that representations appear, in one sort of judgments, as subject in relation to predicates; in another, as ground in relation to consequent; and, in a third, as parts which constitute together a total possible cognition. Furthermore, we know *a priori* that without considering the representation of an object as determined in one or the other of these respects, we can have no valid knowledge of the object; and, if we should occupy ourselves about the object in itself, there is not a single possible attribute by which I could know that it is determined under any of these aspects, that is, under the concept either of substance, or of cause, or (in relation to other substances) of community, for I have no concept of the possibility of such a connection of existence. But the question is not how things in themselves but how the empirical knowledge of things is determined, as regards the above aspects of judgments in general; that is, how things, as objects of experience, can and must be subsumed under these concepts of the understanding. And then it is clear that I completely comprehend, not only the possibility, but also the necessity, of subsuming all appearances under these concepts—that is, of using them for principles of the possibility of experience.

312 § 29. In order to test Hume's problematical concept (his *crux metaphysicorum*), the concept of cause, we are first given *a priori*, by means of logic, the form of a conditional judgment in general; that is, we have one cognition given as antecedent and another as consequent. But it is possible that in perception we may meet with a rule of relation which runs thus: that a certain appearance is constantly followed by another (though not conversely); and this is a case for me to use the hypothetical judgment and, for instance, to say if the sun shines long enough upon a body it grows warm. Here there is indeed as yet no necessity of connection or concept of cause. But I proceed and say that, if this proposition, which is merely a subjective connection of perceptions, is to be a proposition of experience, it must be seen as necessary and universally valid. Such a proposition would be that the sun is by its light the cause of heat. The empirical rule is now considered as a law, and as valid, not merely of appearances but valid of them for the purposes of a possible experience which requires universal and therefore necessarily valid rules. I therefore easily comprehend the concept of cause, as a concept necessarily belonging to the mere form of experience, and its possibility as a synthetical union of perceptions in consciousness in general; but I do not at all comprehend the possibility of a thing in general as a cause, because the concept of cause denotes a condition not at all belonging to things, but to experience. For experience can be nothing but objectively valid knowledge of appearances and of their succession, only so far as the earlier can be conjoined with the later according to the rule of hypothetical judgments.

§ 30. Hence if even the pure concepts of the understanding are thought to go beyond objects of experience to things in themselves (*noumena*), they have no meaning whatever.

They serve, as it were, only to decipher appearances, that we may be able to read them as experience. The principles which arise from their reference to the sensible world only serve our understanding for empirical use. Beyond this they are arbitrary combinations without objective reality, and we can neither know their possibility *a priori* nor verify—or even render intelligible by any example—their reference to objects; because examples can only be borrowed from some possible experience, and consequently the objects of these concepts can be found nowhere but in a possible experience.

313

This complete (though to its originator unexpected) solution of Hume's problem rescues for the pure concepts of the understanding their *a priori* origin and for the universal laws of nature their validity as laws of the understanding, yet in such a way as to limit their use to experience, because their possibility depends solely on the reference of the understanding to experience, but with a completely reversed mode of connection which never occurred to Hume—they do not derive from experience, but experience derives from them.

This is, therefore, the result of all our foregoing inquiries: "All synthetical principles *a priori* are nothing more than principles of possible experience" and can never be referred to things in themselves, but to appearances as objects of experience. And hence pure mathematics as well as a pure science of nature can never be referred to anything more than mere appearances, and can only represent either that which makes experience in general possible, or else that which, as it is derived from these principles, must always be capable of being represented in some possible experience.

§ 31. And thus we have at last something definite upon which to depend in all metaphysical enterprises, which have hitherto, boldly enough but always blindly, attempted everything without discrimination. That the aim of their exertions should be so near struck neither the dogmatic thinkers nor those who, confident in their supposed sound common sense, started with concepts and principles of pure reason (which were legitimate and natural, but destined for mere empirical use) in quest of insights to which they neither knew nor could know any definite bounds, because they had never reflected nor were able to reflect on the nature or even on the possibility of such a pure understanding.

314

Many a naturalist of pure reason (by which I mean the man who believes he can decide in matters of metaphysics without any science) may pretend that he, long ago, by the prophetic spirit of his sound sense, not only suspected but knew and comprehended what is here propounded with so much ado, or, if he likes, with prolix and pedantic pomp: "that with all our reason we can never reach beyond the field of experience." But when he is questioned about his rational principles individually, he must grant that there are many of them which he has not taken from experience and which are therefore independent of it and valid *a priori*. How then and on what grounds will he restrain both himself and the dogmatist, who makes use of these concepts and principles beyond all possible experience because they are recognized to be independent of it? And even he, this adept in sound sense, in spite of all his assumed and cheaply acquired wisdom, is not exempt from wandering inadvertently beyond objects of experience into the field of chimeras. He is often deeply enough involved in them; though, in announcing everything as mere probability, rational conjecture, or analogy, he gives by his popular language a color to his groundless pretensions.

§ 32. Since the oldest days of philosophy, inquirers into pure reason have conceived, besides the things of sense, or appearances (*phenomena*), which make up the sensible world, certain beings of the understanding (*noumena*), which should constitute an intelligible world. And as appearance and illusion were by those men identified (a thing which we may well excuse in an undeveloped epoch), actuality was only conceded to the beings of the understanding.

315 And we indeed, rightly considering objects of sense as mere appearances, confess thereby that they are based upon a thing in itself, though we know not this thing as it is in itself but only know its appearances, namely, the way in which our senses are affected by this unknown something. The understanding, therefore, by assuming appearances, grants the existence of things in themselves also; and to this extent we may say that the representation of such things as are the basis of appearances, consequently of mere beings of the understanding, is not only admissible but unavoidable.

Our critical deduction by no means excludes things of that sort (*noumena*), but rather limits the principles of the Aesthetic* to this, that they shall not extend to all things—as everything would then be turned into mere appearance—but that they shall hold good only of objects of possible experience. Hereby, then, beings of the understanding are granted, but with the inculcation of this rule which admits of no exception: that we neither know nor can know anything at all definite of these pure beings of the understanding, because our pure concepts of the understanding as well as our pure intuitions extend to nothing but objects of possible experience, consequently to mere things of sense; and as soon as we leave this sphere, these concepts retain no meaning whatever.

§ 33. There is indeed something seductive in our pure concepts of the understanding which tempts us to a transcendent use—a use which transcends all possible experience. Not only are our concepts of substance, of power, of action, of reality, and others, quite independent of experience, containing nothing of sense appearance, and so apparently applicable to things in themselves (*noumena*), but, what strengthens this conjecture, they contain a necessity of determination in themselves, which experience never attains. The concept of cause implies a rule according to which one state follows another necessarily; but experience can only show us that one state of things often or, at most, commonly follows another, and therefore affords neither strict universality nor necessity.

316 Hence the concepts of the understanding seem to have a deeper meaning and import than can be exhausted by their merely empirical use, and so the understanding inadvertently adds for itself to the house of experience a much more extensive wing, which it fills with nothing but beings of thought, without ever observing that it has transgressed with its otherwise legitimate concepts the bounds of their use.

§ 34. Two important and even indispensable, though very dry, investigations therefore became indispensable in the *Critique of Pure Reason* [namely, the chapters “The Schematism of the Pure Concepts of the Understanding” and “On the Ground of the Distinction of All Objects as Phenomena and Noumena.”] In the former it is shown that the senses furnish, not the pure concepts of the understanding *in concreto*, but only the schema for their use, and that the object conformable to it occurs only in experience (as the product of the understanding from materials of the sensibility). In the latter it is shown that, although our pure concepts of the understanding and our principles are independent of experience, and despite the apparently greater sphere of their use, still nothing whatever can be thought by them beyond the field of experience, because they can do nothing but merely determine the logical form of the judgment relatively to given intuitions. But as there is no intuition at all beyond the field of the sensibility, these pure concepts, as they cannot possibly be exhibited *in concreto*, are void of all meaning; consequently all these *noumena*, together with their

*[That is, the first part of the *Critique of Pure Reason*, establishing space and time as pure intuitions.—L.W.B.]

complex, the intelligible world,* are nothing but representation of a problem, of which the object in itself is possible but the solution, from the nature of our understanding, totally impossible. For our understanding is not a faculty of intuition, but of the connection of given intuitions in one experience. Experience must therefore contain all the objects for our concepts; but beyond it no concepts have any significance, as there is no intuition that might offer them a foundation. 317

§ 35. The imagination may perhaps be forgiven for occasional vagaries and for not keeping carefully within the limits of experience, since it gains life and vigor by such flights and since it is always easier to moderate its boldness than to stimulate its languor. But the understanding which ought to *think* can never be forgiven for indulging in vagaries; for we depend upon it alone for assistance to set bounds, when necessary, to the vagaries of the imagination.

But the understanding begins its aberrations very innocently and modestly. It first brings to light the elementary cognitions which inhere in it prior to all experience, but which yet must always have their application in experience. It gradually drops these limits—and what is there to prevent it, as it has quite freely derived its principles from itself? It then proceeds first to newly imagined powers in nature, then to beings outside nature—in short, to a world for whose construction the materials cannot be wanting, because fertile fiction furnishes them abundantly, and though not confirmed it is never refuted by experience. This is the reason that young thinkers are so partial to metaphysics constructed in a truly dogmatic manner, and often sacrifice to it their time and their talents, which might be otherwise better employed.

But there is no use in trying to moderate these fruitless endeavors of pure reason by all manner of cautions as to the difficulties of solving questions so occult, by complaints of the limits of our reason, and by degrading our assertions into mere conjectures. For if their impossibility is not distinctly shown, and reason's knowledge of itself does not become a true science, in which the field of its right use is distinguished, so to say, with geometrical certainty from that of its worthless and idle use, these fruitless efforts will never be wholly abandoned.

§ 36. How is nature itself possible? This question—the highest point that transcendental philosophy can ever reach, and to which, as its boundary and completion, it must proceed—really contains two questions. 318

First: How is nature in the material sense, that is, as to intuition, or considered as the totality of appearances, possible; how are space, time, and that which fills both—the object of sensation—possible generally? The answer is: By means of the constitution of our sensibility, according to which it is in its own way affected by objects which are in themselves unknown to it and totally distinct from those appearances. This answer is given in the *Critique* itself in the “Transcendental Aesthetic,” and in these *Prolegomena* by the solution of the first general problem.

Secondly: How is nature possible in the formal sense, as the totality of the rules under which all appearances must come in order to be thought as connected in experience? The answer must be this: It is only possible by means of the constitution of our understanding, according to which all the above representations of the sensibility are necessarily referred to

*We speak of the “intelligible world,” not (as the usual expression is) “intellectual world.” For cognitions are intellectual through the understanding and refer to our world of sense also; but objects, in so far as they can be represented merely by the understanding, and to which none of our sensible intuitions can refer, are termed “intelligible.” But as some possible intuition must correspond to every object, we would have to assume an understanding that intuits things immediately; but of such we have not the least notion, nor have we any notion of the *beings of the understanding* to which it should be applied.

a consciousness, and by which the peculiar way in which we think (namely, by rules) and hence experience also are possible, but must be clearly distinguished from an insight into the objects in themselves. This answer is given in the *Critique* itself in the “Transcendental Logic” and in these *Prolegomena*, in the course of the solution of the second main problem.

But how this peculiar property of our sensibility itself is possible, or that of our understanding and of the apperception which is necessarily its basis and that of all thinking, cannot be further analyzed or answered, because it is of them that we are in need for all our answers and for all our thinking about objects.

There are many laws of nature which we can know only by means of experience; but conformity to law in the connection of appearances, that is, in nature in general, we cannot discover by any experience, because experience itself requires laws which are *a priori* at the basis of its possibility.

The possibility of experience in general is therefore at the same time the universal law of nature, and the principles of experience are the very laws of nature. For we know nature only as the totality of appearances, that is, of representations in us; and hence we can only derive the laws of their connection from the principles of their connection in us, that is, from the conditions of their necessary union in one consciousness which constitutes the possibility of experience.

Even the main proposition expounded throughout this section—that universal laws of nature can be known *a priori*—leads naturally to the proposition that the highest legislation of nature must lie in ourselves, that is, in our understanding; and that we must not seek the universal laws of nature in nature by means of experience, but conversely must seek nature, as to its universal conformity to law, in the conditions of the possibility of experience which lie in our sensibility and in our understanding. For how were it otherwise possible to know *a priori* these laws, as they are not rules of analytical knowledge but truly synthetical extensions of it?

Such a necessary agreement of the principles of possible experience with the laws of the possibility of nature can only proceed from one of two causes: either these laws are drawn from nature by means of experience, or conversely nature is derived from the laws of the possibility of experience in general and is quite the same as the mere universal conformity to law of the latter. The former is self-contradictory, for the universal laws of nature can and must be known *a priori* (that is, independently of all experience) and be the foundation of all empirical use of the understanding; the latter alternative therefore alone remains.*

But we must distinguish the empirical laws of nature, which always presuppose particular perceptions, from the pure or universal laws of nature, which, without being based on particular perceptions, contain merely the conditions of their necessary union in experience. In relation to the latter, nature and possible experience are quite the same; and as the conformity to law in the latter depends upon the necessary connection of appearances in experience (without which we cannot know any object whatever in the sensible world), consequently upon the original laws of the understanding, it seems at first strange, but is not the less certain, to say: *The understanding does not derive its laws (a priori) from, but prescribes them to, nature.*

§ 37. We shall illustrate this seemingly bold proposition by an example, which will show that laws which we discover in objects of sensuous intuition (especially when

*Crusius alone thought of a compromise: that a spirit, who can neither err nor deceive, implanted these laws in us originally. But since false principles often intrude themselves, as indeed the very system of this man shows in not a few instances, we are involved in difficulties as to the use of such a principle in the absence of sure criteria to distinguish the genuine origin from the spurious, since we never can know certainly what the spirit of truth or the father of lies may have instilled into us.

these laws are known as necessary) are commonly held by us to be such as have been placed there by the understanding, in spite of their being similar in all points to the laws of nature which we ascribe to experience.

§ 38. If we consider the properties of the circle, by which this figure combines in itself so many arbitrary determinations of space in a universal rule, we cannot avoid attributing a constitution to this geometrical thing. Two straight lines, for example, which intersect each other and the circle, howsoever they may be drawn, are always divided so that the rectangle constructed with the segments of the one is equal to that constructed with the segments of the other. The question now is: Does this law lie in the circle or in the understanding? That is, does this figure, independently of the understanding, contain in itself the ground of the law; or does the understanding, having constructed according to its concepts (of the equality of the radii) the figure itself, introduce into it this law of the chords intersecting in geometrical proportion? When we follow the proofs of this law, we soon perceive that it can only be derived from the condition on which the understanding founds the construction of this figure, namely, the concept of the equality of the radii. But if we enlarge this concept to pursue further the unity of various properties of geometrical figures under common laws and consider the circle as a conic section, which of course is subject to the same fundamental conditions of construction as other conic sections, we shall find that all the chords which intersect within the ellipse, parabola, and hyperbola always intersect so that the rectangles of their segments are not indeed equal but always bear a constant ratio to one another. If we proceed still farther to the fundamental teachings of physical astronomy, we find a physical law of reciprocal attraction applicable to all material nature, the rule of which is that it decreases inversely as the square of the distance from each attracting point, that is, as the spherical surfaces increase over which this force spreads, which law seems to be necessarily inherent in the very nature of things, and hence is usually propounded as knowable *a priori*. Simple as the sources of this law are, merely resting upon the relation of spherical surfaces of different radii, its consequences are so valuable with regard to the variety and simplicity of their agreement that not only are all possible orbits of the celestial bodies conic sections, but such a relation of these orbits to one another results that no other law of attraction than that of the inverse square of the distance can be imagined as fit for a cosmical system.

321

Here accordingly is nature, which rests upon laws that the understanding knows *a priori*, and chiefly from the universal principles of the determination of space. Now I ask: Do the laws of nature lie in space, and does the understanding learn them by merely endeavoring to find out the enormous wealth of meaning that lies in space; or do they inhere in the understanding and in the way in which it determines space according to the conditions of the synthetical unity in which its concepts are all centered?

Space is something so uniform and as to all particular properties so indeterminate that we should certainly not seek a store of laws of nature in it. Whereas that which determines space to assume the form of a circle, or the figures of a cone and a sphere, is the understanding, so far as it contains the ground of the unity of their constructions.

322

The mere universal form of intuition, called space, must therefore be the substratum of all intuitions determinable to particular objects; and in it, of course, the condition of the possibility and of the variety of these intuitions lies. But the unity of the objects is entirely determined by the understanding and on conditions which lie in its own nature; and thus the understanding is the origin of the universal order of nature, in that it comprehends all appearances under its own laws and thereby produces, in an *a priori* manner, experience (as to its form), by means of which whatever is to be known only by experience is necessarily subjected to its laws. For we are not concerned with the nature

of things in themselves, which is independent of the conditions both of our sensibility and our understanding, but with nature as an object of possible experience; and in this case the understanding, since it makes experience possible, thereby insists that the sensuous world is either not an object of experience at all or that it is nature [namely, the existence of things determined according to universal laws].

APPENDIX TO THE PURE SCIENCE OF NATURE

§ 39. *Of the System of the Categories.* There can be nothing more desirable to a philosopher than to be able to derive the scattered multiplicity of the concepts or principles which had occurred to him in concrete use from a principle *a priori*, and to unite everything in this way in one cognition. He formerly only believed that those things which remained after a certain abstraction, and seemed by comparison among one another to constitute a particular kind of cognitions, were completely collected; but this was only an *aggregate*. Now he knows that just so many, neither more nor less, can constitute the kind of cognition, and perceives the necessity of his division. This constitutes comprehension; and only then has he attained a *system*.

323 To search in our common knowledge for the concepts which do not rest upon particular experience and yet occur in all knowledge from experience, of which they as it were constitute the mere form of connection, presupposes neither greater reflection nor deeper insight than to detect in a language the rules of the actual use of words generally and thus to collect elements for a grammar (in fact both researches are very nearly related), even though we are not able to give a reason why each language has just this and no other formal constitution, and still less why any precise number of such formal determinations in general, neither more nor less, can be found in it.

Aristotle collected ten pure elementary concepts under the name of *categories*.^{*} To these, which are also called “predicaments,” he found himself obliged afterward to add five post-predicaments,^{**} some of which however (*prius*, *simul*, and *motus*) are contained in the former; but this rhapsody must be considered (and commended) as a mere hint for future inquirers, not as an idea developed according to rule; and hence it has, in the present more advanced state of philosophy, been rejected as quite useless.

After long reflection on the pure elements of human knowledge (those which contain nothing empirical), I at last succeeded in distinguishing with certainty and in separating the pure elementary notions of the sensibility (space and time) from those of the understanding. Thus the seventh, eighth, and ninth categories had to be excluded from the old list. And the others were of no service to me because there was no principle on which the understanding could be exhaustively investigated, and all the functions, whence its pure concepts arise, determined exhaustively and precisely.

But in order to discover such a principle, I looked about for an act of the understanding which comprises all the rest and is distinguished only by various modifications or phases, in reducing the multiplicity of representation to the unity of thinking in general. I found this act of the understanding to consist in judging. Here, then, the labors of the logicians were ready at hand, though not yet quite free from defects; and with this help I was enabled to exhibit a complete table of the pure functions of the

^{*}1. *Substantia*. 2. *Qualitas*. 3. *Quantitas*. 4. *Relatio*. 5. *Actio*. 6. *Passio*. 7. *Quando*. 8. *Ubi*. 9. *Situs*. 10. *Habitus*.

^{**}*Oppositum*. *Prius*. *Simul*. *Motus*. *Habere*.

understanding, which are however undetermined with respect to any object. I finally referred these functions of judging to objects in general, or rather to the condition of determining judgments as objectively valid; and so there arose the pure concepts of the understanding, concerning which I could make certain that these, and this exact number only, constitute our whole knowledge of things by pure understanding. I was justified in calling them by their old name "categories," while I reserved for myself the liberty of adding, under the title of "predicables," a complete list of all the concepts deducible from them by combinations, whether among themselves, or with the pure form of the appearance, that is, space or time, or with its matter, so far as it is not yet empirically determined (namely, the object of sensation in general), as soon as a system of transcendental philosophy should be completed, with the construction of which I was engaged in the *Critique of Pure Reason* itself. 324

Now the essential point in this system of categories, which distinguishes it from the old rhapsody which proceeded without any principle and for which alone it deserves to be considered as philosophy, consists in this: that, by means of it, the true significance of the pure concepts of the understanding and the condition of their use could be precisely determined. For here it became obvious that they are themselves nothing but logical functions, and as such do not produce the least concept of an object, but require sensuous intuition as a basis. These concepts, therefore, only serve to determine empirical judgments (which are otherwise undetermined and indifferent as regards all functions of judging) with respect to the functions of judging, thereby procuring them universal validity and, by means of them, making judgments of experience in general possible.

Such an insight into the nature of the categories, which limits them at the same time to use merely in experience, never occurred either to their first author or to any of his successors; but without this insight (which immediately depends upon their derivation or deduction), they are quite useless and only a miserable list of names, without explanation or rule for their use. Had the ancients ever conceived such a notion, doubtless the whole study of pure rational knowledge, which under the name of metaphysics has for centuries spoiled many a sound mind, would have reached us in quite another shape and would have enlightened the human understanding, instead of actually exhausting it in obscure and vain speculations and rendering it unfit for true science. 325

This system of categories makes all treatment of every object of pure reason itself systematic, and affords a direction or clue how and through what points of inquiry every metaphysical consideration must proceed in order to be complete; for it exhausts all the possible functions of the understanding, among which every concept must be classed. In like manner the table of principles has been formulated, the completeness of which we can only vouch for by the system of the categories. Even in the division of the concepts,* which must go beyond the physical application of the understanding, it is always the very same clue, which, as it must always be determined *a priori* by the same fixed points of the human understanding, always forms a closed circle. There is no doubt that the object of a pure concept, either of the understanding or of reason, so far as it is to be estimated philosophically and on *a priori* principles, can in this way be completely known. I could not therefore omit to make use of this clue with regard to one of the most abstract ontological divisions, namely, the various distinctions of the

*Cf. the tables in the *Critique of Pure Reason* in the chapters on "The Paralogisms of Pure Reason" and the "System of Cosmological Ideas."

concepts of something and of nothing, and to construct accordingly* a systematic and necessary table of their divisions.**

326 And this system, like every other true one founded on a universal principle, shows its inestimable value in that it excludes all foreign concepts which might otherwise intrude among the pure concepts of the understanding, and determines the place of every cognition. Those concepts, which under the name of “concepts of reflection” have been likewise arranged in a table according to the clue of the categories, intrude into ontology without any privilege or just claim to be among the pure concepts of the understanding. The latter are concepts of connection, and thereby of the objects themselves, whereas the former are only concepts of mere comparison of concepts already given, and hence are of quite another nature and use. By my systematic division*** they are saved from this confusion. But the value of the special table of the categories will be still more obvious when we separate—as we are about to do—the table of the transcendental concepts of reason from the concepts of the understanding. As the transcendental concepts of reason are of an entirely different nature and origin, the table of them must have quite another form than the table of categories. This so necessary separation has never yet been made in any system of metaphysics, where, as a rule, these Ideas of reason are all mixed up with the concepts of the understanding, as if they were children of the same family—a confusion which was unavoidable in the absence of a definite system of categories.

327 THIRD PART OF THE MAIN TRANSCENDENTAL PROBLEM

HOW IS METAPHYSICS IN GENERAL POSSIBLE?

§ 40. Pure mathematics and pure science of nature had, for their own safety and certainty, no need for such a deduction as we have made of both. For the former rests upon its own evidence, and the latter (though sprung from pure sources of the understanding) upon experience and its thorough confirmation. The pure science of nature cannot altogether refuse and dispense with the testimony of experience; because with all its certainty it can never, as philosophy, rival mathematics. Both sciences, therefore, stood in need of this inquiry, not for themselves, but for the sake of another science: metaphysics.

*In the chapter on “The Amphiboly of the Concepts of Reflection,” in the *Critique of Pure Reason*.

**On the table of the categories many neat observations may be made, for instance: (1) that the third arises from the first and the second, joined in one concept; (2) that in those of quantity and of quality there is merely a progress from unity to totality or from something to nothing (for this purpose the categories of quality must stand thus: reality, limitation, total negation), without *correlata* or *opposita*, whereas those of relation and of modality have them; (3) that, as in logic categorical judgments are the basis of all others, so the category of substance is the basis of all concepts of actual things; (4) that, as modality in the judgment is not a particular predicate, so by the modal concepts a determination is not superadded to things, etc. Such observations are of great use. If we enumerate all the predicables, which we can find pretty completely in any good ontology (for example, Baumgarten’s), and arrange them in classes under the categories, in which operation we must not neglect to add as complete a dissection of all these concepts as possible, there will then arise a merely analytical part of metaphysics which does not contain a single synthetical proposition, which might precede the second (the synthetical) and would, by its precision and completeness, be not only useful but, in virtue of its system, be even to some extent elegant.

***See *Critique of Pure Reason*, “The Amphiboly of the Concepts of Reflection.”

Metaphysics has to do not only with concepts of nature, which always find their application in experience, but also with pure rational concepts, which never can be given in any possible experience whatever. Consequently it deals with concepts whose objective reality (namely, that they are not mere chimeras) and with assertions whose truth or falsity cannot be discovered or confirmed by any experience. This part of metaphysics, however, is precisely what constitutes its essential end, to which the rest is only a means, and thus this science is in need of such a deduction for its own sake. The third question now proposed relates therefore as it were to the root and peculiarity of metaphysics, that is, the occupation of reason merely with itself and the supposed knowledge of objects arising immediately from this brooding over its own concepts, without requiring, or indeed being able to reach that knowledge through, experience.*

Without solving this problem, reason can never satisfy itself. The empirical use to which reason limits the pure understanding does not fully satisfy the proper calling of reason. Every single experience is only a part of the whole sphere of its domain, but the absolute totality of all possible experience is itself not experience. Yet it is a necessary problem for reason, the mere representation of which requires concepts quite different from the pure concepts of the understanding, whose use is only *immanent*, or refers to experience, so far as it can be given. Whereas the concepts of reason aim at the completeness, that is, the collective unity of all possible experience, and thereby transcend every given experience. Thus they become *transcendent*. 328

As the understanding stands in need of categories for experience, reason contains in itself the source of Ideas, by which I mean necessary concepts whose object *cannot* be given in any experience. The latter are inherent in the nature of reason, as the former are in that of the understanding. While the former carry with them an illusion likely to mislead, the illusion of the latter is inevitable, though it certainly can be kept from misleading us.

Since all illusion consists in holding the subjective ground of our judgments to be objective, a self-knowledge of pure reason in its transcendent (presumptuous) use is the sole preservative from the aberrations into which reason falls when it mistakes its calling and transcendentally refers to the object that which concerns only its own subject and its guidance in all immanent use.

§ 41. The distinction of Ideas—that is, of pure concepts of reason—from categories, or pure concepts of the understanding, as cognitions of a quite distinct species, origin, and use, is so important a point in founding a science which is to contain the system of all these *a priori* cognitions that, without this distinction, metaphysics is absolutely impossible or is at best a random, bungling attempt to build a castle in the air without a knowledge of the materials or of their fitness for this or any purpose. Had the *Critique of Pure Reason* done nothing but first point out this distinction, it would thereby have contributed more to clear up our conception of, and to guide our inquiry in, the field of metaphysics than all the vain efforts which had hitherto been made to satisfy the transcendent problems of pure reason, but which had never surmised that we were in quite another field than that of the understanding, and hence classed concepts of the understanding and those of reason together as if they were of the same kind. 329

§ 42. All pure cognitions of the understanding have this feature that their concepts present themselves in experience, and their principles can be confirmed by it; whereas

*If we can say that a science is actual, at least in the idea of all men, as soon as it appears that the problems which lead to it are proposed to everybody by the nature of human reason, and that therefore many (though faulty) endeavors are unavoidably made in its behalf, then we are bound to say that metaphysics is subjectively (and indeed necessarily) actual, and therefore, we justly ask, how is it (objectively) possible.

the transcendent cognitions of reason cannot either, as Ideas, appear in experience or, as propositions, ever be confirmed or refuted by it. Hence whatever errors may slip in unawares can only be discovered by pure reason itself—a discovery of much difficulty, because this very reason naturally becomes dialectical by means of its Ideas; and this unavoidable illusion cannot be limited by any objective and dogmatic researches into things, but only by a subjective investigation of reason itself as a source of ideas.

§ 43. In the *Critique of Pure Reason* it was always my greatest care to endeavor, not only carefully to distinguish the several species of knowledge, but to derive concepts belonging to each one of them from their common source. I did this in order that, by knowing whence they originated, I might determine their use with safety and also have the unanticipated but invaluable advantage of knowing, according to principles, the completeness of my enumeration, classification, and specification of concepts *a priori*.
 330 Without this, metaphysics is mere rhapsody, in which no one knows whether he has enough or whether and where something is still wanting. We can indeed have this advantage only in pure philosophy, but of this philosophy it constitutes the very essence.

As I had found the origin of the categories in the four logical forms of all the judgments of the understanding, it was quite natural to seek the origin of the Ideas in the three forms of syllogisms. For as soon as these pure concepts of reason (the transcendental Ideas) are given, they could hardly, except they be held innate, be found anywhere else than in the same activity of reason, which, so far as it regards mere form, constitutes the logical element of syllogisms; but, so far as it represents judgments of the understanding as determined *a priori* with respect to one or another form, constitutes transcendental concepts of pure reason.

The formal distinction of syllogisms renders necessary their division into categorical, hypothetical, and disjunctive. The concepts of reason founded on them contain therefore, first, the Idea of the complete subject (the substantial); secondly, the Idea of the complete series of conditions; thirdly, the determination of all concepts in the Idea of a complete complex of that which is possible.* The first idea is psychological, the second cosmological, the third theological; and, as all three give occasion to dialectic, yet each in its own way, the division of the whole dialectic of pure reason into its paralogism, its antinomy, and its Ideal was arranged accordingly. Through this deduction we may feel assured that all the claims of pure reason are completely represented and that none can be wanting, because the faculty of reason itself, whence they all take their origin, is thereby completely surveyed.

331 § 44. In these general considerations it is also remarkable that the Ideas of reason, unlike the categories, are of no service to the use of our understanding in experience, but quite dispensable, and become even an impediment to the maxims of a rational knowledge of nature. Yet in another aspect still to be determined they are necessary. Whether the soul is or is not a simple substance is of no consequence to us in the explanation of its phenomena. For we cannot render the concept of a simple being sensuous and thus concretely intelligible by any possible experience. The concept is therefore

*In disjunctive judgments, we consider all possibility as divided in respect to a particular concept. By the ontological principle of the universal determination of a thing in general, I understand the principle that either the one or the other of all possible contradictory predicates must be assigned to any object. This is, at the same time, the principle of all disjunctive judgments, constituting the foundation of a complete whole of possibility, and in it the possibility of every object in general is considered as determined. This may serve as a slight explanation of the above propositions: that the activity of reason in disjunctive syllogisms is formally the same as that by which it fashions the idea of a complete whole of all reality, containing in itself that which is positive in all pairs of contradictory predicates.

quite void as regards all hoped-for insight into the cause of appearances and cannot at all serve as a principle of the explanation of that which inner or outer experience supplies. Similarly, the cosmological Ideas of the beginning of the world or of its eternity (*a parte ante*) cannot be of any service to us for the explanation of any event in the world itself. And finally we must, according to a right maxim of the philosophy of nature, refrain from explaining the design of nature as drawn from the will of a Supreme Being, because this would not be natural philosophy but a confession that we have come to the end of it. The use of these Ideas, therefore, is quite different from that of those categories by which (and by the principles built upon which) experience itself first becomes possible. But our laborious Analytic of the understanding would be superfluous if we had nothing else in view than the mere knowledge of nature as it can be given in experience; for reason does its work, both in mathematics and in the science of nature, quite safely and well without any of this subtle deduction. Therefore our critical examination of the understanding combines with the Ideas of pure reason for a purpose which lies beyond the empirical use of the understanding; but such an extended use of the understanding we have above declared to be totally inadmissible and without any object or meaning. Yet there must be a harmony between the nature of reason and that of the understanding, and the former must contribute to the perfection of the latter and cannot possibly upset it.

The solution of this question is as follows: Pure reason does not in its Ideas 332 point to particular objects which lie beyond the field of experience, but only requires completeness of the use of the understanding in the system of experience. But this completeness can be a completeness of principles only, not of intuitions and of objects. In order, however, to represent the Ideas definitely, reason conceives them after the fashion of the knowledge of an object. This knowledge is, as far as these rules are concerned, completely determined; but the object is only an Idea [invented for the purpose of] bringing the knowledge of the understanding as near as possible to the completeness indicated by that Idea.

PREFATORY REMARK TO THE DIALECTIC OF PURE REASON

§ 45. We have shown in §§ 33 and 34 that the purity of the categories from all admixture of sensuous restrictions may mislead reason into extending their use beyond all experience to things in themselves; for though these categories themselves find no intuition which can give them meaning or sense *in concreto*, they, as mere logical functions, can represent a thing in general, but not give by themselves alone a determinate concept of anything. Such hyperbolic objects are distinguished by the appellation of *noumena*, or pure beings of the understanding (or better, beings of thought)—such as, for example, “substance”—but conceived without permanence in time, or “cause,” but not acting in time, etc. Here predicates that only serve to make the conformity-to-law of experience possible are applied to these concepts, and yet they are deprived of all the conditions of intuition on which alone experience is possible, and so these concepts lose all significance.

There is no danger, however, of the understanding spontaneously making an excursion so very wantonly beyond its own bounds into the field of the mere beings of thought unless it is impelled by foreign laws. But when reason, which cannot be fully

satisfied with any empirical use of the rules of the understanding, as being always conditioned, requires a completion of this chain of conditions, then the understanding is forced out of its sphere. And then it partly represents objects of experience in a series so
 333 extended that no experience can grasp it; partly even (with a view to complete the series) it seeks entirely beyond it *noumena*, to which it can attach that chain; and so, having at last escaped from the conditions of experience, it makes its stand as it were final. These are then the transcendental Ideas, which, in accord with the true but hidden ends of the natural destiny of our reason, aim, not at extravagant concepts, but at an unbounded extension of their empirical use, yet seduce the understanding by an unavoidable illusion to a transcendent use, which, though deceitful, cannot be restrained within the bounds of experience by any resolution, but only by scientific instruction and with much difficulty.

I. THE PSYCHOLOGICAL IDEAS*

§ 46. People have long since observed that in all substances the subject proper, that which remains after all the accidents (as predicates) are abstracted, consequently the *substantial*, remains unknown, and various complaints have been made concerning these limits to our knowledge. But it will be well to consider that the human understanding is not to be blamed for its inability to know the substance of things—that is, to determine it by itself—but rather for demanding definitely to know substance, which is a mere Idea, as though it were a given object. Pure reason requires us to seek for every predicate of a thing its own subject, and for this subject, which is itself necessarily nothing but a predicate, its subject, and so on indefinitely (or as far as we can reach). But hence it follows that we must not hold anything at which we can arrive to be an ultimate subject, and that substance itself never can be thought by our understanding, however deep we may penetrate, even if all nature were unveiled to us. For the specific
 334 nature of our understanding consists in thinking everything discursively, that is, by concepts, and so by mere predicates, to which, therefore, the absolute subject must always be wanting. Hence all the real properties by which we know bodies are mere accidents—not excepting even impenetrability, which we can only represent to ourselves as the effect of a power of which the subject is unknown to us.

Now we appear to have this substance in the consciousness of ourselves (in the thinking subject), and indeed in an immediate intuition; for all the predicates of an internal sense refer to the *ego*, as a subject, and I cannot conceive myself as the predicate of any other subject. Hence completeness in the reference of the given concepts as predicates to a subject—not merely an Idea, but an object—that is, the absolute subject itself, seems to be given in experience. But this expectation is disappointed. For the *ego* is not a concept,** but only the indication of the object of the inner sense, so far as we know it by no further predicate. Consequently it cannot indeed be itself a predicate of any other thing; but just as little can it be a definite concept of an absolute subject, but is, as in all other cases, only the reference of the inner phenomena to their unknown subject. Yet this idea (which serves very well as a regulative principle totally to destroy

*See *Critique of Pure Reason*, “The Paralogisms of Pure Reason.”

**Were the representation of the apperception (the *Ego*) a concept, by which anything whatever could be thought, it could be used as a predicate of other things or contain predicates in itself. But it is nothing more than the feeling of an existence without the least concept and is only the representation of that to which all thinking stands in relation (*relatione accidentis*).

all materialistic explanations of the internal phenomena of the soul) occasions by a very natural misunderstanding a very specious argument, which infers its nature from this supposed knowledge of the substance of our thinking being. This is specious so far as the knowledge of it falls quite without the complex of experience.

§ 47. But though we may call this thinking self (the soul) “substance,” as being the ultimate subject of thinking which cannot be further represented as the predicate of another thing, it remains quite empty and without significance if permanence—the quality which renders the concept of substances in experience fruitful—cannot be proved of it.

But permanence can never be proved of the concept of a substance as a thing in itself, but for the purposes of experience only. This is sufficiently shown by the first Analogy of Experience,* and whoever will not yield to this proof may try for himself whether he can succeed in proving, from the concept of a subject which does not exist itself as the predicate of another thing, that its existence is absolutely permanent and that it cannot either in itself or by any natural cause originate or be annihilated. These synthetical *a priori* propositions can never be proved in themselves, but only in reference to things as objects of possible experience. 335

§ 48. If, therefore, from the concept of the soul as a substance we would infer its permanence, this can hold good as regards possible experience only, not of the soul as a thing in itself and beyond all possible experience. Life is the subjective condition of all our possible experience; consequently we can only infer the permanence of the soul in life, for the death of a man is the end of all experience which concerns the soul as an object of experience, except the contrary be proved—which is the very question in hand. The permanence of the soul can therefore only be proved (and no one cares to do that) during the life of man, but not, as we desire to do, after death. The reason for this is that the concept of substance, so far as it is to be considered necessarily combined with the concept of permanence, can be so combined only according to the principles of possible experience, and therefore for the purposes of experience only.**

§ 49. That there is something real outside us which not only corresponds but must correspond to our outer perceptions can likewise be proved to be, not a connection of things in themselves, but for the sake of experience. This means that there is something empirical, that is, some appearance in space without us, that admits of a satisfactory proof; for we have nothing to do with other objects than those which belong to possible experience, because objects which cannot be given us in any experience are nothing for us. Empirically outside me is that which is intuited in space; and space, together with all 336

*In the *Critique of Pure Reason*.

**It is indeed very remarkable how carelessly metaphysicians have always passed over the principle of the permanence of substances without ever attempting a proof of it; doubtless because they found themselves abandoned by all proofs as soon as they began to deal with the concept of substance. Common sense, which felt distinctly that without this presupposition no union of perceptions in experience is possible, supplied the want by a postulate. From experience itself it never could derive such a principle, partly because material things (substances) cannot be so traced in all their alterations and dissolutions that the matter can always be found undiminished, partly because the principle contains *necessity*, which is always the sign of an *a priori* principle. People then boldly applied this postulate to the concept of soul as a *substance*, and concluded a necessary continuance of the soul after the death of man (especially as the simplicity of this substance, which is inferred from the indivisibility of consciousness, secured it from destruction by dissolution). Had they found the genuine source of this principle—a discovery which requires deeper researches than they were ever inclined to make—they would have seen that the law of the permanence of substances arises for the purposes of experience only, and hence can hold good of things so far as they are to be known and conjoined with others in experience, but never independently of all possible experience, and consequently cannot hold good of the soul after death.

the appearances it contains, belongs to the representations whose connection, according to laws of experience, proves their objective truth, just as the connection of the appearances of the inner sense proves the actuality of my soul (as an object of the inner sense). By means of outer experience I am conscious of the actuality of bodies as external appearances in space, in the same manner as by means of the inner experience I am conscious of the existence of my soul in time; but this soul is known only as an object of the inner sense by appearances that constitute an inner state and of which the being in itself, which forms the basis of these appearances, is unknown. Cartesian idealism therefore does nothing but distinguish outer experience from a dream and the conformity to law (as a criterion of its truth) of the former from the irregularity and false illusion of the latter. In both it presupposes space and time as conditions of the existence of objects, and it only inquires whether the objects of the outer senses which we, when awake, put in space, are as actually to be found in it as the object of the internal sense, the soul, is in time; that is, whether experience carries with it sure criteria to distinguish it from imagination. This doubt, however, may easily be disposed of, and we always do so in common life by investigating the connection of appearances in both space and time according to universal laws of experience, and we cannot doubt, when the representation of external things throughout agrees therewith that they constitute truthful experience. Material idealism, in which appearances are considered as such only according to their connection in experience may accordingly be very easily refuted; and it is just as sure an experience that bodies exist outside us (in space) as that I myself exist according to the representation of the inner sense (in time), for the concept "outside us" only signifies existence in space. However, as the Ego in the proposition "I am" means not only the object of inner intuition (in time) but the subject of consciousness, just as body means not only outer intuition (in space) but the thing in itself which is the basis of this appearance, then the question whether bodies (as appearances of the outer sense) exist as bodies in nature apart from my thoughts may without any hesitation be denied. But the question whether I myself as an appearance of the inner sense (the soul according to empirical psychology) exist apart from my faculty of representation in time is an exactly similar one and must likewise be answered in the negative. And in this manner everything, when it is reduced to its true meaning, is decided and certain. The formal (which I have also called "transcendental") actually abolishes the material, or Cartesian, idealism. For if space be nothing but a form of my sensibility, it is as a representation in me just as actual as I myself am, and nothing but the empirical truth of the appearances in it remains for consideration. But if this is not the case, if space and the appearances in it are something existing outside us, then all the criteria of experience besides our perception can never prove the actuality of these objects outside us.

338

II. THE COSMOLOGICAL IDEAS*

§ 50. This product of pure reason in its transcendent use is its most remarkable phenomenon. It serves as a very powerful agent to rouse philosophy from its dogmatic slumber and to stimulate it to the arduous task of undertaking a critical examination of reason itself.

I term this Idea cosmological because it always takes its object only in the sensible world and does not need any other world than one whose object is given to sense; consequently it remains in this respect in its native home, does not become transcendent, and is therefore so far not an Idea; whereas to conceive the soul as a simple

*Cf. *Critique of Pure Reason*, "The Antinomy of Pure Reason."

substance, on the contrary, means to conceive such an object (the simple) as cannot be presented to the senses. Yet, in spite of this, the cosmological idea extends the connection of the conditioned with its condition (whether this is mathematical or dynamical) so far that experience never can keep up with it. It is therefore with regard to this point always an Idea, whose object never can be adequately given in any experience.

§ 51. In the first place, the use of a system of categories becomes here so obvious and unmistakable that, even if there were not several other proofs of it, this alone would sufficiently prove it indispensable in the system of pure reason. There are only four such transcendent Ideas, as many as there are classes of categories; in each of which, however, they refer only to the absolute completeness of the series of the conditions for a given conditioned. In accordance with these cosmological Ideas, there are only four kinds of dialectical assertions of pure reason, which, being dialectical, prove that to each of them, on equally specious principles of pure reason, a contradictory assertion stands opposed. As all the metaphysical art of the most subtle distinction cannot prevent this opposition, it compels the philosopher to recur to the first sources of pure reason itself. This antinomy, not arbitrarily invented but founded in the nature of human reason, and hence unavoidable and never ceasing, contains the following four theses together with their antitheses:

339

1

Thesis

The world has, as to time and space, a beginning (limit).

Antithesis

The world is, as to time and space, infinite.

2

Thesis

Everything in the world consists of [elements that are] simple.

Antithesis

There is nothing simple, but everything is composite.

3

Thesis

There are in the world causes through freedom.

Antithesis

There is no freedom, but all is nature.

4

Thesis

In the series of the world-causes there is some necessary being.

Antithesis

There is nothing necessary in the world, but in this series all is contingent.

§ 52a. Here is the most singular phenomenon of human reason, no other instance of which can be shown in any other use of reason. If we, as is commonly done, represent to ourselves the appearances of the sensible world as things in themselves, if we assume the principles of their combination as principles universally valid of things in themselves and not merely of experience, as is usually, nay, without our *Critique* unavoidably, done,

there arises an unexpected conflict which never can be removed in the common dogmatic way; because the thesis, as well as the antithesis, can be shown by equally clear, evident, and irresistible proofs—for I pledge myself as to the correctness of all these proofs—and reason therefore perceives that it is divided against itself, a state at which the skeptic rejoices, but which must make the critical philosopher pause and feel ill at ease.

340 § 52b. We may blunder in various ways in metaphysics without any fear of being detected in falsehood. If we but avoid self-contradiction, which in synthetical though purely fictitious propositions is quite possible, then whenever the concepts which we connect are mere Ideas that cannot be given (with respect to their whole content) in experience, we cannot be refuted by experience. For how can we make out by experience whether the world is from eternity or had a beginning, whether matter is infinitely divisible or consists of simple parts? Such concepts cannot be given in any experience, however extensive, and consequently the falsehood either of the affirmative or the negative proposition cannot be discovered by this touchstone.

The only possible way in which reason could have revealed unintentionally its secret dialectic, falsely announced as its dogmatics, would be when it were made to ground an assertion upon a universally admitted principle and to deduce the exact contrary with the greatest accuracy of inference from another which is equally granted. This is actually here the case with regard to four natural Ideas of reason, whence four assertions on the one side and as many counterassertions on the other arise, each consistently following from universally acknowledged principles. Thus they reveal, by the use of these principles, the dialectical illusion of pure reason, which would otherwise forever remain concealed.

341 This is therefore a decisive experiment, which must necessarily expose any error lying hidden in the assumptions of reason.* Contradictory propositions cannot both be false, except the concept on which each is founded is self-contradictory; for example, the propositions, “A square circle is round,” and “A square circle is not round,” are both false. For, as to the former, it is false that the circle is round because it is quadrangular; and it is likewise false that it is not round, that is, angular, because it is a circle. For the logical criterion of the impossibility of a concept consists in this that, if we presuppose it, two contradictory propositions both become false; consequently, as no middle between them is conceivable, nothing at all is thought by that concept.

§ 52c. The first two antinomies, which I call mathematical because they are concerned with the addition or division of the homogeneous, are founded on such a contradictory concept; and hence I explain how it happens that both the thesis and antithesis of the two are false.

342 When I speak of objects in time and in space, it is not of things in themselves, of which I know nothing, but of things in appearance, that is, of experience, as the particular way of knowing objects which is afforded to man. I must not say of what I think in time or in space, that in itself, and independent of these my thoughts, it exists in space and in time, for in that case I should contradict myself; because space and time, together with the appearances in them, are nothing existing in themselves and outside of my representations, but are themselves only modes of representation, and it is palpably contradictory to say that a mere mode of representation exists without our representation.

*I therefore would be pleased to have the critical reader to devote to this antinomy of pure reason his chief attention, because nature itself seems to have established it with a view to stagger reason in its daring pretensions and to force it to self-examination. For every proof which I have given of both thesis and antithesis I undertake to be responsible, and thereby to show the certainty of the inevitable antinomy of reason. When the reader is brought by this curious phenomenon to fall back upon the proof of the presumption upon which it rests, he will feel himself obliged to investigate the ultimate foundation of all knowledge by pure reason with me more thoroughly.

Objects of the senses therefore exist only in experience, whereas to give them a self-subsisting existence apart from experience or before it is merely to represent to ourselves that experience actually exists apart from experience or before it.

Now if I inquire into the magnitude of the world, as to space and time, it is equally impossible, as regards all my concepts, to declare it infinite or to declare it finite. For neither assertion can be contained in experience, because experience either of an infinite space or of an infinite elapsed time, or again, of the boundary of the world by a void space or by an antecedent void time, is impossible; these are mere Ideas. The magnitude of the world, decided either way, would therefore have to exist in the world itself apart from all experience. But this contradicts the concept of a world of sense, which is merely a complex of the appearances whose existence and connection occur only in our representations, that is, in experience; since this latter is not an object in itself but a mere mode of representation. Hence it follows that, as the concept of an absolutely existing world of sense is self-contradictory, the solution of the problem concerning its magnitude, whether attempted affirmatively or negatively, is always false.

The same holds of the second antinomy, which relates to the division of appearances. For these are mere representations; and the parts exist merely in their representation, consequently in the division—that is, in a possible experience in which they are given—and the division reaches only as far as the possible experience reaches. To assume that an appearance, for example, that of body, contains in itself before all experience all the parts which any possible experience can ever reach is to impute to a mere appearance, which can exist only in experience, an existence previous to experience. In other words, it would mean that mere representations exist before they can be found in our faculty of representation. Such an assertion is self-contradictory, as also every solution of our misunderstood problem, whether we maintain that bodies in themselves consist of an infinite number of parts or of a finite number of simple parts.

§ 53. In the first (the mathematical) class of antinomies the falsehood of the presupposition consists in representing in one concept something self-contradictory as if it were compatible (that is, an appearance as a thing in itself). But, as to the second (the dynamical) class of antinomies, the falsehood of the presupposition consists in representing as contradictory what is compatible; so that while in the former case the opposed assertions were both false, in this case, on the other hand, where they are opposed to one another by mere misunderstanding, they may both be true. 343

Any mathematical connection necessarily presupposes homogeneity of what is connected (in the concept of magnitude), while the dynamical one by no means requires this. When we have to deal with extended magnitudes all the parts must be homogeneous with one another and with the whole, whereas in the connection of cause and effect homogeneity may indeed likewise be found but is not necessary; for the concept of causality (by means of which something is posited through something else quite different from it) does not in the least require it.

If the objects of the world of sense are taken for things in themselves and the above laws of nature for laws of things in themselves, the contradiction would be unavoidable. So also, if the subject of freedom were, like other objects, represented as mere appearance, the contradiction would be just as unavoidable; for the same predicate would at once be affirmed and denied of the same kind of object in the same sense. But if natural necessity is referred merely to appearances and freedom merely to things in themselves, no contradiction arises if we at the same time assume or admit both kinds of causality, however difficult or impossible it may be to make the latter kind conceivable.

In appearance every effect is an event, or something that happens in time; it must, according to the universal law of nature, be preceded by a determination of the causal

act of its cause—this determination being a state of the cause—which it follows according to a constant law. But this determination of the cause to a causal act must likewise be something that takes place or happens; the cause must have begun to act, otherwise
 344 no succession between it and the effect could be conceived. Otherwise the effect, as well as the causal act of the cause, would have always existed. Therefore the determination of the cause to act must also have originated among appearances and must consequently, like its effect, be an event, which must again have its cause, and so on; hence natural necessity must be the condition on which efficient causes are determined. Whereas if freedom is to be a property of certain causes of appearances, it must, as regards these, which are events, be a faculty of starting them spontaneously. That is, it would not require that the causal act of the cause should itself begin [in time], and hence it would not require any other ground to determine its start. But then the cause, as to its causal act, could not rank under time-determinations of its state; that is, it could not be an appearance, but would have to be considered a thing in itself, while only its effects would be appearances.* If without contradiction we can think of the beings of understanding as exercising such an influence on appearances, then natural necessity will attach to all connections of cause and effect in the sensuous world; though, on the other hand, freedom can be granted to the cause which is itself not an appearance (but the foundation of appearance). Nature and freedom therefore can without contradiction be attributed to the very same thing, but in different relations—on one side as an appearance, on the other as a thing in itself.

We have in us a faculty which not only stands in connection with its subjective
 345 determining grounds [motives] which are the natural causes of its actions and is so far the faculty of a being that itself belongs to appearances, but is also related to objective grounds which are only Ideas so far as they can determine this faculty. This connection is expressed by the word *ought*. This faculty is called “reason,” and, so far as we consider a being (man) entirely according to this objectively determinable reason, he cannot be considered as a being of sense; this property is a property of a thing in itself, a property whose possibility we cannot comprehend. I mean we cannot comprehend how the *ought* should determine (even if it never has actually determined) its activity and could become the cause of actions whose effect is an appearance in the sensible world. Yet the causality of reason would be freedom with regard to the effects in the sensuous world, so far as we can consider *objective grounds*, which are themselves Ideas, as their determinants. For its action in that case would not depend upon subjective conditions, consequently not upon those of time, and of course not upon the law of nature which serves to determine them, because grounds of reason give the rule universally to actions, according to principles, without influence of the circumstances of either time or place.

*The Idea of freedom occurs only in the relation of the intellectual, as cause, to the appearance, as effect. Hence we cannot attribute freedom to matter in regard to the incessant action by which it fills its space, though this action takes place from an internal principle. We can likewise find no notion of freedom suitable to purely rational beings, for instance, to God, so far as his action is immanent. For his action, though independent of external determining causes, is determined in his eternal reason, that is, in the divine *nature*. It is only if *something is to start* by an action, and so the effect occurs in the sequence of time, or in the world of sense (for example, the beginning of the world), that we can put the question whether the causal act of the cause must in its turn have been started or whether the cause can originate an effect without its causal act itself beginning. In the former case, the concept of this activity is a concept of natural necessity; in the latter, that of freedom. From this the reader will see that as I explained freedom to be the faculty of starting an event spontaneously, I have exactly hit the concept which is the problem of metaphysics.

What I adduce here is merely meant as an example to make the thing intelligible and does not necessarily belong to our problem, which must be decided from mere concepts independently of the properties which we meet in the actual world.

Now I may say without contradiction that all the actions of rational beings, so far as they are appearances (met with in any experience), are subject to the necessity of nature, but the very same actions, as regards merely the rational subject and its faculty of acting according to mere reason, are free. For what is required for the necessity of nature? Nothing more than the determinability of every event in the world of sense according to constant laws, that is, a reference to cause in the [world of] appearance; in this process the thing in itself at its foundation and its causality remain unknown. But, I say, the law of nature remains, whether the rational being is the cause of the effects in the sensuous world from reason—that is, through freedom—or whether it does not determine them on grounds of reason. For if the former is the case, the action is performed according to maxims, the effect of which as appearance is always conformable to constant laws; if the latter is the case, and the action not performed on principles of reason, it is subjected to the empirical laws of the sensibility, and in both cases the effects are connected according to constant laws; more than this we do not require or know concerning natural necessity. But in the former case reason is the cause of these laws of nature, and therefore free; in the latter, the effects follow according to mere natural laws of sensibility, because reason does not influence it. But reason itself is not determined on that account by the sensibility (which is impossible) and is therefore free in this case too. Freedom is therefore no hindrance to natural law in appearances; neither does this law abrogate the freedom of the practical use of reason, which is connected with things in themselves, as determining grounds.

346

Thus practical freedom, namely, the freedom in which reason possesses causality according to objectively determining grounds, is rescued; and yet natural necessity is not in the least curtailed with regard to the very same effects, as appearances. The same remarks will serve to explain what we had to say concerning transcendental freedom and its compatibility with natural necessity in the same subject, but not taken in the same context. For, as to this, every beginning of the action of a being from objective causes regarded as determining grounds is always a *first beginning*, though the same action is in the series of appearances only a *subordinate beginning*, which must be preceded by a state of the cause which determines it and is itself determined in the same manner by another immediately preceding. Thus we are able, in rational beings, or in beings generally so far as their causality is determined in them as things in themselves, to think of a faculty of beginning from themselves a series of states without falling into contradiction with the laws of nature. For the relation of the action to objective grounds of reason is not a time relation; in this case that which determines the causality does not precede in time the action, because such determining grounds represent, not a reference to objects of sense, for example, to causes in the appearances, but to determining causes as things in themselves, which do not fall under conditions of time. And in this way the action, with regard to the causality of reason, can be considered as a first beginning, while in respect to the series of appearances as merely a subordinate beginning. We may therefore without contradiction consider it in the former aspect as free, but in the latter (as it is merely appearance) as subject to natural necessity.

347

As to the fourth antinomy, it is solved in the same way as the conflict of reason with itself in the third. For, provided the cause *in* the appearance is distinguished from the cause *of* the appearances (so far as it can be thought as a thing in itself), both propositions are perfectly reconcilable: the one, that there is nowhere in the sensuous world a cause (according to similar laws of causality) whose existence is absolutely necessary; the other,

that this world is nevertheless connected with a necessary being as its cause (but of another kind and according to another law). The incompatibility of these propositions rests entirely upon the mistake of extending what is valid merely of appearances to things in themselves and in confusing both in one concept.

§ 54. This, then, is the exposition, and this the solution of the whole antinomy in which reason finds itself involved in the application of its principles to the sensible world. The former alone (the mere exposition) would be a considerable service in the cause of our knowledge of human reason, even though the solution might fail fully to satisfy the reader, who has here to combat a natural illusion which has been but recently exposed to him and which he had hitherto always regarded as genuine. For one result at least is unavoidable. As it is quite impossible to prevent this conflict of reason with itself—so long as the objects of the sensible world are taken for things in themselves and not for mere appearances, which they are in fact—the reader is thereby compelled to examine over again the deduction of all our *a priori* knowledge and the proof which I have given of my deduction in order to come to a decision on the question. This is all I require at present; for when in this occupation he shall have thought himself deep enough into the nature of pure reason, those concepts by which alone the solution of the conflict of reason is possible will become sufficiently familiar to him. Without this preparation, I cannot expect an unreserved assent even from the most attentive reader.

III. THE THEOLOGICAL IDEA*

§ 55. The third transcendental Idea, which affords matter for the most important but (if pursued only speculatively) transcendent and thereby dialectical use of reason, is the Ideal of pure reason. Reason in this case does not, as with the psychological and the cosmological Ideas, begin from experience and err by exaggerating its grounds in striving to attain, if possible, the absolute completeness of their series. Rather, it totally breaks with experience and from mere concepts of what constitutes the absolute completeness of a thing in general; and thus, by means of the Idea of a most perfect primal Being, it proceeds to determine the possibility and therefore the actuality of all other things. And so the mere presupposition of a Being conceived, not in the series of experience yet for the purposes of experience, for the sake of comprehending its connection, order, and unity—in a word, the Idea—is more easily distinguished from the concept of the understanding here than in the former cases. Hence we can easily expose the dialectical illusion which arises from our making the subjective conditions of our thinking objective conditions of objects themselves, and from making an hypothesis necessary for the satisfaction of our reason into a dogma. As the observations of the *Critique* on the pretensions of transcendental theology are intelligible, clear, and decisive, I have nothing more to add on the subject.

General Remark on the Transcendental Ideas

§ 56. The objects which are given us by experience are in many respects incomprehensible, and many questions to which the law of nature leads us when carried beyond a certain point (though still quite conformably to the laws of nature) admit of no answer. An example is the question: Why do material things attract one another? But if we entirely quit nature or, in pursuing its combinations, exceed all possible experience, and so enter the realm of mere Ideas, we cannot then say that the object is incomprehensible and

*Cf. *Critique of Pure Reason*, "The Transcendental Ideal."

that the nature of things proposes to us insoluble problems. For we are not then concerned with nature or even with given objects, but with mere concepts which have their origin solely in our reason, and with mere beings of thought; and all the problems that arise from our concepts of them must be solved, because of course reason can and must give a full account of its own procedure.* As the psychological, cosmological, and theological Ideas are nothing but pure concepts of reason which cannot be given in any experience, the questions which reason asks us about them are put to us, not by the objects, but by mere maxims of our reason for the sake of its own satisfaction. They must all be capable of satisfactory answers, which are given by showing that they are principles which bring our use of the understanding into thorough agreement, completeness, and synthetical unity, and that they thus hold good of experience only, but of experience as a whole.

Although an absolute whole of experience is impossible, the Idea of a whole of knowledge according to principles must impart to our knowledge a peculiar kind of unity, that of a system, without which it is nothing but piecework and cannot be used for proving the existence of a highest purpose (which can only be the general system of all purposes). I do not here refer only to the practical, but also to the highest purpose of the speculative use of reason. 350

The transcendental Ideas therefore express the peculiar vocation of reason as a principle of systematic unity in the use of the understanding. Yet if we assume this unity of the mode of knowledge to pertain to the object of knowledge, if we regard that which is merely *regulative* to be *constitutive*, and if we persuade ourselves that we can by means of these Ideas widen our knowledge transcendently or far beyond all possible experience, while it only serves to render experience within itself as nearly complete as possible, that is, to limit its progress by nothing that cannot belong to experience—if we do this, I say—we suffer from a mere misunderstanding in our estimate of the proper role of our reason and of its principles, and a dialectic arises which both confuses the empirical use of reason and sets reason at variance with itself.

CONCLUSION

ON THE DETERMINATION OF THE BOUNDS OF PURE REASON

§ 57. Having adduced the clearest arguments, it would be absurd for us to hope that we can know more of any object than belongs to the possible experience of it or lay claim to the least knowledge of anything not assumed to be an object of possible experience which would determine it according to the constitution it has in itself. For how could we

*Herr Platner, in his *Aphorismen*, acutely says (§§ 728, 729), "If reason be a criterion, no concept which is incomprehensible to human reason can be possible. Incomprehensibility has place in what is actual only. Here incomprehensibility arises from the insufficiency of the acquired ideas." It sounds paradoxical, but is otherwise not strange to say that in nature there is much that is incomprehensible (for example, the faculty of reproduction); but if we mount still higher and go even beyond nature, everything again becomes comprehensible. For we then quit entirely the objects which can be given us and occupy ourselves merely about Ideas, in which occupation we can easily comprehend the law that reason prescribes by them to the understanding for its use in experience, because the law is the reason's own production.

A drawing from Andreas Cellarius' *Harmonia Macrocosmica* (1661) with some of the greatest names of astronomy and cosmology, including (from left to right): Tycho Brahe (1546–1601), Ptolemy (fl. A.D. 130), St. Augustine (A.D. 354–430), Nicholas Copernicus (1473–1543), Galileo Galilei (with pointer) (1564–1642), and Andreas Cellarius (seated at right). (*Library of Congress*)

determine anything in this way, since time, space, and all the concepts of the understanding, and still more all the concepts formed by empirical intuition (perception) in the sensible world, have and can have no other use than to make experience possible? And if this condition is omitted from the pure concepts of the understanding, they do not determine any object and have no meaning whatever.

351 But it would be, on the other hand, a still greater absurdity if we conceded no things in themselves or set up our experience as the only possible mode of knowing things, our intuition of them in space and in time for the only possible intuition and our discursive understanding for the archetype of every possible understanding; for this would be to wish to have the principles of the possibility of experience considered universal conditions of things in themselves.

Our principles, which limit the use of reason to possible experience, might in this way become transcendent and the limits of our reason be set up as limits of the possibility of things in themselves (as Hume's *Dialogues* may illustrate) if a careful critique

did not guard the bounds of our reason with respect to its empirical use and set a limit to its pretensions. Skepticism originally arose from metaphysics and its anarchic dialectic. At first it might, merely to favor the empirical use of reason, announce everything that transcends this use as worthless and deceitful; but by and by, when it was perceived that the very same principles that are used in experience insensibly and apparently with the same right led still further than experience extends, then men began to doubt even the principles of experience. But here there is no danger, for common sense will doubtless always assert its rights. A certain confusion, however, arose in science, which cannot determine how far reason is to be trusted, and why only so far and no farther; and this confusion can only be cleared up and all future relapses obviated by a formal determination, on principle, of the boundary of the use of our reason.

We cannot indeed, beyond all possible experience, form a definite concept of what things in themselves may be. Yet we are not at liberty to abstain entirely from inquiring into them; for experience never satisfies reason fully but, in answering questions, refers us further and further back and leaves us dissatisfied with regard to their complete solution. This anyone may gather from the dialectic of pure reason, which therefore has its good subjective grounds. Having acquired, as regards the nature of our soul, a clear conception of the subject, and having come to the conviction that its manifestations cannot be explained materialistically, who can refrain from asking what the soul really is and, if no concept of experience suffices for the purpose, from accounting for it by a concept of reason (that of a simple immaterial being), though we cannot by any means prove its objective reality? Who can satisfy himself with mere empirical knowledge in all the cosmological questions of the duration and of the magnitude of the world, of freedom or of natural necessity, since every answer given on principles of experience begets a fresh question, which likewise requires its answer and thereby clearly shows the insufficiency of all physical modes of explanation to satisfy reason? Finally, who does not see in the thoroughgoing contingency and dependence of all his thoughts and assumptions on mere principles of experience the impossibility of stopping there? And who does not feel himself compelled, notwithstanding all interdictions against losing himself in transcendent Ideas, to seek rest and contentment, beyond all the concepts which he can vindicate by experience, in the concept of a Being the possibility of the Idea of which cannot be conceived but at the same time cannot be refuted, because it relates to a mere being of the understanding and without it reason must needs remain forever dissatisfied? 352

Bounds (in extended beings) always presuppose a space existing outside a certain definite place and inclosing it; limits do not require this, but are mere negations which affect a quantity so far as it is not absolutely complete. But our reason, as it were, sees in its surroundings a space for knowledge of things in themselves, though we can never have definite concepts of them and are limited to appearances only.

As long as the knowledge of reason is homogeneous, definite bounds to it are inconceivable. In mathematics and in natural philosophy, human reason admits of limits but not of bounds, namely, it admits that something indeed lies without it, at which it can never arrive, but not that it will at any point find completion in its internal progress. The enlarging of our views in mathematics and the possibility of new discoveries are infinite; and the same is the case with the discovery of new properties of nature, of new powers and laws, by continued experience and its rational combination. But limits cannot be mistaken here, for mathematics refers to appearances only, and what cannot be an object of sensuous intuition, such as the concepts of metaphysics and of morals, lies entirely without its sphere; it can never lead to them, but neither does it require 353

them. There is, therefore, not a continual progress and approximation towards these sciences, and there is not, as it were, any point or line of contact. Natural science will never reveal to us the internal constitution of things, which, though not appearance, yet can serve as the ultimate ground for explaining appearances. Nor does that science require this for its physical explanations. Nay, even if such grounds should be offered from other sources (for instance, the influence of immaterial beings), they must be rejected and not used in the progress of its explanations. For these explanations must only be grounded upon that which as an object of sense can belong to experience, and be brought into connection with our actual perceptions and empirical laws.

But metaphysics leads us towards bounds in the dialectical attempts of pure reason (not undertaken arbitrarily or wantonly, but stimulated thereto by the nature of reason itself). And the transcendental Ideas, as they do not admit of evasion but are never capable of realization, serve to point out to us actually not only the bounds of the pure use of reason, but also the way to determine them. Such is the end and the use of this natural predisposition of our reason, which has brought forth metaphysics as its favorite child, whose generation, like every other in the world, is not to be ascribed to blind chance but to an original germ, wisely organized for great ends. For metaphysics, in its fundamental features, perhaps more than any other science, is placed in us by nature itself and cannot be considered the production of an arbitrary choice or a casual enlargement in the progress of experience from which it is quite disparate.

Reason through all its concepts and laws of the understanding which are sufficient to it for empirical use, that is, within the sensible world, finds in it no satisfaction, because ever-recurring questions deprive us of all hope of their complete solution. The transcendental Ideas which have that completion in view are such
 354 problems of reason. But it sees clearly that the sensuous world cannot contain this completion; neither, consequently, can all the concepts which serve merely for understanding the world of sense, for example, space and time, and what we have adduced under the name of pure concepts of the understanding. The sensuous world is nothing but a chain of appearances connected according to universal laws; it has therefore no subsistence by itself; it is not the thing in itself, and consequently must point to that which contains the basis of this appearance, to beings which cannot be known merely as appearances, but as things in themselves. In the knowledge of them alone can reason hope to satisfy its desire for completeness in proceeding from the conditioned to its conditions.

We have above (§§ 33 and 34) indicated the limits of reason with regard to all knowledge of mere beings of thought. Now, since the transcendental Ideas have made it necessary to approach them and thus have led us, as it were, to the spot where the occupied space (namely, experience) touches the void (that of which we can know nothing, namely, *noumena*), we can determine the bounds of pure reason. For in all bounds there is something positive (for example, a surface is the boundary of corporeal space, and is therefore itself a space; a line is a space, which is the boundary of the surface, a point the boundary of the line, but yet always a place in space), but limits contain mere negations. The limits pointed out in those paragraphs are not enough after we have discovered that beyond them there still lies something (though we can never know what it is in itself). For the question now is, What is the attitude of our reason in this connection of what we know with what we do not, and never shall, know? This is an actual connection of a known thing with one quite unknown (and which will always remain so), and though what is unknown should not become in the least more known—which we cannot even hope—yet the concept of this connection must be definite and capable of being rendered distinct.

We must therefore think an immaterial being, a world of understanding, and a Supreme Being (all mere *noumena*), because in them only, as things in themselves, reason finds that completion and satisfaction which it can never hope for in the derivation of appearances from their homogeneous grounds, and because these actually have reference to something distinct from them (and totally heterogeneous), as appearances always presuppose an object in itself and therefore suggest its existence whether we can know more of it or not. 355

But as we can never know these beings of understanding as they are in themselves, that is, as definite, yet must assume them as regards the sensible world and connect them with it by reason, we are at least able to think this connection by means of such concepts as express their relation to the world of sense. If we represent to ourselves a being of the understanding by nothing but pure concepts of the understanding, we then indeed represent nothing definite to ourselves, and consequently our concept has no significance; but if we think of it by properties borrowed from the sensuous world, it is no longer a being of understanding, but is conceived phenomenally and belongs to the sensible world. Let us take an instance from the notion of the Supreme Being.

The deistic conception is a quite pure concept of reason, but represents only a thing containing all reality, without being able to determine any one reality [in it]; because for that purpose an example must be taken from the world of sense, in which case I should have an object of sense only, not something quite heterogeneous which can never be an object of sense. Suppose I attribute to the Supreme Being understanding, for instance; I have no concept of an understanding other than my own, one that must receive its intuitions by the senses and which is occupied in bringing them under rules of the unity of consciousness. Then the elements of my concept would always lie in the appearance; I should, however, by the insufficiency of the appearance have to go beyond them to the concept of a being which neither depends upon appearances nor is bound up with them as conditions of its determination. But if I separate understanding from sensibility to obtain a pure understanding, then nothing remains but the mere form of thinking without intuition, by which form alone I can know nothing definite and consequently no object. For that purpose I should finally have to conceive another understanding, such as would intuit its objects but of which I have not the least concept, because the human understanding is discursive and can know only by means of general concepts. And the very same difficulties arise if we attribute a will to the Supreme Being, for I have this concept only by drawing it from my inner experience, and therefore from my dependence for satisfaction upon objects whose existence I require; and so the concept rests upon sensibility, which is absolutely incompatible with the pure concept of the Supreme Being. 356

Hume's objections to deism are weak, and affect only the proofs and not the deistic assertion itself. But as regards theism, which depends on a stricter determination of the concept of the Supreme Being, which in deism is merely transcendent, they are very strong and, as this concept is formed, in certain (in fact in all common) cases irrefutable. Hume always insists that by the mere concept of an original being to which we apply only ontological predicates (eternity, omnipresence, omnipotence) we think nothing definite, and that properties which could yield a concept *in concreto* would have to be superadded. He further insists that it is not enough to say it is cause, but we must explain the nature of its causality, for example, that it is that of an understanding and of a will. He then begins his attacks on the essential point itself, that is, theism, as he had previously directed his battery only against the proofs of deism, an attack which is not very dangerous to it in its consequences. All his dangerous arguments refer to anthropomorphism, which he holds to

be inseparable from theism and to make it contradictory in itself; but if the former be abandoned, the latter must vanish with it and nothing remain but deism, of which nothing can come, which is of no value and which cannot serve as any foundation to religion or morals. If this anthropomorphism were really unavoidable, no proofs whatever of the existence of a Supreme Being, even were they all granted, could determine for us the concept of this Being without involving us in contradictions.

If we connect with the command to avoid all transcendent judgments of pure reason the command (which apparently conflicts with it) to proceed to concepts that lie beyond the field of its immanent (empirical) use, we discover that both can subsist
 357 together, but only at the boundary of all permitted use of reason. For this boundary belongs to the field of experience as well as to that of the beings of thought, and we are thereby taught how these so remarkable Ideas serve merely for marking the bounds of human reason. On the one hand, they give warning not boundlessly to extend knowledge of experience, as if nothing but world remained for us to know, and yet, on the other hand, not to transgress the bounds of experience and to think of judging about things beyond them as things in themselves.

But we stop at this boundary if we limit our judgment merely to the relation which the world may have to a Being whose very concept lies beyond all the knowledge which we can attain within the world. For we then do not attribute to the Supreme Being any of the properties in themselves by which we represent objects of experience, and thereby avoid *dogmatic* anthropomorphism; but we attribute them to the relation of this Being to the world and allow ourselves a *symbolical* anthropomorphism, which in fact concerns language only and not the object itself.

If I say that we are compelled to consider the world *as if* it were the work of a Supreme Understanding and Will, I really say nothing more than that a watch, a ship, a regiment, bears the same relation to the watchmaker, the shipbuilder, the commanding officer as the world of sense (or whatever constitutes the substratum of this complex of appearances) does to the unknown, which I do not hereby know as it is in itself but as it is for me, that is, in relation to the world of which I am a part.

§ 58. Such a cognition is one of analogy and does not signify (as is commonly understood) an imperfect similarity of two things, but a perfect similarity of relations
 358 between two quite dissimilar things.* By means of this analogy, however, there remains a concept of the Supreme Being sufficiently determined *for us*, though we have left out everything that could determine it absolutely or *in itself*; for we determine it as regards the world and hence as regards ourselves, and more do we not require. The attacks which Hume makes upon those who would determine this concept absolutely, by taking the materials for so doing from themselves and the world, do not affect us; and he cannot object to us that we have nothing left if we give up the objective anthropomorphism of the concept of the Supreme Being.

*There is, for example, an analogy between the juridical relation of human actions and the mechanical relation of moving forces. I never can do anything to another man without giving him a right to do the same to me on the same conditions; just as no mass can act with its moving forces on another mass without thereby occasioning the other to react equally against it. Here right and moving force are quite dissimilar things, but in their relation there is complete similarity. By means of such an analogy, I can obtain a notion of the relation of things which absolutely are unknown to me. For instance, as the promotion of the welfare of children (= a) is to the love of parents (= b), so the welfare of the human species (= c) is to that unknown character in God (= x), which we call love; not as if it had the least similarity to any human inclination, but because we can suppose its relation to the world to be similar to that which things of the world bear one another. But the concept of relation in this case is a mere category, namely, the concept of cause, which has nothing to do with sensibility.

For let us assume at the outset (as Hume in his *Dialogues* makes Philo grant Cleanthes), as a necessary hypothesis, the deistic concept of the First Being, in which this Being is thought by the mere ontological predicates of substance, of cause, and so on. This must be done because reason, actuated in the sensible world by mere conditions which are themselves always conditional, cannot otherwise have any satisfaction; and it therefore can be done without falling into anthropomorphism (which transfers predicates from the world of sense to a Being quite distinct from the world) because those predicates are mere categories which, though they do not give a determinate concept of that Being, yet give a concept not limited to any conditions of sensibility. Thus nothing can prevent our predicating of this Being a causality through reason with regard to the world, and thus passing to theism, without being obliged to attribute to this Being itself this kind of reason, as a property inherent in it. For as to the former, the only possible way of prosecuting the use of reason (as regards all possible experience in complete harmony with itself) in the world of sense to the highest point is to assume a supreme reason as a cause of all the connections in the world. Such a principle must be quite advantageous to reason and can hurt it nowhere in its application to nature. As to the latter, reason is thereby not transferred as a property to the First Being in itself, but only to its relation to the world of sense, and so anthropomorphism is entirely avoided. For nothing is considered here but the cause of the form of reason which is perceived everywhere in the world, and reason is indeed attributed to the Supreme Being so far as it contains the ground of this form of reason in the world, but according to analogy only—that is, so far as this expression shows merely the relation which the Supreme Cause, unknown to us, has to the world in order to determine everything in it conformably to reason in the highest degree. We are thereby kept from using reason as an attribute for the purpose of conceiving God, but not from conceiving the world in such a manner as is necessary to have the greatest possible use of reason within it according to principle. We thereby acknowledge that the Supreme Being is quite inscrutable and even unthinkable in any definite way as to what it is in itself. We are thereby kept, on the one hand, from making a transcendent use of the concepts which we have of reason as an efficient cause (by means of the will), in order to determine the Divine Nature by properties which are only borrowed from human nature, and from losing ourselves in gross and extravagant notions; and, on the other hand, from deluging the contemplation of the world with hyperphysical modes of explanation according to our notions of human reason which we transfer to God, and so from losing for this contemplation its proper rôle, according to which it should be a rational study of mere nature and not a presumptuous derivation of its appearances from a Supreme Reason. The expression suited to our feeble notions is: we conceive the world *as if* it came, in its existence and internal plan, from a Supreme Reason. By this, on the one hand, we know the constitution which belongs to the world itself without pretending to determine the nature of its cause in itself; and, on the other hand, we transfer the ground of this constitution (of the form of reason in the world) upon the *relation* of the Supreme Cause to the world, without finding the world sufficient by itself for that purpose.*

Thus the difficulties which seem to oppose theism disappear by combining with Hume's principle, "not to carry the use of reason dogmatically beyond the field of all

*I may say that the causality of the Supreme Cause holds the same place with regard to the world that human reason does with regard to its works of art. Here the nature of the Supreme Cause itself remains unknown to me; I only compare its effects (the order of the world), which I know, and their conformity to reason to the effects of human reason, which I also know; and hence I term the former "reason," without attributing to it on that account what I understand in man by this term, or attaching to it anything else known to me as its property.

possible experience," this other principle, which he quite overlooked, "not to consider the field of experience as one which bounds itself in the eyes of our reason." The *Critique of Pure Reason* here points out the true mean between dogmatism, which Hume combats, and skepticism, which he would substitute for it—a mean which is not like others that we find advisable to determine for ourselves, as it were mechanically (by adopting something from one side and something from the other), and by which nobody is taught a better way, but such a one as can be precisely determined on principles.

§ 59. At the beginning of this note I made use of the metaphor of a boundary, in order to establish the limits of reason in regard to its suitable use. The world of sense contains merely appearances, which are not things in themselves; but the understanding, because it recognizes that the objects of experience are mere appearances, must assume that there are things in themselves, namely, *noumena*. In our reason both are comprehended, and the question is, How does reason proceed to set boundaries to the understanding as regards both these fields? Experience, which contains all that belongs to the sensible world, does not bound itself; it only proceeds in every case from the conditioned to some other equally conditioned object. That which bounds it must lie quite without it, and this is the field of the pure beings of the understanding. But this field, so far as the *determination* of the nature of these beings is concerned, is an empty space for us; and apart from dogmatically defined concepts, we cannot pass beyond the field of possible experience. But as a boundary itself is something positive, which belongs to that which lies within as well as to the space that lies without the given content, it is still an actual positive cognition which reason only acquires by enlarging itself to this boundary, yet without attempting to pass it because it there finds itself in the presence of an empty space in which it can conceive forms of things, but not things themselves. But the setting of a boundary to the field of the understanding by something which is otherwise unknown to it is still a cognition which belongs to reason even at this point, and by which it is neither confined within the sensible nor strays beyond it, but only limits itself, as befits the knowledge of a boundary, to the relation between that which lies beyond it and that which is contained within it.

Natural theology is such a concept at the boundary of human reason, being constrained to look beyond this boundary to the Idea of a Supreme Being (and, for practical purposes, to that of an intelligible world also), not in order to determine anything relatively to this pure being of the understanding, and thus to determine something that lies beyond the world of sense, but in order to guide the use of reason within it according to principles of the greatest possible (theoretical as well as practical) unity. For this purpose, it makes use of the reference of the world of sense to an independent reason as the cause of all its connections. Thereby it does not just *invent* a being, but, as beyond the sensible world there must be something that can be thought only by the pure understanding, it determines that something in this particular way, though only of course by analogy.

And thus there remains our original proposition, which is the *résumé* of the whole *Critique*: "Reason by all its *a priori* principles never teaches us anything more than objects of possible experience, and even of these nothing more than can be known in experience." But this limitation does not prevent reason from leading us to the objective boundary of experience, namely, to the relation to something which is not itself an object of experience but is the ground of all experience. Reason does not, however, teach us anything concerning the thing in itself; it only instructs us as regards its own complete and highest use in the field of possible experience. But this is all that can be reasonably desired in the present case, and with it we have cause to be satisfied.

§ 60. Thus we have fully exhibited metaphysics, in its subjective possibility, as it is actually given in the natural predisposition of human reason and in that which constitutes the essential end of its pursuit. Though we have found that this merely natural use of such a predisposition of our reason, if no discipline arising only from a scientific critique bridles and sets limits to it, involves it in transcendent and specious inferences and really conflicting dialectical inferences, and this fallacious metaphysics is not only unnecessary as regards the promotion of our knowledge of nature but even disadvantageous to it, there yet remains a problem worthy of investigation, which is to find out the natural ends intended by this disposition to transcendent concepts in our nature, because everything that lies in nature must be originally intended for some useful purpose.

Such an inquiry is of a doubtful nature, and I acknowledge that what I can say about it is conjecture only, like every speculation about the ultimate ends of nature. Such conjecture may be allowed me here, for the question does not concern the objective validity of metaphysical judgments but our natural predisposition to them, and therefore does not belong to the system of metaphysics but to anthropology.

When I compare all the transcendental Ideas, the totality of which constitutes the proper problem of natural pure reason, compelling it to quit the mere contemplation of nature, to transcend all possible experience, and in this endeavor to produce the thing (be it knowledge or fiction) called metaphysics, I think I perceive that the aim of this natural tendency is to free our concepts from the fetters of experience and from the limits of the mere contemplation of nature so far as at least to open to us a field containing mere objects for the pure understanding which no sensibility can reach, not indeed for the purpose of speculatively occupying ourselves with them (for there we can find no ground to stand on), but in order that practical principles [may be assumed as at least possible]; for practical principles, unless they find scope for their necessary expectation and hope, could not expand to the universality which reason unavoidably requires from a moral point of view.

363

So I find that the psychological Idea (however little it may reveal to me the nature of the human soul, which is elevated above all concepts of experience), shows the insufficiency of these concepts plainly enough and thereby deters me from materialism, a psychological concept which is unfit for any explanation of nature and which moreover confines reason in practical respects. The cosmological Ideas, by the obvious insufficiency of all possible knowledge of nature to satisfy reason in its legitimate inquiry, serve in the same manner to keep us from naturalism, which asserts nature to be sufficient for itself. Finally, all natural necessity in the sensible world is conditional, as it always presupposes the dependence of things upon others, and unconditional necessity must be sought only in the unity of a cause different from the world of sense. But as the causality of this cause, in its turn, were it merely nature, could never render the existence of the contingent (as its consequent) comprehensible, reason frees itself by means of the theological Idea from fatalism (both as a blind natural necessity in the coherence of nature itself, without a first principle, and as a blind causality of this principle itself) and leads to the concept of a cause possessing freedom or of a Supreme Intelligence. Thus the transcendental Ideas serve, if not to instruct us positively, at least to destroy the narrowing assertions of materialism, of naturalism, and of fatalism, and thus to afford scope for the moral Ideas beyond the field of speculation. These considerations, I should think, explain in some measure the natural predisposition of which I spoke.

The practical value, which a merely speculative science may have, lies without the bounds of this science, and can therefore be considered as a scholium merely, and like all scholia does not form part of the science itself. This application, however, surely lies within the bounds of philosophy, especially of philosophy drawn from the pure sources

of reason, where its speculative use in metaphysics must necessarily be at one with its practical use in morals. Hence the unavoidable dialectic of pure reason, considered in metaphysics as a natural tendency, deserves to be explained not as a mere illusion, which is to be removed, but also, if possible, as a natural provision as regards its end, though this task, a work of supererogation, cannot justly be assigned to metaphysics proper.

The solutions of these questions which are treated in the *Critique** should be considered a second scholium, which, however, has a greater affinity with the subject of metaphysics. For there certain rational principles are expounded which determine *a priori* the order of nature or rather of the understanding, which seeks nature's laws through experience. They seem to be constitutive and legislative with regard to experience, though they spring from pure reason, which cannot be considered, like the understanding, as a principle of possible experience. Now whether or not this harmony rests upon the fact that, just as nature does not inhere in appearances or in their source (the sensibility) itself, but only in the relation of the latter to the understanding, a thorough unity in applying the understanding to bring about an entirety of all possible experience (in a system) can only belong to the understanding when in relation to reason, with the consequence that experience is in this way mediately subordinate to the legislation of reason—this question may be discussed by those who desire to trace the nature of reason even beyond its use in metaphysics, into the general principles, which will make a history of nature in general systematic. I have presented this task as important, but not attempted its solution in the book itself.**

And thus I conclude the analytical solution of the main question which I had proposed: "How is metaphysics in general possible?" by ascending from the data of its actual use, as shown in its consequences, to the grounds of its possibility.

SOLUTION OF THE GENERAL QUESTION OF THE *PROLEGOMENA*

How Is Metaphysics Possible as Science?

Metaphysics, as a natural disposition of reason, is actual; but if considered by itself alone (as the analytical solution of the third principal question showed), dialectical and illusory. If we think of taking principles from it, and in using them follow the natural, but on that account not less false, illusion, we can never produce science, but only a vain dialectical art, in which one school may outdo another but none can ever acquire a just and lasting approbation.

In order that as a science metaphysics may be entitled to claim, not mere fallacious plausibility, but insight and conviction, a critique of reason itself must exhibit the whole stock of *a priori* concepts, their division according to their various sources (sensibility, understanding, and reason), together with a complete table of them, the analysis of all these concepts, with all their consequences, and especially the possibility of synthetical knowledge *a priori* by means of a deduction of these concepts, the principles and the bounds of their application, all in a complete system. Critique, therefore, and critique

**Critique of Pure Reason*, "Regulative Use of the Ideas of Pure Reason."

**Throughout in the *Critique* I never lost sight of the plan not to neglect anything, were it ever so recondite, that could render the inquiry into the nature of pure reason complete. Everybody may afterward carry his research as far as he pleases, when he has been merely shown what yet remains to be done. This can reasonably be expected of him who has made it his business to survey the whole field, in order to consign it to others for future cultivation and allotment. And to this branch both the scholia belong, which will hardly recommend themselves because of their dryness to amateurs, and hence are added here for connoisseurs only.

alone contains in itself the whole well-proved and well-tested plan, and even all the means, required to establish metaphysics as a science; by other ways and means it is impossible. The question here, therefore, is not so much how this performance is possible as how to set it going and to induce men of clear heads to quit their hitherto perverted and fruitless cultivation for one that will not deceive, and how such a union for the common end may best be directed.

This much is certain, that whoever has once tasted critique will be ever after disgusted with all dogmatic twaddle which he formerly had to put up with because his reason had to have something and could find nothing better for its support. 366

Critique stands in the same relation to the common metaphysics of the schools as chemistry does to alchemy, or as astronomy to the astrology of the fortune teller. I pledge myself that nobody who has thought through and grasped the principles of critique, even in these *Prolegomena* only, will ever return to that old and sophistical pseudo-science; but will rather with a certain delight look forward to metaphysics, which is now indeed in his power, requiring no more preparatory discoveries and affording permanent satisfaction to reason at last. For here is an advantage upon which, of all possible sciences, metaphysics alone can with certainty reckon: that it can be brought to such completion and fixity as to be in need of no further change or be subject to any augmentation by new discoveries; because here reason has the sources of its knowledge in itself, not in objects and their observation, by which its stock of knowledge could be further increased. When, therefore, it has exhibited the fundamental laws of its faculty completely and so definitely as to avoid all misunderstanding, there remains nothing further which pure reason could know *a priori*; nay, there is no ground even to raise further questions. The sure prospect of knowledge so definite and so compact has a peculiar charm, even though we should set aside all its advantages, of which I shall hereafter speak.

All false art, all vain wisdom, lasts its time but finally destroys itself, and its highest culture is also the epoch of its decay. That this time is come for metaphysics appears from the state into which it has fallen among all learned nations, despite all the zeal with which other sciences of every kind are prosecuted. The old arrangement of our university studies still preserves its shadow. Now and then an academy of science tempts men by offering prizes to write some essay on it, but it is no longer numbered among the rigorous sciences; and let anyone judge for himself how a sophisticated man, if he were called a great metaphysician, would receive the compliment, which may be well meant but is scarcely envied by anybody.

Yet, though the period of the downfall of all dogmatic metaphysics has undoubtedly arrived, we are yet far from being able to say that the period of its regeneration is come by means of a thorough and complete critique of reason. All transitions from a tendency to its contrary pass through the stage of indifference, and this moment is the most dangerous for an author but, in my opinion, the most favorable for the science. For when party spirit has died out by a total dissolution of former connections, minds are in the best state to listen to several proposals for an organization according to a new plan. 367

When I say that I hope these *Prolegomena* will excite investigation in the field of critique and afford a new and promising object to sustain the general spirit of philosophy, which seems on its speculative side to want sustenance, I can imagine beforehand that everyone whom the thorny paths of my *Critique* have tired and put out of humor will ask me upon what I found this hope. My answer is: upon the irresistible law of necessity.

That the human mind will ever give up metaphysical researches is as little to be expected as that we, to avoid inhaling impure air, should prefer to give up breathing altogether. There will, therefore, always be metaphysics in the world; nay, everyone,

especially every reflective man, will have it and, for want of a recognized standard, will shape it for himself after his own pattern. What has hitherto been called metaphysics cannot satisfy any critical mind, but to forego it entirely is impossible; therefore a *Critique of Pure Reason* itself must now be attempted or, if one exists, investigated and brought to the full test, because there is no other means of supplying this pressing want which is something more than mere thirst for knowledge.

368 Ever since I have come to know critique, whenever I finish reading a book of metaphysical contents which, by the preciseness of its notions, by variety, order, and an easy style, was not only entertaining but also helpful, I cannot help asking, "Has this author indeed advanced metaphysics a single step?" The learned men whose works have been useful to me in other respects and always contributed to the culture of my mental powers will, I hope, forgive me for saying that I have never been able to find either their essays or my own less important ones (though self-love may recommend them to me) to have advanced the science of metaphysics in the least.

There is a very obvious reason for this: metaphysics did not then exist as a science, nor can it be gathered piecemeal; but its germ must be fully preformed in critique. But, in order to prevent all misconception, we must remember what has been already said—that, by the analytical treatment of our concepts, the understanding gains indeed a great deal; but the science of metaphysics is thereby not in the least advanced, because these dissections of concepts are nothing but the materials from which the intention is to carpenter our science. Let the concepts of substance and of accident be ever so well dissected and determined; all this is very well as a preparation for some future use. But if we cannot prove that in all which exists the substance endures and only the accidents vary, our science is not the least advanced by all our analyses.

Metaphysics has hitherto never been able to prove *a priori* either this proposition or that of sufficient reason, still less any more complex theorem such as belongs to psychology or cosmology, or indeed any synthetical proposition. By all its analyzing, therefore, nothing is affected, nothing obtained or forwarded; and the science, after all this bustle and noise, still remains as it was in the days of Aristotle, though there were far better preparations for it than of old if only the clue to synthetical cognitions had been discovered.

369 If anyone thinks himself offended, he is at liberty to refute my charge by producing a single synthetical proposition belonging to metaphysics which he would prove dogmatically *a priori*; for until he has actually performed this feat I shall not grant that he has truly advanced the science, even if this proposition should be sufficiently confirmed by common experience. No demand can be more moderate or more equitable and, in the (inevitably certain) event of its nonperformance, no assertion more just than that hitherto metaphysics has never existed as a science.

But there are two things which, in case the challenge be accepted, I must deprecate: first, trifling about probability and conjecture, which are suited as little to metaphysics as to geometry; and secondly, a decision by means of the magic wand of so-called common sense, which does not convince everyone but accommodates itself to personal peculiarities.

For as to the former, nothing can be more absurd than in metaphysics, a philosophy from pure reason, to think of grounding our judgments upon probability and conjecture. Everything that is to be known *a priori* is thereby announced as apodictically certain, and must therefore be proved in this way. We might as well think of grounding geometry or arithmetic upon conjectures. As to the calculus of probabilities in the latter, it does not contain probable but perfectly certain judgments concerning the degree of the possibility of certain cases under given uniform conditions, which, in the sum of all possible cases, must infallibly happen according to the rule, though the rule is not sufficiently definite

with respect to every single instance. Conjectures (by means of induction and of analogy) can be suffered in an empirical science of nature only, yet even there at least the possibility of what we assume must be quite certain.

The appeal to common sense is even more absurd—if anything more absurd can be imagined—when it is a question of concept and principles claimed as valid, not in so far as they hold with regard to experience, but beyond the conditions of experience. For what is common sense? It is normal good sense, so far it judges right. But what is normal good sense? It is the faculty of the knowledge and use of rules *in concreto*, as distinguished from the speculative understanding, which is a faculty of knowing rules *in abstracto*. Common sense can hardly understand the rule that every event is determined by means of its cause and can never comprehend it in its generality. It therefore demands an example from experience; and when it hears that this rule means nothing but what it always thought when a pane was broken or a kitchen utensil missing, it then understands the principle and grants it. Common sense, therefore, is only of use so far as it can see its rules (though they actually are *a priori*) confirmed by experience; consequently to comprehend them *a priori*, or independently of experience, belongs to the speculative understanding and lies quite beyond the horizon of common sense. But the province of metaphysics is entirely confined to the latter kind of knowledge, and it is certainly a bad sign of common sense to appeal to it as a witness, for it cannot here form any opinion whatever, and men look down upon it with contempt until they are in straits and can find in their speculation neither advice nor help.

370

It is a common subterfuge of those false friends of common sense (who occasionally prize it highly, but usually despise it) to say that there must surely be at all events some propositions which are immediately certain and of which there is no occasion to give any proof, or even any account at all, because we otherwise could never stop inquiring into the grounds of our judgments. But if we except the principle of contradiction, which is not sufficient to show the truth of synthetical judgments, they can never adduce, in proof of this privilege, anything else indubitable which they can immediately ascribe to common sense, except mathematical propositions, such as twice two make four, between two points there is but one straight line, etc. But these judgments are radically different from those of metaphysics. For in mathematics I can by thinking itself construct whatever I represent to myself as possible by a concept: I add to the first two the other two, one by one, and myself make the number four, or I draw in thought from one point to another all manner of lines, equal as well as unequal; yet I can draw one only which is like itself in all its parts. But I cannot, by all my power of thinking, extract from the concept of a thing the concept of something else whose existence is necessarily connected with the former; for this I must call in experience. And though my understanding furnishes me *a priori* (yet only in reference to possible experience) with the concept of such a connection (that is causation), I cannot exhibit it, like the concepts of mathematics, by intuiting it *a priori*, and so show its possibility *a priori*. This concept, together with the principles of its application, always requires, if it shall hold *a priori*—as is requisite in metaphysics—a justification and deduction of its possibility, because we cannot otherwise know how far it holds good and whether it can be used in experience only or beyond it also.

371

Therefore in metaphysics, as a speculative science of pure reason, we can never appeal to common sense, but may do so only when we are forced to surrender it and to renounce all pure speculative knowledge which must always be theoretical cognition, and thereby under some circumstances to forego metaphysics itself and its instruction for the sake of adopting a rational faith which alone may be possible for us, sufficient to our wants, and perhaps even more salutary than knowledge itself. For in this case the

state of affairs is quite altered. Metaphysics must be science, not only as a whole, but in all its parts; otherwise it is nothing at all; because, as speculation of pure reason, it finds a hold only on common convictions. Beyond its field, however, probability and common sense may be used justly and with advantage, but on quite special principles, the importance of which always depends on their reference to practical life.

This is what I hold myself justified in requiring for the possibility of metaphysics as a science.

APPENDIX

ON WHAT CAN BE DONE TO MAKE METAPHYSICS AS A SCIENCE ACTUAL

Since all the ways heretofore taken have failed to attain the goal, and since without a preceding critique of pure reason it is not likely ever to be attained, the present attempt has a right to an accurate and careful examination, unless it be thought more advisable
372 to give up all pretensions to metaphysics, to which, if men but would consistently adhere to their purpose, no objection can be made.

If we take the course of things as it is, not as it ought to be, there are two sorts of judgments: (1) one a judgment which precedes investigation (in our case one in which the reader from his own metaphysics pronounces judgment on the *Critique of Pure Reason*, which was intended to discuss the very possibility of metaphysics); (2) the other a judgment subsequent to investigation. In the latter, the reader is enabled to ignore for a while the consequences of the critical researches that may be repugnant to his formerly adopted metaphysics, and first examines the grounds whence those consequences are derived. If what common metaphysics propounds were demonstrably certain, as is the case with the theorems of geometry, the former way of judging would hold good. For if the consequences of certain principles are repugnant to established truths, these principles are false and without further inquiry to be repudiated. But if metaphysics does not possess a stock of indisputably certain (synthetical) propositions, and should it even be the case that there are a number of them, which, though among the most plausible, are by their consequences in mutual conflict, and if no sure criterion of the truth of peculiarly metaphysical (synthetical) propositions is to be met with in it, then the former way of judging is not admissible, but the investigation of the principles of the *Critique* must precede all judgments as to its value.

A SPECIMEN OF A JUDGMENT OF THE CRITIQUE PRIOR TO ITS EXAMINATION

Such a judgment is to be found in the *Göttingische gelehrte Anzeigen*, in the supplement to the third part, of January 19, 1782, pages 40 *et seq.*

When an author who is familiar with the subject of his work and endeavors to present his independent reflections in its elaboration falls into the hands of a reviewer who, in his turn, is keen enough to discern the points on which the worth or worthlessness of the book rests, who does not cling to words but goes to the heart of the subject, sifting and testing the principles which the author takes as his point of departure, the severity of the
373 judgment may indeed displease the author, but the public does not care, as it gains thereby. And the author himself may be contented, as an opportunity of correcting or explaining his positions is afforded to him at an early date by the examination of a competent judge,

in such a manner that if he believes himself fundamentally right, he can remove in time any stumbling block that might hurt the success of his work.

I find myself, with my reviewer, in quite another position. He seems not to see at all the real matter of the investigation with which (successfully or unsuccessfully) I have been occupied. It is either impatience at thinking out a lengthy work, or vexation at a threatened reform of a science in which he believed he had brought everything to perfection long ago, or, what I am reluctant to suspect, real narrow-mindedness that prevents him from ever carrying his thoughts beyond his school metaphysics. In short, he passes impatiently in review a long series of propositions, of which, without knowing their premises, one can understand nothing, intersperses here and there his censure, the reason of which the reader understands just as little as the propositions against which it is directed; and hence [his report] can neither serve the public nor damage me in the judgment of experts. I should, for these reasons, have passed over this judgment altogether, were it not that it may afford me occasion for some explanations which may in some cases save the readers of these *Prolegomena* from a misconception.

In order to take a position from which my reviewer could most easily set the whole work in a most unfavorable light, without venturing to trouble himself with any special investigation, he begins and ends by saying: "This work is a system of transcendental (or, as he translates it, of higher*) idealism."

A glance at this line soon showed me the sort of criticism that I had to expect, much as though the reviewer were one who had never seen or heard of geometry, having found a Euclid and coming upon various figures in turning over its leaves, were to say, on being asked his opinion of it: "The work is a textbook of drawing; the author introduces a peculiar terminology, in order to give dark, incomprehensible directions, which in the end teach nothing more than what everyone can effect by a fair natural accuracy of eye, etc." 374

Let us see, in the meantime, what sort of an idealism it is that goes through my whole work, although it does not by a long way constitute the soul of the system.

The dictum of all genuine idealists, from the Eleatic school to Bishop Berkeley, is contained in this formula: "All knowledge through the senses and experience is nothing but sheer illusion, and only in the ideas of the pure understanding and reason is there truth."

The principle that throughout dominates and determines my idealism, is on the contrary: "All knowledge of things merely from pure understanding or pure reason is nothing but sheer illusion, and only in experience is there truth."

But this is directly contrary to idealism proper. How came I then to use this expression for quite an opposite purpose, and how came my reviewer to see it everywhere?

The solution of this difficulty rests on something that could have been very easily understood from the general bearing of the work if the reader had only desired to understand it. Space and time, together with all that they contain, are not things in themselves or their qualities, but belong merely to the appearances of the things in themselves. Up to this point I am one in confession with the above idealists. But these, and among them more particularly Berkeley, regarded space as a mere empirical representation that, like

*By no means "higher." High towers and metaphysically great men resembling them, round both of which there is commonly much wind, are not for me. My place is the fruitful bathos of experience; and the word "transcendental," the meaning of which is so often explained by me but not once grasped by my reviewer (so carelessly has he regarded everything), does not signify something passing beyond all experience but something that indeed precedes it *a priori*, but that is intended simply to make knowledge of experience possible. If these conceptions overstep experience, their employment is termed "transcendent," which must be distinguished from the immanent use, that is, use restricted to experience. All misunderstandings of this kind have been sufficiently guarded against in the work itself, but my reviewer found his advantage in misunderstanding me.

375 the appearances it contains, is, together with its determinations, known to us only by means of experience or perception. I, on the contrary, prove in the first place that space (and also time, which Berkeley did not consider) and all its *a priori* determinations can be known by us, because, no less than time, it inheres in us as a pure form of our sensibility before all perception or experience and makes all intuition of the form, and therefore all appearances, possible. It follows from this that, as truth rests on universal and necessary laws as its criteria, experience, according to Berkeley, can have no criteria of truth because its phenomena* (according to him) have nothing *a priori* at their foundation, whence it follows that experience is nothing but sheer illusion; whereas with us, space and time (in conjunction with the pure concept of the understanding) prescribe their law to all possible experience *a priori* and, at the same time, afford the certain criterion for distinguishing truth from illusion therein.

My so-called (properly critical) idealism is of quite a special character, in that it subverts the ordinary idealism and in that only through it all *a priori* knowledge, even that of geometry, receives objective reality, which, without my demonstrated ideality of space and time, could not be maintained by the most zealous realists. This being the state of the case, I could wish, in order to avoid all misunderstanding, to have named this conception of mine otherwise, but to alter it altogether is probably impossible. It may be permitted me however, in future, as has been above intimated, to term it “formal” or, better still, “critical” idealism, to distinguish it from the dogmatic idealism of Berkeley and from the skeptical idealism of Descartes.

376 Beyond this, I find nothing remarkable in the judgment of my book. The reviewer makes sweeping criticisms, a mode prudently chosen, since it does not betray one’s own knowledge or ignorance; a single thorough criticism in detail, had it touched the main question, as is only fair, would have exposed either my error or my reviewer’s measure of insight into this species of research. It was, moreover, not a badly conceived plan, in order at once to take from readers (who are accustomed to form their conceptions of books from newspaper reports) the desire to read the book itself, to pour out in one breath a number of passages in succession which, torn from their connection with their premises and explanations, must necessarily sound senseless, especially considering how antipathetic they are to all school-metaphysics; to exhaust the reader’s patience *ad nauseam*, and then, having made me acquainted with the lucid proposition that persistent illusion is truth, to conclude with the crude paternal moralization: to what end, then, the quarrel with accepted language; to what end, and whence, the idealistic distinction? A judgment which seeks all that is characteristic of my book, first supposed to be metaphysically heterodox, in a mere innovation of the nomenclature proves clearly that my would-be judge has understood nothing of the subject and, in addition, has not understood himself.**

*Idealism proper always has a mystical tendency, and can have no other, but mine is solely designed for the purpose of comprehending the possibility of our *a priori* knowledge of objects of experience, which is a problem never hitherto solved or even suggested. In this way all mystical idealism falls to the ground, for (as may be seen in Plato) it inferred from our cognitions *a priori* (even from those of geometry) another intuition different from that of the senses (namely, an intellectual intuition), because it never occurred to anyone that the senses themselves might intuit *a priori*.

**The reviewer often fights with his own shadow. When I oppose the truth of experience to dream, he never thinks that I am here speaking simply of the well-known *somnio objective sumto* of the Wolffian philosophy, which is merely formal, and with which the distinction between sleeping and waking is in no way concerned—a distinction which can indeed have no place in a transcendental philosophy. For the rest, he calls my deduction of the categories and table of the principles of the understanding “common well-known axioms of logic and ontology, expressed in an idealistic manner.” The reader need only consult these *Prolegomena* upon this point to convince himself that a more miserable and historically incorrect judgment could hardly be made.

My reviewer speaks like a man who is conscious of important and superior insight which he keeps hidden, for I am aware of nothing recent with respect to metaphysics that could justify his tone. But he should not withhold his discoveries from the world, for there are doubtless many who, like myself, have not been able to find in all the fine things that have for long past been written in this department anything that has advanced the science by so much as a finger's breadth; we find indeed the giving a new point to definitions, the supplying of lame proofs with new crutches, the adding to the crazy-quilt of metaphysics fresh patches or changing its pattern. But all this is not what the world requires. The world is tired of metaphysical assertions; it wants [to know] the possibility of this science, the sources from which certainty therein can be derived, and certain criteria by which it may distinguish the dialectical illusion of pure reason from truth. To this the critic seems to possess a key, otherwise he would never have spoken out in such a high tone. 377

But I am inclined to suspect that no such requirement of the science has ever entered his thoughts, for in that case he would have directed his judgment to this point, and even a mistaken attempt in such an important matter would have won his respect. If that be the case, we are once more good friends. He may penetrate as deeply as he likes into his metaphysics, without any one hindering him; only as concerns that which lies outside metaphysics, its sources, which are to be found in reason, he cannot form a judgment. That my suspicion is not without foundation is proved by the fact that he does not mention a word about the possibility of synthetic knowledge *a priori*, the special problem upon the solution of which the fate of metaphysics wholly rests and upon which my *Critique* (as well as the present *Prolegomena*) entirely hinges. The idealism he encountered and which he hung upon was only taken up in the doctrine as the sole means of solving the above problem (although it received its confirmation on other grounds), and hence he must have shown either that the above problem does not possess the importance I attribute to it (even in these *Prolegomena*) or that, by my conception of appearances, it is either not solved at all or can be better solved in another way; but I do not find a word of this in the criticism. The reviewer, then, understands nothing of my work and possibly also nothing of the spirit and essential nature of metaphysics itself; and it is not, what I would rather assume, the hurry of a reviewer to finish his review, incensed at the labor of plodding through so many obstacles, that threw an unfavorable shadow over the work lying before him and made its fundamental features unrecognizable.

There is a good deal to be done before a learned journal, it matters not with what care its writers may be selected, can maintain its otherwise well-merited reputation in the field of metaphysics as elsewhere. Other sciences and branches of knowledge have their standard. Mathematics has it in itself, history and theology in profane or sacred books, natural science and the art of medicine in mathematics and experience, jurisprudence in law books, and even matters of taste in the examples of the ancients. But for the judgment of the thing called metaphysics, the standard has yet to be found. I have made an attempt to determine it, as well as its use. What is to be done, then, until it be found when works of this kind have to be judged of? If they are of a dogmatic character, one may do what one likes; no one will play the master over others here for long before someone else appears to deal with him in the same manner. If, however, they are critical in character, not indeed with reference to other works but to reason itself, so that the standard of judgment cannot be assumed but has first of all to be sought for, then, though objection and blame may indeed be permitted, yet a certain degree of leniency is indispensable, since the need is common to us all and the lack of the necessary insight makes the high-handed attitude of judge unwarranted. 378

In order, however, to connect my defense with the interest of the philosophical commonwealth, I propose a test, which must be decisive as to the mode whereby all metaphysical investigations may be directed to their common purpose. This is nothing more than what mathematicians have done in establishing the advantage of their methods by competition. I challenge my critic to demonstrate, as is only just, on *a priori* grounds, in his own way, any single really metaphysical proposition asserted by him. Being metaphysical, it must be synthetical and known *a priori* from concepts, but it may also be any one of the most indispensable propositions, as, for instance, the principle of the persistence of substance or of the necessary determination of events in the world by their causes. If he cannot do this (silence however is confession), he must admit that, since metaphysics without apodictic certainty of propositions of this kind is nothing at all, its possibility or impossibility must before all things be established in a critique of pure reason. Thus he is bound either to confess that my principles in the *Critique* are correct, or he must prove their invalidity. But as I can already foresee that, confidently as he has hitherto relied on the certainty of his principles, when it comes to a strict test he will not find a single one in the whole range of metaphysics he can boldly bring forward, I will concede to him an advantageous condition, which can only be expected in such a competition, and will relieve him of the *onus probandi* by laying it on myself.

He finds in these *Prolegomena* and in my *Critique** eight propositions, of which one in each pair contradicts the other, but each of which necessarily belongs to metaphysics, by which it must either be accepted or rejected (although there is not one that has not in its time been assumed by some philosopher). Now he has the liberty of selecting any one of these eight propositions at his pleasure and accepting it without any proof, of which I shall make him a present, but only one (for waste of time will be just as little serviceable to him as to me), and then of attacking my proof of the opposite proposition. If I can save this one and at the same time show that, according to principles which every dogmatic metaphysics must necessarily recognize, the opposite of the proposition adopted by him can be just as clearly proved, it is thereby established that metaphysics has an hereditary failing not to be explained, much less set aside, until we ascend to its birthplace, pure reason itself. And thus my *Critique* must either be accepted or a better one take its place; at least it must be studied, which is the only thing I now require. If, on the other hand, I cannot save my demonstration, then a synthetic proposition *a priori* from dogmatic principles is to be reckoned to the score of my opponent, and I shall deem my impeachment of ordinary metaphysics unjust and pledge myself to recognize his stricture on my *Critique* as justified (although this would not be the consequence by a long way). To this end it would be necessary, it seems to me, that he should step out of his incognito. Otherwise I do not see how it could be avoided that, instead of dealing with one, I should be honored or besieged by several challenges coming from anonymous and unqualified opponents.

PROPOSALS AS TO AN INVESTIGATION OF THE "CRITIQUE" UPON WHICH A JUDGMENT MAY FOLLOW

I feel obliged to the learned public even for the silence with which it for a long time honored my *Critique*, for this proves at least a postponement of judgment and some supposition that, in a work leaving all beaten tracks and striking out on a new path, in

*[The reference is to the theses and antitheses of the antinomies.—L.W.B.]

which one cannot at once perhaps so easily find one's way, something may perchance lie from which an important but at present dead branch of human knowledge may derive new life and productiveness. Hence may have originated a solicitude for the as yet tender shoot, lest it be destroyed by a hasty judgment. A specimen of a judgment, delayed for the above reasons, is now before my eye in the *Gothaische gelehrte Zeitung*, the thoroughness of which—disregarding my praise, which might be suspicious—every reader will himself perceive from the clear and unperverted presentation of a fragment of one of the first principles of my work.

Since an extensive structure cannot be judged of as a whole from a hurried glance, I suggest that it be tested piece by piece from the ground up, and in this, the present *Prolegomena* may fitly be used as a general outline with which the work itself may occasionally be compared. This notion, if it were founded on nothing more than my conceit of importance, such as vanity commonly attributes to all of one's own productions, would be immodest and would deserve to be repudiated with indignation. But now the interests of speculative philosophy have arrived at the point of total extinction, while human reason hangs upon them with inextinguishable affection; and only after having been ceaselessly deceived, does it vainly attempt to change this into indifference.

In our thinking age, it is not to be supposed but that many deserving men would use any good opportunity of working for the common interest of the more and more enlightened reason, if there were only some hope of attaining the goal. Mathematics, 381 natural science, laws, arts, even morality, etc., do not completely fill the soul; there is always a space left over reserved for pure and speculative reason, the emptiness of which prompts us to seek in vagaries, buffooneries, and mysticism for what seems to be employment and entertainment, but what actually is mere pastime undertaken in order to deaden the troublesome voice of reason, which, in accordance with its nature, requires something that can satisfy it and does not merely subserve other ends or the interests of our inclinations. A consideration, therefore, which is concerned only with reason as it exists for itself has, as I may reasonably suppose, a great fascination for everyone who has attempted thus to extend his conceptions, and I may even say a greater fascination than any other theoretical branch of knowledge, for which he would not willingly exchange it because here all other branches of knowledge and even purposes must meet and unite themselves in a whole.

I offer, therefore, these *Prolegomena* as a sketch and textbook for this investigation, and not the work itself. Although I am even now perfectly satisfied with the latter as far as contents, order, and mode of presentation, and the care that I have expended in weighing and testing every sentence before writing it down are concerned (for it has taken me years to satisfy myself fully, not only as regards the whole, but in some cases even as to the sources of one particular proposition); yet I am not quite satisfied with my exposition in some sections of the Doctrine of Elements,* as for instance in the deduction of the concepts of the understanding or in the chapter on the paralogisms of pure reason, because a certain diffuseness takes away from their clearness, and in place of them what is here said in the *Prolegomena* respecting these sections may be made the basis of the test.**

It is the boast of the Germans that, where steady and continuous industry are requisite, they can carry things farther than other nations. If this opinion be well founded, an

*[The first part of the *Critique of Pure Reason*, the other being the Methodology.—L.W.B.]

**[These sections were almost completely rewritten in the second edition of the *Critique* (1787), though the new deduction of the categories does not follow the argument of the *Prolegomena*.—L.W.B.]

382 opportunity, a task, presents itself the successful issue of which we can scarcely doubt and in which all thinking men can equally take part, though they have hitherto been unsuccessful in accomplishing it and in thus confirming the above good opinion. This is chiefly because the science in question is of so peculiar a kind that it can all at once be brought to completion and to that enduring state beyond which it can never be developed, in the least degree enlarged by later discoveries, or changed if we leave out of account adornment by greater clearness in some places or additional uses. This is an advantage no other science has or can have, because there is none so fully isolated and independent of others and so exclusively concerned with the faculty of cognition pure and simple. And the present moment seems not to be unfavorable to my expectation, for just now, in Germany, no one seems to know wherewith to occupy himself, apart from the so-called useful sciences, so as to pursue not mere play but a business possessing an enduring purpose.

To discover how the endeavors of the learned may be united in such a purpose I must leave to others. In the meantime, it is not my intention to persuade anyone merely to follow my propositions or even to flatter me with the hope that he will do so; but attacks, repetitions, limitations, or confirmation, completion, and extension, as the case may be, should be appended. If the matter be but investigated from its foundation, it cannot fail that a system, albeit not my own, shall be erected that shall be a possession for future generations for which they may have reason to be grateful.

383 It would lead us too far here to show what kind of metaphysics may be expected when the principles of criticism have been perfected and how, though the old false feathers have been pulled out, it need by no means appear poor and reduced to an insignificant figure but may be in other respects richly and respectably adorned. But other and great uses which would result from such a reform strike one immediately. The ordinary metaphysics had its uses, in that it sought out the elementary concepts of the pure understanding in order to make them clear through analysis and definite through definitions. In this way it was a training for reason, in whatever direction it might be turned. But this was all the good it did. The service was subsequently effaced when it favored conceit by venturesome assertions, sophistry by subtle distinctions and adornment, and shallowness by the ease with which it decided the most difficult problems by means of a little school wisdom, which is only the more seductive the more it has the choice, on the one hand, of taking something from the language of science and, on the other, from that of popular discourse—thus being everything to everybody but in reality nothing at all. By criticism, however, a standard is given to our judgment whereby knowledge may be with certainty distinguished from pseudo-science and firmly founded, being brought into full operation in metaphysics—a mode of thought extending by degrees its beneficial influence over every other use of reason, at once infusing into it the true philosophical spirit. But the service that metaphysics performs also for theology, by making it independent of the judgment of dogmatic speculation and thereby assuring it completely against the attacks of all such opponents, is certainly not to be valued lightly. For ordinary metaphysics, although it promised theology much advantage, could not keep this promise, and by summoning speculative dogmatics to its assistance did nothing but arm enemies against itself. Mysticism, which can prosper in a rationalistic age only when it hides itself behind a system of school metaphysics, under the protection of which it may venture to rave with a semblance of rationality, is driven from theology, its last hiding place, by critical philosophy. Last, but not least, it cannot be otherwise than important to a teacher of metaphysics to be able to say with universal assent that what he expounds is *science*, and that by it genuine services will be rendered to the commonweal.

FOUNDATIONS OF THE METAPHYSICS OF MORALS

PREFACE

387

Ancient Greek philosophy was divided into three sciences: physics, ethics, and logic. This division conforms perfectly to the nature of the subject, and one need improve on it perhaps only by supplying its principle in order both to insure its exhaustiveness and to define correctly the necessary subdivisions.

All rational knowledge is either material, and concerns some object, or formal, and is occupied only with the form of understanding and reason itself and with the universal rules of thinking, without regard to distinctions among objects. Formal philosophy is called logic. Material philosophy, however, which has to do with definite objects and the laws to which they are subject, is divided into two parts. This is because these laws are either laws of nature or laws of freedom. The science of the former is called physics, and that of the latter ethics. The former is also called theory of nature and the latter theory of morals.

Logic can have no empirical part—a part in which universal and necessary laws of thinking would rest upon grounds taken from experience. For in that case it would not be logic (i.e., a canon for understanding or reason which is valid for all thinking and which must be demonstrated). Natural and moral philosophy, on the other hand, can each have its empirical part. The former must do so, for it must determine the laws of nature as an object of experience, and the latter must do so because it must determine the human will so far as it is affected by nature. The laws of the former are laws according to which everything happens; those of the latter are laws according to which everything ought to happen, but allow for conditions under which what ought to happen often does not.

388

All philosophy, so far as it is based on experience, may be called empirical; but, so far as it presents its doctrines solely on the basis of *a priori* principles, it may be called pure philosophy. Pure philosophy, when formal only, is logic; when limited to definite objects of the understanding, it is metaphysics.

In this way there arises the idea of a two-fold metaphysics—a metaphysics of nature and a metaphysics of morals. Physics, therefore, will have an empirical part and also a rational part, and ethics likewise. In ethics, however, the empirical part may be called more specifically practical anthropology; the rational part, morals proper.

All crafts, handiworks, and arts have gained by the division of labor, for when one person does not do everything but each limits himself to a particular job which is distinguished from all the others by the treatment it requires, he can do it with greater perfection and more facility. Where work is not thus differentiated and divided, where everyone is a jack-of-all-trades, the crafts remain at a primitive level. It might be worth considering whether pure philosophy in each of its parts does not require a man particularly devoted to it, and whether it would not be better for the learned profession as a whole to warn those who are in the habit of catering to the taste of the public by mixing up the empirical with the rational in all sorts of proportions which they themselves do

not know—a warning to those who call themselves independent thinkers and who give the name of speculator to those who apply themselves exclusively to the rational part of philosophy. This warning would be that they should not, at one and the same time, carry on two employments which differ widely in the treatment they require, and for each of which perhaps a special talent is required, since the combination of these talents in one person produces only bunglers. I only ask whether the nature of the science does not require that a careful separation of the empirical from the rational part be made, with a metaphysics of nature put before real (empirical) physics and a metaphysics of morals before practical anthropology. Each branch of metaphysics must be carefully purified of everything empirical so that we can know how much pure reason can accomplish in each case and from what sources it creates its *a priori* teaching, whether the latter inquiry be conducted by all moralists (whose name is legion) or only by some who feel a calling to it.

Since my purpose here is directed to moral philosophy, I narrow my proposed question to this: Is it not of the utmost necessity to construct a pure moral philosophy which is completely freed from everything which may be only empirical and thus belong to anthropology? That there must be such a philosophy is self-evident from the common idea of duty and moral laws. Everyone must admit that a law, if it is to hold morally (i.e., as a ground of obligation), must imply absolute necessity; he must admit that the command: Thou shalt not lie, does not apply to men only as if other rational beings had no need to observe it. The same is true for all other moral laws properly so called. He must concede that the ground of obligation here must not be sought in the nature of man or in the circumstances in which he is placed but *a priori* solely in the concepts of pure reason, and that every precept which rests on principles of mere experience, even a precept which is in certain respects universal, so far as it leans in the least on empirical grounds (perhaps only in regard to the motive involved) may be called a practical rule but never a moral law.

Thus not only are moral laws together with their principles essentially different from all practical knowledge in which there is anything empirical, but all moral philosophy rests solely on its pure part. Applied to man, it borrows nothing from knowledge of him (anthropology) but gives man, as a rational being, *a priori* laws. No doubt these laws require a power of judgment sharpened by experience partly in order to decide in which cases they apply and partly to procure for them access to man's will and to provide an impetus to their practice. For man is affected by so many inclinations that, though he is capable of the Idea of a practical pure reason, he is not so easily able to make it concretely effective in the conduct of his life.

A metaphysics of morals is therefore indispensable, not merely because of motives to speculation on the source of the *a priori* practical principles which lie in our reason, but also because morals themselves remain subject to all kinds of corruption so long as the guide and supreme norm for their correct estimation is lacking. For it is not sufficient to that which should be morally good that it conform to the law; it must be done for the sake of the law. Otherwise its conformity is merely contingent and spurious because, though the unmoral ground may indeed now and then produce lawful actions, more often it brings forth unlawful ones. But the moral law can be found in its purity and genuineness (which is the central concern in the practical) nowhere else than in a pure philosophy; therefore metaphysics must lead the way, and without it there can be no moral philosophy. Philosophy which mixes pure principles with empirical ones does not deserve the name, for what distinguishes philosophy from common sense knowledge is its treatment in separate sciences of what is confusedly apprehended in such

knowledge. Much less does it deserve the name of moral philosophy, since by this confusion it spoils the purity of morals themselves, and works contrary to its own end.

It should not be thought that what is here required is already present in the celebrated Wolff's propaedeutic to his moral philosophy (i.e., in what he calls *Universal Practical Philosophy*) and that it is not an entirely new field which is to be opened. Precisely because his work was to be universal practical philosophy, it contained no will of any particular kind, such as one determined without any empirical motives by *a priori* principles; in a word, it had nothing which could be called a pure will, since it considered only volition in general with all the actions and conditions which pertain to it in this general sense. Thus his propaedeutic differs from a metaphysic of morals in the same way that general logic is distinguished from transcendental philosophy, the former expounding the actions and rules of thinking in general, and the latter presenting the actions and rules of pure thinking (thinking by which objects are known completely *a priori*). For the metaphysics of morals is meant to investigate the Idea and principles of a possible pure will and not the actions and conditions of human volition as such, which for the most part are drawn from psychology.

391

That universal practical philosophy discussed (though improperly) laws and duty is no objection to my assertion. For the authors of this science remain even here true to their idea of it. They do not distinguish the motives which are presented completely *a priori* by reason alone and which are thus moral in the proper sense of the world, from empirical motives which the understanding raises to universal concepts by comparing experiences. Rather, they consider motives without regard to the difference in their source but only with reference to their larger or smaller number (as they are considered to be all of the same kind); they thus formulate their concept of obligation, which is anything but moral, but which is all that can be desired in a philosophy which does not decide whether the origin of all possible practical concepts is *a priori* or *a posteriori*.

As a preliminary to a *Metaphysics of Morals* which I intend to publish someday, I issue these *Foundations*. There is, to be sure, no other foundation for such a metaphysics than a critical examination of pure practical reason, just as there is no other foundation for metaphysics than the already published critical examination of pure speculative reason. But, in the first place, a critical examination of pure practical reason is not of such extreme importance as that of the speculative reason, because human reason, even in the commonest mind, can easily be brought to a high degree of correctness and completeness in moral matters while, on the other hand, in its theoretical but pure use it is wholly dialectical. In the second place, I require of a critical examination of pure practical reason, if it is to be complete, that its unity with the speculative be subject to presentation under a common principle, because in the final analysis there can be but one and the same reason which must be different only in application. But I could not bring this to such a completeness without bringing in observations of an altogether different kind and without thereby confusing the reader. For these reasons I have employed the title, *Foundations of the Metaphysics of Morals*, instead of *Critique of Pure Practical Reason*.

Because, in the third place, a *Metaphysics of Morals*, in spite of its forbidding title, is capable of a high degree of popular adaptation to common understanding, I find it useful to separate this preliminary work of laying the foundation, in order not to have to introduce unavoidable subtleties into the latter, more comprehensible work.

392

The present foundations, however, are nothing more than the search for and establishment of the supreme principle of morality. This constitutes a task altogether complete in design and one which should be kept separate from all other moral inquiry. My conclusions

concerning this important question, which has not yet been discussed nearly enough, would, of course, be clarified by application of the principle to the whole system of morality, and it would receive much confirmation by the adequacy which it would everywhere show. But I must forego this advantage which would be, in the final analysis, more personally gratifying than commonly useful, because ease of use and apparent adequacy of a principle are not any sure proof of correctness, but rather awaken a certain partiality which prevents a rigorous investigation and evaluation of it for itself without regard to consequences.

I have adopted in this writing the method which is, I think, most suitable if one wishes to proceed analytically from common knowledge to the determination of its supreme principle, and then synthetically from the examination of this principle and its sources back to common knowledge where it finds its application. The division is therefore as follows:

1. First Section. Transition from Common Sense Knowledge of Morals to the Philosophical
2. Second Section. Transition from Popular Moral Philosophy to the Metaphysics of Morals
3. Third Section. Final Step from the Metaphysics of Morals to the Critical Examination of Pure Practical Reason

393 FIRST SECTION

TRANSITION FROM COMMON SENSE* KNOWLEDGE OF MORALS TO THE PHILOSOPHICAL

Nothing in the world—indeed nothing even beyond the world—can possibly be conceived which could be called good without qualification except a GOOD WILL. Intelligence, wit, judgment, and other talents of the mind however they may be named, or courage, resoluteness, and perseverance as qualities of temperament, are doubtless in many respects good and desirable; but they can become extremely bad and harmful if the will, which is to make use of these gifts of nature and which in its special constitution is called character, is not good. It is the same with gifts of fortune. Power, riches, honor, even health, general well-being and the contentment with one's condition which is called happiness make for pride and even arrogance if there is not a good will to correct their influence on the mind and on its principle of action, so as to make it generally fitting to its entire end. It need hardly be mentioned that the sight of a being adorned with no feature of a pure and good will yet enjoying lasting good fortune can never give pleasure to an impartial rational observer. Thus the good will seems to constitute the indispensable condition even of worthiness to be happy.

*[*gemeine Vernunftkenntnis* ("common rational knowledge") is one of several expressions Kant uses which may sometimes best be translated as "common sense." Kant is very strict in his censure of those who appeal to common sense as an arbiter in philosophical disputes, yet he accepts it as a starting point, especially in ethics, where he says that the man of common sense has at least as much chance to be right as the philosopher. In this title "common sense" is not being used as a technical term; it just means "what everyone knows" about morality.]

Some qualities seem to be conducive to this good will and can facilitate its action, but in spite of that they have no intrinsic unconditional worth. They rather presuppose a good will, which limits the high esteem which one otherwise rightly has for them and prevents their being held to be absolutely good. Moderation in emotions and passions, self-control, and calm deliberation not only are good in many respects but seem even to constitute part of the inner worth of the person. But however unconditionally they were esteemed by the ancients, they are far from being good without qualification, for without the principles of a good will they can become extremely bad, and the coolness of a villain makes him not only far more dangerous but also more directly abominable in our eyes than he would have seemed without it. 394

The good will is not good because of what it effects or accomplishes or because of its competence to achieve some intended end; it is good only because of its willing (i.e., it is good in itself). And, regarded for itself, it is to be esteemed as incomparably higher than anything which could be brought about by it in favor of any inclination or even of the sum total of all inclinations. Even if it should happen that, by a particularly unfortunate fate or by the niggardly provision of a step-motherly nature, this will should be wholly lacking in power to accomplish its purpose, and if even the greatest effort should not avail it to achieve anything of its end, and if there remained only the good will—not as a mere wish, but as the summoning of all the means in our power—it would sparkle like a jewel all by itself, as something that had its full worth in itself. Usefulness or fruitlessness can neither diminish nor augment this worth. Its usefulness would be only its setting, as it were, so as to enable us to handle it more conveniently in commerce or to attract the attention of those who are not yet connoisseurs, but not to recommend it to those who are experts or to determine its worth.

But there is something so strange in this idea of the absolute worth of the will alone, in which no account is taken of any use, that, notwithstanding the agreement even of common sense, the suspicion must arise that perhaps only high-flown fancy is its hidden basis, and that we may have misunderstood the purpose of nature in appointing reason as the ruler of our will. We shall therefore examine this idea from this point of view. 395

In the natural constitution of an organized being (i.e., one suitably adapted to life), we assume as an axiom that no organ will be found for any purpose which is not the fittest and best adapted to that purpose. Now if its preservation, its welfare, in a word its happiness, were the real end of nature in a being having reason and will, then nature would have hit upon a very poor arrangement in appointing the reason of the creature to be the executor of this purpose. For all the actions which the creature has to perform with this intention of nature, and the entire rule of his conduct, would be dictated much more exactly by instinct, and the end would be far more certainly attained by instinct than it ever could be by reason. And if, over and above this, reason should have been granted to the favored creature, it would have served only to let him contemplate the happy constitution of his nature, to admire it, to rejoice in it, and to be grateful for it to its beneficent cause. But reason would not have been given in order that the being should subject his faculty of desire to that weak and delusive guidance and to meddle with the purpose of nature. In a word, nature would have taken care that reason did not break forth into practical use nor have the presumption, with its weak insight, to think out for itself the plan of happiness and the means of attaining it. Nature would have taken over the choice not only of ends but also of the means, and with wise foresight she would have entrusted both to instinct alone.

And, in fact, we find that the more a cultivated reason deliberately devotes itself to the enjoyment of life and happiness, the more the man falls short of true contentment.

From this fact there arises in many persons, if only they are candid enough to admit it, a certain degree of misology, hatred of reason. This is particularly the case with those who are most experienced in its use. After counting all the advantages which they draw—I will not say from the invention of the arts of common luxury—from the sciences (which in the end seem to them to be also a luxury of the understanding), they nevertheless find that they have actually brought more trouble on their shoulders instead of gaining in happiness; they finally envy, rather than despise, the common run of men who are better guided by merely natural instinct and who do not permit their reason much influence on their conduct. And we must at least admit that a morose attitude or ingratitude to the goodness with which the world is governed is by no means found always among those who temper or refute the boasting eulogies which are given of the advantages of happiness and contentment with which reason is supposed to supply us. Rather, their judgment is based on the Idea of another and far more worthy purpose of their existence for which, instead of happiness, their reason is properly intended; this purpose, therefore, being the supreme condition to which the private purposes of men must, for the most part, defer.

Since reason is not competent to guide the will safely with regard to its objects and the satisfaction of all our needs (which it in part multiplies), to this end an innate instinct would have led with far more certainty. But reason is given to us as a practical faculty (i.e., one which is meant to have an influence on the will). As nature has elsewhere distributed capacities suitable to the functions they are to perform, reason's proper function must be to produce a will good in itself and not one good merely as a means, since for the former, reason is absolutely essential. This will need not be the sole and complete good, yet it must be the condition of all others, even of the desire for happiness. In this case it is entirely compatible with the wisdom of nature that the cultivation of reason, which is required for the former unconditional purpose, at least in this life restricts in many ways—indeed, can reduce to nothing—the achievement of the latter unconditional purpose, happiness. For one perceives that nature here does not proceed unsuitably to its purpose, because reason, which recognizes its highest practical vocation in the establishment of a good will, is capable of a contentment of its own kind (i.e., one that springs from the attainment of a purpose determined by reason), even though this injures the ends of inclination.

We have, then, to develop the concept of a will which is to be esteemed as good in itself without regard to anything else. It dwells already in the natural and sound understanding and does not need so much to be taught as only to be brought to light. In the estimation of the total worth of our actions it always takes first place and is the condition of everything else. In order to show this, we shall take the concept of duty. It contains the concept of a good will, though with certain subjective restrictions and hindrances, but these are far from concealing it and making it unrecognizable, for they rather bring it out by contrast and make it shine forth all the more brightly.

I here omit all actions which are recognized as opposed to duty, even though they may be useful in one respect or another, for with these the question does not arise as to whether they may be done from duty, since they conflict with it. I also pass over actions which are really in accord with duty and to which one has no direct inclination, rather doing them because impelled to do so by another inclination. For it is easily decided whether an action in accord with duty is done from duty or for some selfish purpose. It is far more difficult to note this difference when the action is in accord with duty and, in addition, the subject has a direct inclination to do it. For example, it is in accord with duty that a dealer should not overcharge an inexperienced customer, and wherever there is much trade the prudent merchant does not do so, but has a fixed price for everyone so that a child

may buy from him as cheaply as any other. Thus the customer is honestly served, but this is far from sufficient to warrant the belief that the merchant has behaved in this way from duty and principles of honesty. His own advantage required this behavior, but it cannot be assumed that over and above that he had a direct inclination to his customers and that, out of love, as it were, he gave none an advantage in price over another. The action was done neither from duty nor from direct inclination but only for a selfish purpose.

On the other hand, it is a duty to preserve one's life, and moreover everyone has a direct inclination to do so. But for that reason, the often anxious care which most men take of it has no intrinsic worth, and the maxim of doing so has no moral import. They preserve their lives according to duty, but not from duty. But if adversities and hopeless sorrow completely take away the relish for life; if an unfortunate man, strong in soul, is indignant rather than despondent or dejected over his fate and wishes for death, and yet preserves his life without loving it and from neither inclination nor fear but from duty—then his maxim has moral merit. 398

To be kind where one can is a duty, and there are, moreover, many persons so sympathetically constituted that without any motive of vanity or selfishness they find an inner satisfaction in spreading joy and rejoice in the contentment of others which they have made possible. But I say that, however dutiful and however amiable it may be, that kind of action has no true moral worth. It is on a level with [actions done from] other inclinations, such as the inclination to honor, which, if fortunately directed to what in fact accords with duty and is generally useful and thus honorable, deserve praise and encouragement, but no esteem. For the maxim lacks the moral import of an action done not from inclination but from duty. But assume that the mind of that friend to mankind was clouded by a sorrow of his own which extinguished all sympathy with the lot of others, and though he still had the power to benefit others in distress their need left him untouched because he was preoccupied with his own. Now suppose him to tear himself, unsolicited by inclination, out of his dead insensibility and to do this action only from duty and without any inclination—then for the first time his action has genuine moral worth. Furthermore, if nature has put little sympathy into the heart of a man, and if he, though an honest man, is by temperament cold and indifferent to the sufferings of others perhaps because he is provided with special gifts of patience and fortitude and expects and even requires that others should have them too—and such a man would certainly not be the meanest product of nature—would not he find in himself a source from which to give himself a far higher worth than he could have got by having a good-natured temperament? This is unquestionably true even though nature did not make him philanthropic, for it is just here that the worth of character is brought out, which is morally the incomparably highest of all: he is beneficent not from inclination, but from duty. 399

To secure one's own happiness is at least indirectly a duty, for discontent with one's condition under pressure from many cares and amid unsatisfied wants could easily become a great temptation to transgress against duties. But, without any view to duty, all men have the strongest and deepest inclination to happiness, because in this Idea all inclinations are summed up. But the precept of happiness is often so formulated that it definitely thwarts some inclinations, and men can make no definite and certain concept of the sum of satisfaction of all inclinations, which goes under the name of happiness. It is not to be wondered at, therefore, that a single inclination, definite as to what it promises and as to the time at which it can be satisfied, can outweigh a fluctuating idea and that, for example, a man with the gout can choose to enjoy what he likes and to suffer what he may, because according to his calculations at least on this occasion he has not sacrificed the enjoyment of the present moment to a perhaps groundless expectation of a happiness supposed to lie in health. But

even in this case if the universal inclination to happiness did not determine his will, and if health were not at least for him a necessary factor in these calculations, there would still remain, as in all other cases, a law that he ought to promote his happiness not from inclination but from duty. Only from this law could his conduct have true moral worth.

It is in this way, undoubtedly, that we should understand those passages of Scripture which command us to love our neighbor and even our enemy, for love as an inclination cannot be commanded. But beneficence from duty, even when no inclination impels it and even when it is opposed by a natural and unconquerable aversion, is practical love, not pathological* love; it resides in the will and not in the propensities of feeling, in principles of action and not in tender sympathy; and it alone can be commanded.

[Thus the first proposition of morality is that to have genuine moral worth, an action must be done from duty.] The second proposition is: An action done from duty does not have its moral worth in the purpose which is to be achieved through it but in the maxim whereby it is determined. Its moral value, therefore, does not depend upon the realization of the object of the action but merely on the principle of the volition by which the action is done irrespective of the objects of the faculty of desire. From the preceding discussion it is clear that the purposes we may have for our actions and their effects as ends and incentives of the will cannot give the actions any unconditional and moral worth. Wherein, then, can this worth lie, if it is not in the will in its relation to its hoped-for effect? It can lie nowhere else than in the principle of the will irrespective of the ends which can be realized by such action. For the will stands, as it were, at the crossroads halfway between its *a priori* principle which is formal and its posteriori incentive which is material. Since it must be determined by something, if it is done from duty it must be determined by the formal principle of volition as such, since every material principle has been withdrawn from it.

The third principle, as a consequence of the two preceding, I would express as follows: Duty is the necessity to do an action from respect for law. I can certainly have an inclination to an object as an effect of the proposed action, but I can never have respect for it precisely because it is a mere effect and not an activity of a will. Similarly, I can have no respect for any inclination whatsoever, whether my own or that of another; in the former case I can at most approve of it and in the latter I can even love it (i.e., see it as favorable to my own advantage). But that which is connected with my will merely as ground and not as consequence, that which does not serve my inclination but overpowers it or at least excludes it from being considered in making a choice—in a word, law itself—can be an object of respect and thus a command. Now as an act from duty wholly excludes the influence of inclination and therewith every object of the will, nothing remains which can determine the will objectively except law and subjectively except pure respect for this practical law. This subjective element is the maxim** that I should follow such a law even if it thwarts all my inclinations.

Thus the moral worth of an action does not lie in the effect which is expected from it or in any principle of action which has to borrow its motive from this expected effect. For all these effects (agreeableness of my own condition, indeed even the promotion of the happiness of others) could be brought about through other causes and would not require the will of a rational being, while the highest and unconditional good can be found only in such a will. Therefore the preeminent good can consist only in the

*[Here as elsewhere Kant uses the word pathological to describe motives and actions arising from feeling or bodily impulses, with no suggestion of abnormality or disease.]

**A maxim is the subjective principle of volition. The objective principle (i.e., that which would serve all rational beings also subjectively as a practical principle if reason had full power over the faculty of desire) is the practical law.

conception of law in itself (which can be present only in a rational being) so far as this conception and not the hoped-for effect is the determining ground of the will. This pre-eminent good, which we call moral, is already present in the person who acts according to this conception, and we do not have to look for it first in the result.*

But what kind of law can that be, the conception of which must determine the will without reference to the expected result? Under this condition alone can the will be called absolutely good without qualification. Since I have robbed the will of all impulses which could come to it from obedience to any law, nothing remains to serve as a principle of the will except universal conformity to law as such. That is, I ought never to act in such a way that I could not also will that my maxim should be a universal law. Strict conformity to law as such (without assuming any particular law applicable to certain actions) serves as the principle of the will, and it must serve as such a principle if duty is not to be a vain delusion and chimerical concept. The common sense of mankind (*gemeine Menschenvernunft*) in its practical judgments is in perfect agreement with this and has this principle constantly in view.

402

Let the question, for example, be: May I, when in distress, make a promise with the intention not to keep it? I easily distinguish the two meanings which the question can have, viz., whether it is prudent to make a false promise, or whether it conforms to duty. The former can undoubtedly be often the case, though I do see clearly that it is not sufficient merely to escape from the present difficulty by this expedient, but that I must consider whether inconveniences much greater than the present one may not later spring from this lie. Even with all my supposed cunning, the consequences cannot be so easily foreseen. Loss of credit might be far more disadvantageous than the misfortune I am now seeking to avoid, and it is hard to tell whether it might not be more prudent to act according to a universal maxim and to make it a habit not to promise anything without intending to fulfill it. But it is soon clear to me that such a maxim is based only on an apprehensive concern with consequences.

To be truthful from duty, however, is an entirely different thing from being truthful out of fear of untoward consequences, for in the former case the concept of the action itself contains a law for me, while in the latter I must first look about to see what results for me may be connected with it. To deviate from the principle of duty is certainly bad, but to be unfaithful to my maxim of prudence can sometimes be very advantageous to me, though it is certainly safer to abide by it. The shortest but most infallible way to find the answer to the question as to whether a deceitful promise is consistent with duty is to ask

403

*It might be objected that I seek to take refuge in an obscure feeling behind the word "respect," instead of clearly resolving the question with a concept of reason. But though respect is a feeling, it is not one received through any [outer] influence but is self-wrought by a rational concept; thus it differs specifically from all feelings of the former kind which may be referred to inclination or fear. What I recognize directly as a law for myself I recognize with respect, which means merely the consciousness of the submission of my will to a law without the intervention of other influences on my mind. The direct determination of the will by law and the consciousness of this determination is respect; thus respect can be regarded as the effect of the law on the subject and not as the cause of the law. Respect is properly the conception of a worth which thwarts my self-love. Thus it is regarded as an object neither of inclination nor of fear, though it has something analogous to both. The only object of respect is law, and indeed only the law which we impose on ourselves and yet recognize as necessary in itself. As a law we are subject to it without consulting self-love; as imposed on us by ourselves, it is a consequence of our will. In the former respect it is analogous to fear and in the latter to inclination. All respect for a person is only respect for the law (of righteousness, etc.) of which the person provides an example. Because we see the improvement of our talents as a duty, we think of a person of talent as the example of a law, as it were (the law that we should by practice become like him in his talents), and that constitutes our respect. All so-called moral interest consists solely in respect for the law.

myself: Would I be content that my maxim of extricating myself from difficulty by a false promise should hold as a universal law for myself as well as for others? And could I say to myself that everyone may make a false promise when he is in a difficulty from which he otherwise cannot escape? Immediately I see that I could will the lie but not a universal law to lie. For with such a law there would be no promises at all, inasmuch as it would be futile to make a pretense of my intention in regard to future actions to those who would not believe this pretense or—if they overhastily did so—would pay me back in my own coin. Thus my maxim would necessarily destroy itself as soon as it was made a universal law.

I do not, therefore, need any penetrating acuteness to discern what I have to do in order that my volition may be morally good. Inexperienced in the course of the world, incapable of being prepared for all its contingencies, I only ask myself: Can I will that my maxim become a universal law? If not, it must be rejected, not because of any disadvantage accruing to myself or even to others, but because it cannot enter as a principle into a possible enactment of universal law, and reason extorts from me an immediate respect for such legislation. I do not as yet discern on what it is grounded (this is a question the philosopher may investigate), but I at least understand that it is an estimation of a worth which far outweighs all the worth of whatever is recommended by the inclinations, and that the necessity that I act from pure respect for the practical law constitutes my duty. To duty every other motive must give place, because duty is the condition of a will good in itself, whose worth transcends everything.

Thus within the moral knowledge of ordinary human reason (*gemeine Menschenvernunft*) we have attained its principle. To be sure, ordinary human reason does not think this principle abstractly in such a universal form, but it always has the principle in view and uses it as the standard for its judgments. It would be easy to show how ordinary human reason, with this compass, knows well how to distinguish what is good, what is bad, and what is consistent or inconsistent with duty. Without in the least teaching common reason anything new, we need only to draw its attention to its own principle (in the manner of Socrates), thus showing that neither science nor philosophy is needed in order to know what one has to do in order to be honest and good, and even wise and virtuous. We might have conjectured beforehand that the knowledge of what everyone is obliged to do and thus also to know would be within the reach of everyone, even of the most ordinary man. Here we cannot but admire the great advantages which the practical faculty of judgment has over the theoretical in ordinary human understanding. In the theoretical, if ordinary reason ventures to go beyond the laws of experience and perceptions of the senses, it falls into sheer inconceivabilities and selfcontradictions, or at least into a chaos of uncertainty, obscurity, and instability. In the practical, on the other hand, the power of judgment first shows itself to advantage when common understanding excludes all sensuous incentives from practical laws. It then even becomes subtle, quibbling with its own conscience or with other claims to what should be called right, or wishing to determine accurately, for its own instruction, the worth of certain actions. But the most remarkable thing about ordinary human understanding in its practical concern is that it may have as much hope as any philosopher of hitting the mark. In fact, it is almost more certain to do so that the philosopher, for while he has no principle which common understanding lacks, his judgment is easily confused by a mass of irrelevant considerations so that it easily turns aside from the correct way. Would it not, therefore, be wiser in moral matters to acquiesce in ordinary reasonable judgment and at most to call in philosophy in order to make the system of morals more complete and comprehensible and its rules more convenient for use (especially in disputation), than to steer the ordinary understanding from its happy simplicity in practical matters and to lead it through philosophy into a new path of inquiry and instruction?

Innocence is indeed a glorious thing, but it is very sad that it cannot well maintain itself, being easily led astray. For this reason, even wisdom—which consists more in acting than in knowing—needs science, not so as to learn from it but to secure admission and permanence to its precepts. Man feels in himself a powerful counterpoise against all commands of duty which reason presents to him as so deserving of respect. This counterpoise is his needs and inclinations, the complete satisfaction of which he sums up under the name of happiness. Now reason issues inexorable commands without promising anything to the inclinations. It disregards, as it were, and holds in contempt those claims which are so impetuous and yet so plausible, and which refuse to be suppressed by any command. From this a natural dialectic arises, i.e., a propensity to argue against the stern laws of duty and their validity, or at least to place their purity and strictness in doubt and, where possible, to make them more accordant with our wishes and inclinations. This is equivalent to corrupting them in their very foundations and destroying their dignity—a thing which even ordinary practical reason cannot finally call good.

In this way ordinary human reason is impelled to go outside its sphere and to take a step into the field of practical philosophy. But it is forced to do so not by any speculative need, which never occurs to it so long as it is satisfied to remain merely healthy reason; rather, it is impelled on practical grounds to obtain information and clear instruction respecting the source of its principle and the correct definition of this principle in its opposition to the maxims based on need and inclination. It seeks this information in order to escape from the perplexity of opposing claims and to avoid the danger of losing all genuine moral principles through the equivocation in which it is easily involved. Thus when ordinary practical reason cultivates itself, a dialectic surreptitiously ensues which forces it to seek aid in philosophy, just as the same thing happens in the theoretical use of reason. Ordinary practical reason, like theoretical reason, will find rest only in a complete critical examination of our reason.

SECOND SECTION

406

TRANSITION FROM POPULAR MORAL PHILOSOPHY TO THE METAPHYSICS OF MORALS

Although we have derived our earlier concept of duty from the ordinary use of our practical reason, it is by no means to be inferred that we have treated it as an empirical concept. On the contrary, if we attend to our experience of the way men act, we meet frequent and, as we must confess, justified complaints that we cannot cite a single sure example of the disposition to act from pure duty. There are also justified complaints that, though much may be done that accords with what duty commands, it is nevertheless always doubtful whether it is done from duty and thus whether it has moral worth. There have always been philosophers who for this reason have absolutely denied the reality of this disposition in human actions, attributing everything to more or less refined self-love. They have done so without questioning the correctness of the concept of morality. Rather they spoke with sincere regret of the frailty and corruption of human nature, which is noble enough to take as its precept an Idea so worthy of respect but which at the same time is too weak to follow it, employing reason, which should give laws for human nature, only to provide for the interest of the inclinations either singly or, at best, in their greatest possible harmony with one another.

407 It is, in fact, absolutely impossible by experience to discern with complete certainty a single case in which the maxim of an action, however much it might conform to duty, rested solely on moral grounds and on the conception of one's duty. It sometimes happens that in the most searching self-examination we can find nothing except the moral ground of duty which could have been powerful enough to move us to this or that good action and to such great sacrifice. But from this we cannot by any means conclude with certainty that a secret impulse of self-love, falsely appearing as the Idea of duty, was not actually the true determining cause of the will. For we like to flatter ourselves with a pretended nobler motive, while in fact even the strictest examination can never lead us entirely behind the secret incentives, for when moral worth is in question it is not a matter of actions which one sees but of their inner principles which one does not see.

Moreover, one cannot better serve the wishes of those who ridicule all morality as a mere phantom of human imagination overreaching itself through self-conceit than by conceding that the concepts of duty must be derived only from experience (for they are ready, from indolence, to believe that this is true of all other concepts too). For, by this concession, a sure triumph is prepared for them. Out of love for humanity I am willing to admit that most of our actions are in accord with duty; but if we look more closely at our thoughts and aspirations, we come everywhere upon the dear self, which is always turning up, and it is this instead of the stern command of duty (which would often require self-denial) which supports our plans. One need not be an enemy of virtue, but only a cool observer who does not confuse even the liveliest aspiration for the good with its actuality, to be sometimes doubtful whether true virtue can really be found anywhere in the world. This is especially true as one's years increase and the power of judgment is made wiser by experience and more acute in observation. This being so, nothing can secure us against
408 the complete abandonment of our ideas of duty and preserve in us a well-founded respect for its law except the conviction that, even if there never were actions springing from such pure sources, our concern is not whether this or that was done, but that reason of itself and independently of all appearances commanded what ought to be done. Our concern is with actions of which perhaps the world has never had an example, with actions whose feasibility might be seriously doubted by those who base everything on experience, and yet with actions inexorably commanded by reason. For example, pure sincerity in friendship can be demanded of every man, and this demand is not in the least diminished if a sincere friend has never existed, because this duty, as duty in general, prior to all experience lies in the Idea of reason which determines the will on *a priori* grounds.

No experience, it is clear, can give occasion for inferring the possibility of such apodictic laws. This is especially clear when we add that, unless we wish to deny all truth to the concept of morality and renounce its application to any possible object, we cannot refuse to admit that the law is of such broad significance that it holds not merely for men but for all rational beings as such; we must grant that it must be valid with absolute necessity, and not merely under contingent conditions and with exceptions. For with what right could we bring into unlimited respect something that might be valid only under contingent human conditions? And how could laws of the determination of our will be held to be laws of the determination of the will of any rational being whatever and of ourselves in so far as we are rational beings, if they were merely empirical and did not have their origin completely *a priori* in pure, but practical, reason?

Nor could one given poorer counsel to morality than to attempt to derive it from examples. For each example of morality which is exhibited must itself have been previously judged according to principles of morality to see whether it was worthy to serve as an original example or model. By no means could it authoritatively furnish the concept of

morality. Even the Holy One of the Gospel must be compared with our ideal of moral perfection before He is recognized as such; even He says of Himself, "Why call ye Me (Whom you see) good? None is good (the archetype of the good) except God only (Whom you do not see)." But whence do we have the concept of God as the highest good? Solely from the Idea of moral perfection which reason formulates *a priori* and which it inseparably connects with the concept of a free will. Imitation has no place in moral matters, and examples serve only for encouragement. That is, they put beyond question the possibility of performing what the law commands, and they make visible that which the practical rule expresses more generally. But they can never justify our guiding ourselves by examples and our setting aside their true original, which lies in reason. 409

If there is thus no genuine supreme principle of morality which does not rest on pure reason alone independent of all possible experience, I do not believe it is necessary even to ask whether it is well to exhibit these concepts generally (in abstracto), which, together with the principles belonging to them, are established *a priori*. At any rate, the question need not be asked if knowledge of them is to be distinguished from ordinary knowledge and called philosophical. But in our times this question may be necessary. For if we collected votes as to whether pure rational knowledge separated from all experience (i.e., a metaphysics of morals) or popular practical philosophy is to be preferred, it is easily guessed on which side the majority would stand.

This condescension to popular notions is certainly very commendable once the ascent to the principles of pure reason has been satisfactorily accomplished. That would mean the prior establishment of the doctrine of morals on metaphysics and then, when it is established, procuring a hearing for it through popularization. But it is extremely absurd to want to achieve popular appeal in the first investigation, where everything depends on the correctness of the fundamental principles. Not only can this procedure never make claim to that rarest merit of true philosophical popularity, since there is really no art in being generally comprehensible if one thereby renounces all basic insight; but it produces a disgusting jumble of patched-up observations and half-reasoned principles. Shallow pates enjoy this, for it is very useful in everyday chitchat, while the more sensible feel confused and dissatisfied and avert their eyes without being able to help themselves. But philosophers, who see through this delusion, get little hearing when they call people away from this would-be popularity so that they may have genuine popular appeal once they have gained a definite understanding. 410

One need only look at the essays on morality favored by popular taste. One will sometimes meet with the particular vocation of human nature (but occasionally with the Idea of a rational nature in general), sometimes perfection and sometimes happiness, here moral feeling, there fear of God, a little of this and a little of that in a marvelous mixture. It never occurs to the authors, however, to ask whether the principles of morality are, after all, to be sought anywhere in knowledge of human nature (which we can derive only from experience). And if this is not the case, if the principles are *a priori*, free from everything empirical, and found exclusively in pure rational concepts and not at all in any other place, they never ask whether they should undertake this investigation as a separate inquiry (i.e., as pure practical philosophy) or (if one may use a name so decried) a metaphysics* of morals. They never think of dealing with it alone and bringing it by

*If one wishes, the pure philosophy (metaphysics) of morals can be distinguished from the applied (i.e., applied to human nature), just as pure mathematics and pure logic are distinguished from applied mathematics and applied logic. By this designation one is immediately reminded that moral principles are not founded on the peculiarities of human nature but must stand of themselves *a priori*, and that from such principles practical rules for every rational nature, and accordingly for man, must be derivable.

itself to completeness and of requiring the public, which desires popularization, to await the outcome of this undertaking.

But a completely isolated metaphysics of morals, mixed with no anthropology, no theology, no physics or hyperphysics, and even less with occult qualities (which might be called hypophysical), is not only an indispensable substrate of all theoretically sound and definite knowledge of duties; it is also a desideratum of the highest importance to the actual fulfillment of its precepts. For the thought of duty and of the moral law generally, with no admixture of empirical inducements, has an influence on the human heart so
 411 much more powerful than all other incentives* which may be derived from the empirical field that reason, in the consciousness of its dignity, despises them and gradually becomes master over them. It has this influence only through reason alone, which thereby first realizes that it can of itself be practical. A mixed theory of morals which is put together from incentives of feelings and inclinations and from rational concepts must, on the other hand, make the mind vacillate between motives which cannot be brought together under any principle and which can lead only accidentally to the good, and frequently lead to the bad.

From what has been said it is clear that all moral concepts have their seat and origin entirely *a priori* in reason. This is just as much the case in the most ordinary reason as in the reason which is speculative to the highest degree. It is obvious that they can be abstracted from no empirical and hence merely contingent cognitions. In the purity of origin lies their worthiness to serve us as supreme practical principles, and to the extent that something empirical is added to them, just this much is subtracted from their genuine influence and from the unqualified worth of actions. Furthermore, it is evident that it is not only of the greatest necessity from a theoretical point of view when it is a question of speculation but also of the utmost practical importance to derive the concepts and laws of morals from pure reason and to present them pure and unmixed, and to determine the scope of this entire practical but pure rational knowledge (the entire faculty of pure practical reason) without making the principles depend upon the particular nature of human
 412 reason, as speculative philosophy may permit and even find necessary. But since moral laws should hold for every rational being as such, the principles must be derived from the universal concept of a rational being in general. In this manner all morals, which need anthropology for their application to men, must be completely developed first as pure philosophy (i.e., metaphysics), independently of anthropology (a thing feasibly done in such distinct fields of knowledge). For we know well that if we are not in possession of such a metaphysics, it is not merely futile [to try to] define accurately for the purposes of speculative judgment the moral element of duty in all actions which accord with duty, but impossible to base morals on legitimate principles for even ordinary practical use, especially in moral instruction; and it is only in this manner that pure moral dispositions can be produced and engrafted on men's minds for the purpose of the highest good in the world.

*I have a letter from the late excellent Sulzer in which he asks me why the theories of virtue accomplish so little even though they contain so much that is convincing to reason. My answer was delayed in order that I might make it complete. The answer is only that the teachers themselves have not completely clarified their concepts, and when they wish to make up for this by hunting in every quarter for motives to the morally good so as to make their physic right strong, they spoil it. For the commonest observation shows that if we imagine an act of honesty performed with a steadfast soul and sundered from all view to any advantage in this or another world and even under the greatest temptations of need or allurements, it far surpasses and eclipses any similar action which was affected in the least by any foreign incentive; it elevates the soul and arouses the wish to be able to act in this way. Even moderately young children feel this impression, and one should never represent duties to them in any other way.

In this study we do not advance merely from the common moral judgment (which here is very worthy of respect) to the philosophical, as this has already been done; but we advance by natural stages from popular philosophy (which goes no farther than it can grope by means of examples) to metaphysics (which is not held back by anything empirical and which, as it must measure out the entire scope of rational knowledge of this kind, reaches even Ideas, where examples fail us). In order to make this advance, we must follow and clearly present the practical faculty of reason from its universal rules of determination to the point where the concept of duty arises from it.

Everything in nature works according to laws. Only a rational being has the capacity of acting according to the *conception* of laws (i.e., according to principles). This capacity is the will. Since reason is required for the derivation of actions from laws, will is nothing less than practical reason. If reason infallibly determines the will, the actions which such a being recognizes as objectively necessary are also subjectively necessary. That is, the will is a faculty of choosing only that which reason, independently of inclination, recognizes as practically necessary (i.e., as good). But if reason of itself does not sufficiently determine the will, and if the will is subjugated to subjective conditions (certain incentives) which do not always agree with the objective conditions—in a word, if the will is not of itself in complete accord with reason (which is the actual case with men), then the actions which are recognized as objectively necessary are subjectively contingent, and the determination of such a will according to objective laws is a constraint. That is, the relation of objective laws to a will which is not completely good is conceived as the determination of the will of a rational being by principles of reason to which this will is not by its nature necessarily obedient. 413

The conception of an objective principle, so far as it constrains a will, is a command (of reason), and the formula of this command is called an *imperative*.

All imperatives are expressed by an “ought” and thereby indicate the relation of an objective law of reason to a will which is not in its subjective constitution necessarily determined by this law. This relation is that of constraint. Imperatives say that it would be good to do or to refrain from doing something, but they say it to a will which does not always do something simply because the thing is presented to it as good to do. Practical good is what determines the will by means of the conception of reason and hence not by subjective causes but objectively, on grounds which are valid for every rational being as such. It is distinguished from the pleasant, as that which has an influence on the will only by means of a sensation from purely subjective causes, which hold for the senses only of this or that person and not as a principle of reason which holds for everyone.*

A perfectly good will, therefore, would be equally subject to objective laws of the good, but it could not be conceived as constrained by them to accord with them, because 414

*The dependence of the faculty of desire on sensations is called inclination, and inclination always indicates a need. The dependence of a contingently determinable will on principles of reason, however, is called interest. An interest is present only in a dependent will which is not of itself always in accord with reason; in the divine will we cannot conceive of an interest. But even the human will can take an interest in something without thereby acting from interest. The former means the practical interest in the action; the latter, the pathological interest in the object of the action. The former indicates only the dependence of the will on principles of reason in themselves, while the latter indicates dependence on the principles of reason for the purpose of inclination, since reason gives only the practical rule by which the needs of inclination are to be aided. In the former case the action interests me, and in the latter the object of the action (so far as it is pleasant for me) interests me. In the First Section we have seen that, in the case of an action done from duty, no regard must be given to the interest in the object, but merely to the action itself and its principle in reason (i.e., the law).

it can be determined to act by its own subjective constitution only through the conception of the good. Thus no imperatives hold for the divine will or, more generally, for a holy will. The "ought" here is out of place, for the volition of itself is necessarily in unison with the law. Therefore imperatives are only formulas expressing the relation of objective laws of volition in general to the subjective imperfection of the will of this or that rational being, for example, the human will.

All imperatives command either *hypothetically* or *categorically*. The former present the practical necessity of a possible action as a means to achieving something else which one desires (or which one may possibly desire). The categorical imperative would be one which presented an action as of itself objectively necessary, without regard to any other end.

Since every practical law presents a possible action as good and thus as necessary for a subject practically determinable by reason, all imperatives are formulas of the determination of action which is necessary by the principle of a will which is in any way good. If the action is good only as a means to something else, the imperative is hypothetical; but if it is thought of as good in itself, and hence as necessary in a will which of itself conforms to reason as the principle of this will, the imperative is categorical.

The imperative thus says what action possible for me would be good, and it presents the practical rule in relation to a will which does not forthwith perform an action simply because it is good, in part because the subject does not always know that the action is good, and in part (when he does know it) because his maxims can still be opposed to the objective principles of a practical reason.

415 The hypothetical imperative, therefore, says only that the action is good to some purpose, possible or actual. In the former case, it is a problematical, in the latter an assertorical, practical principle. The categorical imperative, which declares the action to be of itself objectively necessary without making any reference to any end in view (i.e., without having any other purpose), holds as an apodictical practical principle.

We can think of what is possible only through the powers of some rational being as a possible end in view of any will. As a consequence, the principles of action thought of as necessary to attain a possible end in view which can be achieved by them, are in reality infinitely numerous. All sciences have some practical part consisting of problems which presuppose some purpose as well as imperatives directing how it can be reached. These imperatives can therefore be called, generally, imperatives of skill. Whether the purpose is reasonable and good is not in question at all, for the questions concerns only what must be done in order to attain it. The precepts to be followed by a physician in order to cure his patient and by a poisoner to bring about certain death are of equal value in so far as each does that which will perfectly accomplish his purpose. Since in early youth we do not know what purposes we may have in the course of our life, parents seek to let their children learn a great many things and provide for skill in the use of means to all sorts of ends which they might choose, among which they cannot determine whether any one of them will become their child's actual purpose, though it may be that someday he may have it as his actual purpose. And this anxiety is so great that they commonly neglect to form and correct their children's judgment on the worth of the things which they may make their ends.

There is one end, however, which we may presuppose as actual in all rational beings so far as imperatives apply to them, that is, so far as they are dependent beings. There is one purpose which they not only can have but which we can presuppose that they all *do* have by a necessity of nature. This purpose is happiness. The hypothetical imperative which represents the practical necessity of an action as means to the promotion of happiness is an assertorical imperative. We may not expound it as necessary to a

Immanuel Kant and Luncheon Guests, 1893, by E. Doestling. While Kant led a simple, routine-filled life, he was known as a delightful conversationalist and host who had many friends and admirers. (©ullstein bild/Getty)

merely uncertain and merely possible purpose, but as necessary to a purpose which we can *a priori* and with assurance assume for everyone because it belongs to his essence. Skill in the choice of means to one's own highest well-being can be called prudence* in the narrowest sense. Thus the imperative which refers to the choice of means to one's own happiness (i.e., the precept of prudence) is still only hypothetical, and the action is not commanded absolutely but commanded only as a means to another end in view. 416

*The word "prudence" may be taken in two senses, and it may bear the names of prudence with reference to things of the world and private prudence. The former sense means the skill of a man in having an influence on others so as to use them for his own purposes. The latter is the ability to unite all these purposes to his own lasting advantage. The worth of the first is finally reduced to the latter, and of one who is prudent in the former sense but not in the latter we might better say that he is clever and cunning yet, on the whole, imprudent.

Finally, there is one imperative which directly commands certain conduct without making its condition some purpose to be reached by it. This imperative is categorical. It concerns not the material of the action and its intended result, but the form and principle from which it originates. What is essentially good in it consists in the mental disposition, the result being what it may. This imperative may be called the imperative of morality.

Volition according to these three principles is plainly distinguished by the dissimilarity in the constraints by which they subject the will. In order to clarify this dissimilarity, I believe that they are most suitably named if one says that they are either rules of skill, counsels of prudence, or commands (laws) of morality, respectively. For law alone implies the concept of an unconditional and objective and hence universally valid necessity, and commands are laws which must be obeyed even against inclination. Counsels do indeed involve necessity, but a necessity that can hold only under a subjectively contingent condition (i.e., whether this or that man counts this or that as part of his happiness). The categorical imperative, on the other hand, is restricted by no condition. As absolutely, though practically, necessary it can be called a command in the strict sense. We could also
 417 call the first imperatives technical (belonging to art), the second *pragmatic** (belonging to well-being), and the third moral (belonging to free conduct as such, i.e., to morals).

The question now arises: How are all these imperatives possible? This question does not require an answer as to how the action which the imperative commands can be performed, but only an answer as to how the constraint of the will, which the imperative expresses in setting the problem, can be conceived. How an imperative of skill is possible requires no particular discussion. Whoever wills the end, so far as reason has decisive influence on his action, wills also the indispensably necessary steps to it that he can take. This proposition, in what concerns the will, is analytical; for, in the willing of an object as an effect, my causality, as an acting cause of this effect shown in my use of the means to it, is already thought, and the imperative derives the concept of actions necessary to this purpose from the concept of willing this purpose. Synthetical propositions undoubtedly are necessary for determining the means to a proposed end, but they do not concern the ground, the act of the will, but only the way to achieve the object. Mathematics teaches, by synthetical propositions only, that in order to bisect a line according to an infallible principle, I must make two intersecting arcs from each of its extremities; but if I know the proposed result can be obtained only by such an action, then it is an analytical proposition that, if I fully will the effect, I must also will the action necessary to produce it. For it is one and the same thing to conceive of something as an effect which is in a certain way possible through me, and to conceive of myself as acting in this way.

If it were only easy to give a definite concept of happiness, the imperatives of prudence would perfectly correspond to those of skill and would likewise be analytical. For
 418 it could then be said in this case as well as in the former that whoever wills the end wills also (necessarily according to reason) the only means to it which are in his power. But it is a misfortune that the concept of happiness is so indefinite that, although each person wishes to attain it, he can never definitely and self-consistently state what it is that he really wishes and wills. The reason for this is that all elements which belong to the concept of happiness are empirical (i.e., they must be taken from experience), while for the Idea of happiness an absolute whole, a maximum, of well-being is needed in my present

*It seems to me that the proper meaning of the word "pragmatic" could be most accurately defined in this way. For sanctions which properly flow not from the law of states as necessary statutes but from provision for the general welfare are called pragmatic. A history is pragmatically composed when it teaches prudence (i.e., instructs the world how it could provide for its interest better than, or at least as well as, has been done in the past).

and in every future condition. Now it is impossible for even a most clear-sighted and most capable but finite being to form here a definite concept of that which he really wills. If he wills riches, how much anxiety, envy, and intrigues might he not thereby draw upon his shoulders! If he wills much knowledge and vision, perhaps it might become only an eye that much sharper to show him as more dreadful the evils which are now hidden from him and which are yet unavoidable; or it might be to burden his desires—which already sufficiently engage him—with even more needs! If he wills long life, who guarantees that it will not be long misery! If he wills at least health, how often has not the discomfort of his body restrained him from excesses into which perfect health would have led him? In short, he is not capable, on any principle and with complete certainty, of ascertaining what would make him truly happy; omniscience would be needed for this. He cannot, therefore, act according to definite principles so as to be happy, but only according to empirical counsels (e.g., those of diet, economy, courtesy, restraint, etc.) which are shown by experience best to promote well-being on the average. Hence the imperatives of prudence cannot, in the strict sense, command (i.e., present actions objectively as practically necessary); thus they are to be taken as counsels (*consilia*) rather than as commands (*praecepta*) of reason, and the task of determining infallibly and universally what action will promote the happiness of a rational being is completely unsolvable. There can be no imperative which would, in the strict sense, command us to do what makes for happiness, because happiness is an ideal not of reason but of imagination, depending only on empirical grounds which one would expect in vain to determine an action through which the totality of consequences—which in fact is infinite—could be achieved. Assuming that the means to happiness could be infallibly stated, this imperative of prudence would be an analytically practical proposition for it differs from the imperative of skill only in that its purpose is given, while in the imperative of skill it is merely a possible purpose. Since both, however, command the means to that which one presupposes as a willed purpose, the imperative which commands the willing of the means to him who wills the end is in both cases analytical. There is, consequently, no difficulty in seeing the possibility of such an imperative.

419

To see how the imperative of morality is possible, then, is without doubt the only question needing an answer. It is not hypothetical, and thus the objectively conceived necessity cannot be supported by any presupposed purpose, as was the case with the hypothetical imperatives. But it must not be overlooked that it cannot be shown by any example (i.e., it cannot be empirically shown) that there is such an imperative. Rather, it is to be suspected that all imperatives which appear to be categorical are tacitly hypothetical. For instance, when it is said, "Thou shalt not make a false promise," we assume that the necessity of this prohibition is not a mere counsel for the sake of escaping some other evil, so that it would read: "Thou shalt not make a false promise, lest, if it comes to light, thou ruinest thy credit." [In so doing] we assume that an action of this kind must be regarded as in itself bad and that the imperative prohibiting it is categorical, but we cannot show with certainty by any example that the will is here determined by the law alone without any other incentives, although it appears to be so. For it is always possible that secretly fear of disgrace, and perhaps also obscure apprehension of other dangers, may have had an influence on the will. Who can prove by experience the nonexistence of a cause when experience shows us only that we do not perceive the cause? In such a case the so-called moral imperative, which as such appears to be categorical and unconditional, would be actually only a pragmatic precept which makes us attentive to our own advantage and teaches us to consider it.

Thus we shall have to investigate purely *a priori* the possibility of a categorical imperative, for we do not have the advantage that experience would show us the reality of this imperative so that the [demonstration of its] possibility would be necessary only for its explanation, and not for its establishment. In the meantime, this much at least may be seen: the categorical imperative alone can be taken as a practical law, while all other imperatives may be called principles of the will but not laws. This is because what is necessary merely for the attainment of some chosen end can be regarded as itself contingent and we get rid of the precept once we give up the end in view, whereas the unconditional command leaves the will no freedom to choose the opposite. Thus it alone implies the necessity which we require of a law.

Secondly, in the case of the categorical imperative or law of morality, the cause of the difficulty in discerning its possibility is very weighty. This imperative is an *a priori* synthetical practical proposition* and since to discern the possibility of propositions of this sort is so difficult in theoretical knowledge it may well be gathered that it will be no less difficult in practical knowledge.

In attacking this problem, we will first inquire whether the mere concept of a categorical imperative does not also furnish the formula containing the proposition which alone can be a categorical imperative. For even when we know the formula of the imperative, to learn how such an absolute command is possible will require difficult and special labors which we shall postpone to the last Section.

If I think of a hypothetical imperative as such, I do not know what it will contain until the condition is stated [under which it is an imperative]. But if I think of a categorical imperative, I know immediately what it will contain. For since the imperative contains, besides the law, only the necessity of the maxim** of acting in accordance with the law, while the law contains no condition to which it is restricted, nothing remains except the universality of law as such to which the maxim of the action should conform; and this conformity alone is what is represented as necessary by the imperative.

There is, therefore, only one categorical imperative. It is: Act only according to that maxim by which you can at the same time will that it should become a universal law.

Now if all imperatives of duty can be derived from this one imperative as a principle, we can at least show what we understand by the concept of duty and what it means, even though it remain undecided whether that which is called duty is an empty concept or not.

The universality of law according to which effects are produced constitutes what is properly called nature in the most general sense (as to form) (i.e., the existence of things so far as it is determined by universal laws). [By analogy], then, the universal imperative of duty can be expressed as follows: Act as though the maxim of your action were by your will to become a universal law of nature.

*I connect *a priori*, and hence necessarily, the action with the will without supposing as a condition that there is any inclination [to the action] (though I do so only objectively, i.e., under the Idea of a reason which would have complete power over all subjective motives). This is, therefore, a practical proposition which does not analytically derive the willing of an action from some other volition already presupposed (for we do not have such a perfect will); it rather connects it directly with the concept of the will of a rational being as something which is not contained within it.

**A maxim is the subjective principle of acting and must be distinguished from the objective principle (i.e., the practical law). The former contains the practical rule which reason determines according to the conditions of the subject (often his ignorance or inclinations) and is thus the principle according to which the subject acts. The law, on the other hand, is the objective principle valid for every rational being, and the principle by which it ought to act, i.e., an imperative.

We shall now enumerate some duties, adopting the usual division of them into duties to ourselves and to others and into perfect and imperfect duties.*

1. A man who is reduced to despair by a series of evils feels a weariness with life but is still in possession of his reason sufficiently to ask whether it would not be contrary to his duty to himself to take his own life. Now he asks whether the maxim of his action could become a universal law of nature. His maxim, however is: For love of myself, I make it my principle to shorten my life when by a longer duration it threatens more evil than satisfaction. But it is questionable whether this principle of self-love could become a universal law of nature. One immediately sees a contradiction in a system of nature whose law would be to destroy life by the feeling whose special office is to impel the improvement of life. In this case it would not exist as nature; hence that maxim cannot obtain as a law of nature, and thus it wholly contradicts the supreme principle of all duty. 422

2. Another man finds himself forced by need to borrow money. He well knows that he will not be able to repay it, but he also sees that nothing will be lent him if he does not firmly promise to repay it at a certain time. He desires to make such a promise, but he has enough conscience to ask himself whether it is not improper and opposed to duty to relieve his distress in such a way. Now, assuming he does decide to do so, the maxim of his action would be as follows: When I believe myself to be in need of money, I will borrow money and promise to repay it, although I know I shall never be able to do so. Now this principle of self-love or of his own benefit may very well be compatible with his whole future welfare, but the question is whether it is right. He changes the pretension of self-love into a universal law and then puts the question: How would it be if my maxim became a universal law? He immediately sees that it could never hold as a universal law of nature and be consistent with itself; rather it must necessarily contradict itself. For the universality of a law which says that anyone who believes himself to be in need could promise what he pleased with the intention of not fulfilling it would make the promise itself and the end to be accomplished by it impossible; no one would believe what was promised to him but would only laugh at any such assertion as vain pretense.

3. A third finds in himself a talent which could, by means of some cultivation, make him in many respects a useful man. But he finds himself in comfortable circumstances and prefers indulgence in pleasure to troubling himself with broadening and improving his fortunate natural gifts. Now, however, let him ask whether his maxim of neglecting his gifts, besides agreeing with his propensity to idle amusement, agrees also with what is called duty. He sees that a system of nature could indeed exist in accordance with such a law, even though man (like the inhabitants of the South Sea Islands) should let his talents rust and resolve to devote his life merely to idleness, indulgence, and propagation—in a word, to pleasure. But he cannot possibly will that this should become a universal law of nature or that it should be implanted in us by a natural instinct. For, as a rational being, he necessarily wills that all his faculties should be developed, inasmuch as they are given him and serve him for all sorts of purposes. 423

4. A fourth man, for whom things are going well, sees that others (whom he could help) have to struggle with great hardships, and he asks, "What concern of mine is it? Let each one be as happy as heaven wills, or as he can make himself; I will not take anything

*It must be noted here that I reserve the division of duties for a future *Metaphysics of Morals* and that the division here stands as only an arbitrary one (chosen in order to arrange my examples). For the rest, by a perfect duty I here understand a duty which permits no exception in the interest of inclination; thus I have not merely outer but also inner perfect duties. This runs contrary to the usage adopted in the schools, but I am not disposed to defend it here because it is all one to my purpose whether this is conceded or not.

from him or even envy him; but to his welfare or to his assistance in time of need I have no desire to contribute." If such a way of thinking were a universal law of nature, certainly the human race could exist, and without doubt even better than in a state where everyone talks of sympathy and good will or even exerts himself occasionally to practice them while, on the other hand, he cheats when he can and betrays or otherwise violates the right of man. Now although it is possible that a universal law of nature according to that maxim could exist, it is nevertheless impossible to will that such a principle should hold everywhere as a law of nature. For a will which resolved this would conflict with itself, since instances can often arise in which he would need the love and sympathy of others, and in which he would have robbed himself, by such a law of nature springing from his own will, of all hope of the aid he desires.

424 The foregoing are a few of the many actual duties, or at least of duties we hold to be actual, whose derivation from the one stated principle is clear. We must be able to will that a maxim of our action become a universal law; this is the canon of the moral estimation of our action generally. Some actions are of such a nature that their maxim cannot even be *thought* as a universal law of nature without contradiction, far from it being possible that one could will that it should be such. In others this internal impossibility is not found, though it is still impossible to *will* that that maxim should be raised to the universality of a law of nature, because such a will would contradict itself. We easily see that a maxim of the first kind conflicts with stricter or narrower (imprescriptable) duty, that of the latter with broader (meritorious) duty. Thus all duties, so far as the kind of obligation (not the object of their action) is concerned, have been completely exhibited by these examples in their dependence upon the same principle.

When we observe ourselves in any transgression of a duty, we find that we do not actually will that our maxim should become a universal law. That is impossible for us; rather, the contrary of this maxim should remain as a law generally, and we only take the liberty of making an exception to it for ourselves or for the sake of our inclination, and for this one occasion. Consequently, if we weighed everything from one and the same standpoint, namely, reason, we would come upon a contradiction in our own will, viz., that a certain principle is objectively necessary as a universal law and yet subjectively does not hold universally but rather admits exceptions. However, since we regard our action at one time from the point of view of a will wholly conformable to reason and then from that of a will affected by inclinations, there is actually no contradiction, but rather an opposition of inclination to the precept of reason (*antagonismus*). In this the universality of the principle (*universalitas*) is changed into mere generality (*generalitas*), whereby the practical principle of reason meets the maxim halfway. Although this cannot be justified in our own impartial judgment, it does show that we actually acknowledge the validity of the categorical imperative and allow ourselves (with all respect to it) only a few exceptions which seem to us to be unimportant and forced upon us.

425 We have thus at least established that if duty is a concept which is to have significance and actual law-giving authority for our actions, it can be expressed only in categorical imperatives and not at all in hypothetical ones. For every application of it we have also clearly exhibited the content of the categorical imperative which must contain the principle of all duty (if there is such). This is itself very much. But we are not yet advanced far enough to prove *a priori* that that kind of imperative really exists, that there is a practical law which of itself commands absolutely and without any incentives, and that obedience to this law is duty.

With a view to attaining this, it is extremely important to remember that we must not let ourselves think that the reality of this principle can be derived from the particular

constitution of human nature. For duty is practical unconditional necessity of action; it must, therefore, hold for all rational beings (to which alone an imperative can apply), and only for that reason can it be a law for all human wills. Whatever is derived from the particular natural situation of man as such, or from certain feelings and propensities, or even from a particular tendency of the human reason which might not hold necessarily for the will of every rational being (if such a tendency is possible), can give a maxim valid for us but not a law; that is, it can give a subjective principle by which we might act if only we have the propensity and inclination, but not an objective principle by which we would be directed to act even if all our propensity, inclination, and natural tendency were opposed to it. This is so far the case that the sublimity and intrinsic worth of the command is the better shown in a duty the fewer subjective causes there are for it and the more they are against it; the latter do not weaken the constraint of the law or diminish its validity.

Here we see philosophy brought to what is, in fact, a precarious position, which should be made fast even though it is supported by nothing in either heaven or earth. Here philosophy must show its purity, as the absolute sustainer of its laws, and not as the herald of laws which an implanted sense or who knows what tutelary nature whispers to it. Those may be better than nothing at all, but they can never afford fundamental principles, which reason alone dictates. These fundamental principles must originate entirely *a priori* and thereby obtain their commanding authority; they can expect nothing from the inclination of men but everything from the supremacy of the law and due respect for it. Otherwise they condemn man to self-contempt and inner abhorrence. 426

Thus everything empirical is not only wholly unworthy to be an ingredient in the principle of morality but is even highly prejudicial to the purity of moral practices themselves. For, in morals, the proper and inestimable worth of an absolutely good will consists precisely in the freedom of the principle of action from all influences from contingent grounds which only experience can furnish. We cannot too much or too often warn against the lax or even base manner of thought which seeks its principles among empirical motives and laws, for human reason in its weariness is glad to rest on this pillow. In a dream of sweet illusions (in which it embraces not Juno but a cloud), it substitutes for morality a bastard patched up from limbs of very different parentage, which looks like anything one wishes to see in it, but not like virtue to anyone who has ever beheld her in her true form.*

The question then is: Is it a necessary law for all rational beings that they should always judge their actions by such maxims as they themselves could will to serve as universal laws? If there is such a law, it must be connected wholly *a priori* with the concept of the will of a rational being as such. But in order to discover this connection, we must, however reluctantly, take a step into metaphysics, although in a region of it different from speculative philosophy, namely into the metaphysics of morals. In a practical philosophy it is not a question of assuming grounds for what happens but of assuming laws of what ought to happen even though it may never happen (that is to say, we assume objective practical laws). Hence in practical philosophy we need not inquire into the reasons why something pleases or displeases, how the pleasure of mere feeling differs from taste, and whether this is distinct from a general satisfaction of reason. Nor need we ask on what the feeling of pleasure or displeasure rests, how desires and inclinations arise, and how, finally, maxims arise from desires and inclination under the 427

*To behold virtue in her proper form is nothing else than to exhibit morality stripped of all admixture of sensuous things and of every spurious adornment of reward or self-love. How much she then eclipses everything which appears charming to the senses can easily be seen by everyone with the least effort of his reason, if it be not spoiled for all abstraction.

co-operation of reason. For all these matters belong to empirical psychology, which would be the second part of physics if we consider it as philosophy of nature so far as it rests on empirical laws. But here it is a question of objectively practical laws and thus of the relation of a will to itself so far as it determines itself only by reason, for everything which has a relation to the empirical automatically falls away, because if reason of itself alone determines conduct, it must necessarily do so *a priori*. The possibility of reason's thus determining conduct must now be investigated.

The will is thought of as a faculty of determining itself to action in accordance with the conception of certain laws. Such a faculty can be found only in rational beings. That which serves the will as the objective ground of its self-determination is a purpose, and if it is given by reason alone it must hold alike for all rational beings. On the other hand, that which contains the ground of the possibility of the action, whose result is an end, is called the means. The subjective ground of desire is the incentive (Triebfeder) while the objective ground of volition is the motive (Bewegungsgrund). Thus arises the distinction between subjective purposes, which rest on incentives, and objective purposes, which depend on motives valid for every rational being. Practical principles are formal when they disregard all subjective purposes; they are material when they have subjective purposes and thus certain incentives as their basis. The purposes that a rational being holds before himself by choice as consequences of his action are material purposes and are without exception only relative, for only their relation to a particularly constituted faculty of desire in the subject gives them their worth. And this worth cannot afford any universal
428 principles for all rational beings or any principles valid and necessary for every volition. That is, they cannot give rise to any practical laws. All these relative purposes, therefore, are grounds for hypothetical imperatives only.

But suppose that there were something the existence of which in itself had absolute worth, something which, as an end in itself, could be a ground of definite laws. In it and only in it could lie the ground of a possible categorical imperative (i.e., of a practical law).

Now, I say, man and, in general, every rational being exists as an end in himself and not merely as a means to be arbitrarily used by this or that will. In all his actions, whether they are directed toward himself or toward other rational beings, he must always be regarded at the same time as an end. All objects of inclination have only conditional worth, for if the inclinations and needs founded on them did not exist, their object would be worthless. The inclinations themselves as the sources of needs, however, are so lacking in absolute worth that the universal wish of every rational being must be indeed to free himself completely from them. Therefore, the worth of any objects to be obtained by our actions is at times conditional. Beings whose existence does not depend on our will but on nature, if they are not rational beings, have only relative worth as means, and are therefore called "things"; rational beings, on the other hand, are designated "persons" because their nature indicates that they are ends in themselves (i.e., things which may not be used merely as means). Such a being is thus an object of respect, and as such restricts all [arbitrary] choice. Such beings are not merely subjective ends whose existence as a result of our action has a worth for us, but are objective ends (i.e., beings whose existence is an end in itself). Such an end is one in the place of which no other end, to which these beings should serve merely as means, can be put. Without them, nothing of absolute worth could be found, and if all worth is conditional and thus contingent, no supreme practical principle for reason could be found anywhere.

Thus if there is to be a supreme practical principle and a categorical imperative for the human will, it must be one that forms an objective principle of the will from the conception of that which is necessarily an end for everyone because it is an end in itself. Hence this objective principle can serve as a universal law. The ground of this principle is: rational nature exists as an end in itself. Man necessarily thinks of his own existence in this way, and thus far it is a subjective principle of human actions. Also every other rational being thinks of his existence on the same rational ground which holds also for myself;* thus it is at the same time an objective principle from which, as a supreme practical ground, it must be possible to derive all laws of the will. The practical imperative, therefore, is the following: Act so that you treat humanity, whether in your own person or in that of another, always as an end and never as a means only. Let us now see whether this can be achieved. To return to our previous examples: 429

First, according to the concept of necessary duty to oneself, he who contemplates suicide will ask himself whether his action can be consistent with the idea of humanity as an end in itself. If in order to escape from burdensome circumstances he destroys himself, he uses a person merely as a means to maintain a tolerable condition up to the end of life. Man, however, is not a thing, and thus not something to be used merely as a means; he must always be regarded in all his actions as an end in himself. Therefore I cannot dispose of man in my own person so as to mutilate, corrupt, or kill him. (It belongs to ethics proper to define more accurately this basic principle so as to avoid all misunderstanding, e.g., as to amputating limbs in order to preserve myself, or to exposing my life to danger in order to save it; I must therefore omit them here.)

Second, as concerns necessary or obligatory duties to others, he who intends a deceitful promise to others sees immediately that he intends to use another man merely as a means, without the latter at the same time containing the end in himself. For he whom I want to use for my own purposes by means of such a promise cannot possibly assent to my mode of acting against him and thus share in the purpose of this action. This conflict with the principle of other men is even clearer if we cite examples of attacks on their freedom and property, for then it is clear that he who violates the rights of men intends to make use of the person of others merely as means, without considering that, as rational beings, they must always be esteemed at the same time as ends (i.e., only as beings who must be able to embody in themselves the purpose of the very same action).** 430

Third, with regard to contingent (meritorious) duty to oneself, it is not sufficient that the action not conflict with humanity in our person as an end in itself; it must also harmonize with it. In humanity there are capacities for greater perfection which belong to the purpose of nature with respect to humanity in our own person, and to neglect these might perhaps be consistent with the preservation of humanity as an end in itself, but not with the furtherance of that end.

Fourth, with regard to meritorious duty to others, the natural purpose that all men have is their own happiness. Humanity might indeed exist if no one contributed to the happiness of others, provided he did not intentionally detract from it, but this harmony

*Here I present this proposition as a postulate, but in the last Section grounds for it will be found.

**Let it not be thought that the banal "what you do not wish to be done to you . . ." could here serve as guide or principle, for it is only derived from the principle and is restricted by various limitations. It cannot be a universal law, because it contains the ground neither of duties to one's self nor of the benevolent duties to others (for many a man would gladly consent that others should not benefit him, provided only that he might be excused from showing benevolence to them). Nor does it contain the ground of obligatory duties to another, for the criminal would argue on this ground against the judge who sentences him. And so on.

with humanity as an end in itself is only negative, not positive, if everyone does not also endeavor, as far as he can, to further the purposes of others. For the ends of any person, who is an end in himself, must as far as possible be also my ends, if that conception of an end in itself is to have its full effect on me.

431 This principle of humanity, and in general of every rational creature an end in itself, is the supreme limiting condition on the freedom of action of each man. It is not borrowed from experience, first, because of its universality, since it applies to all rational beings generally, and experience does not suffice to determine anything about them; and secondly, because in experience humanity is not thought of (subjectively) as the purpose of men (i.e., as an object which we of ourselves really make our purpose). Rather it is thought of as the objective end which ought to constitute the supreme limiting condition of all subjective ends whatever they may be. Thus this principle must arise from pure reason. Objectively the ground of all practical legislation lies (according to the first principle) in the rule and form of universality, which makes it capable of being a law (at least a natural law); subjectively it lies in the end. But the subject of all ends is every rational being as an end in itself (by the second principle); from this there follows the third practical principle of the will as the supreme condition of its harmony with universal practical reason, viz, the Idea of the will of every rational being as making universal law.

By this principle all maxims are rejected which are not consistent with the will's giving universal law. The will is not only subject to the law, but subject in such a way that it must be conceived also as itself prescribing the law, of which reason can hold itself to be the author; it is on this ground alone that the will is regarded as subject to the law.

By the very fact that the imperatives are thought of as categorical, either way of conceiving them—as imperatives demanding the lawfulness of actions, resembling the lawfulness of the natural order; or as imperatives of the universal prerogative of the purposes of rational beings as such—excludes from their sovereign authority all admixture of any interest as an incentive to obedience. But we have been assuming the imperatives to be categorical, for that was necessary if we wished to explain the concept of duty; that there are practical propositions which command categorically could not of itself be proved independently, just as little as it can be proved anywhere in this section. One thing, however could have been done: to indicate in the imperative itself, by some determination inherent in it, that in willing from duty the renunciation of all interest is the specific mark of the categorical imperative, distinguishing it from the hypothetical. And this is now done in the third formulation of the principle, viz., in the Idea of the will of every rational being as a will giving universal law. A will which is subject to laws can be bound to them by an interest, but a will giving the supreme law cannot possibly depend upon any interest, for such a dependent will would itself need still another law which
432 would restrict the interest of its self-love to the condition that its [maxim] should be valid as a universal law.

Thus the principle of every human will as a will giving universal law in all its maxims* is very well adapted to being a categorical imperative, provided it is otherwise correct. Because of the Idea of giving universal law, it is based on no interest; and thus of all possible imperatives, it alone can be unconditional. Or, better, converting the proposition: if there is a categorical imperative (a law for the will of every rational being), it can command only that everything be done from the maxim of its will as one which could have as its object only itself considered as giving universal law. For only in

*I may be excused from citing examples to elucidate this principle, for those that have already illustrated the categorical imperative and its formula can here serve the same purpose.

this case are the practical principle and the imperative which the will obeys unconditional, because the will can have no interest as its foundation.

If now we look back upon all previous attempts which have ever been undertaken to discover the principle of morality, it is not to be wondered at that they all had to fail. Man was seen to be bound to laws by his duty, but it was not seen that he is subject to his own, but still universal, legislation, and that he is bound to act only in accordance with his own will, which is, however, designed by nature to be a will giving universal law. For if one thought of him as only subject to a law (whatever it may be), this necessarily implied some interest as a stimulus or compulsion to obedience because the law did not arise from his will. Rather, his will had to be constrained by something else to act in a certain way. By this strictly necessary consequence, however, all the labor of finding a supreme ground for duty was irrevocably lost, and one never arrived at duty but only at the necessity of acting from a certain interest. This might be his own interest or that of another, but in either case the imperative always had to be conditional, and could not at all serve as a moral command. The moral principle I will call the principle of *autonomy* of the will in contrast to all other principles which I accordingly count under *heteronomy*. 433

The concept of any rational being as a being that must regard itself as giving universal law through all the maxims of its will, so that it may judge itself and its actions from this standpoint, leads to a very fruitful concept, namely that of a *realm of ends*.

By *realm* I understand the systematic union of different rational beings through common laws. Because laws determine which ends have universal validity, if we abstract from personal differences of rational beings, and thus from all content of their private purposes, we can think of a whole of all ends in systematic connection, a whole of rational beings as ends in themselves as well as a whole of particular purposes which each may set for himself. This is a realm of ends, which is possible on the principles stated above. For all rational beings stand under the law that each of them should treat himself and all others never merely as means, but in every case at the same time as an end in himself. Thus there arises a systematic union of rational beings through common objective laws. This is a realm which may be called a realm of ends (certainly only an ideal) because what these laws have in view is just the relation of these beings to each other as ends and means.

A rational being belongs to the realm of ends as a member when he gives universal laws in it while also himself subject to these laws. He belongs to it as sovereign when, as legislating, he is subject to the will of no other. The rational being must regard himself always as legislative in a realm of ends possible through the freedom of the will whether he belongs to it as member or as sovereign. He cannot maintain his position as sovereign merely through the maxims of his will, but only when he is a completely independent being without need and with unlimited power adequate to his will. 434

Morality, therefore, consists in the relation of every action to the legislation through which alone a realm of ends is possible. This legislation must be found in every rational being. It must be able to arise from his will, whose principle then is to do no action according to any maxim which would be inconsistent with its being a universal law, and thus to act only so that the will through its maxims could regard itself at the same time as giving universal law. If the maxims do not by their nature already necessarily conform to this objective principle of rational beings as giving universal law, the necessity of acting according to that principle is called practical constraint, which is to say: duty. Duty pertains not to the sovereign of the realm of ends, but rather to each member and to each in the same degree.

The practical necessity of acting according to this principle (duty) does not rest at all on feelings, impulses, and inclinations; it rests solely on the relation of rational beings to one another, in which the will of a rational being must always be regarded as legislative, for otherwise it could not be thought of as an end in itself. Reason, therefore, relates every maxim of the will as giving universal laws to every other will and also to every action towards itself; it does not do so for the sake of any other practical motive or future advantage but rather from the Idea of the dignity of a rational being who obeys no law except one which he himself also gives.

In the realm of ends everything has either a *price* or a *dignity*. Whatever has a price can be replaced by something else as its equivalent; on the other hand, whatever is above all price and therefore admits of no equivalent, has dignity.

- 435 That which is related to general human inclinations and needs has a *market price*. That which, without presupposing any need, accords with a certain taste (i.e., with pleasure in the purposeless play of our faculties) has a *fancy price*. But that which constitutes the condition under which alone something can be an end in itself does not have mere relative worth (price) but an intrinsic worth (*dignity*).

Morality is the condition under which alone a rational being can be an end in himself, because only through it is it possible to be a lawgiving member in the realm of ends. Thus morality, and humanity so far as it is capable of morality, alone have dignity. Skill and diligence in work have a market value; wit, lively imagination, and humor have a fancy price; but fidelity in promises and benevolence on principle (not benevolence from instinct) have intrinsic worth. Nature and likewise art contain nothing which could make up for their lack, for their worth consists not in the effects which flow from them nor in any advantage and utility which they procure; it consists only in mental dispositions, maxims of the will, which are ready to reveal themselves in this manner through actions even though success does not favor them. These actions need no recommendation from my subjective disposition or taste in order that they may be looked upon with immediate favor and satisfaction, nor do they have need of any direct propensity or feeling directed to them. They exhibit the will which performs them as the object of an immediate respect, since nothing but reason is required in order to impose them upon the will. The will is not to be cajoled into them, for this, in the case of duties, would be a contradiction. This esteem lets the worth of such a turn of mind be recognized as dignity and puts it infinitely beyond any price; with things of price it cannot in the least be brought into any competition or comparison without, as it were, violating its holiness.

- 436 And what is it that justifies the morally good disposition or virtue in making such lofty claims? It is nothing less that the participation it affords the rational being in giving universal laws. He is thus fitted to be a member in a possible realm of ends, to which his own nature already destined him. For, as an end in himself, he is destined to be a lawgiver in the realm of ends, free from all laws of nature and obedient only to those laws which he himself gives. Accordingly, his maxims can belong to a universal legislation to which he is at the same time subject. A thing has no worth other than that determined for it by the law. The lawgiving which determines all worth must therefore have a dignity (i.e., an unconditional and incomparable worth). For the esteem which a rational being must have for it, only the word "respect" is suitable. Autonomy is thus the basis of the dignity of both human nature and every rational nature.

The three aforementioned ways of presenting the principle of morality are fundamentally only so many formulas of the very same law, and each of them unites the others in itself. There is, nevertheless, a difference between them, but the difference is

more subjectively than objectively practical, for the difference is intended to bring an Idea of reason closer to intuition (by means of a certain analogy) and thus nearer to feeling. All maxims have:

1. A form, which consists in universality, and in this respect the formula of the moral imperative requires that maxims be chosen as though they should hold as universal laws of nature.
2. A material (i.e., an end), and in this respect the formula says that the rational being, as by its nature an end and thus as an end in itself, must serve in every maxim as the condition restricting all merely relative and arbitrary ends.
3. A complete determination of all maxims by the formula that all maxims which stem from autonomous legislation ought to harmonize with a possible realm of ends as with a realm of nature.*

There is a progression here like that through the categories of the unity of the form of the will (its universality), the plurality of material (the objects, ends), to the all-comprehensiveness or totality of the system of ends. But it is better in moral valuation to follow the rigorous method and to make the universal formula of the categorical imperative the basis: Act according to the maxim which can at the same time make itself a universal law. But if one wishes to gain a hearing for the moral law, it is very useful to bring one and the same action under the three stated principles and thus, so far as possible, bring it nearer to intuition.

437

We can now end where we started, with the concept of an unconditionally good will. That will is absolutely good which cannot be bad, and thus it is a will whose maxim, when made universal law, can never conflict with itself. Thus this principle is also its supreme law: Always act according to that maxim whose universality as law you can at the same time will. This is the only condition under which a will can never come into conflict with itself, and such an imperative is categorical. Because the validity of the will as a universal law for possible actions has an analogy with the universal connection of the existence of things under universal laws, which is the formal element of nature in general, the categorical imperative can be expressed also as follows: Act on those maxims which can at the same time have themselves as universal laws of nature as their object. Such, then, is the formula of an absolutely good will.

Rational nature is distinguished from others in that it proposes an end to itself. This end would be the material of every good will. Since, however, in the Idea of an absolutely good will without the limiting condition that this or that end be achieved, we must abstract from every end to be actually effected (as any particular end would make each will only relatively good), we must conceive the end here not as one to be brought about, but as a self-existent end, and thus merely negatively, as that which must never be acted against and which consequently must never be valued merely as a means but in every volition also as an end. Now this end can never be other than the subject of all possible ends themselves, because this is at the same time the subject of a possible will which is absolutely good, for the latter cannot without contradiction be made secondary to any other object. The principle: Act with reference to every rational being (whether yourself or another) so that in your maxim it is an end in itself, is thus basically identical with the principle: Act by a maxim which involves its own universal validity for every rational being.

438

*Teleology considers nature as a realm of ends; morals regards a possible realm of ends as a realm of nature. In the former the realm of ends is a theoretical Idea for the explanation of what actually is. In the latter it is a practical Idea for bringing about that which does not exist but which can become actual through our conduct and for making it conform with this Idea.

That in the use of means to any end I should restrict my maxim to the condition of its universal validity as a law for every subject is tantamount to saying that the subject of ends (i.e., the rational being itself) must be made the basis of all maxims of actions and thus be treated never as a mere means but as the supreme limiting condition in the use of all means (i.e., as at the same time an end).

It follows incontestably that every rational being must be able to regard himself as an end in himself with reference to all laws to which he may be subject whatever they may be, and thus see himself as giving universal laws. For it is just the fitness of his maxims to universal legislation that indicates that he is an end in himself. It also follows that his dignity (his prerogative) over all merely natural beings entails that he must take his maxims from the point of view that regards himself, and hence also every other rational being, as legislative. Rational beings are, on this account, called persons. In this way, a world of rational beings (*mundus intelligibilis*) is possible as a realm of ends, because of the legislation belonging to all persons as members. Consequently every rational being must act as if by his maxims he were at all times a legislative member of the universal realm of ends. The formal principle of these maxims is: So act as if your maxims should serve at the same time as universal law (for all rational beings).

A realm of ends is thus possible only by analogy with a realm of nature. The former is possible only by maxims (i.e., self-imposed rules), while the latter is possible by laws of efficient causes of things externally necessitated. Regardless of this difference, by analogy we call the natural whole a realm of nature so far as it is related to rational beings as its end; we do so even though the natural whole is looked upon as a machine. Such a realm of ends would actually be realized through maxims whose rule is prescribed to all rational beings by the categorical imperative, if they were universally obeyed. But a rational being, though he scrupulously follow this maxim, cannot for that reason expect every other rational being to be true to it, nor can he expect the realm of nature and its orderly design to harmonize with him as a fitting member of a realm of ends which is possible through himself. That is, he cannot count on its favoring his expectation of happiness. Still the law: Act according to the maxim of a member of a merely potential realm of ends who gives universal law, remains in full force because it commands categorically. And just in this lies the paradox that simply the dignity of humanity as rational nature without any end or advantage to be gained by it, and thus respect for a mere Idea, should serve as the inflexible precept of the will. [There is the further paradox that] the sublimity of the maxims and the worthiness of every rational subject to be a law-giving member in the realm of ends consist precisely in the independence of his maxims from all such incentives. Otherwise he would have to be viewed as subject to only the natural law of his needs. Although the realm of nature as well as that of ends would be thought of as united under a sovereign, so that the latter would no longer remain a mere Idea but would receive true reality, the realm of ends would undoubtedly gain a strong urge in its favor though its intrinsic worth would not be augmented. Regardless of this, even the one and only absolute legislator would still have to be conceived as judging the worth of rational beings only by the disinterested conduct which they prescribe to themselves merely from the Idea. The essence of things is not changed by their external relations, and without reference to these relations a man must be judged only by what constitutes his absolute worth, and this is true whoever his judge may be, even if it be the Supreme Being. Morality is thus the relation of actions to the autonomy of the will (i.e., to the possible giving of universal law by the maxims of the will). The action which can be compatible with the autonomy of the will is permitted; that which does not agree with it is prohibited. The will whose maxims

are necessarily in harmony with the laws of autonomy is a holy will or an absolutely good will. The dependence of a will not absolutely good on the principle of autonomy (moral constraint) is *obligation*. Hence obligation cannot be predicated of a holy will. The objective necessity of an action from obligation is called *duty*.

From what has just been said, it can easily be explained how it happens that, although in the concept of duty we think of subjection to law, we do nevertheless at the same time ascribe a certain sublimity and dignity to the person who fulfills all his duties. For though there is no sublimity in him in so far as he is subject to the moral law, yet he is sublime in so far as he is the giver of the law and subject to it for this reason only. We have also shown above how neither fear of nor inclination to the law is the incentive which can give moral worth to action; only respect for it can do so. Our own will, so far as it would act only under the condition of a universal legislation rendered possible by its maxims—this will ideally possible for us—is the proper object of respect, and the dignity of humanity consists just in its capacity to give universal laws under the condition that it is itself subject to this same legislation. 440

The Autonomy of the Will as the Supreme Principle of Morality

Autonomy of the will is that property of it by which it is a law to itself independent of any property of the objects of its volition. Hence the principle of autonomy is: Never choose except in such a way that the maxims of the choice are comprehended as universal law in the same volition. That this practical rule is an imperative, that is, that the will of every rational being is necessarily bound to it as a condition, cannot be proved by a mere analysis of the concepts occurring in it, because it is a synthetical proposition. To prove it, we would have to go beyond the knowledge of objects to a critical examination of the subject (i.e., to a critique of pure practical reason), for this synthetical proposition which commands apodictically must be susceptible of being known *a priori*. This matter, however, does not belong in the present section. But that the principle of autonomy, which is now in question, is the sole principle of morals can be readily shown by mere analysis of the concepts of morality; for by this analysis we find that its principle must be a categorical imperative and that the imperative commands neither more nor less than this very autonomy.

The Heteronomy of the Will as the Source of All Spurious Principles of Morality 441

If the will seeks the law which is to determine it elsewhere than in the fitness of its maxims to be given as universal law, and if thus it goes outside and seeks the law in the property of any of its objects, heteronomy always results. For then the will does not give itself the law, but the object through its relation to the will gives the law to it. This relation, whether it rests on inclination or on conceptions of reason, admits of only hypothetical imperatives: I should do something for the reason that I will something else. The moral (categorical) imperative, on the other hand, says that I should act in this or that way even though I have not willed anything else. For example, the former says that I should not lie if I wish to keep my good name. The latter says that I should not lie even though it would not cause me the least injury. The latter, therefore, must disregard every object to such an extent that it has absolutely no influence on the will; it must so disregard it that practical reason (will) may not just minister to any interest not its own but rather show its commanding authority as the supreme legislation. Thus, for instance, I should seek to further the happiness of others, not as though its realization were of consequence to me (because

of a direct inclination or some satisfaction related to it indirectly through reason); I should do so solely because the maxim which excludes it from my duty cannot be comprehended as a universal law in one and the same volition.

Classification of All Possible Principles of Morality Following from the Assumed Principle of Heteronomy

Here as everywhere in the pure use of reason so long as a critical examination of it is lacking, human reason tries all possible wrong ways before it succeeds in finding the one true way.

442 All principles which can be taken from this point of view are either empirical or rational. The former, drawn from the principles of happiness, are based on physical or moral feeling; the latter, drawn from the principle of perfection, are based either on the rational concept of perfection as a possible result or on the concept of an independent perfection (the will of God) as the determining ground of the will.

Empirical principles are not at all suited to serve as the basis of moral laws. For if the basis of the universality by which they should be valid for all rational beings without distinction (the unconditional practical necessity which is thereby imposed upon them) is derived from a particular tendency of human nature or the accidental circumstance in which it is found, that universality is lost. But the principle of one's own happiness is the most objectionable of the empirical principles. This is not merely because it is false and because experience contradicts the supposition that well-being is always proportional to good conduct, nor yet because this principle contributes nothing to the establishment of morality inasmuch as it is a very different thing to make a man happy from making him good, and to make him prudent and farsighted for his own advantage is far from making him virtuous. Rather, it is because this principle supports morality with incentives which undermine it and destroy all its sublimity, for it puts the motives to virtue and those to vice in the same class, teaching us only to make a better calculation while obliterating the specific difference between them. On the other hand, there is the alleged special sense,* the moral feeling. The appeal to it is superficial, since those who cannot think expect help from feeling, even with respect to that which concerns universal laws; they do so even though feelings naturally differ so infinitely in degree that they are incapable of furnishing a uniform standard of the good and bad, and also in spite of the fact that one cannot validly judge for others by means of one's own feeling. Nevertheless, the moral feeling is nearer to morality and its dignity, inasmuch as it pays 443 virtue the honor of ascribing the satisfaction and esteem for her directly to morality, and does not, as it were, say to her face that it is not her beauty but only our advantage which attaches us to her.

Among the rational principles of morality, there is the ontological concept of perfection. It is empty, indefinite, and consequently useless for finding in the immeasurable field of possible reality the greatest possible sum which is suitable to us; and, in specifically distinguishing the reality which is here in question from all other reality, it inevitably tends to move in a circle and cannot avoid tacitly presupposing the morality which it ought to explain. Nevertheless, it is better than the theological concept, which derives morality from a most perfect divine will. It is better

*I count the principle of moral feeling under that of happiness, because every empirical interest promises to contribute to our well-being by the agreeableness that a thing affords, either directly and without a view to future advantage or with a view to it. We must likewise, with Hutcheson, count the principle of sympathy with the happiness of others under the moral sense which he assumed.

not merely because we cannot intuit the perfection of the divine will, having rather to derive it only from our own concepts of which morality itself is foremost, but also because if we do not so derive it (and to do so would involve a most flagrant circle in explanation), the only remaining concept of the divine will is made up of the attributes of desire for glory and dominion combined with the awful conceptions of might and vengeance, and any system of ethics based on them would be directly opposed to morality.

But if I had to choose between the concept of the moral sense and that of perfection in general (neither of which at any rate weakens morality, though neither is capable of serving as its foundation), I would decide for the latter, because it preserves the indefinite Idea of a will good in itself free from corruption until it can be more narrowly defined. It at least withdraws the decision on the question from the realm of sensibility and brings it to the court of pure reason, although it does not even there decide the question.

For the rest, I think I may be excused from a lengthy refutation of all these doctrines. It is so easy, and presumably so well understood even by those whose office requires them to decide for one of these theories (since their students would not tolerate suspension of judgment), that such a refutation would be superfluous. What interests us more, however, is to know that all these principles set up nothing other than heteronomy of the will as the first ground of morality, and thus they necessarily miss their goal.

In every case in which the object of the will must be assumed as prescribing the rule which is to determine the will, the rule is nothing else than heteronomy. The imperative in this case is conditional, stating that if or because one wills such and such an object, one ought to act thus or so. Therefore the imperative can never command morally, that is, categorically. The object may determine the will by means of inclination, as in the principle of one's own happiness, or by means of reason directed to objects of our possible volition in general, as in the principle of perfection; but the will in these cases never determines itself directly by the conception of the action itself but only by the incentive which the foreseen result of the action incites in the will—that is: I ought to do something because I will something else. And here still another law must be assumed in me as the basis for this imperative; it would be a law by which I would necessarily will that other thing; but this law would in its turn require an imperative to restrict this maxim. Since the conception of a result to be obtained by one's own powers incites in the will an impulse which depends upon the natural characteristic of the subject, either of his sensibility (inclination and taste) or understanding and reason; and since these faculties according to the particular constitution of their nature find satisfaction in exercising themselves on the result of the voluntary action, it follows that it would really be nature which would give the law [to the action]. This law, as a law of nature, would have to be known and proved by experience, and as in itself contingent it would be unfit to be an apodictical practical rule such as the moral rule must be. Such a law always represents heteronomy of the will: the will does not give itself the law, but an external impulse gives the law to the will according to nature of the subject which is susceptible to receive it. 444

The absolutely good will, the principle of which must be a categorical imperative, is thus undetermined with reference to any object. It contains only the form of volition in general, and this form is autonomy. That is, the capability of the maxims of every good will to make themselves universal laws is itself the sole law which the will of every rational being imposes on himself, and it does not need to support this by any incentive or interest.

How such a synthetical practical *a priori* proposition is possible and why it is necessary is a problem whose solution does not lie within the boundaries of the metaphysics of morals. Moreover, we have not here affirmed its truth, and even less
 445 professed to command a proof of it. We showed only through the development of the generally received concept of morals that autonomy of the will is unavoidably connected with it, or rather that it is its foundation. Whoever, therefore, holds morality to be something real and not a chimerical idea without truth must also concede its principle which has been derived here. Consequently, this section, like the first, was merely analytical. To prove that morality is not a mere phantom of the mind—and if the categorical imperative, and with it the autonomy of the will, is true and absolutely necessary as an *a priori* proposition, it follows that it is no phantom—requires that a synthetical use of pure practical reason be possible. But we must not venture on this use without first making a critical examination of this faculty of reason. In the last section we shall give the principal features of such an examination that will be sufficient for our purpose.

446 THIRD SECTION

TRANSITION FROM THE METAPHYSICS OF MORALS TO THE CRITICAL EXAMINATION OF PURE PRACTICAL REASON

The Concept of Freedom Is the Key to the Explanation of the Autonomy of the Will

As will is a kind of causality of living beings so far as they are rational, freedom would be that property of this causality by which it can be effective independent of foreign causes determining it, just as natural necessity is the property of the causality of all irrational beings by which they are determined to activity by the influence of foreign causes.

The preceding definition of freedom is negative and therefore affords no insight into its essence. But a positive concept of freedom flows from it which is so much the richer and more fruitful. Since the concept of a causality entails that of laws according to which something (i.e., the effect) must be established through something else which we call cause, it follows that freedom is by no means lawless even though it is not a property of the will according to laws of nature. Rather, it must be a causality of a peculiar kind according to immutable laws. Otherwise a free will would be an absurdity.
 447 Natural necessity is, as we have seen, a heteronomy of efficient causes, for every effect is possible only according to the law that something else determines the efficient cause to its causality. What else, then, can the freedom of the will be but autonomy (i.e., the property of the will to be law to itself)? The proposition that the will is a law to itself in all its actions, however, only expresses the principle that we should act according to no other maxim than that which can also have itself as a universal law for its object. And this is just the formula of the categorical imperative and the principle of morality. Therefore a free will and a will under moral laws are identical.

Thus if freedom of the will is presupposed, morality together with its principle follows from it by the mere analysis of its concepts. But the principle: An absolutely good will is one whose maxim can always include itself as a universal law, is nevertheless a

synthetical proposition. It is synthetical because by analysis of the concept of an absolutely good will that property of the maxim cannot be found in it. Such synthetical propositions, however, are made possible only by the fact that the two cognitions are connected with each other through their union with a third in which both are to be found. The positive concept of freedom furnishes this third cognition, which cannot be, as in the case of physical causes, the sensible world of nature, in the concept of which we find conjoined the concepts of something as cause in relation to something else as effect. We cannot yet show directly what this third cognition is to which freedom directs us and of which we have an *a priori* Idea, nor can we yet explain the deduction of the concept of freedom from pure practical reason, and therewith the possibility of a categorical imperative. For this, some further preparation is needed.

Freedom Must be Presupposed as the Property of the Will of All Rational Beings

It is not enough to ascribe freedom to our will, on whatever grounds, if we do not also have sufficient grounds for attributing it to all rational beings. For since morality serves as a law for us only as rational beings, it must hold for all rational beings, and since it must be derived exclusively from the property of freedom, freedom as a property of the will of all rational beings must be demonstrated. And it does not suffice to prove it from certain alleged experiences of human nature (which is indeed impossible, as it can be proved only *a priori*), but we must prove it as belonging universally to the activity of rational beings endowed with a will. Now I say that every being which cannot act otherwise than under the Idea of freedom is thereby really free in a practical respect. That is to say, all laws which are inseparably bound with freedom hold for it just as if its wills were proved free in itself by theoretical philosophy.* Now I affirm that we must necessarily grant that every rational being who has a will also has the Idea of freedom and that it acts only under this Idea. For in such a being we think of a reason which is practical (i.e., a reason which has causality with respect to its object). Now we cannot conceive of a reason which, in making its judgments, consciously responds to a bidding from the outside, for then the subject would attribute the determination of its power of judgment not to reason but to an impulse. Reason must regard itself as the author of its principles, independently of alien influences; consequently as practical reason or as the will of a rational being it must regard itself as free. That is to say, the will of a rational being can be a will of its own only under the Idea of freedom, and therefore from a practical point of view such a will must be ascribed to all rational beings.

Of the Interest Attaching to the Ideas of Morality

We have finally reduced the definite concept of morality to the Idea of freedom, but we could not prove freedom to be actual in ourselves and in human nature. We saw only that we must presuppose it if we would think of a being as rational and conscious of its causality with respect to actions, that is, as endowed with a will; and so we find that on the very same grounds we must ascribe to each being endowed with reason and will the property of determining itself to action under the Idea of its freedom.

*I propose this argument as sufficient to our purpose: Freedom as an Idea is posited by all rational beings as the basis for their actions. I do so in order to avoid having to prove freedom also in its theoretical aspect. For even if the latter is left unproved, the laws which would obligate a being who was really free would hold for a being who cannot act except under the Idea of his own freedom. Thus we escape the onus which has been pressed on theory.

From presupposing this Idea [of freedom] there followed also the consciousness of a law of action: that the subjective principles of actions (i.e., maxims) must in every instance be so chosen that they can hold also as objective (i.e., universal) principles, and can thus serve as principles for our giving universal laws. But why should I, as a rational being, and why should all other beings endowed with reason, subject ourselves to this law? I will admit that no interest impels me to do so, for that would then give no categorical imperative. But I must nevertheless take an interest in it and see how it comes about, for this *ought* is properly a *would* that is valid for every rational being provided reason were practical for it without hindrance [i.e., exclusively determined its action]. For beings who, like ourselves, are affected by the senses as incentives different from reason, and who do not always do that which reason by itself alone would have done, that necessity of action is expressed as only an *ought*. The subjective necessity is thus distinguished from the objective.

It therefore seems that we have only presupposed the moral law, the principle of the autonomy of the will in the Idea of freedom, as if we could not prove its reality and objective necessity by itself. Even if that were so, we would still have gained something because we would at least have defined the genuine principle more accurately than had been done before; but with regard to its validity and the practical necessity of subjection to it, we would not have advanced a single step, for we could give no satisfactory answer to anyone who asked us why the universal validity of our maxim as a law had to be the restricting condition of our action. We could not tell on what is based the worth which we ascribe to actions of this kind—a worth so great that there can be no higher
 450 interest—nor could we tell how it happens that man believes that it is only through this that he feels his own personal worth, in contrast to which the worth of a pleasant or unpleasant state is to be regarded as nothing.

We do find sometimes that we can take an interest in a personal quality which involves no [personal] interest in any [external] condition, provided only that the [possession of] this quality makes us fit to participate in the [desired] condition in case reason were to effect the allotment of this condition. That is, being worthy of happiness, even without the motive of partaking in happiness, can interest of itself. But this judgment is in fact only the effect of the importance already ascribed to moral laws (if by the Idea of freedom we detach ourselves from every empirical interest). But that we ought so to detach ourselves from every empirical interest, to regard ourselves as free in acting and yet as subject to certain laws, in order to find a worth wholly in our person which would compensate for the loss of everything which could make our situation desirable—how this is possible and hence on what grounds the moral law obligates us still cannot be seen in this way.

We must openly confess that there is a kind of circle here from which it seems that there is no escape. We assume that we are free in the order of efficient causes so that we can conceive of ourselves as subject to moral laws in the order of ends. And then we think of ourselves subject to these laws because we have ascribed freedom of the will to ourselves. This is circular because freedom and self-legislation of the will are both autonomy and thus are reciprocal concepts, and for that reason one of them cannot be used to explain the other and to furnish a ground for it. At most they can be used for the logical purpose of bringing apparently different conceptions of the same object under a single concept (as we reduce different fractions of the same value to the lowest common terms).

One recourse, however, remains open to us, namely, to inquire whether we do not assume a different standpoint when we think of ourselves as causes *a priori* efficient through freedom from that which we occupy when we conceive of ourselves in the light of our actions as effects which we see before our eyes.

The following remark requires no subtle reflection, and we may suppose that even the commonest understanding can make it, though it does so, after its fashion, by an obscure discernment of judgment which it calls feeling: all conceptions, like those of the senses, which come to us without our choice enable us to know objects only as they affect us, while what they are in themselves remains unknown to us; therefore, as regards this kind of conception, even with the closest attention and clearness which understanding may ever bring to them we can attain only a knowledge of appearances and never a knowledge of things as they are in themselves. When this distinction is once made (perhaps merely because of a difference noticed between conceptions which are given to us from somewhere else and to which we are passive, and those which we produce from ourselves only and in which we show our own activity), it follows of itself that we must admit and assume behind the appearances something else which is not appearance, i.e., things as they are in themselves, although we must admit that we cannot approach them more closely and can never know what they are in themselves, since they can never be known by us except as they affect us. This must furnish a distinction, though a crude one, between a world of sense and a world of understanding. The former, by differences in our sensible faculties, can be very different to various observers, while the latter, which is its foundation, remains always the same. A man may not presume to know even himself as he really is by knowing himself through inner sensation. For since he does not, as it were, produce himself or derive his concept of himself *a priori* but only empirically, it is natural that he obtain his knowledge of himself through inner sense and consequently only through the appearance of his nature and the way in which his consciousness is affected. But beyond the characteristic of his own subject which is compounded of these mere appearances, he necessarily assumes something else as its basis, namely, his ego as it is in itself. Thus in respect to mere perception and receptivity to sensations he must count himself as belonging to the world of sense; but in respect to that which may be pure activity in himself (i.e., in respect to that which reaches consciousness directly and not by affecting the senses) he must reckon himself as belonging to the intellectual world. But he has no further knowledge of that world.

To such a conclusion the thinking man must come with respect to all things which may present themselves to him. Presumably it is to be met with in the commonest understanding which, as is well known, is very much inclined to expect behind the objects of the senses something else invisible and acting of itself. But common understanding soon spoils it by trying to make the invisible again sensible (i.e., to make it an object of intuition). Thus the common understanding becomes not in the least wiser.

Now man really finds in himself a faculty by which he distinguishes himself from all other things, even from himself so far as he is affected by objects. This faculty is reason. As a pure, spontaneous activity it is elevated even above understanding. For though the latter is also a spontaneous activity and does not, like sense, which is passive, merely contain representations which arise only when one is affected by things, it cannot produce by its activity any other concepts than those which serve to bring the sensible representations under rules and thereby to unite them in one consciousness. Without this use of sensibility it would think nothing at all; on the other hand, reason shows such a pure spontaneity in the case of Ideas that it far transcends anything that sensibility can give to consciousness, and shows its chief occupation in distinguishing the world of sense from the world of understanding, thereby prescribing limits to the understanding itself.

For this reason a rational being must regard itself qua intelligence (and not from the side of his lower faculties) as belonging to the world of understanding and not to that of the senses. Thus it has two standpoints from which it can consider itself and

recognize the laws [governing] the employment of its powers and all its actions: first, as belonging to the world of sense, under the laws of nature (heteronomy), and, second, as belonging to the intelligible world under laws which, independent of nature, are not empirical but founded on reason alone.

As a rational being and thus as belonging to the intelligible world, man cannot think of the causality of his own will except under the Idea of freedom, for independence from the determining causes of the world of sense (an independence which reason must always ascribe to itself) is freedom. The concept of autonomy is inseparably connected with the Idea of freedom, and with the former there is inseparably bound
 453 the universal principle of morality, which is the ground in Idea of all actions of rational beings, just as natural law is the ground of all appearances.

We have now removed the suspicion which we raised that there might be a hidden circle in our reasoning from freedom to autonomy and from the latter to the moral law. This suspicion was that we laid down the Idea of freedom for the sake of the moral law in order later to derive the law from freedom, and that we were thus unable to give any basis for the law, presenting it only as a *petitio principii* [begging the question] which well-disposed minds might gladly allow us, but which we could never advance as a demonstrable proposition. But we now see that, if we think of ourselves as free, we transport ourselves into the intelligible world as members of it and know the autonomy of the will together with its consequence, morality; whereas if we think of ourselves as obligated, we consider ourselves as belonging both to the world of sense and at the same time to the intelligible world.

How Is a Categorical Imperative Possible?

The rational being counts himself, *qua* intelligence, as belonging to the intelligible world, and only as an efficient cause belonging to it does he call his causality will. On the other side, however, he is conscious of himself as a part of the world of sense in which his actions are found as mere appearances of that causality. But we do not discern how they are possible on the basis of that causality which we do not know; rather, those actions must be regarded as determined by other appearances, namely, desires and inclinations belonging to the world of sense. As a member of the intelligible world only, all my actions would completely accord with the principle of the autonomy of the pure will, and as a part only of the world of sense would they have to be assumed to conform wholly to the natural law of desires and inclinations and thus to the heteronomy of nature. (The former actions would rest on the supreme principle of morality, and the latter on that of happiness.) But since the intelligible world contains the ground of the world of sense and hence of its laws, the intelligible world is (and must be conceived as) directly legislative for my will, which belongs wholly to the intelligible world. Therefore I recognize myself *qua* intelligence as subject to the law of the world of understanding and to the autonomy of the will. That is, I recognize myself as subject to the law of reason which contains in the Idea of freedom the law of the intelligible world, while at the
 454 same time I must acknowledge that I am a being which belongs to the world of sense. Therefore I must regard the laws of the intelligible world as imperatives for me, and actions in accord with this principle as duties.

Thus categorical imperatives are possible because the Idea of freedom makes me a member of an intelligible world. Consequently, if I were a member of that world only, all my actions *would* always be in accordance with the autonomy of the will. But since I intuit myself at the same time as a member of the world of sense, my actions *ought* to

conform to it, and this categorical “ought” presents a synthetic *a priori* proposition, since besides my will affected by my sensuous desires there is added the Idea of exactly the same will as pure, practical of itself, and belonging to the intelligible world, which according to reason contains the supreme condition of the sensuously affected will. It is similar to the manner in which concepts of the understanding, which of themselves mean nothing but lawful form in general, are added to the intuitions of the sensible world, thus rendering possible *a priori* synthetic propositions on which all knowledge of a system of nature rests.

The practical use of ordinary human reason confirms the correctness of this deduction. When we present examples of honesty of purpose, of steadfastness in following good maxims, and of sympathy and general benevolence even with great sacrifices of advantage and comfort, there is no man, not even the most malicious villain (provided he is otherwise accustomed to using his reason), who does not wish that he also might have these qualities, but because of his inclinations and impulses cannot bring this about, yet at the same time wishes to be free from such inclinations which are burdensome even to him. He thus proves that with a will free from all impulses of sensibility, he in thought transfers himself into an order of things altogether different from that of his desires in the field of sensibility. He cannot expect to obtain by that wish any gratification of desires or any state which would satisfy his actual or even imagined inclinations, for the Idea itself, which elicits this wish from him, would lose its preeminence if he had any such expectation. He imagines himself to be this better person when he transfers himself to the standpoint of a member of the intelligible world to which he is involuntarily impelled by the Idea of freedom (i.e., of independence from the determining causes in the world of sense); and from this standpoint he is conscious of a good will, which on his own confession constitutes the law for his bad will as a member of the world of sense. He acknowledges the authority of the law even while he transgresses it. The moral “ought” is therefore his own volition as a member of the intelligible world, and it is conceived by him as an “ought” only insofar as he regards himself at the same time as a member of the world of sense.

455

On the Extreme Boundary of All Practical Philosophy

In respect to their will, all men think of themselves as free. Hence arise all judgments of acts as being such as ought to have been done, although they were not done. But this freedom is not an empirical concept and cannot be such, for it continues to hold even though experience shows the contrary of the demands which are necessarily conceived to be consequences of the supposition of freedom. On the other hand it is equally necessary that everything that happens should be inexorably determined by natural laws, and this natural necessity is likewise no empirical concept because it implies the concept of necessity and thus of *a priori* knowledge. But this concept of a system of nature is confirmed by experience, and it is inevitably presupposed if experience, which is knowledge of the objects of the sense interconnected by universal laws, is to be possible. Therefore freedom is only an Idea of reason whose objective reality in itself is doubtful, while nature is a concept of the understanding which shows and must necessarily show its reality by examples of experience.

There now arises a dialectic of reason, since the freedom ascribed to the will seems to stand in contradiction to natural necessity. At this parting of the ways reason in its speculative aspect finds the path of natural necessity more well-beaten and usable than that of freedom, but in its practical aspect the path of freedom is the only one on which it

456

is possible to make use of reason in our conduct. Hence it is as impossible for the subtlest philosophy as for the commonest reasoning to argue freedom away. Philosophy must therefore assume that no true contradiction will be found between freedom and natural necessity in the same human actions, for it cannot give up the concept of nature any more than that of freedom.

Hence if we should never be able to conceive how freedom is possible, at least this apparent contradiction must be convincingly eradicated. For if even the thought of freedom contradicted itself or nature, it would have to be surrendered in competition with natural necessity.

But it would be impossible to escape this contradiction if the subject, who seems to himself to be free, thought of himself in the same sense or in the same relationship when he calls himself free as when he assumes that in the same action he is subject to natural law. Therefore it is an inescapable task of speculative philosophy to show at least that its illusion of contradiction rests on the fact that we [do not] think of man in a different sense and relationship when we call him free from that in which we consider him as part of nature and subject to its laws. It must show not only that they can very well coexist but also that they must be thought of as necessarily united in one and the same subject; for otherwise no ground could be given as to why we should burden reason with an Idea which, though it may without contradiction be united with another that is sufficiently established, nevertheless involves us in a perplexity which sorely embarrasses reason in its theoretical use. This duty is imposed only on theoretical philosophy, so that it may clear the way for practical philosophy. Thus the philosopher has no choice as to whether he will remove the apparent contradiction or leave it untouched, for in the latter case the theory of it would be unoccupied land, into the possession of which the fatalist could rightly enter and drive all morality from its alleged property as occupying it without title.

Yet we cannot say here that we have reached the boundary of practical philosophy. For the settlement of the controversy does not belong to practical philosophy, as the latter
 457 only demands from theoretical reason that it put an end to the discord in which it entangles itself in theoretical questions, so that practical reason may have rest and security from outward attacks which could dispute it the ground on which it desires to erect its edifice.

The title to freedom of the will claimed by ordinary reason is based on the consciousness and the conceded presupposition of the independence of reason from merely subjectively determining causes which together constitute what belongs only to sensation and is included under the general name of sensibility. Man, who in this way regards himself as intelligence, puts himself in a different order of things and in a relationship to determining grounds of an altogether different kind when he thinks of himself as intelligence with a will and thus as endowed with causality, compared with that other order of things and that other set of determining grounds which become relevant when he perceives himself as a phenomenon in the world of sense (as he really is also) and submits his causality to external determination according to natural laws. Now he soon realizes that both can subsist together—indeed, that they must. For there is not the least contradiction between a thing in appearance (as belonging to the world of sense) being subject to certain laws from which, as a thing or being regarded as it is in itself, it is independent. That he must think of himself in this twofold manner rests, with regard to the first, on the consciousness of himself as an object affected through the senses, and, with regard to what is required by the second, on the consciousness of himself as intelligence (i.e., as independent of sensible impressions in the use of reason), and thus as belonging to the intelligible world.

This is why man claims to possess a will which does not make him accountable for what belongs only to his desires and inclinations, but thinks of actions which can be done only by disregarding all his desires and sensuous attractions as possible and indeed as necessary for him. The causality of these actions lies in him as an intelligence and in effects and actions in accordance with principles of an intelligible world, of which he knows only that reason alone, and indeed pure reason independent of sensibility, gives the law in it. Moreover, since it is only as intelligence that he is his proper self (as man he is only appearance of himself), he knows that those laws apply to him directly and categorically, so that that to which inclinations and impulses and hence the entire nature of the world of sense incite him cannot in the least impair the laws of his volition as an intelligence. He does not even hold himself responsible for these inclinations and impulses or attribute them to his proper self (i.e., his will), though he does impute to his will the indulgence which he may grant to them when he permits them to influence his maxims to the detriment of the rational laws of his will. 458

When practical reason thinks itself into an intelligible world, it does in no way transcend its boundaries. It would do so, however, if it tried to intuit or feel itself into it. The intelligible world is only a negative thought with respect to the world of sense, which does not give reason any laws for determining the will. It is positive only in the single point that freedom as negative determination is at the same time connected with a positive power and even a causality of reason. This causality we call a will to act so that the principle of actions will accord with the essential characteristic of a rational cause (i.e., with the condition of universal validity of a maxim as law). But if it were to borrow an object of the will (i.e., a motive) from the intelligible world, it would overstep its boundaries and pretend to be acquainted with something of which it knows nothing. The concept of a world of understanding is therefore only a standpoint from which reason sees itself forced to take outside appearances, in order to think of itself as practical. If the influences of sensibility were determining for man, this would not be possible; but it is necessary unless he is to be denied the consciousness of himself as an intelligence, and thus as a rational and rationally active cause (i.e., a cause acting in freedom). This thought certainly implies the Idea of an order and legislation different from that of natural mechanism, which applies to the world of sense; and it makes necessary the concept of an intelligible world, the whole of rational beings as things regarded as they are in themselves. But it does not give us the least occasion to think of it otherwise than according to its formal condition only (i.e., the universality of the maxim of the will as law and thus the autonomy of the will), which alone is consistent with freedom. All laws, on the other hand, which are directed to an object make for heteronomy, which belongs only to natural laws and which can apply only to the world of sense.

But reason would overstep its bounds if it undertook to explain how pure reason can be practical, which is the same problem as explaining how freedom is possible. 459

We can explain nothing but what we can reduce to laws whose object can be given in some possible experience. But freedom is only an Idea, the objective reality which can in no way be shown to accord with natural laws or to be in any possible experience. Since no example in accordance with any analogy can support it, it can never be comprehended or even imagined. It holds only as the necessary presupposition of reason in a being who believes himself conscious of a will (i.e., of a faculty different from the mere faculty of desire, or a faculty of determining himself to act as an intelligence and thus according to laws of reason independently of natural instincts. But where determination according to

natural laws comes to an end, there too all explanation ceases, and nothing remains but defense (i.e., refutation of the objections from those who pretend to have seen more deeply into the essence of things and who boldly declare freedom to be impossible). We can show them only that the supposed contradiction they have discovered lies nowhere else than in their necessarily regarding man [only] as appearance in order to make natural law valid with respect to human actions, and now when we require them to think of man *qua* intelligence as a thing regarded as it is in itself, they still persist in considering him as appearance [only]. Obviously, then, the detachment of his causality (his will) from all natural laws of the world of sense in one and the same subject is a contradiction, but this disappears when they reconsider and confess, as is reasonable, that behind the appearances things regarded as they are in themselves must stand as their hidden ground, and that we cannot expect the laws of the activity of these grounds to be the same as those under which their appearances stand.

460 The subjective impossibility of explaining the freedom of the will is the same as the impossibility of discovering and explaining an interest* which man can take in moral laws. Nevertheless, he does actually take an interest in them, and the foundation of this interest in us we will call the moral feeling. This moral feeling has been erroneously construed by some as the standard for our moral judgment, whereas it must be regarded rather as the subjective effect which the law has upon the will to which reason alone gives objective grounds.

In order to will an action which reason alone prescribes to the sensuously affected rational being as the action which he ought to will, there is certainly required a power of will to instill a feeling of pleasure of satisfaction in the fulfilment of duty, and hence there must be a causality of reason to determine sensibility in accordance with its own principles. But it is wholly impossible to discern, i.e., to make *a priori* conceivable, how a mere thought containing nothing sensuous is able to produce a sensation of pleasure or displeasure. For that is a particular kind of causality of which, as of all causality, we cannot determine anything *a priori* but must consult experience only. But since experience can exemplify the relation of cause to effect only as subsisting between two objects of experience, while here pure reason by mere Ideas (which furnish no object for experience) is to be the cause of an effect which does lie within experience, an explanation of how and why the universality of the maxim as law (and hence morality) interests us is completely impossible for us men. Only this much is certain: that it is valid for us not because it interests us (for that is heteronomy and dependence of practical reason on sensibility, i.e., on a basic feeling; and thus it could never be morally legislating); but that it interests us because it is valid for us as men, inasmuch as it has arisen from our will as intelligence and hence from our proper self; but what belongs to mere appearance is necessarily subordinated to the character of the thing regarded as it is in itself.

461

*Interest is that by which reason becomes practical (i.e., a cause determining the will). We therefore say only of a rational being that he takes an interest in something; irrational creatures feel only sensuous impulses. A direct interest in the action is taken by reason only if the universal validity of its maxim is a sufficient determining ground of the will. Only such an interest is pure. But if reason can determine the will only by means of another object of desire or under the presupposition of a particular feeling of the subject, reason takes merely an indirect interest in the action, and since reason for itself alone without experience can discover neither objects of the will nor a particular feeling which lies at its root, that indirect interest would be only empirical and not a pure interest of reason. The logical interest of reason in advancing its insights is never direct but rather presupposes purposes for which they are to be used.

Thus the question *How is a categorical imperative possible?* can be answered to this extent: We can cite the only presupposition under which it is possible. This is the Idea of freedom, and we can have insight into the necessity of this presupposition which is sufficient to the practical use of reason (i.e., to the conviction of the validity of this imperative and hence also of the moral law). But how this presupposition itself is possible can never be discerned by any human reason. However, on the presupposition of freedom of the will as an intelligence, its autonomy as the formal condition under which alone it can be determined is a necessary consequence. To presuppose the freedom of the will is not only quite possible, as speculative philosophy itself can prove, for it does not involve itself in a contradiction with the principle of natural necessity in the interconnection of appearances in the world of sense. But it is also unconditionally necessary that a rational being conscious of its causality through reason, and thus conscious of a will different from desires, should practically presuppose freedom (i.e., presuppose it in the Idea as the fundamental condition of all his voluntary acts). Yet how pure reason, without any other incentives whencesoever derived, can by itself be practical (i.e., how the simple principle of the universal validity of its maxims as laws—which would certainly be the form of a pure practical reason—without any material (object) of the will in which we might in advance take some interest), and can itself furnish an incentive and produce an interest which would be called purely moral; or, in other words, *how pure reason can be practical*—to explain this, all human reason is wholly incompetent, and all the pain and work of seeking an explanation of it are wasted.

It is just the same as if I sought to find out how freedom itself as the causality of a will is possible, for in so doing I would leave the philosophical basis of explanation behind, and I have no other. Certainly I could revel in the intelligible world, the world of intelligences, which still remains to me; but although I have a well-founded Idea of it, still I do not have the least knowledge of it, nor can I ever attain knowledge of it by all the exertions of my natural faculty of reason. This intelligible world signifies only a something which remains when I have excluded from the determining grounds of my will everything belonging to the world of sense, in order to isolate the principle of motives from the field of sensibility. I do so by limiting it and showing that it does not contain absolutely everything in itself but that outside it there is still more; but this more I do not know. After banishing all material (i.e., knowledge of objects) from pure reason which formulates this ideal, there remain to me only the form, the practical law of the universal validity of maxims, and, in accordance with this, reason in relation to a pure intelligible world as a possible efficient cause determining the will. Any incentive must here be totally absent unless this Idea of an intelligible world or that in which reason directly takes an interest be the incentive. But to make this conceivable is precisely the problem we cannot solve.

Here, then, is the outermost boundary of all moral inquiry. To define it is very important, both in order that reason may not seek around, on the one hand, in the world of sense, in a way harmful to morals, for the supreme motive and for a comprehensible but empirical interest; and so that it will not, on the other hand, impotently flap its wings in the space (for it, an empty space) of transcendent concepts which we call the intelligible world, without being able to move from its starting point and so losing itself amid phantoms. Furthermore, the Idea of a pure intelligible world as a whole of all intelligences to which we ourselves belong as rational beings (though on the other side we are at the same time members of the world of sense) is always a useful and permissible Idea for the purpose of a rational faith. This is so even though all knowledge terminates at its boundary, for the glorious ideal of a

463 universal realm of ends regarded as they are in themselves (rational beings) can awaken in us a lively interest in the moral law. To that realm we can belong as members only when we scrupulously conduct ourselves by maxims of freedom as if they were laws of nature.

Concluding Remark

The speculative use of reason with respect to nature leads to the absolute necessity of some supreme cause of the world. The practical use of reason with respect to freedom leads also to an absolute necessity, but to the necessity only of laws of actions of a rational being as such. Now it is an essential principle of all use of reason to push its knowledge to an awareness of its necessity, for otherwise it would not be rational knowledge. But it is also an equally essential restriction of this very same reason that it cannot discern the necessity of what is or of what occurs or of what ought to be done unless a condition under which it is or occurs or ought to be done is presupposed. In this way, however, the satisfaction of reason is only postponed further and further by the unceasing search for the condition. Reason, therefore, restlessly seeking the unconditionally necessary, sees itself compelled to assume it though it has no means by which to make it comprehensible; it is happy enough if it can discover only the concept which is compatible with this presupposition. It is, therefore, no objection to our deduction of the supreme principle of morality, but a reproach that we must make to human reason generally, that it cannot render comprehensible the absolute necessity of an unconditional practical law (such as the categorical imperative must be). Reason cannot be blamed for being unwilling to explain it by a condition (i.e., by making some interest its basis), for then the law would cease to be moral and would no longer be the supreme law of freedom. And so we do not indeed comprehend the unconditional practical necessity of the moral imperative; yet we do comprehend its incomprehensibility, which is all that can fairly be demanded of a philosophy which in its principles strives to reach the boundary of human reason.

ON A SUPPOSED RIGHT TO LIE FROM ALTRUISTIC MOTIVES

In the journal *France* for 1797, Part VI, No. 1, page 123, in an article entitled “On Political Reactions” by Benjamin Constant,* there appears the following passage:

The moral principle, “It is a duty to tell the truth,” would make any society impossible if it were taken singly and unconditional!” We have proof of this in the very direct consequences which a German philosopher has drawn from this principle. This philosopher goes so far as to assert that it would be a crime to lie to a murderer who asked whether our friend who is pursued by him had taken refuge in our house.

*Henri Benjamin Constant de Rebecque (1767–1830), the French writer, statesman, and orator.

Critique of Practical Reason and Other Writings in Moral Philosophy, translated by Lewis White Beck (Chicago: University of Chicago Press, 1949). Reprinted by permission.

The French philosopher refutes this principle in the following manner:

It is a duty to tell the truth. The concept of duty is inseparable from the concept of right. A duty is that which in one being corresponds to the rights of another. Where there are no rights, there are no duties. To tell the truth is thus a duty; but it is a duty only in respect to one who has a right to the truth. But no one has a right to a truth which injures others.

The <proton pseudos> ["first lie"] in this argument lies in the sentence: "To tell the truth is a duty, but it is a duty only toward one who has a right to the truth."

It must first be noted that the expression, "to have a right to truth" is without meaning. One must rather say, "Man has a right to his own truthfulness," i.e., to the subjective truth in his own person. For to have objectively a right to truth would mean that it is a question of one's will (as in questions of what belongs to individuals generally) whether a given sentence is to be true or false. This would certainly produce an extraordinary logic.

Now the first question is: Does a man, in cases where he cannot avoid answering "Yes" or "No," have a right to be untruthful? The second question is: Is he not in fact bound to tell an untruth, when he is unjustly compelled to make a statement, in order to protect himself or another from a threatened misdeed?

Truthfulness in statements which cannot be avoided is the formal duty of an individual to everyone,* however great may be the disadvantage accruing to himself or to another. If, by telling an untruth, I do not wrong him who unjustly compels me to make a statement, nevertheless by this falsification, which must be called a lie (though not in a legal sense), I commit a wrong against duty generally in a most essential point. That is, so far as in me lies I cause that declarations should in general find no credence, and hence that all rights based on contracts should be void and lose their force, and this is a wrong done to mankind generally.

Thus the definition of a lie as merely an intentional untruthful declaration to another person does not require the additional condition that it must harm another, as jurists think proper in their definition (*mendacium est falsiloquium in praeiudicium alterius*).** For a lie always harms another; if not some other particular man, still it harms mankind generally, for it vitiates the source of law itself.

This benevolent lie, however, can become punishable under civil law through an accident, and that which escapes liability to punishment only by accident can also be condemned as wrong even by external laws. For instance, if by telling a lie you have prevented murder, you have made yourself legally responsible for all the consequences; but if you have held rigorously to the truth, public justice can lay no hand on you, whatever the unforeseen consequences may be. After you have honestly answered the murderer's question as to whether his intended victim is at home, it may be that he has slipped out so that he does not come in the way of the murderer, and thus that the murder may not be committed. But if you had lied and said he was not at home when he had really gone out without your knowing it, and if the murderer had then met him as he went away and murdered him, you might justly be accused as the cause of his death. For if you had told the truth as far as you knew it, perhaps the murderer might

*I should not like to sharpen this principle to the point of saying, "Untruthfulness is a violation of duty to one's self." This principle belongs to ethics, but here we are concerned with a legal duty. [Ethics as a] theory of virtue sees in this transgression only worthlessness, which is the reproach the liar draws upon himself.

**A lie is something spoken deceitfully in prejudgement of another."

have been apprehended by the neighbors while he searched the house and thus the deed might have been prevented. Therefore, whoever tells a lie, however well intentioned he might be, must answer for the consequences, however unforeseeable they were, and pay the penalty for them even in a civil tribunal. This is because truthfulness is a duty which must be regarded as the ground of all duties based on contract, and the laws of these duties would be rendered uncertain and useless if even the least exception to them were admitted.

To be truthful (honest) in all declarations, therefore, is a sacred and absolutely commanding decree of reason, limited by no expediency.

Mr. Constant makes a thoughtful and correct remark on decrying principles so strict that they are alleged to lose themselves in such impracticable ideas that they are to be rejected. He says, "In every case where a principle which has been proved to be true appears to be inapplicable, the reason is that we do not know the middle principle which contains the means of its application." He adduces the doctrine of equality as the first link of the social chain, saying:

No man can be bound by any laws except those to the formulation of which he has contributed. In a very limited society this principle can be applied directly and needs no mediating principle in order to become a common principle. But in a society consisting of very many persons, another principle must be added to this one we have stated. This mediating principle is: the individuals can participate in the formulation of laws either in their own person or through their representatives. Whoever wished to apply the former principle to a large society without making use of the mediating principle would invariably bring about the destruction of the society. But this circumstance, which would only show the ignorance or the incompetence of the legislator, proves nothing against the principle.

He concludes that "a principle acknowledged to be true must never be abandoned, however obviously danger seems to be involved in it." (And yet the good man himself abandoned the unconditional principle of truthfulness on account of the danger which it involved for society. He did so because he could find no mediating principle which could serve to prevent this danger; and, in fact, there is no principle to be interpolated here.)

If we wish to preserve the names of the persons as they have been cited here, the "French philosopher" confuses the action by which someone does harm to another in telling the truth when he cannot avoid making a statement, with the action whereby he does the other a wrong. It was only an accident that the truth of the statement harmed the occupant of the house; it was not a free act (in a juristic sense). For to demand of another that he should lie to one's own advantage would be a claim opposed to all lawfulness. Each man has not only a right but even the strict duty to be truthful in statements he cannot avoid making, whether they harm himself or others. In so doing, he does not do harm to him who suffers as a consequence; accident causes this harm. For one is not at all free to choose in such a case, since truthfulness (if he must speak) is an unconditional duty.

The "German philosopher" will not take as one of his principles the proposition: "To tell the truth is a duty, but only to him who has a right to the truth." He will not do so, first, because of the ambiguous formulation of this proposition, for truth is not a possession the right to which can be granted to one and denied to another. But he will not do so chiefly because the duty of truthfulness (which is the only thing in question here) makes no distinction between persons to whom one has this duty and to whom one can exempt himself from this duty; rather, it is an unconditional duty which holds in all circumstances.

Now in order to proceed from a metaphysics of law (which abstracts from all empirical conditions) to a principle of politics (which applies these concepts to cases met with in experience), and by means of this to achieve the solution of a problem of politics in accord with the universal principle of law, the philosopher will enunciate three notions. The first is an axiom, i.e., an apodictically certain proposition which springs directly from the definition of external law (the harmony of the freedom of each with the freedom of all others according to a universal law). The second is a postulate of external public law (the will of all united according to the principle of equality, without which no one would have any freedom). Third, there is the problem of how it is to be arranged that, in a society however large, harmony may be maintained in accordance with principles of freedom and equality (namely, by means of a representative system). The latter will then become a principle of politics, the organization and establishment of which will entail decrees drawn from the practical knowledge of men, which will have in view only the mechanism of the administration of justice and how this may be suitably carried out. Law must never be accommodated to politics but politics always accommodated to law.

The author says, "A principle recognized as true (I add, recognized as an *a priori* and hence apodictic principle) must never be abandoned, however obviously danger seems to be involved in it." But one must only understand the danger not as a danger of accidentally doing a harm but only as a danger of doing a wrong. This would happen if I made the duty of being truthful, which is unconditional and the supreme juridical condition in testimony, into a conditional duty subordinate to other considerations. Although in telling a certain lie I do not actually do anyone a wrong, I formally but not materially violate the principle of right with respect to all unavoidably necessary utterances. And this is much worse than to do injustice to any particular person, because such a deed against an individual does not always presuppose the existence of a principle in the subject which produces such an act.

If one is asked whether he intends to speak truthfully in a statement that he is about to make and does not receive the question with indignation at the suspicion it expressed that he might be a liar, but rather asks permissions to consider possible exceptions, that person is already potentially a liar. That is because he shows that he does not acknowledge truthfulness as an intrinsic duty but makes reservations with respect to a rule which does not permit any exception, inasmuch as any exception would directly contradict itself.

All practical principles of right must contain rigorous truth, and the so-called "mediating principles" can contain only the more accurate definition of their application to actual cases (according to rules of policy), but they can never contain exceptions from the former. Such exceptions would nullify their universality, and that is precisely the reason that they are called principles.

MARY WOLLSTONECRAFT

1759–1797

Mary Wollstonecraft's life is the fascinating story of a nonconformist seeking her way in an English society that had no place for her. She was born in London, the second of seven children, to an abusive, alcoholic father and a submissive, victimized mother. While still a child, Wollstonecraft had to take a great deal of responsibility for her family. She frequently intervened—even taking blows in the protection of her mother.

As a young woman, Wollstonecraft showed remarkable intellectual ability, despite the fact that she was largely self-taught. Following a period as a grade-school teacher, and at the urging of close friends, she took up writing. She published her first work, *Thoughts on the Education of Daughters*, in 1786. Over the next six years, Wollstonecraft worked extensively as a writer, book reviewer, and translator for the London publishing house of Joseph Johnson. Among the works published in this period were her *Original Stories* (1788), her autobiographical novel *Mary* (1788), and her response to Edmund Burke's *Reflections on the Revolution in France*, *A Vindication of the Rights of Man* (1790; revised 1791). The work for which Wollstonecraft is best known is *A Vindication of the Rights of Woman*, published in 1792.

Beginning in 1793, Wollstonecraft was involved in a series of scandals. She conceived a child out of wedlock, was mentioned in a treason trial, married twice, and twice attempted suicide. In this tumultuous period, she also managed to publish her *Historical and Moral View of the Origin and Progress of the French Revolution* (1794). In 1797, she died from complications following the birth of her second daughter. This second child, also named Mary, went on to fame as the author of the classic horror novel *Frankenstein* (1818), and as the wife of the poet Percy Bysshe Shelley.

* * *

In *A Vindication of the Rights of Woman*, Wollstonecraft argues that women's voices have been silenced because women are denied educational opportunities. Since reason is the key characteristic of human beings, *anyone* denied the possibility of developing reason, male or female, will seem inferior. If women were more "rationally educated, they could take a more comprehensive view of things" and participate more fully in philosophy.

In the selection that follows, Wollstonecraft acknowledges that the women in her society were intellectually inferior. But the reason for this inferiority had nothing to do with "sexual character." Rather they were "inferior" because they had been taught to focus all attention on becoming docile beauties attractive to men.

Although in many ways Wollstonecraft is an Enlightenment thinker (who died at age 38 before the turn of the century), her concerns were echoed by others in the nineteenth century. For example, in *On the Subjection of Women*, John Stuart Mill argued that women's subordination to men is "one of the chief hindrances to human improvement." Wollstonecraft's ideas stand as a challenge to the nineteenth century: How can women be a part of the "Age of Progress"?

* * *

Wollstonecraft's fascinating life has been chronicled by many writers, beginning with her second husband. William Godwin, in *Memoirs of the Author of a Vindication of the Rights of Woman* (London, 1798; reprinted, New York: Greenburg, 1927). Among more recent biographies are Ralph M. Wardle, *Mary Wollstonecraft: A Critical Biography* (Lincoln: University of Nebraska Press, 1951); Eleanor Flexner, *Mary Wollstonecraft: A Biography* (New York: Coward, McCann & Geoghegan, 1972); Claire Tomlin, *The Life and Death of Mary Wollstonecraft* (New York: Harcourt, Brace, Jovanovich, 1974); Jean Detre, *A Most Extraordinary Pair: Mary Wollstonecraft and William Godwin* (Garden City, NY: Doubleday, 1975); Janet M. Todd, *Mary Wollstonecraft: A Revolutionary Life* (New York: Columbia University Press, 2001); and Lyndall Gordon, *Mary Wollstonecraft* (New York: Little, Brown, 2005). For a discussion of the relationship between Wollstonecraft's life and her thought, see Margaret George, *One Woman's "Situation": A Study of Mary Wollstonecraft* (Urbana: University of Illinois Press, 1970). For a brief overview of Wollstonecraft's philosophy, see Kate Lindemann, "Mary Wollstonecraft" in Mary Ellen Waithe, *A History of Women Philosophers, Volume III: Modern Women Philosophers, 1600–1900* (Dordrecht, The Netherlands: Kluwer Academic, 1991), pp. 153–70. For books examining Wollstonecraft's contributions to feminist theory, see Jennifer Lorch, *Mary Wollstonecraft: The Making of a Radical Feminist* (New York: St. Martin's Press, 1990); Gary Kelly, *Revolutionary Feminism: The Mind and Career of Mary Wollstonecraft* (Houndmills, England: Macmillan, 1992); Maria J. Falco, ed., *Feminist Interpretations of Mary Wollstonecraft* (College Park, PA: Pennsylvania State University Press, 1996); and Barbara Taylor, *Mary Wollstonecraft and the Feminist Imagination* (Cambridge: Cambridge University Press, 2003). For her political theory, see Virginia Sapiro, *A Vindication of Political Virtue: The Political Theory of Mary Wollstonecraft* (Chicago: University of Chicago Press, 1992). Finally, Mary Wollstonecraft, *A Vindication*

of the Rights of Woman: An Authoritative Text, Backgrounds, The Wollstonecraft Debate, Criticism, 2nd edition, ed. by Carol H. Poston (New York: W.W. Norton, 1988); and Claudia L. Johnson, ed., *The Cambridge Companion to Mary Wollstonecraft* (Cambridge: Cambridge University Press, 2002) contain helpful essays.

A VINDICATION OF THE RIGHTS OF WOMAN (in part)

CHAPTER 6

THE EFFECT WHICH AN EARLY ASSOCIATION OF IDEAS HAS UPON THE CHARACTER

Educated in [an] enervating style . . . and not having a chance, from their subordinate state in society, to recover their lost ground, is it surprising that women every where appear a defect in nature? Is it surprising, when we consider what a determinate effect an early association of ideas has on the character, that they neglect their understandings, and turn all their attention to their persons?

The great advantages which naturally result from storing the mind with knowledge, are obvious from the following consideration. The association of our ideas is either habitual or instantaneous; and the latter mode seems rather to depend on the original temperature of the mind than on the will. When the ideas, and matters of fact, are once taken in, they lie by for use, till some fortuitous circumstance make the information dart into the mind with illustrative force, that has been received at very different periods of our lives. Like the lightning's flash are many recollections; one idea assimilating and explaining another, with astonishing rapidity. I do not now allude to that quick perception of truth, which is so intuitive that it baffles research, and makes us at a loss to determine whether it is reminiscence or ratiocination, lost sight of in its celerity, that opens the dark cloud. Over those instantaneous associations we have little power; for when the mind is once enlarged by excursive flights, or profound reflection, the raw materials will, in some degree, arrange themselves. The understanding, it is true, may keep us from going out of drawing when we group our thoughts, or transcribe from the imagination the warm sketches of fancy; but the animal spirits, the individual character, give the colouring. Over this subtle electric fluid,* how little power do we possess, and over it how little power can reason obtain! These fine intractable spirits appear to be the essence of genius, and beaming in its eagle eye, produce in the most eminent degree the happy energy of associating thoughts that surprise, delight, and instruct. These are the glowing minds that concentrate pictures

*I have sometimes, when inclined to laugh at materialists, asked whether, as the most powerful effects in nature are apparently produced by fluids, the magnetic, &c. the passions might not be fine volatile fluids that embraced humanity, keeping the more refractory elementary parts together—or whether they were simply a liquid fire that pervaded the more sluggish materials giving them life and heat?

for their fellow-creatures; forcing them to view with interest the objects reflected from the impassioned imagination, which they passed over in nature.

I must be allowed to explain myself. The generality of people cannot see or feel poetically, they want fancy, and therefore fly from solitude in search of sensible objects; but when an author lends them his eyes they can see as he saw, and be amused by images they could not select, though lying before them.

Education thus only supplies the man of genius with knowledge to give variety and contrast to his associations; but there is an habitual association of ideas, that grows "with our growth," which has a great effect on the moral character of mankind; and by which a turn is given to the mind that commonly remains throughout life. So ductile is the understanding, and yet so stubborn, that the associations which depend on adventitious circumstances, during the period that the body takes to arrive at maturity, can seldom be disentangled by reason. One idea calls up another, its old associate, and memory, faithful to the first impressions, particularly when the intellectual powers are not employed to cool our sensations, retraces them with mechanical exactness.

This habitual slavery, to first impressions, has a more baneful effect on the female than the male character, because business and other dry employments of the understanding, tend to deaden the feelings and break associations that do violence to reason. But females, who are made women of when they are mere children, and brought back to childhood when they ought to leave the go-cart for ever, have not sufficient strength of mind to efface the superinductions of art that have smothered nature.

Everything that they see or hear serves to fix impressions, call forth emotions, and associate ideas, that give a sexual character to the mind. False notions of beauty and delicacy stop the growth of their limbs and produce a sickly soreness, rather than delicacy of organs; and thus weakened by being employed in unfolding instead of examining the first associations, forced on them by every surrounding object, how can they attain the vigour necessary to enable them to throw off their factitious character?—where find strength to recur to reason and rise superiour to a system of oppression, that blasts the fair promises of spring? This cruel association of ideas, which everything conspires to twist into all their habits of thinking, or, to speak with more precision, of feeling, receives new force when they begin to act a little for themselves; for they then perceive that it is only through their address to excite emotions in men, that pleasure and power are to be obtained. Besides, all the books professedly written for their instruction, which make the first impression on their minds, all inculcate the same opinions. Educated then in worse than Egyptian bondage, it is unreasonable, as well as cruel, to upbraid them with faults that can scarcely be avoided, unless a degree of native vigour be supposed, that falls to the lot of very few amongst mankind.

For instance, the severest sarcasms have been levelled against the sex, and they have been ridiculed for repeating "a set of phrases learnt by rote," when nothing could be more natural, considering the education they receive, and that their "highest praise is to obey, unargued"—the will of man. If they are not allowed to have reason sufficient to govern their own conduct—why, all they learn—must be learned by rote! And when all their ingenuity is called forth to adjust their dress, "a passion for a scarlet coat," is so natural, that it never surprised me; and, allowing Pope's summary of their character to be just, "that every woman is at heart a rake," why should they be bitterly censured for seeking a congenial mind, and preferring a rake to a man of sense?

Rakes know how to work on their sensibility, whilst the modest merit of reasonable men has, of course, less effect on their feelings, and they cannot reach the heart by the way of the understanding, because they have few sentiments in common.

The Orgy from The Rake's Progress, Tavern Scene, Plate III, 1735, by William Hogarth (1697–1764) depicts the lifestyle of the eighteenth-century English upper classes—and a view of women that Wollstonecraft sought to change. Etching and engraving. (©By Courtesy of the Trustees of Sir John Soane's Museum)

It seems a little absurd to expect women to be more reasonable than men in their *likings*, and still to deny them the uncontrolled use of reason. When do men *fall-in-love* with sense? When do they, with their superior powers and advantages, turn from the person to the mind? And how can they then expect women, who are only taught to observe behaviour, and acquire manners rather than morals, to despise what they have been all their lives labouring to attain? Where are they suddenly to find judgment enough to weigh patiently the sense of an awkward virtuous man, when his manners, of which they are made critical judges, are rebuffing, and his conversation cold and dull, because it does not consist of pretty repartees, or well turned compliments? In order to admire or esteem any thing for a continuance, we must, at least, have our curiosity excited by knowing, in some degree, what we admire; for we are unable to estimate the value of qualities and virtues above our comprehension. Such a respect, when it is felt, may be very sublime; and the confused consciousness of humility may render the dependent creature an interesting object, in some points of view; but human love must have grosser ingredients; and the person very naturally will come in for its share—and, an ample share it mostly has!

Love is, in a great degree, an arbitrary passion, and will reign, like some other stalking mischiefs, by its own authority, without deigning to reason; and it may also be

easily distinguished from esteem, the foundation of friendship, because it is often excited by evanescent beauties and graces, though to give an energy to the sentiment, something more solid must deepen their impression and set the imagination to work, to make the most fair—the first good.

Common passions are excited by common qualities.—Men look for beauty and the simper of good-humoured docility: women are captivated by easy manners; a gentleman-like man seldom fails to please them, and their thirsty ears eagerly drink the insinuating nothings of politeness, whilst they turn from the unintelligible sounds of the charmer—reason, charm he never so wisely. With respect to superficial accomplishments, the rake certainly has the advantage; and of these females can form an opinion, for it is their own ground. Rendered gay and giddy by the whole tenor of their lives, the very aspect of wisdom, or the severe graces of virtue, must have a lugubrious appearance to them; and produce a kind of restraint from which they and love, sportive child, naturally revolt. Without taste, excepting of the lighter kind, for taste is the offspring of judgment, how can they discover that true beauty and grace must arise from the play of the mind? and how can they be expected to relish in a lover what they do not, or very imperfectly, possess themselves? The sympathy that unites hearts, and invites to confidence, in them is so very faint, that it cannot take fire, and thus mount to passion. No, I repeat it, the love cherished by such minds, must have grosser fuel!

The inference is obvious; till women are led to exercise their understandings, they should not be satirized for their attachment to rakes; nor even for being rakes at heart, when it appears to be the inevitable consequence of their education. They who live to please—must find their happiness, in pleasure! It is a trite, yet true remark, that we never do any thing well, unless we love it for its own sake.

Supposing, however, for a moment, that women were, in some future revolution of time, to become, what I sincerely wish them to be, even love would acquire more serious dignity, and be purified in its own fires; and virtue giving true delicacy to their affections, they would turn with disgust from a rake. Reasoning then, as well as feeling, the only province of woman, at present, they might easily guard against exteriour graces, and quickly learn to despise the sensibility that had been excited and hackneyed in the ways of women, whose trade was vice; and allurements, wanton airs. They would recollect that the flame, one must use appropriated expressions, which they wished to light up, had been exhausted by lust, and that the sated appetite losing all relish for pure and simple pleasures, could only be roused by licentious arts or variety. What satisfaction could a woman of delicacy promise herself in a union with such a man, when the very artlessness of her affection might appear insipid? Thus does Dryden describe the situation.

Where love is duty, on the female side,
On theirs mere sensual gust, and sought with surly pride.

But one grand truth women have yet to learn, though much it imports them to act accordingly. In the choice of a husband, they should not be led astray by the qualities of a lover—for a lover the husband, even supposing him to be wise and virtuous, cannot long remain.

Were women more rationally educated, could they take a more comprehensive view of things, they would be contented to love but once in their lives; and after marriage calmly let passion subside into friendship—into that tender intimacy, which is the best

refuge from care; yet is built on such pure, still affections, that idle jealousies would not be allowed to disturb the discharge of the sober duties of life, nor to engross the thoughts that ought to be otherwise employed. This is a state in which many men live; but few, very few women. And the difference may easily be accounted for, without recurring to a sexual character. Men, for whom we are told women were made, have too much occupied the thoughts of women; and this association has so entangled love with all their motives of action; and, to harp a little on an old string, having been solely employed either to prepare themselves to excite love, or actually putting their lessons in practice, they cannot live without love. But, when a sense of duty, or fear of shame, obliges them to restrain this pampered desire of pleasing beyond certain lengths, too far for delicacy, it is true, though far from criminality, they obstinately determine to love, I speak of the passion, their husbands to the end of the chapter—and then acting the part which they foolishly exacted from their lovers, they became abject wooers, and fond slaves.

Men of wit and fancy are often rakes; and fancy is the food of love. Such men will inspire passion. Half the sex, in its present infantile state, would pine for a Lovelace; a man so witty, so graceful, and so valiant: and can they *deserve* blame for acting according to principles so constantly inculcated? They want a lover, and protector; and, behold him kneeling before them—bravely prostrate to beauty! The virtues of a husband are thus thrown by love into the background, and gay hopes, or lively emotions, banish reflection till the day of reckoning comes; and come it surely will, to turn the sprightly lover into a surly suspicious tyrant, who contemptuously insults the very weakness he fostered. Or, supposing the rake reformed, he cannot quickly get rid of old habits. When a man of abilities is first carried away by his passions, it is necessary that sentiment and taste varnish the enormities of vice, and give a zest to brutal indulgences; but when the gloss of novelty is worn off, and pleasure palls upon the sense, lasciviousness becomes barefaced, and enjoyment only the desperate effort of weakness flying from reflection as from a legion of devils. Oh! virtue thou art not an empty name! All that life can give—thou givest!

If much comfort cannot be expected from the friendship of a reformed rake of superior abilities, what is the consequence when he lacks sense, as well as principles? Verily misery, in its most hideous shape. When the habits of weak people are consolidated by time, a reformation is barely possible; and actually makes the beings miserable who have not sufficient mind to be amused by innocent pleasure; like the tradesman who retires from the hurry of business, nature presents to them only a universal blank; and the restless thoughts prey on the damped spirits.* Their reformation, as well as his retirement, actually makes them wretched because it deprives them of all employment, by quenching the hopes and fears that set in motion their sluggish mind.

If such is the force of habit; if such is the bondage of folly, how carefully ought we to guard the mind from storing up vicious associations; and equally careful should we be to cultivate the understanding, to save the poor wight from the weak dependent state of even harmless ignorance. For it is the right use of reason alone which makes us independent of everything—excepting the unclouded Reason—“Whose service is perfect freedom.”

*I have frequently seen this exemplified in women, whose beauty could no longer be repaired. They have retired from the noisy scenes of dissipation; but, unless they become methodists, the solitude of the select society of their family connexions or acquaintances, has presented only a fearful void; consequently, nervous complaints and all the vapourish train of idleness, rendered them quite as useless, and far more unhappy, than when they joined the giddy throng.

NINETEENTH- CENTURY PHILOSOPHY

The nineteenth century has often been described as the Age of Progress. The scientific discoveries of the seventeenth and eighteenth centuries led to numerous technological advances in Europe and America. These advances, in turn, made possible the Industrial Revolution and the incredible outpouring of goods it produced. Millions of people left the hard life of the farm, moving to cities and working in factories. In England, for example, in 1800 only 21 percent of the population lived in cities with a population of more than ten thousand. By 1890, city-dwellers had become 62 percent of the population. Life in the city seemed full of promise, and the good life seemed within reach of all.

The early nineteenth-century philosophies of Hegel and Mill epitomized this optimism about the future. Hegel claimed that “Idea” (or “Spirit” or “Mind”) was guiding all of history. Contradictions in thought and practice would be overcome as history progressed. For his part, Mill wrote in his major work, *Utilitarianism*, of the “progress of science [that] holds out a promise for the future.” Mill argued that free individuals representing the “wisdom of society” could overcome the social problems of the nineteenth century.

Yet by the middle of the century, doubts began to emerge among some thinkers. Kierkegaard questioned the optimistic assumptions of Hegel and expressed skepticism about the inevitability of progress. More fundamentally, Kierkegaard claimed that Hegel’s entire system was flawed, because it assumed an objectivity that is unavailable and a finality that does not exist within history. For his part, Marx noted the effect of the Industrial Revolution on the factory

worker and called for a change in the social and economic order. Marx also raised questions about Hegel, focusing his attack on Hegel's concept of "Idea."

Toward the end of the century, Nietzsche added his voice to those of the skeptics about nineteenth-century progress. Nietzsche decried the lack of passion brought on by the comforts of the Industrial Revolution. He called on thinking persons to recognize that there are no standards, that "God is dead," and he wished them to assert their "will to power" in overcoming the comfortable mediocrity of his age.

Though Nietzsche died in 1900, the nineteenth century really did not come to an end, in terms of ideas, until 1914. In that year, all the impressive technology that had been developed over the previous century was brought to bear in World War I with the goal of killing people. A system of alliances that had been established in the mid-nineteenth century on the basis of rational, pragmatic considerations ensured that virtually the entire world was involved in the struggle. By the time the war ended, the nineteenth-century optimistic assumption of progress had died.

* * *

There are a number of general introductions to nineteenth-century philosophy. Among the classics in this area are Étienne Gilson, *Recent Philosophy: Hegel to the Present* (New York: Random House, 1966); the appropriate works from Frederick Copleston's series, *A History of Philosophy: Volume VII, Fichte to Nietzsche; Volume VIII, Bentham to Russell; and Volume IX, Maine de Biran to Sartre* (New York: Image Doubleday, 1963, 1966, 1974); and from Emile Brehier's series, *The History of Philosophy: Volume 6, The Nineteenth Century: Period of Systems, 1800–1850; Volume 7, Contemporary Philosophy, Since 1850*, translated by Joseph Thomas (Chicago: University of Chicago Press, 1969); Karl Löwith, *From Hegel to Nietzsche: The Revolution in Nineteenth-Century Thought*, translated by David E. Green (1964; reprinted New York: Columbia University Press, 1991); and W.T. Jones, *Kant and the Nineteenth Century*, 2nd edition, revised (New York: Harcourt, Brace & World, 1975). More recent general surveys include Roger Scruton, *A Short History of Modern Philosophy: From Descartes to Wittgenstein* (London: Routledge, 1984); Wallace I. Matson, *A New History of Philosophy: Volume II, Modern* (San Diego, CA: Harcourt Brace Jovanovich, 1987); and C.L. Ten, ed., *Routledge History of Philosophy, Volume 7: The Nineteenth Century* (London: Routledge, 1994). The following is a sampling of the many books on specific topics from this era: William Barrett, *Irrational Man* (New York: Doubleday, 1958); David Knight, *The Age of Science: The Scientific World-View in the Nineteenth Century* (Oxford: Blackwell, 1986); Robert C. Solomon, *Hegel to Existentialism* (Oxford: Oxford University Press, 1987); David Jasper and T.R. Wright, eds., *The Critical Spirit and the Will to Believe: Essays in Nineteenth-Century Literature and Religion* (London: Macmillan, 1989); Mary Ellen Waithe, *A History of Women Philosophers: Volume III, Modern Women Philosophers, 1600–1900* (Dordrecht, Netherlands: Kluwer Academic, 1991); and Mark Francis and John Morrow, *A History of English Political Thought in the Nineteenth Century* (London: Duckworth, 1994).

G.W.F. HEGEL

1770–1831

Georg Wilhelm Friedrich Hegel was born in Stuttgart, in southern Germany. Hegel and his father, a minor government official; his mother, a loving hausfrau (housewife); and his sister and brother were all close, affectionate, and loving. It is easy to see why Hegel would later describe the family as the “immediate Ethical Substance.” Following grade school in Stuttgart, at age 18, Hegel won a scholarship to Tübingen University, where he studied theology. While there, he met and befriended the poet Johann Christian Friedrich Hölderlin and the philosopher Friedrich Wilhelm Joseph Schelling. The work Hegel submitted to his professors at the university gave no indication of the brilliant philosophical career that was to follow. In fact, his diploma from the university recorded that his knowledge of theology was fair, but his knowledge of philosophy was inadequate. Nevertheless, Hegel was already beginning to write insightful essays, not for classroom assignments, but to clarify his own thoughts.

After graduating from the university in 1793, Hegel spent seven years as a tutor for wealthy families in Bern and Frankfurt. During this time he continued to write essays—mostly on religious topics—that indicated he had moved far away from orthodox Christianity. For example, one early essay compared Jesus and Socrates, and Socrates’ ethical teaching was seen as superior.

Following his father’s death in 1799, Hegel inherited a modest sum of money, quit tutoring, and joined his friend Schelling at the University of Jena. There, Hegel became a *Privatdozent* (an unsalaried lecturer) and co-edited a philosophic journal with Schelling. While at Jena, Hegel wrote his first great work, *The Phenomenology of Spirit* (1807), which laid out the major themes of his philosophy. This work included a critique of Schelling’s ideas, which ended the friendship. Before this important work could be published, Napoleon’s war with Prussia

closed the University of Jena, and so Hegel, whose inheritance had now been exhausted, was forced to find other employment.

After a stint as a newspaper editor, Hegel served eight years in Nürnberg as the rector of a *Gymnasium* (high school). There he published his second major work, *Science of Logic* (1812–1816). He also met and married a young woman from a distinguished family who was half his age, and they had two sons. In 1816, Hegel accepted a chair of philosophy at the University of Heidelberg. He continued his practice of producing a major book at each place he worked by publishing the *Encyclopedia of the Philosophical Sciences in Outline* in 1817. In 1818, Hegel moved to his final institution, the University of Berlin. There he published his *Philosophy of Right* (1821)—and became famous throughout Europe. He remained in Berlin until his death from cholera in 1831.

Following his death, a group of his friends published an eighteen-volume collection of his works, including his early essays and his lectures on aesthetics, the history of philosophy, the philosophy of history (portions of which are reprinted here), and the philosophy of religion.

* * *

Like all philosophers of his age, Hegel was greatly influenced by Kant. Kant had managed to synthesize two previously disparate realities—the rational world of ideas (emphasized by rationalists) with the phenomenal world of perception (emphasized by empiricists). But in so doing, Kant separated the noumenal world of “things-in-themselves” from the phenomenal world of experience and declared the noumenal world unknowable. In a sense, he had reconciled two competing epistemologies—Continental Rationalism and British Empiricism—at the expense of abandoning metaphysics. Hegel sought to go one step further than Kant and effect a complete synthesis that would not only draw together competing epistemologies but would also show the connection between epistemology and metaphysics. The key to this synthesis is the recognition that consciousness is the ultimate reality, or, to use his famous phrase, “What is real is rational—what is rational is real.” That is, metaphysical reality (the real) *is* Idea or Spirit or Mind (that which knows). The resulting philosophy is called “Absolute Idealism” because all things that exist are essentially related to absolute Idea or Spirit or Mind.

According to Hegel, traditional rationalism (what he calls *raisonnement*) tends to classify all experience formally into abstract, lifeless universals. Taken to its logical extreme, rationalists end up with the abstraction “Being”: “But this mere Being, as it is mere abstraction, is therefore the absolutely negative: which, in a similarly immediate aspect, is just NOTHING.” By abstracting away the concreteness or particularity of actual experience, one is left with Being which is Nothing. The short article “Who Thinks Abstractly?” (1807–1808?), reprinted here in Walter Kaufmann’s translation, clearly conveys Hegel’s contempt for the process of abstraction.

Whereas Being and Nothing are both identical and yet contradictory, according to Hegel, “the truth of Being and Nothing is . . . the unity of the two: and this unity is BECOMING.” The unity of Becoming does not obliterate Being and Nothing but holds both in tension in a higher truth. The two parts of the contradiction, together with that which unites or overcomes them, make up a triad. This method of overcoming contradictions by moving to a higher level of truth is known as the “dialectic.” Hegel proposed to develop a complete dialectical system of reality based on the three foundational triads of “Being—Nothing—Becoming,” “Being—Essence—Notion,”

and “Idea—Nature—Mind.” Though he developed several proposals for this system, Hegel never completed any of them.

Although Hegel never developed a complete system, he did use the dialectical method to explain consciousness. In the section entitled “Relations of Master and Servant” from *The Phenomenology of Spirit* (1807), reprinted here in the J.L.H. Thomas translation, Hegel explains one stage in the dialectical development of consciousness. He begins by pointing out that only by acknowledging an “other” is self-consciousness possible. But if there is an other, then the original self-consciousness feels threatened and asserts its freedom by trying to dominate that other and force acknowledgment of its dominance. The ensuing struggle results in a master who dominates and a servant who is dominated. The master then forces the servant to produce material goods for the enjoyment of the master.

But at this point, the master now depends upon the servant he has dominated. In the first place, his self-consciousness as master is subject to his recognition as master by the servant. But more important, while the master has been consuming or destroying what the servant makes, the servant has been learning to create—to bend nature to his will—and so has established his own self-consciousness in relation to what he has created. Furthermore, the labor of the servant has a permanent quality, whereas the master’s consumption again depends on the servant’s production. So by dominating the servant, the master is dominated.

The solution to this contradiction is to acknowledge that neither master nor servant is free and that freedom is not possible in relationships of domination. The next stage in the dialectic is for the mind to seek freedom within itself.

Hegel’s ideas have been both lauded and attacked. His insights on the master-servant relationship made a powerful impression on Marx and Nietzsche. Indeed, Hegel’s understanding of dialectical development became a central feature of Marx’s thought—though Marx rejected the notion of Absolute Spirit. Phenomenology developed Hegel’s insights about the different types of consciousness. The sociology of knowledge developed his notions about the connection between consciousness and the culture of a particular epoch. Chief among Hegel’s critics was Kierkegaard, who objected strenuously to the devaluing of the individual, questioned the implicit optimism of the dialectic, and mocked the incompleteness of Hegel’s “System.” Perhaps Hegel’s greatest legacy was not any specific idea, but the vision of a complete historical development of thought.

For a selection of primary source readings for Hegel, see *Hegel, The Essential Writings*, edited by Frederick G. Weiss (New York: Harper & Row, 1974). Many secondary books about Hegel are difficult for beginning students. Two accessible classics are W.T. Stace, *The Philosophy of Hegel* (1924; reprinted New York: Dover, 1955) and G.R.G. Mure, *An Introduction to Hegel* (Oxford: Clarendon Press, 1940). Recent helpful studies include J.N. Findlay, *Hegel: A Re-examination* (New York: Macmillan, 1958); Walter Kaufmann, *Hegel: Reinterpretation, Texts and Commentary* (Garden City, NY: Doubleday, 1965); Peter Singer, *Hegel* (Oxford: Oxford University Press, 1983); Raymond Plant, *Hegel* (London: Routledge, 1999); Terry Pinkard, *Hegel: A Biography* (Cambridge: Cambridge University Press, 2001); Frederick Beiser, *Hegel* (London: Routledge, 2005); David James, *Hegel: A Guide for the Perplexed* (London: Continuum, 2007); and Allen Speight, *The Philosophy of Hegel* (Montreal: McGill–Queen’s University Press, 2008). Charles

Taylor's massive *Hegel* (Cambridge: Cambridge University Press, 1975) can be consulted for particular topics. For specialized topics, see Ivan Soll, *An Introduction to Hegel's Metaphysics* (Chicago: University of Chicago Press, 1969); Walter Kaufmann, ed., *Hegel's Political Philosophy* (New York: Atherton Press, 1970); Quentin Lauer, *Hegel's Idea of Philosophy* (New York: Fordham University Press, 1971); Quentin Lauer, *A Reading of Hegel's "Phenomenology of Spirit"* (New York: Fordham University Press, 1976); Robert C. Solomon, *From Hegel to Existentialism* (New York: Oxford University Press, 1987); Merold Westphal, *History and Truth in Hegel's "Phenomenology"* (Atlantic Highlands, NJ: Humanities Press, 1990); H.S. Harris, *Hegel: Phenomenology and System* (Cambridge, MA: Hackett, 1995); John Russon, *The Self and Its Body in Hegel's Phenomenology of Spirit* (Toronto: University of Toronto Press, 1997); Joseph McCarney, *Routledge Philosophy Guidebook to Hegel on History* (London: Routledge, 2000); Robert Stern, *Routledge Philosophy Guidebook to Hegel and the Phenomenology of Spirit* (London: Routledge, 2002); and Howard Kainz, *Hegel's Phenomenology of Spirit: Not Missing the Trees for the Forest* (Lanham, MD: Lexington Books, 2008). Karl Marx, *Critique of Hegel's "Philosophy of Right,"* edited by Joseph O'Malley (Cambridge: Cambridge University Press, 1970) is both a critical review of Hegel's work and a major work in its own right. Michael Inwood, *A Hegel Dictionary* (Oxford: Basil Blackwell, 1992) provides a useful reference work. General collections of critical essays include W.E. Steinkraus, ed., *New Studies in Hegel's Philosophy* (New York: Holt, Rinehart & Winston, 1971); Alasdair MacIntyre, ed., *Hegel: A Collection of Critical Essays* (Notre Dame, IN: University of Notre Dame Press, 1972); Michael Inwood, ed., *Hegel* (Oxford: Oxford University Press, 1985); Frederick C. Beiser, ed., *The Cambridge Companion to Hegel* (Cambridge: Cambridge University Press, 1993); the multi-volume Robert Stern, ed., *G.W.F. Hegel: Critical Assessments* (London: Routledge, 1993); Patricia Jagentowicz Mills, ed., *Feminist Interpretations of Hegel* (College Park, PA: Pennsylvania State University Press, 1996); and Michael Baur and John Russon, eds., *Hegel and the Tradition* (Toronto: University of Toronto Press, 1998).

PHENOMENOLOGY OF SPIRIT

INDEPENDENCE AND DEPENDENCE OF SELF-CONSCIOUSNESS: RELATIONS OF MASTER AND SERVANT

Self-consciousness is *in* and *for itself* in and through being in and for itself for another self-consciousness; that is, it is only as something acknowledged, or recognized. The concept of this unity of self-consciousness in its duplication, of the infinitude realising itself in self-consciousness, is a many-sided and many-sensed complex, so that the

Hegel, *Phenomenology of Spirit* (B, IV, A: "Independence and Dependence of Self-Consciousness: Relations of Master and Servant"). Translated by J.L.H. Thomas. Reprinted from *Hegel: Selections*, edited by M.J. Inwood, *The Great Philosophers* series, Paul Edwards, general editor (New York: Macmillan, 1989).

moments of this complex must both be held carefully apart, and at the same time taken and understood in this differentiation as not distinct, or always also in their opposed sense. The double-sensedness of what is distinguished lies in the essence of self-consciousness, of being infinite, or boundless, that is, immediately the contrary of the determination in which it is established. The laying-apart of the concept of this spiritual unity in its duplication presents to us the movement of *acknowledging*.

There is for self-consciousness another self-consciousness; it has come *outside itself*. This has a twofold significance: *first*, self-consciousness has lost itself, for it finds itself as *another* being; *second*, it has thereby done away with the other, for it does not see the other either as the essential being, but *it itself* in the *other*.

Self-consciousness must do away with this *otherness* it has; this is the doing away with of the first double-sense, and hence itself a second double-sense: *first*, it must set out to do away with *the other* independent being in order thereby to become certain of *itself* as the essential being; *second*, in so doing it sets out to do away with *itself*, for this other being is itself.

This double-sensed doing away with its double-sensed otherness is equally a double-sensed return *into itself*; for, *first*, through doing away it gets itself back, for it becomes once more equal to itself through doing away with *its* otherness; *second*, however, it no less gives back the other self-consciousness to the latter again, for it had itself in the other, it does away with this being *it* has in the other, thus letting the other go free again.

This movement of self-consciousness in its relation to another self-consciousness has been presented in this way now, as *the doing of the one*; but this doing of the one has itself the two-fold significance of being as much *its doing* as *the doing of the other*; for the other is no less independent, shut up within itself, and there is nothing in it that is not owing to itself. The first self-consciousness does not have the object before it as the latter to begin with is merely for desire, but an independent object existing for itself, over which therefore it has of itself no power, unless the object does with itself what self-consciousness does with it. The movement is thus in all respects the double movement of both self-consciousnesses. Each sees the *other one* do the same as it does; each does itself what it demands of the other, and so does what it does only inasmuch as the other does the same; a one-sided doing would be unavailing, because what it is intended should occur can come about only through both.

The doing is therefore double-sensed not only inasmuch as it is a doing as much *to itself* as *to the other*, but also inasmuch as it is undividedly as much *the doing of the one* as *of the other*.

In this movement we see the process repeat itself which presented itself as the play of forces, but in consciousness. What in the earlier process was for us, is here for the extremes themselves. The centre is self-consciousness, which puts itself apart into the extremes; and each extreme is this exchanging of its determination and absolute going over into the opposed extreme. But though, as consciousness, it does indeed come *out of itself*, yet it is in its being-out-of-itself at the same time held back within itself, is *for itself*, and its "outside-itself" is *for it*. It is for consciousness that it immediately *is* and *is not* another consciousness; and, equally, that this other is only for itself in doing away with itself as something being for itself, and only in the being-for-itself of the other is for itself. Each is to the other the centre through which each brings into relation and connects itself with itself, and each is to itself and to the other an immediate entity existing for itself, which at the same time is thus for itself only through this relating, or mediation. They *acknowledge* one another as *mutually acknowledging one other*.

This pure concept of acknowledgement, the duplication of self-consciousness in its unity, will now be studied in the way in which its process appears for self-consciousness. This process will first present the facet of the *inequality* of the two, or the coming out of the centre into the extremes, which, being extremes, are opposed to one another, the one acknowledged only, the other acknowledging only.

Self-consciousness is to begin with simple being-for-itself, equal-with-itself through the exclusion of everything *other from itself*; its essence and absolute object is to it "*I*"; and it is in this *immediacy*, or in this *being* of its being-for-itself, an *individual*. Whatever else there is for it, is as an inessential object, one marked with the character of the negative. But the other is also a self-consciousness: an individual comes on opposite an individual. Thus *immediately* coming on, they are for each other in the way of common objects: *independent* forms, consciousnesses immersed in the *existence* of life—for it is as life that the existent object has here determined itself—which have not yet carried out *for each other* the movement of absolute abstraction, of expunging all immediate existence and of being merely the purely negative existence of consciousness equal-with-itself, or which have not yet presented themselves to each other as pure *being-for-self*, that is, as *self-consciousness*. Each is indeed certain of itself, but not of the other, and consequently each's own certainty of itself has as yet no truth; for its truth could only be that its own being-for-itself had presented itself to it as an independent object or, what amounts to the same thing, that the object had presented itself as this pure certainty of itself. This, however, on the concept of acknowledgement is not possible, save that as the other does for the one, so the one does for the other, each with itself through its own activity, and again through the activity of the other, carrying out this pure abstraction of being-for-itself.

The *presentation* of oneself as the pure abstraction of self-consciousness, however, consists in showing oneself to be the pure negation of one's objective way of being, that is, in showing oneself not to be attached to a particular *concrete existence*, nor to the universal individuality of concrete existence in general, nor even to life. This presentation is a *double* doing: doing of the other, and doing through oneself. Inasmuch as it is the doing *of the other*, each then is set upon the death of the other. But in this there is present also the second doing, *the doing through oneself*; for the former contains within itself the staking of one's own life. The relation of the two self-consciousnesses is hence determined in such a way that through the combat for life and death they *prove* themselves and each other.—They must enter this combat, for they must raise the certainty of themselves, *of being for themselves*, to truth in the other and in themselves. And it is solely through the staking of life that freedom arises, that it is confirmed to self-consciousness that it is not *being*, not the *immediate* way in which it comes on, not its being immersed in the expanse of life which is its essence—but that there is nothing present in it which is not for it a vanishing moment, that it is just pure *being-for-itself*. The individual that has not risked life can indeed be acknowledged as a *person*; but it has not attained the truth of this state of acknowledgement as that of an independent self-consciousness. Likewise, each must as much aim at the death of the other as it stakes its own life; for the other means no more to it than it itself does; the individual's essence presents itself to it as another, it is outside itself, it must do away with its being-outside-itself; the other is a consciousness engaged and existing in manifold ways; it must view its otherness as pure being-for-self, or as absolute negation.

This proving through death does away, however, with the truth that was to result from it, just as much as it thereby also does away with the certainty of oneself altogether; for just as life was the *natural* position of consciousness, independence without

absolute negativity, so death is the *natural* negation of consciousness, negation without independence, which therefore remains without the required sense of acknowledgement. Through death the certainty has indeed arisen that both risked their life and despised it in themselves and in the other; though not for those who underwent this combat. They do away with their consciousness set in this alien essentiality that is natural concrete existence, or they do away with themselves, and are done away with as the *extremes* which would be for themselves. There thereby vanishes, however, from the play of exchange the essential moment of setting oneself apart into extremes of opposed determinations; and the centre collapses into a dead unity, which is set apart into dead, merely existent, not opposed, extremes; and the two do not mutually give back and receive back themselves from each other through consciousness, but let each other free merely indifferently, as things. Their deed is abstract negation, not the negation of consciousness, which *does away* in such a manner that it *puts by* and *preserves* what is done away, and consequently survives its being-done-away.

In this experience self-consciousness comes to realise that life is as essential to it as pure self-consciousness is. In immediate self-consciousness the simple "I" is the absolute object, which however, for us or in itself, is absolute mediation and has existent independence as an essential moment. The dissolution of that simple unity is the result of the first experience; through it there is established a pure self-consciousness, and a consciousness which is not purely for itself, but is for another consciousness, that is, is as *existent*, or is consciousness in the form of *thinghood*. Both moments are essential;—but as they are to begin with unequal and opposed, and their reflexion into unity is not yet a reality, they are as two opposed forms of consciousness: one, the independent consciousness, to which being-for-self is the essence; the other, the dependent consciousness, to which life or being for another is the essence: the former is the *master*; the latter the *servant*.

The master is the consciousness existing *for itself*, though no longer merely the concept of the latter, but a consciousness existing for itself which is in mediate relation with itself through *another* consciousness, namely through one to whose essence it pertains to be synthesised with independent *being* or thinghood in general. The master relates himself to both these moments, to a *thing* as such, the object of desire, and to the consciousness to whom thinghood is what is essential; and since he (a), *qua* concept of self-consciousness, is immediate relation of *being-for-himself*, but (b) now is also as mediation, or as a being-for-self which is for itself only through another, so he relates himself (a) immediately to both and (b) mediately to each through the other. The master relates himself *to the servant mediately through independent being*; for it is precisely to this that the servant is kept; it is his chain, from which in the combat he could not abstract, and consequently showed himself to be dependent, to have his independence in thinghood. The master, however, is the power over the being in question, for he showed in the combat that it meant merely something negative to him; since he is the power over this being, while this being is the power over the other, the master thus has in this conjunction the other under himself. Likewise the master relates himself *mediately through the servant to the thing*, the servant relates himself, *qua* self-consciousness as such, to the thing negatively also, and does away with it; but the thing is at the same time independent for him, and hence he cannot through his negating dispose of it so far as to destroy it, or he *works* it merely. The master on the other hand *gains* through this mediation the *immediate* relation as the pure negation of the thing, or the *enjoyment*; where desire did not succeed, he succeeds, namely in disposing of the thing and in satisfying himself in the enjoyment of it. Desire did not

succeed in this on account of the independence of the thing; the master, however, who has interposed the servant between the thing and himself, thereby connects himself only with the nonindependence of the thing, and enjoys it in its purity; the facet of independence, on the other hand, he leaves to the servant, who works it.

In these two moments the master has his acknowledgement, or recognition, by another consciousness granted him; for the other consciousness establishes itself in these moments as something inessential, first, in the working of the thing, second, in the dependence upon a particular existence; in both it cannot achieve mastery over being and attain absolute negation. There is therefore present here the following moment of recognition, that the other consciousness does away with itself as being-for-itself, and so itself does what the other does to it. Likewise the other moment is present, that this doing of the second consciousness is the first's own doing for what the servant does is really the doing of the master; to the latter, solely being-for-himself is the essence; he is the pure negative power to which the thing is nothing, and hence the pure essential doing in this situation; while the servant is not a pure doing, but an inessential one. But for true recognition there is lacking the moment that what the master does to the other he also does to himself, and what the servant does to himself he also does to the other. Thus there has arisen a one-sided and unequal recognizing.

The inessential consciousness is here for the master the object which constitutes the *truth* of the certainty of oneself. But it is evident that this object does not match its concept, and that there where the master has fulfilled himself, he has instead had something quite other than an independent consciousness come to be. It is not such a consciousness that is for him, but a dependent one rather; he is consequently not certain of *being-for-himself* as the truth, and his truth is rather the inessential consciousness, and the inessential doing of the latter.

The *truth* of independent consciousness is accordingly the servile or *subject consciousness*. The latter admittedly appears at first *outside* itself, and not as the truth of self-consciousness. But just as masterhood or dominion, showed that its essence is the converse of what it itself would be, so too, as we shall see, subjection will in its fulfillment turn rather into the contrary of what it is immediately; it will, *qua* consciousness *driven back* into itself, go into itself and turn about to true independence.

We have seen only what subjection is in the context of dominion. But the former is self-consciousness, and accordingly we shall now see what it is in and for itself. First of all, for subjection the master is the essence; hence the *independent consciousness existing for itself* is to subjection *the truth*, which however *for subjection* is not yet *in subjection*. But it has this truth of pure negativity and of *being-for-itself in the event in itself*; for subjection has *experienced* this essence within itself. This consciousness was, namely, not afraid for this or that, or for this instant or that, but for its whole being; for it has felt the fear of death, the absolute lord, or master. In this fear it has been internally broken up, it has been thoroughly shaken in itself, and everything fixed has trembled within it. This pure universal movement, the absolute becoming fluid of all that is permanent, is however the simple essence of self-consciousness, absolute negativity, *pure being-for-itself*, which is consequently *in* this consciousness. This moment of pure being-for-itself is also *for it*, for in the master it has it as its *object*. It is further not merely this universal dissolution *in general*, but in serving it *actually* brings it about; in serving it does away in all *particular* moments with its dependency on natural existence, and works that existence off.

But the feeling of absolute power, in general and in the particulars of service, is only the dissolution *in itself*; and although "the fear of the Lord is the beginning of

wisdom," consciousness in this fear is *for its self*, not *being-for-itself*. Through work, however, it comes to itself. In the moment which corresponds to desire in the consciousness of the master, the facet of the inessential relation to the thing seemed to have fallen to the consciousness that serves, inasmuch as in this relation the thing retains its independence. Desire has reserved to itself the pure negating of the object and thereby the unmixed feeling-of-self. This satisfaction is on that account, however, itself just a vanishing, for it lacks the facet of the *object*, or *permanency*. Work by contrast is *contained* desire, *arrested* vanishing, or work *improves*. The negative relation to the object turns into the *form* of the object and into something *enduring*, precisely because to the worker the object has independence. This *negative* centre, or the *activity* that forms, or fashions, is at the same time *the particularity*, or the pure being-for-self of consciousness, which now in work steps out of consciousness into the element of permanency; the consciousness that works therefore attains as a consequence a view of independent being *as itself*.

The fashioning has not only this positive significance, however, that in it the consciousness that serves has itself as pure *being-for-itself* become something *existent*; but also a negative significance as against its first moment, the fear. For, in the improving of the thing, the consciousness which serves has its own negativity, its being-for-itself, become object only by doing away with the opposed existent *form*. But this objective, *negative* thing is precisely the alien being before which it trembled. Now, however, it destroys this alien negative thing, sets *itself* as something negative into the element of permanency, and thereby comes to be *for itself*, something *existing-for-itself*. In the master it has being-for-self as *an other*; or as merely *for it*; in the fear being-for-self is *in the consciousness itself that serves*; in the improving being-for-self comes to be for the consciousness that serves as *its own*, and the latter becomes conscious that it itself is in and for itself. Through being *set outside*, the form does not become to the consciousness that serves something other than the consciousness itself; for it is precisely the form that is its pure being-for-itself, which thereby to consciousness becomes the truth. Through this refinding of itself by itself, then, the consciousness that serves becomes a mind or *sense of its own*, and in the very work in which it seemed to be only *another's sense*.—For this reflexion both moments, that of fear and service in general, as well as that of improving, are necessary, and at the same time both in a general way. Without the discipline of service and obedience, fear remains at the formal stage, and does not spread itself upon the known reality of concrete existence. Without the improving, fear remains inward and silent, and consciousness does not become for itself. If consciousness fashions, or forms, without the initial absolute fear, it is merely a vain sense of self; for its form or negativity is not negativity *in itself*, and its fashioning cannot therefore give it the consciousness of itself as the essence. If it has not endured absolute fear, but only some anxiety, then it has the negative essence remain something external, its substance has not been infected through and through by the negative essence. Inasmuch as not all aspects of its natural consciousness have become insecure, it still *in itself* belongs to some particular existence; its self-sense is *self-will*, a freedom which as yet remains within subjection. No more than it can have the pure form become essence, no more is the form, regarded as something spread over individual things, a universal cultivating, an absolute concept, but is instead a dexterity which has power over merely some things, not over universal power and the whole objective realm of being.

LECTURES ON THE HISTORY OF PHILOSOPHY (in part)

THE FINAL RESULT

The present standpoint of philosophy is that the Idea is known in its necessity; the sides of its diremption, nature and spirit, are each recognized as representing the totality of the Idea, and not only as being in themselves identical, but as producing this one identity from themselves; and thus the identity is recognized as necessary. Nature, and the spiritual world, history, are the two actualities; what exists as actual nature is an image of divine reason; the forms of self-conscious reason are also forms of nature. The ultimate aim and concern of philosophy is to reconcile thought or the concept with actuality. It is easy to adopt subordinate standpoints, to find satisfaction in modes of intuition and of feeling. But the deeper the spirit goes within itself, the stronger the opposition, the more abundant the wealth without; depth is to be measured by the greatness of the need with which spirit seeks to find itself in what lies outside of itself. We saw the thought which apprehends itself emerge; it strove to make itself concrete within itself. Its first activity is formal; Aristotle was the first to say that *nous* is the thinking of thinking. The result is the thought which is at home with itself, and at the same time embraces the universe, and transforms it into an intelligent world. In conceptualisation the spiritual and the natural universe interpenetrate as one harmonious universe, which flees from itself into itself, and in its aspects develops the absolute into a totality, to become thereby conscious of itself in its unity, in thought. Philosophy is thus the true theodicy, as contrasted with art and religion and the feelings which these call up—a reconciliation of spirit, of the spirit which has apprehended itself in its freedom and in the riches of its actuality.

To this point the world-spirit has come, and each stage has its own form in the true system of philosophy; nothing is lost, all principles are preserved, since philosophy in its final aspect is the totality of forms. This concrete Idea is the result of the strivings of spirit during almost twenty-five centuries of earnest work to become objective to itself, to know itself:

Tantae molis erat, se ipsam cognoscere mentem.

All this time was required to produce the philosophy of our day; so tardily and slowly did the world-spirit work to reach this goal. What we pass in rapid review when we recall it, stretched itself out in actuality to this great length of time. For in this period, the concept of spirit, invested with its entire concrete development, external subsistence, wealth, strives to bring spirit to perfection, to make progress itself and to emerge from spirit. It goes ever on and on, because spirit is progress alone. Spirit often seems to have forgotten and lost itself, but inwardly opposed to itself, it is inwardly working ever forward (as Hamlet says of the ghost of his father, “Well said, old mole! canst work i’ the ground so fast?”), until grown strong in itself it bursts asunder the crust of earth which divided it from

the sun, its concept, so that the earth crumbles away. At such a time, when the encircling crust, like a soulless decaying tenement, crumbles away, and spirit displays itself arrayed in new youth, the seven league boots are put on. This work of the spirit to know itself, this activity to find itself, is the life of the spirit and the spirit itself. Its result is the concept which it takes up of itself; the history of philosophy is a revelation of what has been the aim of spirit in its history; it is therefore the world's history in its innermost signification. This work of the human spirit in inner thinking is parallel with all the stages of actuality. No philosophy oversteps its own time. The importance of the determinations of thought is another matter, which does not belong to the history of philosophy. These concepts are the simplest revelation of the world spirit: in their more concrete form they are history.

We must, therefore, firstly, not esteem lightly what spirit has won, and won now. Older philosophy is to be revered as necessary, and as a link in this sacred chain, but all the same only a link. The present is the highest stage. Secondly, all the various philosophies are no mere fashions or the like; they are neither chance products nor the blaze of a fire of straw, nor casual eruptions here and there, but a spiritual, rational, forward advance; they are of necessity one philosophy in its development, the revelation of God, as He knows Himself to be. Where several philosophies appear at the same time, they are different sides which make up one totality forming their basis; and on account of their one-sidedness we see the refutation of the one by the other. Thirdly, we do not find here feeble little efforts to establish or to criticize this or that particular point; each philosophy sets up a *principle* of its own, and this must be recognized.

If we glance at the main epochs in the whole history of philosophy, and grasp the necessary succession of stages in the leading moments, each of which expresses a determinate Idea, we find that after the Oriental whirl of subjectivity, which attains to no understanding and therefore to no subsistence, the light of thought dawned among the Greeks.

1. The philosophy of the ancients had the absolute Idea as its thought; and the realization or reality of it consisted in comprehending the existing present world, and regarding it as it is in and for itself. This philosophy did not start from the Idea itself, but from the objective as something given, and transformed it into the Idea: the being of Parmenides.

2. Abstract thought, *nous*, became known to itself as universal essence, not as subjective thinking: the universal of Plato.

3. In Aristotle the concept emerges, free and unconstrained, as conceptual thinking, permeating and spiritualizing all the formations of the universe.

4. The concept as subject, its becoming for itself, its inwardness, abstract separation, is represented by the Stoics, Epicureans and Sceptics: not the free concrete form, but universality abstract and in itself formal.

5. The thought of totality, the intelligible world, is the concrete Idea as we have seen it in the Neo-Platonists. This principle is ideality in general in all reality, the Idea as totality, but not the Idea which knows itself: this is not reached until the principle of subjectivity, individuality, found a place in it, and God as spirit became actual to Himself in self-consciousness.

6. But it is the work of modern times to grasp this Idea as spirit, as the Idea that knows itself. In order to proceed from the knowing Idea to the self-knowing, we must have the infinite opposition, the Idea must have come to the consciousness of its bifurcation. As spirit had the thought of objective essence, philosophy thus perfected the intellectuality of the world, and produced this spiritual world as an object existing beyond present actuality, like a nature—the first creation of spirit. The work of the spirit now consisted in bringing this Beyond back to actuality and into self-consciousness. This is accomplished by self-consciousness thinking itself, and recognizing the absolute essence to be the self-consciousness that thinks itself. With Descartes pure thought directed itself

on that bifurcation. Self-consciousness, first, thinks of itself as consciousness; therein is contained all objective actuality and the positive, intuitive connexion of its actuality with the other. With Spinoza thought and being are opposed and yet identical; he has the intuition of substance, but the knowledge of substance in his case is external. We have here the principle of reconciliation taking its rise from thought as such, in order to sublimate the subjectivity of thought: this is the ease in Leibniz's monad, which possesses the power of representation.

7. Secondly, self-consciousness thinks of itself as being self-consciousness; in being self-conscious it is for itself, but still for itself it has a negative connexion with another. This is infinite subjectivity, which appears at one time as the critique of thought in Kant, and at another time, in Fichte, as the impulse towards the concrete. Absolutely pure, infinite form is expressed as self-consciousness, the ego.

8. This is a light that breaks forth on spiritual substance, and shows absolute content and absolute form to be identical; substance is in itself identical with knowledge. Self-consciousness thus, thirdly, recognizes its positive connexion as its negative, and its negative as its positive,—or it recognizes these opposite activities as the same, i.e. it recognizes pure thought or being as self-equality, and this again as bifurcation. This is intellectual intuition; but it is requisite in order that it be in truth intellectual, that we hear of, but absolute knowledge. This intuition which does not cognize itself is taken as starting-point as if it were absolutely presupposed; it has in itself intuition only as immediate knowledge, not as self-knowledge: or it knows nothing, and what it intuits it does not really know,—for, at its best, it consists of beautiful thoughts, but not knowledge.

But intellectual intuition is known, since firstly, in spite of the separation of each of the opposed sides from the other, all external reality is known as internal. If it is known according to its essence, as it is, it shows itself as not existing of itself, but as essentially consisting in the movement of transition. This Heraclitean or sceptical principle, that nothing is at rest, must be demonstrated of each individual thing; and thus in this consciousness—that the essence of each thing lies in determinacy, in the opposite of itself—there appears the comprehended unity with its opposite. Similarly this unity is, secondly, to be cognized even in its essence; its essence as this identity is likewise to pass over into its opposite, or to realize itself, to become something different; and thus the opposition in it is brought about by itself. Again, it may be said of the opposition, thirdly, that it is not in the absolute; this absolute is the essence, the eternal, etc. This is however itself an abstraction in which the absolute is apprehended in a one-sided manner only and the opposition is only ideal; but in fact it is form, as the essential moment of the movement of the absolute. This absolute is not at rest, and that opposition is not the unresting concept; for the Idea, unresting though it is, is yet at rest and satisfied in itself. Pure thought has advanced to the opposition of the subjective and objective; the true reconciliation of the opposition is the perception that this opposition, when pushed to its absolute extreme, resolves itself; as Schelling says, the opposites are in themselves identical—and not only in themselves, but eternal life consists in the very process of eternally producing the opposition and eternally reconciling it. To know opposition in unity, and unity in opposition—this is absolute knowledge; and science is the knowledge of this unity in its whole development by means of itself.

This is now the need of the time in general and of philosophy. A new epoch has arisen in the world. It would appear as if the world-spirit had at last succeeded in stripping off from itself all alien objective being, and apprehending itself at last as absolute spirit, in developing from itself what for it is objective, and keeping it in its power, yet remaining at rest. The strife of the finite self-consciousness with the absolute self-consciousness, which seemed to the former to lie outside itself, now ceases. Finite self-consciousness has ceased to be finite; and in this way absolute self-consciousness has, on the other hand, acquired

the actuality which it lacked before. This is the whole history of the world in general up to the present, and the history of philosophy in particular, which only depicts this strife. Now it seems to have reached its goal, when this absolute self-consciousness, which it had the work of representing, has ceased to be alien, and when spirit is thus actualized as spirit. For it becomes such only by knowing itself to be absolute spirit, and this it knows in science. Spirit produces itself as nature, as the state; nature is its unconscious work, in which it appears to itself something different, not spirit; but in the deeds and life of history, as also of art, it brings itself to pass with consciousness; it knows very various modes of its actuality, yet they are only modes. In science alone it knows itself as absolute spirit; and this knowledge, or spirit, is its only true existence. This then is the standpoint of the present day, and the series of spiritual forms is with it for now concluded.

At this point I bring this history of philosophy to a close. It has been my desire that you should learn from it that the history of philosophy is not a blind collection of brain-waves, nor a fortuitous progression. I have rather sought to show the necessary development of the successive philosophies from one another, so that the one of necessity presupposes the preceding. The general result of the history of philosophy is this: (1) at all times there has been only one philosophy, the contemporary differences of which constitute the necessary aspects of the one principle; (2) the succession of philosophic systems is not due to chance, but the necessary succession of stages in the development of this science; (3) the final philosophy of a period is the result of this development, and is truth in the highest form which the self-consciousness of spirit affords of itself. The latest philosophy contains therefore those which went before; it embraces in itself all the stages; it is the product and result of those that preceded it. We can now be Platonists no longer. We must rise above the pettinesses of individual opinions, thoughts, objections, and difficulties; and also above our own vanity, as if our own thoughts were of particular value. For to apprehend the inward substantial spirit is the standpoint of the individual; within the whole, individuals are like blind men, driven forward by the inner spirit. Our standpoint now is accordingly the knowledge of this Idea as spirit, as absolute spirit, which in this way opposes another spirit, the finite, the principle of which is to know absolute spirit, so that absolute spirit is for it. I have tried to develop and bring before your thoughts this series of spiritual forms of philosophy in its progress, and to indicate the connection between them. This series is the true kingdom of spirits, the only kingdom of spirits that there is—it is a series which is not a multiplicity, nor does it even remain a series or succession, but in the very process of coming to knowledge of itself it is transformed into the moments of the one spirit, of the one self-present spirit. This long procession of spirits is formed by the individual pulses which beat in its life; they are the organism of our substance, an absolutely necessary progression, which expresses nothing less than the nature of spirit itself, and which lives in us all. We have to give ear to its urgency—when the mole within forces its way on—and we have to give it actuality. It is my desire that this history of philosophy should contain for you a summons to grasp the spirit of the time, which is in us by nature, and—each in his own place—consciously to bring it from its natural condition, from its lifeless seclusion, into the light of day.

I have to express my thanks to you for the attention with which you have listened to me while I have been making this attempt; it is also due to you that my efforts have met with so great a measure of success. And it has been a source of pleasure to myself to have been associated with you in this spiritual community; I ought not to speak of it as if it were a thing of the past, for I hope that a spiritual bond has been knit between us which will prove permanent. I bid you a most hearty farewell.

JOHN STUART MILL

1806–1873

John Stuart Mill was born in London, the eldest of James and Harriet Burrow Mill's nine children. His father, a well-known philosopher and follower of Jeremy Bentham, educated young John at home. Beginning with Greek at age 3 and Latin at age 8, the younger Mill had read six of Plato's dialogues by the age of 10. John spent most of the day in the study with his father, who was writing a history of India. Each morning, they would go on a walk and James would quiz his son on what he had learned the previous day. During these walks, James would often discourse on various topics and then expect his son to prepare a summary of his points for the following day. Given the severity of this schooling—and the fact that his father showed no “signs of feeling”—it is not surprising that John later concluded, “I never was a boy.”

The publication of the elder Mill's work on India in 1818 resulted in his receiving a government post as an Assistant Examiner at the East India House. Five years later, James managed to arrange a similar position for his 17-year-old son. John worked for the East India House for the next thirty-four years, eventually becoming chief of his department. In his early years as a clerk, John was, like his father, a disciple of Bentham's utilitarianism. John established the Utilitarian Society, contributed articles to the *Westminster Review*, and was active in the London Debating Society. He was developing a reputation as a polemicist for the “philosophic radicals”—those who sought social changes along the lines of Bentham's theories.

But in 1826, at age 20, Mill suffered a breakdown and went through a period of severe depression. He discovered to his horror that even if all the social changes he advocated were enacted and all the ideas he was taught about happiness were proven correct, it would not make *him* happy. As he later wrote in his *Autobiography*, “All my happiness was to have been found in the continual

pursuit of this end. The end had ceased to charm, and how could there ever again be any interest in the means? I seemed to have nothing left to live for.” He eventually came to the conclusion that his rigorous intellectual training had weakened his ability to feel emotion. Reading such writers as Wordsworth and Coleridge, he began to teach himself to feel as his father had taught him to think. During this period, he encountered divergent philosophies, such as those of socialist philosopher Claude-Henry Saint-Simon and positivist thinker Auguste Comte, and he began to see some of the inadequacies of the strict quantificational method of Bentham.

In 1831, Mill was introduced to Harriet Taylor, the wife of a successful merchant. They quickly developed a strong friendship and collaborated on a number of works, including *Principles of Political Economy*, *On Liberty*, and *The Subjection of Women*. Mill attributed to Taylor a number of his most important ideas, including his liberal feminism, and claimed that next to his father, she was the chief intellectual influence on his life. He even claimed she was the inspiration for his major epistemological work, *A System of Logic* (1843). Following her husband’s death in 1849, they were finally married in 1851.

John and Harriet Mill moved to Avignon, France, in 1858, with neither of them in good health. Shortly after arriving, Harriet Taylor Mill died, and her daughter came to take care of her stepfather. Over the next seven years, Mill published *On Liberty* (1859), *Utilitarianism* (1861), *Considerations on Representative Government* (1861), *Auguste Comte and Positivism* (1865), and *The Subjection of Women* (written 1861, published 1869). In 1865, Mill was surprised by an offer to run for Parliament. Without campaigning he was elected and spent two years working on behalf of women’s suffrage, Irish land reform, and the rights of blacks in Jamaica. Returning once again to the south of France, he wrote his *Autobiography* just before dying in 1873.

* * *

Although Mill wrote on a variety of topics and his work on induction is still used today, he is best known for his modification of Bentham’s utilitarianism and his defense of individual liberty. Bentham had taught that ethics should be grounded on maximizing pleasure and minimizing pain, rather than on abstractions such as Kant’s “duty” or conscience. Accordingly, Bentham developed a “hedonistic calculus,” a mathematical method of determining which actions would most likely provide a greater quantity of pleasure over pain and hence yield happiness. Whereas this system might seem egoistic and individualistic, Bentham claimed that it would be to each individual person’s advantage to seek the “greatest happiness of the greatest number.”

In his *Utilitarianism*, given here (complete), Mill accepts Bentham’s quantitative hedonism and argues that happiness, or pleasure, is the one thing that all people seek. But whereas Bentham’s system merely measured quantities of pleasure and pain, Mill maintains that the *quality* of a given pleasure or pain has to be considered as well. Even though a pig might gain a great *quantity* of pleasure from wallowing in the mud, it would be a very low *quality* pleasure; and “It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied.” According to Mill, the person best able to make a qualitative determination between rival pleasures is the one who has

experienced both. Presumably anyone who has both wallowed in the mud *and* studied philosophy would prefer the difficult but fulfilling pleasures of the latter.

Mill's contemporary critics pointed out that there seemed to be discrepancies between the philosophy of *Utilitarianism* and that of Mill's other works that advocated individual freedom. For example, following the greatest happiness principle of *Utilitarianism*, wouldn't it make sense for society to increase general happiness by intruding on an individual's liberty? Mill countered this objection by arguing that on balance, *laissez-faire* individualism will ultimately benefit society, that the diversity of individual choices is more conducive to general happiness than any socially imposed standard.

More recent critics have questioned Mill's distinction between private and public—for example, what you choose to do to yourself in the privacy of your home may cost the public money if you end up in a tax-supported hospital. Feminist critics have pointed out the potential oppression of the private/public distinction, questioned the possibility of “perfect equality” if paternalistic structures continue, and assailed Mill's “equal opportunity until marriage” doctrine. But there is no question that as a reforming impulse, Mill's beliefs—about the rights of the individual, the rights of women and minorities, freedom from societal intrusion into personal affairs, and utility rather than tradition—have had an enormous influence.

* * *

There are several good overviews of Mill's life and thought, including R.P. Anschutz, *The Philosophy of John Stuart Mill* (Oxford: Oxford University Press, 1953); Karl Britton, *John Stuart Mill* (1953; reprinted New York: Dover, 1969); Alan Ryan, *J.S. Mill* (London: Routledge & Kegan Paul, 1974); William Thomas, *Mill* (Oxford: Oxford University Press, 1985); and Nicholas Capaldi, *John Stuart Mill: A Biography* (Cambridge: Cambridge University Press, 2004). F.A. Hayek, *John Stuart Mill and Harriet Taylor* (Chicago: University of Chicago Press, 1951) presents a study of Mill's relationship with Harriet Taylor. For a critical evaluation of his work, see H.J. McCloskey, *John Stuart Mill: A Critical Study* (London: Macmillan, 1971). Guides to specific works of Mill include John Gray and G.W. Smith, eds., *J.S. Mill's “On Liberty” in Focus* (London: Routledge, 1991); Roger Crisp, *Routledge Philosophy Guidebook to Mill's Utilitarianism* (London: Routledge, 1997); and Henry R. West, *Mill's Utilitarianism: A Reader's Guide* (London: Continuum, 2007). For more specialized studies, see Dennis F. Thompson, *John Stuart Mill and Representative Government* (Princeton, NJ: Princeton University Press, 1976); Gertrude Himmelfarb, *On Liberty and Liberalism: The Case of John Stuart Mill* (New York: Knopf, 1974); Andrew Pyle's pair of books, *Liberty: Contemporary Responses to John Stuart Mill* and *The Subjection of Women: Contemporary Responses to John Stuart Mill* (both Bristol, UK: Thoemmes Press, 1994 and 1995); Joseph Hamburger, *John Stuart Mill on Liberty and Control* (Princeton, NJ: Princeton University Press, 1999); Colin Heydt, *Rethinking Mill's Ethics* (London: Continuum, 2006); and John R. Fitzpatrick, *John Stuart Mill's Political Philosophy* (London: Continuum, 2006). For collections of essays, see J.B. Schneewind, ed., *Mill: A Collection of Critical Essays* (Garden City, NY: Anchor Doubleday, 1968), J.M. Smith and E. Sosa, eds., *Mill's Utilitarianism*

(Belmont, CA: Wadsworth, 1969); John Skorupski, ed., *The Cambridge Companion to Mill* (Cambridge: Cambridge University Press, 1997) and G.W. Smith, ed., *John Stuart Mill's Social and Political Thought: Critical Assessments*; four volumes (London: Routledge, 1998).

UTILITARIANISM

CHAPTER 1: GENERAL REMARKS

There are few circumstances among those which make up the present condition of human knowledge, more unlike what might have been expected, or more significant of the backward state in which speculation on the most important subjects still lingers, than the little progress which has been made in the decision of the controversy respecting the criterion of right and wrong. From the dawn of philosophy, the question concerning the *summum bonum*, or, what is the same thing, concerning the foundation of morality, has been accounted the main problem in speculative thought, has occupied the most gifted intellects, and divided them into sects and schools, carrying on a vigorous warfare against one another. And after more than two thousand years the same discussions continue, philosophers are still ranged under the same contending banners, and neither thinkers nor mankind at large seem nearer to being unanimous on the subject, than when the youth Socrates listened to the old Protagoras, and asserted (if Plato's dialogue be grounded on a real conversation) the theory of utilitarianism against the popular morality of the so-called sophist.

It is true that similar confusion and uncertainty, and in some cases similar discordance, exist respecting the first principles of all the sciences, not excepting that which is deemed the most certain of them, mathematics; without much impairing, generally indeed without impairing at all, the trustworthiness of the conclusions of those sciences. An apparent anomaly, the explanation of which is, that the detailed doctrines of a science are not usually deduced from, nor depend for their evidence upon, what are called its first principles. Were it not so, there would be no science more precarious, or whose conclusions were more insufficiently made out, than algebra; which derives none of its certainty from what are commonly taught to learners as its elements, since these, as laid down by some of its most eminent teachers, are as full of fictions as English law, and of mysteries as theology. The truths which are ultimately accepted as the first principles of a science, are really the last results of metaphysical analysis, practised on the elementary notions with which the science is conversant; and their relation to the science is not that of foundations to an edifice, but of roots to a tree, which may perform their office equally well though they be never dug down to and exposed to light. But though in science the particular truths precede the general theory, the contrary might be expected to be the case with a practical art, such as morals or legislation. All action is for the sake of some end, and rules of action, it seems natural to suppose, must take their whole character and colour from the end to which they are subservient. When we engage in a pursuit, a clear and precise conception of what we are pursuing would seem to be the first thing we need, instead of the last we are to look forward to. A test of right and wrong must be the means, one would think, of ascertaining what is right or wrong, and not a consequence of having already ascertained it.

The difficulty is not avoided by having recourse to the popular theory of a natural faculty, a sense or instinct, informing us of right and wrong. For—besides that the existence of such a moral instinct is itself one of the matters in dispute—those believers in it who have any pretensions to philosophy, have been obliged to abandon the idea that it discerns what is right or wrong in the particular case in hand, as our other senses discern the sight or sound actually present. Our moral faculty, according to all those of its interpreters who are entitled to the name of thinkers, supplies us only with the general principles of moral judgments; it is a branch of our reason, not of our sensitive faculty; and must be looked to for the abstract doctrines of morality, not for perception of it in the concrete. The intuitive, no less than what may be termed the inductive, school of ethics, insists on the necessity of general laws. They both agree that the morality of an individual action is not a question of direct perception, but of the application of a law to an individual case. They recognise also, to a great extent, the same moral laws; but differ as to their evidence, and the source from which they derive their authority. According to the one opinion, the principles of morals are evident *a priori*, requiring nothing to command assent, except that the meaning of the terms be understood. According to the other doctrine, right and wrong, as well as truth and falsehood, are questions of observation and experience. But both hold equally that morality must be deduced from principles; and the intuitive school affirm as strongly as the inductive, that there is a science of morals. Yet they seldom attempt to make out a list of the *a priori* principles which are to serve as the premises of the science; still more rarely do they make any effort to reduce those various principles to one first principle, or common ground of obligation. They either assume the ordinary precepts of morals as of *a priori* authority, or they lay down as the common groundwork of those maxims, some generality much less obviously authoritative than the maxims themselves, and which has never succeeded in gaining popular acceptance. Yet to support their pretensions there ought either to be some one fundamental principle or law, at the root of all morality, or if there be several, there should be a determinate order of precedence among them; and the one principle, or the rule for deciding between the various principles when they conflict, ought to be self-evident.

To inquire how far the bad effects of this deficiency have been mitigated in practice, or to what extent the moral beliefs of mankind have been vitiated or made uncertain by the absence of any distinct recognition of an ultimate standard, would imply a complete survey and criticism of past and present ethical doctrine. It would, however, be easy to show that whatever steadiness or consistency these moral beliefs have attained, has been mainly due to the tacit influence of a standard not recognised. Although the non-existence of an acknowledged first principle has made ethics not so much a guide as a consecration of men's actual sentiments, still, as men's sentiments, both of favour and of aversion, are greatly influenced by what they suppose to be the effects of things upon their happiness, the principle of utility, or as Bentham latterly called it, the Greatest Happiness Principle, has had a large share in forming the moral doctrines even of those who most scornfully reject its authority. Nor is there any school of thought which refuses to admit that the influence of actions on happiness is a most material and even predominant consideration in many of the details of morals, however unwilling to acknowledge it as the fundamental principle of morality, and the source of moral obligation. I might go much further, and say that to all those *a priori* moralists who deem it necessary to argue at all, utilitarian arguments are indispensable. It is not my present purpose to criticise these thinkers; but I cannot help referring, for illustration, to a systematic treatise by one of the most illustrious of them, the *Metaphysics of Ethics* by Kant. This remarkable man,

whose system of thought will long remain one of the landmarks in the history of philosophical speculation, does, in the treatise in question, lay down a universal first principle as the origin and ground of moral obligation; it is this:—"So act, that the rule on which thou actest would admit of being adopted as a law by all rational beings." But when he begins to deduce from this precept any of the actual duties of morality, he fails, almost grotesquely, to show that there would be any contradiction, any logical (not to say physical) impossibility, in the adoption by all rational beings of the most outrageously immoral rules of conduct. All he shows is that the *consequences* of their universal adoption would be such as no one would choose to incur.

On the present occasion, I shall, without further discussion of the other theories, attempt to contribute something towards the understanding and appreciation of the Utilitarian or Happiness theory, and towards such proof as it is susceptible of. It is evident that this cannot be proof in the ordinary and popular meaning of the term. Questions of ultimate ends are not amenable to direct proof. Whatever can be proved to be good, must be so by being shown to be a means to something admitted to be good without proof. The medical art is proved to be good by its conducing to health; but how is it possible to prove that health is good? The art of music is good, for the reason, among others, that it produces pleasure; but what proof is it possible to give that pleasure is good? If, then, it is asserted that there is a comprehensive formula, including all things which are in themselves good, and that whatever else is good, is not so as an end, but as a mean, the formula may be accepted or rejected, but is not a subject of what is commonly understood by proof. We are not, however, to infer that its acceptance or rejection must depend on blind impulse, or arbitrary choice. There is a larger meaning of the word proof, in which this question is as amenable to it as any other of the disputed questions of philosophy. The subject is within the cognisance of the rational faculty; and neither does that faculty deal with it solely in the way of intuition. Considerations may be presented capable of determining the intellect either to give or withhold its assent to the doctrine; and this is equivalent to proof.

We shall examine presently of what nature are these considerations; in what manner they apply to the case, and what rational grounds, therefore, can be given for accepting or rejecting the utilitarian formula. But it is a preliminary condition of rational acceptance or rejection, that the formula should be correctly understood. I believe that the very imperfect notion ordinarily formed of its meaning, is the chief obstacle which impedes its reception; and that could it be cleared, even from only the grosser misconceptions, the question would be greatly simplified, and a large proportion of its difficulties removed. Before, therefore, I attempt to enter into the philosophical grounds which can be given for assenting to the utilitarian standard, I shall offer some illustrations of the doctrine itself; with the view of showing more clearly what it is, distinguishing it from what it is not, and disposing of such of the practical objections to it as either originate in, or are closely connected with, mistaken interpretations of its meaning. Having thus prepared the ground, I shall afterwards endeavour to throw such light as I can upon the question, considered as one of philosophical theory.

CHAPTER 2: WHAT UTILITARIANISM IS

A passing remark is all that needs be given to the ignorant blunder of supposing that those who stand up for utility as the test of right and wrong, use the term in that restricted and merely colloquial sense in which utility is opposed to pleasure. An

apology is due to the philosophical opponents of utilitarianism, for even the momentary appearance of confounding them with any one capable of so absurd a misconception; which is the more extraordinary, inasmuch as the contrary accusation, of referring everything to pleasure, and that too in its grossest form, is another of the common charges against utilitarianism: and, as has been pointedly remarked by an able writer, the same sort of persons, and often the very same persons, denounce the theory “as impracticably dry when the word ‘utility’ precedes the word ‘pleasure,’ and as too practicably voluptuous when the word ‘pleasure’ precedes the word ‘utility.’” Those who know anything about the matter are aware that every writer, from Epicurus to Bentham, who maintained the theory of utility, meant by it, not something to be contradistinguished from pleasure, but pleasure itself, together with exemption from pain; and instead of opposing the useful to the agreeable or the ornamental, have always declared that the useful means these, among other things. Yet the common herd, including the herd of writers, not only in newspapers and periodicals, but in books of weight and pretension, are perpetually falling into this shallow mistake. Having caught up the word Utilitarian, while knowing nothing whatever about it but its sound, they habitually express by it the rejection, or the neglect, of pleasure in some of its forms; of beauty, of ornament, or of amusement. Nor is the term thus ignorantly misapplied solely in disparagement, but occasionally in compliment; as though it implied superiority to frivolity and the mere pleasures of the moment. And this perverted use is the only one in which the word is popularly known, and the one from which the new generation are acquiring their sole notion of its meaning. Those who introduced the word, but who had for many years discontinued it as a distinctive appellation, may well feel themselves called upon to resume it, if by doing so they can hope to contribute anything towards rescuing it from this utter degradation.*

The creed which accepts as the foundation of morals Utility or the Greatest Happiness Principle holds that actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness. By happiness is intended pleasure, and the absence of pain; by unhappiness, pain, and the privation of pleasure. To give a clear view of the moral standard set up by the theory, much more requires to be said; in particular, what things it includes in the ideas of pain and pleasure; and to what extent this is left an open question. But these supplementary explanations do not affect the theory of life on which this theory of morality is grounded—namely, that pleasure, and freedom from pain, are the only things desirable as ends; and that all desirable things (which are as numerous in the utilitarian as in any other scheme) are desirable either for the pleasure inherent in themselves, or as means to the promotion of pleasure and the prevention of pain.

Now, such a theory of life excites in many minds, and among them in some of the most estimable in feeling and purpose, inveterate dislike. To suppose that life has (as they express it) no higher end than pleasure—no better and nobler object of desire and pursuit—they designate as utterly mean and grovelling; as a doctrine worthy only of swine, to whom the followers of Epicurus were, at a very early period, contemptuously

*The author of this essay has reason for believing himself to be the first person who brought the word “utilitarian” into use. He did not invent it, but adopted it from a passing expression in Mr. Galt’s *Annals of the Parish*. After using it as a designation for several years, he and others abandoned it from a growing dislike to anything resembling a badge or watchword of sectarian distinction. But as a name for one single opinion, not a set of opinions—to denote the recognition of utility as a standard not any particular way of applying it—the term supplies a want in the language, and offers, in many cases, a convenient mode of avoiding tiresome circumlocution.

likened; and modern holders of the doctrine are occasionally made the subject of equally polite comparisons by its German, French, and English assailants.

When thus attacked, the Epicureans have always answered, that it is not they; but their accusers, who represent human nature in a degrading light; since the accusation supposes human beings to be capable of no pleasures except those of which swine are capable. If this supposition were true, the charge could not be gainsaid, but would then be no longer an imputation; for if the sources of pleasure were precisely the same to human beings and to swine, the rule of life which is good enough for the one would be good enough for the other. The comparison of the Epicurean life to that of beasts is felt as degrading, precisely because a beast's pleasures do not satisfy a human being's conceptions of happiness. Human beings have faculties more elevated than the animal appetites, and when once made conscious of them, do not regard anything as happiness which does not include their gratification. I do not, indeed, consider the Epicureans to have been by any means faultless in drawing out their scheme of consequences from the utilitarian principle. To do this in any sufficient manner, many Stoic, as well as Christian elements require to be included. But there is no known Epicurean theory of life which does not assign to the pleasures of the intellect, of the feelings and imagination, and of the moral sentiments, a much higher value as pleasures than to those of mere sensation. It must be admitted, however, that utilitarian writers in general have placed the superiority of mental over bodily pleasures chiefly in the greater permanency, safety, uncostliness, etc., of the former—that is, in their circumstantial advantages rather than in their intrinsic nature. And on all these points utilitarians have fully proved their case; but they might have taken the other, and, as it may be called, higher ground, with entire consistency. It is quite compatible with the principle of utility to recognise the fact, that some kinds of pleasure are more desirable and more valuable than others. It would be absurd that while, in estimating all other things, quality is considered as well as quantity, the estimation of pleasures should be supposed to depend on quantity alone.

If I am asked, what I mean by difference of quality in pleasures, or what makes one pleasure more valuable than another, merely as a pleasure, except its being greater in amount, there is but one possible answer. Of two pleasures, if there be one to which all or almost all who have experience of both give a decided preference, irrespective of any feeling of moral obligation to prefer it, that is the more desirable pleasure. If one of the two is, by those who are competently acquainted with both, placed so far above the other that they prefer it, even though knowing it to be attended with a greater amount of discontent, and would not resign it for any quantity of the other pleasure which their nature is capable of, we are justified in ascribing to the preferred enjoyment a superiority in quality, so far outweighing quantity as to render it, in comparison, of small account.

Now it is an unquestionable fact that those who are equally acquainted with, and equally capable of appreciating and enjoying, both, do give almost marked preference to the manner of existence which employs their higher faculties. Few human creatures would consent to be changed into any of the lower animals, for a promise of the fullest allowance of a beast's pleasures; no intelligent human being would consent to be a fool, no instructed person would be an ignoramus, no person of feeling and conscience would be selfish and base, even though they should be persuaded that the fool, the dunce, or the rascal is better satisfied with his lot than they are with theirs. They would not resign what they possess more than he for the most complete satisfaction of all the desires which they have in common with him. If they ever fancy they would, it is only in cases of unhappiness so extreme, that to escape from it they would exchange their lot

for almost any other, however undesirable in their own eyes. A being of higher faculties requires more to make him happy, is capable probably of more acute suffering, and certainly accessible to it at more points, than one of an inferior type; but in spite of these liabilities, he can never really wish to sink into what he feels to be a lower grade of existence. We may give what explanation we please of this unwillingness; we may attribute it to pride, a name which is given indiscriminately to some of the most and to some of the least estimable feelings of which mankind are capable: we may refer it to the love of liberty and personal independence, an appeal to which was with the Stoics one of the most effective means for the inculcation of it; to the love of power, or to the love of excitement, both of which do really enter into and contribute to it: but its most appropriate appellation is a sense of dignity, which all human beings possess in one form or other, and in some, though by no means in exact, proportion to their higher faculties, and which is so essential a part of the happiness of those in whom it is strong, that nothing which conflicts with it could be, otherwise than momentarily, an object of desire to them. Whoever supposes that this preference takes place at a sacrifice of happiness—that the superior being, in anything like equal circumstances, is not happier than the inferior—confounds the two very different ideas, of happiness, and content. It is indisputable that the being whose capacities of enjoyment are low, has the greatest chance of having them fully satisfied; and a highly endowed being will always feel that any happiness which he can look for, as the world is constituted, is imperfect. But he can learn to bear its imperfections, if they are at all bearable; and they will not make him envy the being who is indeed unconscious of the imperfections, but only because he feels not at all the good which those imperfections qualify. It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied. And if the fool, or the pig, are of a different opinion, it is because they only know their own side of the question. The other party to the comparison knows both sides.

It may be objected, that many who are capable of the higher pleasures, occasionally, under the influence of temptation, postpone them to the lower. But this is quite compatible with a full appreciation of the intrinsic superiority of the higher. Men often, from infirmity of character, make their election for the nearer good, though they know it to be the less valuable; and this no less when the choice is between two bodily pleasures, than when it is between bodily and mental. They pursue sensual indulgences to the injury of health, though perfectly aware that health is the greater good. It may be further objected, that many who begin with youthful enthusiasm for everything noble, as they advance in years sink into indolence and selfishness. But I do not believe that those who undergo this very common change, voluntarily choose the lower description of pleasures in preference to the higher. I believe that before they devote themselves exclusively to the one, they have already become incapable of the other. Capacity for the nobler feelings is in most natures a very tender plant, easily killed, not only by hostile influences, but by mere want of sustenance; and in the majority of young persons it speedily dies away if the occupations to which their position in life has devoted them, and the society into which it has thrown them, are not favourable to keeping that higher capacity in exercise. Men lose their high aspirations as they lose their intellectual tastes, because they have not time or opportunity for indulging them; and they addict themselves to inferior pleasures, not because they deliberately prefer them, but because they are either the only ones to which they have access, or the only ones which they are any longer capable of enjoying. It may be questioned whether any one who has remained equally susceptible to both classes of pleasures, ever knowingly and calmly preferred the lower; though many, in all ages, have broken down in an ineffectual attempt to combine both.

From this verdict of the only competent judges, I apprehend there can be no appeal. On a question which is the best worth having of two pleasures, or which of two modes of existence is the most grateful to the feelings, apart from its moral attributes and from its consequences, the judgment of those who are qualified by knowledge of both, or, if they differ, that of the majority among them, must be admitted as final. And there needs be the less hesitation to accept this judgment respecting the quality of pleasures, since there is no other tribunal to be referred to even on the question of quantity. What means are there of determining which is the acutest of two pains, or the intensest of two pleasurable sensations, except the general suffrage of those who are familiar with both? Neither pains nor pleasures are homogeneous, and pain is always heterogeneous with pleasure. What is there to decide whether a particular pleasure is worth purchasing at the cost of a particular pain, except the feelings and judgment of the experienced? When, therefore, those feelings and judgment declare the pleasures derived from the higher faculties to be preferable in kind, apart from the question of intensity, to those of which the animal nature, disjoined from the higher faculties, is susceptible, they are entitled on this subject to the same regard.

I have dwelt on this point, as being a necessary part of a perfectly just conception of Utility or Happiness, considered as the directive rule of human conduct. But it is by no means an indispensable condition to the acceptance of the utilitarian standard; for that standard is not the agent's own greatest happiness, but the greatest amount of happiness altogether; and if it may possibly be doubted whether a noble character is always the happier for its nobleness, there can be no doubt that it makes other people happier, and that the world in general is immensely a gainer by it. Utilitarianism, therefore, could only attain its end by the general cultivation of nobleness of character, even if each individual were only benefited by the nobleness of others, and his own, so far as happiness is concerned, were a sheer deduction from the benefit. But the bare enunciation of such an absurdity as this last, renders refutation superfluous.

According to the Greatest Happiness Principle, as above explained, the ultimate end, with reference to and for the sake of which all other things are desirable (whether we are considering our own good or that of other people), is an existence exempt as far as possible from pain, and as rich as possible in enjoyments, both in point of quantity and quality; the test of quality, and the rule for measuring it against quantity, being the preference felt by those who in their opportunities of experience, to which must be added their habits of self-consciousness and self-observation, are best furnished with the means of comparison. This, being, according to the utilitarian opinion, the end of human action, is necessarily also the standard of morality; which may accordingly be defined "the rules and precepts for human conduct" by the observance of which an existence such as has been described might be, to the greatest extent possible, secured to all mankind; and not to them only, but, so far as the nature of things admits, to the whole sentient creation.

Against this doctrine, however, arises another class of objectors, who say that happiness, in any form, cannot be the rational purpose of human life and action; because, in the first place, it is unattainable: and they contemptuously ask, what right hast thou to be happy? a question which Mr. Carlyle clenches by the addition, What right, a short time ago, hadst thou even to be? Next, they say, that men can do without happiness; that all noble human beings have felt this, and could not have become noble but by learning the lesson of *Entsagen*, or renunciation; which lesson, thoroughly learnt and submitted to, they affirm to be the beginning and necessary condition of all virtue.

The first of these objections would go to the root of the matter were it well founded; for if no happiness is to be had at all by human beings, the attainment of it

cannot be the end of morality, or of any rational conduct. Though, even in that case, something might still be said for the utilitarian theory; since utility includes not solely the pursuit of happiness, but the prevention or mitigation of unhappiness; and if the former aim be chimerical, there will be all the greater scope and more imperative need for the latter, so long at least as mankind think fit to live, and do not take refuge in the simultaneous act of suicide recommended under certain conditions by Novalis.* When, however, it is thus positively asserted to be impossible that human life should be happy, the assertion, if not something like a verbal quibble, is at least an exaggeration. If by happiness be meant a continuity of highly pleasurable excitement, it is evident enough that this is impossible. A state of exalted pleasure lasts only moments, or in some cases, and with some intermissions, hours or days, and is the occasional brilliant flash of enjoyment, not its permanent and steady flame. Of this the philosophers who have taught that happiness is the end of life were as fully aware as those who taunt them. The happiness which they meant was not a life of rapture; but moments of such, in an existence made up of few and transitory pains, many and various pleasures, with a decided predominance of the active over the passive, and having as the foundation of the whole, not to expect more from life than it is capable of bestowing. A life thus composed, to those who have been fortunate enough to obtain it, has always appeared worthy of the name of happiness. And such an existence is even now the lot of many, during some considerable portion of their lives. The present wretched education, and wretched social arrangements, are the only real hindrance to its being attainable by almost all.

The objectors perhaps may doubt whether human beings, if taught to consider happiness as the end of life, would be satisfied with such a moderate share of it. But great numbers of mankind have been satisfied with much less. The main constituents of a satisfied life appear to be two, either of which by itself is often found sufficient for the purpose: tranquillity, and excitement. With much tranquillity, many find that they can be content with very little pleasure: with much excitement, many can reconcile themselves to a considerable quantity of pain. There is assuredly no inherent impossibility in enabling even the mass of mankind to unite both; since the two are so far from being incompatible that they are in natural alliance, the prolongation of either being a preparation for, and exciting a wish for, the other. It is only those in whom indolence amounts to a vice, that do not desire excitement after an interval of repose: it is only those in whom the need of excitement is a disease, that feel the tranquillity which follows excitement dull and insipid, instead of pleasurable in direct proportion to the excitement which preceded it. When people who are tolerably fortunate in their outward lot do not find in life sufficient enjoyment to make it valuable to them, the cause generally is, caring for nobody but themselves. To those who have neither public nor private affections, the excitements of life are much curtailed, and in any case dwindle in value as the time approaches when all selfish interests must be terminated by death: while those who leave after them objects of personal affection, and especially those who have also cultivated a fellow-feeling with the collective interests of mankind, retain as lively an interest in life on the eve of death as in the vigour of youth and health. Next to selfishness, the principal cause which makes life unsatisfactory is want of mental cultivation. A cultivated mind—I do not mean that of a philosopher, but any mind to which the fountains of knowledge have been opened, and which has been taught, in any tolerable degree, to exercise its faculties—finds sources of inexhaustible interest in all that surrounds it; in the objects of nature, the achievements of art, the

*[The German poet Friedrich Leopold Freiherr von Hardenberg (1772–1801).]

imaginings of poetry, the incidents of history, the ways of mankind, past and present, and their prospects in the future. It is possible, indeed, to become indifferent to all this, and that too without having exhausted a thousandth part of it; but only when one has had from the beginning no moral or human interest in these things, and has sought in them only the gratification of curiosity.

Now there is absolutely no reason in the nature of things why an amount of mental culture sufficient to give an intelligent interest in these objects of contemplation, should not be the inheritance of every one born in a civilised country. As little is there an inherent necessity that any human being should be a selfish egotist, devoid of every feeling or care but those which centre in his own miserable individuality. Something far superior to this is sufficiently common even now, to give ample earnest of what the human species may be made. Genuine private affections, and a sincere interest in the public good, are possible, though in unequal degrees, to every rightly brought up human being. In a world in which there is so much to interest, so much to enjoy, and so much also to correct and improve, every one who has this moderate amount of moral and intellectual requisites is capable of an existence which may be called enviable; and unless such a person, through bad laws, or subjection to the will of others, is denied the liberty to use the sources of happiness within his reach, he will not fail to find this enviable existence, if he escape the positive evils of life, the great sources of physical and mental suffering—such as indigence, disease, and the unkindness, worthlessness, or premature loss of objects of affection. The main stress of the problem lies, therefore, in the contest with these calamities, from which it is a rare good fortune entirely to escape; which, as things now are, cannot be obviated, and often cannot be in any material degree mitigated. Yet no one whose opinion deserves a moment's consideration can doubt that most of the great positive evils of the world are in themselves removable, and will, if human affairs continue to improve, be in the end reduced within narrow limits. Poverty, in any sense implying suffering, may be completely extinguished by the wisdom of society, combined with the good sense and providence of individuals. Even that most intractable of enemies, disease, may be indefinitely reduced in dimensions by good physical and moral education, and proper control of noxious influences; while the progress of science holds out a promise for the future of still more direct conquests over this detestable foe. And every advance in that direction relieves us from some, not only of the chances which cut short our own lives, but, what concerns us still more, which deprive us of those in whom our happiness is wrapt up. As for vicissitudes of fortune, and other disappointments connected with worldly circumstances, these are principally the effect either of gross imprudence, of ill-regulated desires, or of bad or imperfect social institutions. All the grand sources, in short, of human suffering are in a great degree, many of them almost entirely, conquerable by human care and effort; and though their removal is grievously slow—though a long succession of generations will perish in the breach before the conquest is completed, and this world becomes all that, if will and knowledge were not wanting, it might easily be made—yet every mind sufficiently intelligent and generous to bear a part, however small and unobtrusive, in the endeavour, will draw a noble enjoyment from the contest itself, which he would not for any bribe in the form of selfish indulgence consent to be without.

And this leads to the true estimation of what is said by the objectors concerning the possibility, and the obligation, of learning to do without happiness. Unquestionably it is possible to do without happiness; it is done involuntarily by nineteen-twentieths of mankind, even in those parts of our present world which are least deep in barbarism;

and it often has to be done voluntarily by the hero or the martyr, for the sake of something which he prizes more than his individual happiness. But this something, what is it, unless the happiness of others, or some of the requisites of happiness? It is noble to be capable of resigning entirely one's own portion of happiness, or chances of it: but, after all, this self-sacrifice must be for some end; it is not its own end; and if we are told that its end is not happiness, but virtue, which is better than happiness, I ask, would the sacrifice be made if the hero or martyr did not believe that it would earn for others immunity from similar sacrifices? Would it be made if he thought that his renunciation of happiness for himself would produce no fruit for any of his fellow creatures, but to make their lot like his, and place them also in the condition of persons who have renounced happiness? All honour to those who can abnegate for themselves the personal enjoyment of life, when by such renunciation they contribute worthily to increase the amount of happiness in the world; but he who does it, or professes to do it, for any other purpose, is no more deserving of admiration than the ascetic mounted on his pillar. He may be an inspiring proof of what men *can* do, but assuredly not an example of what they *should*.

Though it is only in a very imperfect state of the world's arrangements that any one can best serve the happiness of others by the absolute sacrifice of his own, yet so long as the world is in that imperfect state, I fully acknowledge that the readiness to make such a sacrifice is the highest virtue which can be found in man. I will add, that in this condition of the world, paradoxical as the assertion may be, the conscious ability to do without happiness gives the best prospect of realising such happiness as is attainable. For nothing except that consciousness can raise a person above the chances of life, by making him feel that, let fate and fortune do their worst, they have not power to subdue

Interior, Crystal Palace. The palace was a shrine to science, industrialization, and progress. This architectural marvel represented in concrete form Mill's optimism when he spoke of the "wisdom of society" and the "progress of science [which] holds out a promise for the future." (*Victoria and Albert Museum, London/V&A Picture Library*)

him: which, once felt, frees him from excess of anxiety concerning the evils of life, and enables him, like many a Stoic in the worst times of the Roman Empire, to cultivate in tranquillity the sources of satisfaction accessible to him, without concerning himself about the uncertainty of their duration, any more than about their inevitable end.

Meanwhile, let utilitarians never cease to claim the morality of self devotion as a possession which belongs by as good a right to them, as either to the Stoic or to the Transcendentalist. The utilitarian morality does recognise in human beings the power of sacrificing their own greatest good for the good of others. It only refuses to admit that the sacrifice is itself a good. A sacrifice which does not increase, or tend to increase, the sum total of happiness, it considers as wasted. The only self-renunciation which it applauds, is devotion to the happiness, or to some of the means of happiness, of others; either of mankind collectively, or of individuals within the limits imposed by the collective interests of mankind.

I must again repeat, what the assailants of utilitarianism seldom have the justice to acknowledge, that the happiness which forms the utilitarian standard of what is right in conduct, is not the agent's own happiness, but that of all concerned. As between his own happiness and that of others, utilitarianism requires him to be as strictly impartial as a disinterested and benevolent spectator. In the golden rule of Jesus of Nazareth, we read the complete spirit of the ethics of utility. "To do as you would be done by," and "to love your neighbour as yourself," constitute the ideal perfection of utilitarian morality. As the means of making the nearest approach to this ideal, utility would enjoin, first, that laws

and social arrangements should place the happiness, or (as speaking practically it may be called) the interest, of every individual, as nearly as possible in harmony with the interest of the whole; and secondly, that education and opinion, which have so vast a power over human character, should so use that power as to establish in the mind of every individual an indissoluble association between his own happiness and the good of the whole; especially between his own happiness and the practice of such modes of conduct, negative and positive, as regard for the universal happiness prescribes; so that not only he may be unable to conceive the possibility of happiness to himself, consistently with conduct opposed to the general good, but also that a direct impulse to promote the general good may be in every individual one of the habitual motives of action, and the sentiments connected therewith may fill a large and prominent place in every human being's sentient existence. If the impugnors of the utilitarian morality represented it to their own minds in this its true character, I know not what recommendation possessed by any other morality they could possibly affirm to be wanting to it; what more beautiful or more exalted developments of human nature any other ethical system can be supposed to foster, or what springs of action, not accessible to the utilitarian, such systems rely on for giving effect to their mandates.

The objectors to utilitarianism cannot always be charged with representing it in a discreditable light. On the contrary, those among them who entertain anything like a just idea of its disinterested character, sometimes find fault with its standard as being too high for humanity. They say it is exacting too much to require that people shall always act from the inducement of promoting the general interests of society. But this is to mistake the very meaning of a standard of morals, and confound the rule of action with the motive of it. It is the business of ethics to tell us what are our duties, or by what test we may know them; but no system of ethics requires that the sole motive of all we do shall be a feeling of duty; on the contrary, ninety-nine hundredths of all our actions are done from other motives, and rightly so done, if the rule of duty does not condemn them. It is the more unjust to utilitarianism that this particular misapprehension should be made a ground of objection to it, inasmuch as utilitarian moralists have gone beyond almost all others in affirming that the motive has nothing to do with the morality of the action, though much with the worth of the agent. He who saves a fellow creature from drowning does what is morally right, whether his motive be duty, or the hope of being paid for his trouble; he who betrays the friend that trusts him, is guilty of a crime, even if his object be to serve another friend to whom he is under greater obligations. But to speak only of actions done from the motive of duty, and in direct obedience to principle: it is a misapprehension of the utilitarian mode of thought, to conceive it as implying that people should fix their minds upon so wide a generality as the world, or society at large. The great majority of good actions are intended not for the benefit of the world, but for that of individuals, of which the good of the world is made up; and the thoughts of the most virtuous man need not on these occasions travel beyond the particular persons concerned, except so far as is necessary to assure himself that in benefiting them he is not violating the rights, that is, the legitimate and authorised expectations, of any one else. The multiplication of happiness is, according to the utilitarian ethics, the object of virtue: the occasions on which any person (except one in a thousand) has it in his power to do this on an extended scale, in other words to be a public benefactor, are but exceptional; and on these occasions alone is he called on to consider public utility; in every other case, private utility, the interest or happiness of some few persons, is all he has to attend to. Those alone the influence of whose actions extends to society in general, need concern themselves habitually about so large an object. In the case of abstinences

indeed—of things which people forbear to do from moral considerations, though the consequences in the particular case might be beneficial—it would be unworthy of an intelligent agent not to be consciously aware that the action is of a class which, if practised generally, would be generally injurious, and that this is the ground of the obligation to abstain from it. The amount of regard for the public interest implied in this recognition, is no greater than is demanded by every system of morals, for they all enjoin to abstain from whatever is manifestly pernicious to society.

The same considerations dispose of another reproach against the doctrine of utility, founded on a still grosser misconception of the purpose of a standard of morality, and of the very meaning of the words “right” and “wrong.” It is often affirmed that utilitarianism renders men cold and unsympathising; that it chills their moral feelings towards individuals; that it makes them regard only the dry and hard consideration of the consequences of actions, not taking into their moral estimate the qualities from which those actions emanate. If the assertion means that they do not allow their judgment respecting the rightness or wrongness of an action to be influenced by their opinion of the qualities of the person who does it, this is a complaint not against utilitarianism, but against having any standard of morality at all; for certainly no known ethical standard decides an action to be good or bad because it is done by a good or a bad man, still less because done by an amiable, a brave, or a benevolent man, or the contrary. These considerations are relevant, not to the estimation of actions, but of persons; and there is nothing in the utilitarian theory inconsistent with the fact that there are other things which interest us in persons besides the rightness and wrongness of their actions. The Stoics, indeed, with the paradoxical misuse of language which was part of their system, and by which they strove to raise themselves above all concern about anything but virtue, were fond of saying that he who has that has everything; that he, and only he, is rich, is beautiful, is a king. But no claim of this description is made for the virtuous man by the utilitarian doctrine. Utilitarians are quite aware that there are other desirable possessions and qualities besides virtue, and are perfectly willing to allow to all of them their full worth. They are also aware that a right action does not necessarily indicate a virtuous character, and that actions which are blamable, often proceed from qualities entitled to praise. When this is apparent in any particular case, it modifies their estimation, not certainly of the act, but of the agent. I grant that they are, notwithstanding, of opinion, that in the long run the best proof of a good character is good actions; and resolutely refuse to consider any mental disposition as good, of which the predominant tendency is to produce bad conduct. This makes them unpopular with many people; but it is an unpopularity which they must share with every one who regards the distinction between right and wrong in a serious light; and the reproach is not one which a conscientious utilitarian need be anxious to repel.

If no more be meant by the objection than that many utilitarians look on the morality of actions, as measured by the utilitarian standard, with too exclusive a regard, and do not lay sufficient stress upon the other beauties of character which go towards making a human being lovable or admirable, this may be admitted. Utilitarians who have cultivated their moral feelings, but not their sympathies nor their artistic perceptions, do fall into this mistake; and so do all other moralists under the same conditions. What can be said in excuse for other moralists is equally available for them, namely, that, if there is to be any error, it is better that it should be on that side. As a matter of fact, we may affirm that among utilitarians as among adherents of other systems, there is every imaginable degree of rigidity and of laxity in the application of their standard: some are even puritanically rigorous, while others are as indulgent as can possibly be desired by sinner or

by sentimentalist. But on the whole, a doctrine which brings prominently forward the interest that mankind have in the repression and prevention of conduct which violates the moral law, is likely to be inferior to no other in turning the sanctions of opinion against such violations. It is true, the question, "What does violate the moral law?" is one on which those who recognise different standards of morality are likely now and then to differ. But difference of opinion on moral questions was not first introduced into the world by utilitarianism, while that doctrine does supply, if not always an easy, at all events a tangible and intelligible mode of deciding such differences.

It may not be superfluous to notice a few more of the common misapprehensions of utilitarian ethics, even those which are so obvious and gross that it might appear impossible for any person of candour and intelligence to fall into them; since persons, even of considerable mental endowments, often give themselves so little trouble to understand the bearings of any opinion against which they entertain a prejudice, and men are in general so little conscious of this voluntary ignorance as a defect, that the vulgar misunderstandings of ethical doctrines are continually met with in the deliberate writings of persons of the greatest pretensions both to high principle and to philosophy. We not uncommonly hear the doctrine of utility inveighed against as a godless doctrine. If it be necessary to say anything at all against so mere an assumption, we may say that the question depends upon what idea we have formed of the moral character of the Deity. If it be a true belief that God desires, above all things, the happiness of his creatures, and that this was his purpose in their creation, utility is not only not a godless doctrine, but more profoundly religious than any other. If it be meant that utilitarianism does not recognise the revealed will of God as the supreme law of morals, I answer, that a utilitarian who believes in the perfect goodness and wisdom of God, necessarily believes that whatever God has thought fit to reveal on the subject of morals, must fulfil the requirements of utility in a supreme degree. But others besides utilitarians have been of opinion that the Christian revelation was intended, and is fitted, to inform the hearts and minds of mankind with a spirit which should enable them to find for themselves what is right, and incline them to do it when found, rather than to tell them, except in a very general way, what it is; and that we need a doctrine of ethics, carefully followed out, to *interpret* to us the will of God. Whether this opinion is correct or not, it is superfluous here to discuss; since whatever aid religion, either natural or revealed, can afford to ethical investigation, is as open to the utilitarian moralist as to any other. He can use it as the testimony of God to the usefulness or hurtfulness of any given course of action, by as good a right as others can use it for the indication of a transcendental law, having no connection with usefulness or with happiness.

Again, Utility is often summarily stigmatised as an immoral doctrine by giving it the name of "expediency," and taking advantage of the popular use of that term to contrast it with Principle. But the Expedient, in the sense in which it is opposed to the Right, generally means that which is expedient for the particular interest of the agent himself; as when a minister sacrifices the interests of his country to keep himself in place. When it means anything better than this, it means that which is expedient for some immediate object, some temporary purpose, but which violates a rule whose observance is expedient in a much higher degree. The Expedient, in this sense, instead of being the same thing with the useful, is a branch of the hurtful. Thus, it would often be expedient, for the purpose of getting over some momentary embarrassment, or attaining some object immediately useful to ourselves or others, to tell a lie. But inasmuch as the cultivation in ourselves of a sensitive feeling on the subject of veracity, is one of the most useful, and the enfeeblement of that feeling one of the most hurtful,

things to which our conduct can be instrumental; and inasmuch as any, even unintentional, deviation from truth, does that much towards weakening the trustworthiness of human assertion, which is not only the principal support of all present social well-being, but the insufficiency of which does more than any one thing that can be named to keep back civilisation, virtue, everything on which human happiness on the largest scale depends; we feel that the violation, for a present advantage, of a rule of such transcendent expediency, is not expedient, and that he who, for the sake of a convenience to himself or to some other individual, does what depends on him to deprive mankind of the good, and inflict upon them the evil, involved in the greater or less reliance which they can place in each other's word, acts the part of one of their worst enemies. Yet that even this rule, sacred as it is, admits of possible exceptions, is acknowledged by all moralists; the chief of which is when the withholding of some fact (as of information from a malefactor, or of bad news from a person dangerously ill) would save an individual (especially an individual other than oneself) from great and unmerited evil, and when the withholding can only be effected by denial. But in order that the exception may not extend itself beyond the need, and may have the least possible effect in weakening reliance on veracity, it ought to be recognised, and, if possible, its limits defined; and if the principle of utility is good for anything, it must be good for weighing these conflicting utilities against one another, and marking out the region within which one or the other preponderates.

Again, defenders of utility often find themselves called upon to reply to such objections as this—that there is not time, previous to action, for calculating and weighing the effects of any line of conduct on the general happiness. This is exactly as if any one were to say that it is impossible to guide our conduct by Christianity, because there is not time, on every occasion on which anything has to be done, to read through the Old and New Testaments. The answer to the objection is, that there has been ample time, namely, the whole past duration of the human species. During all that time, mankind have been learning by experience the tendencies of actions; on which experience all the prudence, as well as all the morality of life, are dependent. People talk as if the commencement of this course of experience had hitherto been put off, and as if, at the moment when some man feels tempted to meddle with the property or life of another, he had to begin considering for the first time whether murder and theft are injurious to human happiness. Even then I do not think that he would find the question very puzzling; but, at all events, the matter is now done to his hand. It is truly a whimsical supposition that, if mankind were agreed in considering utility to be the test of morality, they would remain without any agreement as to what is useful, and would take no measures for having their notions on the subject taught to the young, and enforced by law and opinion. There is no difficulty in proving any ethical standard whatever to work ill, if we suppose universal idiocy to be conjoined with it; but on any hypothesis short of that, mankind must by this time have acquired positive beliefs as to the effects of some actions on their happiness; and the beliefs which have thus come down are the rules of morality for the multitude, and for the philosopher until he has succeeded in finding better. That philosophers might easily do this, even now, on many subjects; that the received code of ethics is by no means of divine right; and that mankind have still much to learn as to the effects of actions on the general happiness, I admit, or rather, earnestly maintain. The corollaries from the principle of utility, like the precepts of every practical art, admit of indefinite improvement, and, in a progressive state of the human mind, their improvement is perpetually going on. But to consider the rules of morality as improvable, is one thing; to pass over the intermediate generalisations entirely, and

endeavour to test each individual action directly by the first principle, is another. It is a strange notion that the acknowledgment of a first principle is inconsistent with the admission of secondary ones. To inform a traveller respecting the place of his ultimate destination, is not to forbid the use of landmarks and direction-posts on the way. The proposition that happiness is the end and aim of morality, does not mean that no road ought to be laid down to that goal, or that persons going thither should not be advised to take one direction rather than another. Men really ought to leave off talking a kind of nonsense on this subject, which they would neither talk nor listen to on other matters of practical concernment. Nobody argues that the art of navigation is not founded on astronomy, because sailors cannot wait to calculate the *Nautical Almanac*. Being rational creatures, they go to sea with it ready calculated; and all rational creatures go out upon the sea of life with their minds made up on the common questions of right and wrong, as well as on many of the far more difficult questions of wise and foolish. And this, as long as foresight is a human quality, it is to be presumed they will continue to do. Whatever we adopt as the fundamental principle of morality, we require subordinate principles to apply it by; the impossibility of doing without them, being common to all systems, can afford no argument against any one in particular; but gravely to argue as if no such secondary principles could be had, and as if mankind had remained till no, and always must remain, without drawing any general conclusions from the experience of human life, is as high a pitch, I think, as absurdity has ever reached in philosophical controversy.

The remainder of the stock arguments against utilitarianism mostly consist in laying to its charge the common infirmities of human nature, and the general difficulties which embarrass conscientious persons in shaping their course through life. We are told that a utilitarian will be apt to make his own particular case an exception to moral rules, and, when under temptation, will see a utility in the breach of a rule, greater than he will see in its observance. But is utility the only creed which is able to furnish us with excuses for evil doing, and means of cheating our own conscience? They are afforded in abundance by all doctrines which recognise as a fact in morals the existence of conflicting considerations; which all doctrines do, that have been believed by sane persons. It is not the fault of any creed, but of the complicated nature of human affairs, that rules of conduct cannot be so framed as to require no exceptions, and that hardly any kind of action can safely be laid down as either always obligatory or always condemnable. There is no ethical creed which does not temper the rigidity of its laws, by giving a certain latitude, under the moral responsibility of the agent, for accommodation to peculiarities of circumstances; and under every creed, at the opening thus made, self-deception and dishonest casuistry get in. There exists no moral system under which there do not arise unequivocal cases of conflicting obligation. These are the real difficulties, the knotty points both in the theory of ethics, and in the conscientious guidance of personal conduct. They are overcome practically, with greater or with less success, according to the intellect and virtue of the individual; but it can hardly be pretended that any one will be the less qualified for dealing with them, from possessing an ultimate standard to which conflicting rights and duties can be referred. If utility is the ultimate source of moral obligations, utility may be invoked to decide between them when their demands are incompatible. Though the application of the standard may be difficult, it is better than none at all: while in other systems, the moral laws all claiming independent authority, there is no common umpire entitled to interfere between them; their claims to precedence one over another rest on little better than sophistry, and unless determined, as they generally are, by the unacknowledged influence of considerations of utility,

afford a free scope for the action of personal desires and partialities. We must remember that only in these cases of conflict between secondary principles is it requisite that first principles should be appealed to. There is no case of moral obligation in which some secondary principle is not involved; and if only one, there can seldom be any real doubt which one it is, in the mind of any person by whom the principle itself is recognised.

CHAPTER 3: OF THE ULTIMATE SANCTION OF THE PRINCIPLE OF UTILITY

The question is often asked, and properly so, in regard to any supposed moral standard—What is its sanction? what are the motives to obey it? or more specifically, what is the source of its obligation? whence does it derive its binding force? It is a necessary part of moral philosophy to provide the answer to this question; which, though frequently assuming the shape of an objection to the utilitarian morality, as if it had some special applicability to that above others, really arises in regard to all standards. It arises, in fact, whenever a person is called on to *adopt* a standard, or refer morality to any basis on which he has not been accustomed to rest it. For the customary morality, that which education and opinion have consecrated, is the only one which presents itself to the mind with the feeling of being *in itself* obligatory; and when a person is asked to believe that this morality *derives* its obligation from some general principle round which custom has not thrown the same halo, the assertion is to him a paradox; the supposed corollaries seem to have a more binding force than the original theorem; the superstructure seems to stand better without, than with, what is represented as its foundation. He says to himself, I feel that I am bound not to rob or murder, betray or deceive; but why am I bound to promote the general happiness? If my own happiness lies in something else, why may I not give that the preference?

If the view adopted by the utilitarian philosophy of the nature of the moral sense be correct, this difficulty will always present itself, until the influences which form moral character have taken the same hold of the principle which they have taken of some of the consequences—until, by the improvement of education, the feeling of unity with our fellow-creatures shall be (what it cannot be denied that Christ intended it to be) as deeply rooted in our character, and to our own consciousness as completely a part of our nature, as the horror of crime is in an ordinarily well brought up young person. In the meantime, however, the difficulty has no peculiar application to the doctrine of utility, but is inherent in every attempt to analyse morality and reduce it to principles; which, unless the principle is already in men's minds invested with as much sacredness as any of its applications, always seems to divest them of a part of their sanctity.

The principle of utility either has, or there is no reason why it might not have, all the sanctions which belong to any other system of morals. Those sanctions are either external or internal. Of the external sanctions it is not necessary to speak at any length. They are, the hope of favour and the fear of displeasure, from our fellow-creatures or from the Ruler of the Universe, along with whatever we may have of sympathy or affection for them, or of love and awe of Him, inclining us to do his will independently of selfish consequences. There is evidently no reason why all these motives for observance should not attach themselves to the utilitarian morality, as completely and as powerfully as to any other. Indeed, those of them which refer to our fellow-creatures are sure to do so, in proportion to the amount of general intelligence; for whether there be any other ground of moral obligation than the general happiness or not, men do desire happiness;

and however imperfect may be their own practice, they desire and commend all conduct in others towards themselves, by which they think their happiness is promoted. With regard to the religious motive, if men believe, as most profess to do, in the goodness of God, those who think that conduciveness to the general happiness is the essence, or even only the criterion of good, must necessarily believe that it is also that which God approves. The whole force therefore of external reward and punishment, whether physical or moral, and whether proceeding from God or from our fellow men, together with all that the capacities of human nature admit of disinterested devotion to either, become available to enforce the utilitarian morality, in proportion as that morality is recognised; and the more powerfully, the more the appliances of education and general cultivation are bent to the purpose.

So far as to external sanctions. The internal sanction of duty, whatever our standard of duty may be, is one and the same—a feeling in our own mind; a pain, more or less intense, attendant on violation of duty, which in properly cultivated moral natures rises, in the more serious cases, into shrinking from it as an impossibility. This feeling, when disinterested, and connecting itself with the pure idea of duty, and not with some particular form of it, or with any of the merely accessory circumstances, is the essence of Conscience; though in that complex phenomenon as it actually exists, the simple fact is in general all encrusted over with collateral associations, derived from sympathy, from love, and still more from fear; from all the forms of religious feeling; from the recollections of childhood and of all our past life; from self-esteem, desire of the esteem of others, and occasionally even self-abasement. This extreme complication is, I apprehend, the origin of the sort of mystical character which, by a tendency of the human mind of which there are many other examples, is apt to be attributed to the idea of moral obligation, and which leads people to believe that the idea cannot possibly attach itself to any other objects than those which, by a supposed mysterious law, are found in our present experience to excite it. Its binding force, however, consists in the existence of a mass of feeling which must be broken through in order to do what violates our standard of right, and which, if we do nevertheless violate that standard, will probably have to be encountered afterwards in the form of remorse. Whatever theory we have of the nature or origin of conscience, this is what essentially constitutes it.

The ultimate sanction, therefore, of all morality (external motives apart) being a subjective feeling in our own minds, I see nothing embarrassing to those whose standard is utility, in the question, “What is the sanction of that particular standard?” We may answer, the same as of all other moral standards—the conscientious feelings of mankind. Undoubtedly this sanction has no binding efficacy on those who do not possess the feelings it appeals to; but neither will these persons be more obedient to any other moral principle than to the utilitarian one. On them morality of any kind has no hold but through the external sanctions. Meanwhile the feelings exist, a fact in human nature, the reality of which, and the great power with which they are capable of acting on those in whom they have been duly cultivated, are proved by experience. No reason has ever been shown why they may not be cultivated to as great intensity in connection with the utilitarian, as with any other rule of morals.

There is, I am aware, a disposition to believe that a person who sees in moral obligation a transcendental fact, an objective reality belonging to the province of “things in themselves,” is likely to be more obedient to it than one who believes it to be entirely subjective, having its seat in human consciousness only. But whatever a person’s opinion may be on this point of Ontology, the force he is really urged by is his own subjective feeling, and is exactly measured by its strength. No one’s belief that

duty is an objective reality is stronger than the belief that God is so; yet the belief in God, apart from the expectation of actual reward and punishment, only operates on conduct through, and in proportion to, the subjective religious feeling. The sanction, so far as it is disinterested, is always in the mind itself; and the notion therefore of the transcendental moralists must be, that this sanction will not exist *in* the mind unless it is believed to have its root out of the mind; and that if a person is able to say to himself, "This which is restraining me, and which is called my conscience, is only a feeling in my own mind," he may possibly draw the conclusion that when the feeling ceases the obligation ceases, and that if he find the feeling inconvenient, he may disregard it, and endeavour to get rid of it. But is this danger confined to the utilitarian morality? Does the belief that moral obligation has its seat outside the mind make the feeling of it too strong to be got rid of? The fact is so far otherwise, that all moralists admit and lament the ease with which, in the generality of minds, conscience can be silenced or stifled. The question, "Need I obey my conscience?" is quite as often put to themselves by persons who never heard of the principle of utility, as by its adherents. Those whose conscientious feelings are so weak as to allow of their asking this question, if they answer it affirmatively, will not do so because they believe in the transcendental theory, but because of the external sanctions.

It is not necessary, for the present purpose, to decide whether the feeling of duty is innate or implanted. Assuming it to be innate, it is an open question to what objects it naturally attaches itself; for the philosophic supporters of that theory are now agreed that the intuitive perception is of principles of morality and not of the details. If there be anything innate in the matter, I see no reason why the feeling which is innate should not be that of regard to the pleasures and pains of others. If there is any principle of morals which is intuitively obligatory, I should say it must be that. If so, the intuitive ethics would coincide with the utilitarian, and there would be no further quarrel between them. Even as it is, the intuitive moralists, though they believe that there are other intuitive moral obligations, do already believe this to be one; for they unanimously hold that a large *portion* of morality turns upon the consideration due to the interests of our fellow-creatures. Therefore, if the belief in the transcendental origin of moral obligation gives any additional efficacy to the internal sanction, it appears to me that the utilitarian principle has already the benefit of it.

On the other hand, if, as is my own belief, the moral feelings are not innate, but acquired, they are not for that reason the less natural. It is natural to man to speak, to reason, to build cities, to cultivate the ground, though these are acquired faculties. The moral feelings are not indeed a part of our nature, in the sense of being in any perceptible degree present in all of us; but this, unhappily, is a fact admitted by those who believe the most strenuously in their transcendental origin. Like the other acquired capacities above referred to, the moral faculty, if not a part of our nature, is a natural outgrowth from it; capable, like them, in a certain small degree, of springing up spontaneously; and susceptible of being brought by cultivation to a high degree of development. Unhappily it is also susceptible, by a sufficient use of the external sanctions and of the force of early impressions, of being cultivated in almost any direction: so that there is hardly anything so absurd or so mischievous that it may not, by means of these influences, be made to act on the human mind with all the authority of conscience. To doubt that the same potency might be given by the same means to the principle of utility, even if it had no foundation in human nature, would be flying in the face of all experience.

But moral associations which are wholly of artificial creation, when intellectual culture goes on, yield by degrees to the dissolving force of analysis: and if the feeling

of duty, when associated with utility, would appear equally arbitrary; if there were no leading department of our nature, no powerful class of sentiments, with which that association would harmonise, which would make us feel it congenial, and incline us not only to foster it in others (for which we have abundant interested motives), but also to cherish it in ourselves; if there were not, in short, a natural basis of sentiment for utilitarian morality, it might well happen that this association also, even after it had been implanted by education, might be analysed away.

But there *is* this basis of powerful natural sentiment; and this it is which, when once the general happiness is recognised as the ethical standard, will constitute the strength of the utilitarian morality. This firm foundation is that of the social feelings of mankind; the desire to be in unity with our fellow creatures, which is already a powerful principle in human nature, and happily one of those which tend to become stronger, even without express inculcation, from the influences of advancing civilisation. The social state is at once so natural, so necessary, and so habitual to man, that, except in some unusual circumstances or by an effort of voluntary abstraction, he never conceives himself otherwise than as a member of a body; and this association is riveted more and more, as mankind are further removed from the state of savage independence. Any condition, therefore, which is essential to a state of society, becomes more and more an inseparable part of every person's conception of the state of things which he is born into, and which is the destiny of a human being. Now, society between human beings, except in the relation of master and slave, is manifestly impossible on any other footing than that the interests of all are to be consulted. Society between equals can only exist on the understanding that the interests of all are to be regarded equally. And since in all states of civilisation, every person, except an absolute monarch, has equals, every one is obliged to live on these terms with somebody; and in every age some advance is made towards a state in which it will be impossible to live permanently on other terms with anybody. In this way people grow up unable to conceive as possible to them a state of total disregard of other people's interests. They are under a necessity of conceiving themselves as at least abstaining from all the grosser injuries, and (if only for their own protection) living in a state of constant protest against them. They are also familiar with the fact of cooperating with others and proposing to themselves a collective, not an individual interest as the aim (at least for the time being) of their actions. So long as they are cooperating, their ends are identified with those of others; there is at least a temporary feeling that the interests of others are their own interests. Not only does all strengthening of social ties, and all healthy growth of society, give to each individual a stronger personal interest in practically consulting the welfare of others; it also leads him to identify his *feelings* more and more with their good, or at least with an even greater degree of practical consideration for it. He comes, as though instinctively, to be conscious of himself as a being who *of course* pays regard to others. The good of others becomes to him a thing naturally and necessarily to be attended to, like any of the physical conditions of our existence. Now, whatever amount of this feeling a person has, he is urged by the strongest motives both of interest and of sympathy to demonstrate it, and to the utmost of his power encourage it in others; and even if he has none of it himself, he is as greatly interested as any one else that others should have it. Consequently the smallest germs of the feeling are laid hold of and nourished by the contagion of sympathy and the influences of education; and a complete web of corroborative association is woven round it, by the powerful agency of the external sanctions. This mode of conceiving ourselves and human life, as civilisation goes on, is felt to be more and more natural. Every step in political improvement renders it more so, by removing the

sources of opposition of interest, and levelling those inequalities of legal privilege between individuals or classes, owing to which there are large portions of mankind whose happiness it is still practicable to disregard. In an improving state of the human mind, the influences are constantly on the increase, which tend to generate in each individual a feeling of unity with all the rest; which, if perfect, would make him never think of, or desire, any beneficial condition for himself, in the benefits of which they are not included. If we now suppose this feeling of unity to be taught as a religion, and the whole force of education, of institutions, and of opinion, directed, as it once was in the case of religion, to make every person grow up from infancy surrounded on all sides both by the profession and the practice of it, I think that no one, who can realise this conception, will feel any misgiving about the sufficiency of the ultimate sanction for the Happiness morality. To any ethical student who finds the realisation difficult, I recommend, as a means of facilitating it, the second of M. Comte's two principal works, the *Traité de Politique Positive*. I entertain the strongest objections to the system of politics and morals set forth in that treatise; but I think it has superabundantly shown the possibility of giving to the service of humanity, even without the aid of belief in a Providence, both the psychological power and the social efficacy of a religion; making it take hold of human life, and colour all thought, feeling, and action, in a manner of which the greatest ascendancy ever exercised by any religion may be but a type and foretaste; and of which the danger is, not that it should be insufficient, but that it should be so excessive as to interfere unduly with human freedom and individuality.

Neither is it necessary to the feeling which constitutes the binding force of the utilitarian morality on those who recognise it, to wait for those social influences which would make its obligation felt by mankind at large. In the comparatively early state of human advancement in which we now live, a person cannot indeed feel that entireness of sympathy with all others, which would make any real discordance in the general direction of their conduct in life impossible; but already a person in whom the social feeling is at all developed, cannot bring himself to think of the rest of his fellow-creatures as struggling rivals with him for the means of happiness, whom he must desire to see defeated in their object in order that he may succeed in his. The deeply rooted conception which every individual even now has of himself as a social being, tends to make him feel it one of his natural wants that there should be harmony between his feelings and aims and those of his fellow-creatures. If differences of opinion and of mental culture make it impossible for him to share many of their actual feelings—perhaps make him denounce and defy those feelings—he still needs to be conscious that his real aim and theirs do not conflict; that he is not opposing himself to what they really wish for, namely their own good, but is, on the contrary, promoting it. This feeling in most individuals is much inferior in strength to their selfish feelings, and is often wanting altogether. But to those who have it, it possesses all the characters of a natural feeling. It does not present itself to their minds as a superstition of education, or a law despotically imposed by the power of society, but as an attribute which it would not be well for them to be without. This conviction is the ultimate sanction of the greatest happiness morality. This it is which makes any mind, of well-developed feelings, work with, and not against, the outward motives to care for others, afforded by what I have called the external sanctions; and when those sanctions are wanting, or act in an opposite direction, constitutes in itself a powerful internal binding force, in proportion to the sensitiveness and thoughtfulness of the character; since few but those whose mind is a moral blank, could bear to lay out their course of life on the plan of paying no regard to others except so far as their own private interest compels.

CHAPTER 4: OF WHAT SORT OF PROOF
THE PRINCIPLE OF UTILITY IS SUSCEPTIBLE

It has already been remarked, that questions of ultimate ends do not admit of proof, in the ordinary acceptation of the term. To be incapable of proof by reasoning is common to all first principles; to the first premises of our knowledge, as well as to those of our conduct. But the former, being matters of fact, may be the subject of a direct appeal to the faculties which judge of fact—namely, our senses, and our internal consciousness. Can an appeal be made to the same faculties on questions of practical ends? Or by what other faculty is cognisance taken of them?

Questions about ends are, in other words, questions what things are desirable. The utilitarian doctrine is, that happiness is desirable, and the only thing desirable, as an end; all other things being only desirable as means to that end. What ought to be required of this doctrine—what conditions is it requisite that the doctrine should fulfil—to make good its claim to be believed?

The only proof capable of being given that an object is visible, is that people actually see it. The only proof that a sound is audible, is that people hear it: and so of the other sources of our experience. In like manner, I apprehend, the sole evidence it is possible to produce that anything is desirable, is that people do actually desire it. If the end which the utilitarian doctrine proposes to itself were not, in theory and in practice, acknowledged to be an end, nothing could ever convince any person that it was so. No reason can be given why the general happiness is desirable, except that each person, so far as he believes it to be attainable, desires his own happiness. This, however, being a fact, we have not only all the proof which the case admits of, but all which it is possible to require, that happiness is a good: that each person's happiness is a good to that person, and the general happiness, therefore, a good to the aggregate of all persons. Happiness has made out its title as one of the ends of conduct, and consequently one of the criteria of morality.

But it has not, by this alone, proved itself to be the sole criterion. To do that, it would seem, by the same rule, necessary to show, not only that people desire happiness, but that they never desire anything else. Now it is palpable that they do desire things which, in common language, are decidedly distinguished from happiness. They desire, for example, virtue, and the absence of vice, no less really than pleasure and the absence of pain. The desire of virtue is not as universal, but it is as authentic a fact, as the desire of happiness. And hence the opponents of the utilitarian standard deem that they have a right to infer that there are other ends of human action besides happiness, and that happiness is not the standard of approbation and disapprobation.

But does the utilitarian doctrine deny that people desire virtue, or maintain that virtue is not a thing to be desired? The very reverse. It maintains not only that virtue is to be desired, but that it is to be desired disinterestedly, for itself. Whatever may be the opinion of utilitarian moralists as to the original conditions by which virtue is made virtue; however they may believe (as they do) that actions and dispositions are only virtuous because they promote another end than virtue; yet this being granted, and it having been decided, from considerations of this description, what is virtuous, they not only place virtue at the very head of the things which are good as means to the ultimate end, but they also recognise as a psychological fact the possibility of its being, to the individual, a good in itself, without looking to any end beyond it; and hold, that the mind is not in a right state, not in a state conformable to Utility, not in the state most conducive to the general happiness, unless it does love virtue in this manner—as a thing

desirable in itself, even although, in the individual instance, it should not produce those other desirable consequences which it tends to produce, and on account of which it is held to be virtue. This opinion is not, in the smallest degree, a departure from the Happiness principle. The ingredients of happiness are very various, and each of them is desirable in itself, and not merely when considered as swelling an aggregate. The principle of utility does not mean that any given pleasure, as music, for instance, or any given exemption from pain, as for example health, is to be looked upon as means to a collective something termed happiness, and to be desired on that account. They are desired and desirable in and for themselves; besides being means, they are a part of the end. Virtue, according to the utilitarian doctrine, is not naturally and originally part of the end, but it is capable of becoming so; and in those who love it disinterestedly it has become so, and is desired and cherished, not as a means to happiness, but as a part of their happiness.

To illustrate this farther, we may remember that virtue is not the only thing, originally a means, and which if it were not a means to anything else, would be and remain indifferent, but which by association with what it is a means to, comes to be desired for itself, and that too with the utmost intensity. What, for example, shall we say of the love of money? There is nothing originally more desirable about money than about any heap of glittering pebbles. Its worth is solely that of the things which it will buy; the desires for other things than itself, which it is a means of gratifying. Yet the love of money is not only one of the strongest moving forces of human life, but money is, in many cases, desired in and for itself; the desire to possess it is often stronger than the desire to use it, and goes on increasing when all the desires which point to ends beyond it, to be compassed by it, are falling off. It may, then, be said truly, that money is desired not for the sake of an end, but as part of the end. From being a means to happiness, it has come to be itself a principal ingredient of the individual's conception of happiness. The same may be said of the majority of the great objects of human life—power, for example, or fame; except that to each of these there is a certain amount of immediate pleasure annexed, which has at least the semblance of being naturally inherent in them; a thing which cannot be said of money. Still, however, the strongest natural attraction, both of power and of fame, is the immense aid they give to the attainment of our other wishes; and it is the strong association thus generated between them and all our objects of desire, which gives to the direct desire of them the intensity it often assumes, so as in some characters to surpass in strength all other desires. In these cases the means have become a part of the end, and a more important part of it than any of the things which they are means to. What was once desired as an instrument for the attainment of happiness, has come to be desired for its own sake. In being desired for its own sake it is, however, desired as *part* of happiness. The person is made, or thinks he would be made, happy by its mere possession; and is made unhappy by failure to obtain it. The desire of it is not a different thing from the desire of happiness, any more than the love of music, or the desire of health. They are included in happiness. They are some of the elements of which the desire of happiness is made up. Happiness is not an abstract idea, but a concrete whole; and these are some of its parts. And the utilitarian standard sanctions and approves their being so. Life would be a poor thing, very ill provided with sources of happiness, if there were not this provision of nature, by which things originally indifferent, but conducive to, or otherwise associated with, the satisfaction of our primitive desires, become in themselves sources of pleasure more valuable than the primitive pleasures, both in permanency, in the space of human existence that they are capable of covering, and even in intensity.

Virtue, according to the utilitarian conception, is a good of this description. There was no original desire of it, or motive to it, save its conduciveness to pleasure, and especially to protection from pain. But through the association thus formed, it may be felt a good in itself, and desired as such with as great intensity as any other good; and with this difference between it and the love of money, of power, or of fame, that all of these may, and often do, render the individual noxious to the other members of the society to which he belongs, whereas there is nothing which makes him so much a blessing to them as the cultivation of the disinterested love of virtue. And consequently, the utilitarian standard, while it tolerates and approves those other acquired desires, up to the point beyond which they would be more injurious to the general happiness than promotive of it, enjoins and requires the cultivation of the love of virtue up to the greatest strength possible, as being above all things important to the general happiness.

It results from the preceding considerations, that there is in reality nothing desired except happiness. Whatever is desired otherwise than as a means to some end beyond itself, and ultimately to happiness, is desired as itself a part of happiness, and is not desired for itself until it has become so. Those who desire virtue for its own sake, desire it either because the consciousness of it is a pleasure, or because the consciousness of being without it is a pain, or for both reasons united; as in truth the pleasure and pain seldom exist separately, but almost always together, the same person feeling pleasure in the degree of virtue attained, and pain in not having attained more. If one of these gave him no pleasure, and the other no pain, he would not love or desire virtue, or would desire it only for the other benefits which it might produce to himself or to persons whom he cared for.

We have now, then, an answer to the question, of what sort of proof the principle of utility is susceptible. If the opinion which I have now stated is psychologically true—if human nature is so constituted as to desire nothing which is not either a part of happiness or a means of happiness—we can have no other proof, and we require no other, that these are the only things desirable. If so, happiness is the sole end of human action, and the promotion of it the test by which to judge of all human conduct; from whence it necessarily follows that it must be the criterion of morality, since a part is included in the whole.

And now to decide whether this is really so; whether mankind do desire nothing for itself but that which is a pleasure to them, or of which the absence is a pain; we have evidently arrived at a question of fact and experience, dependent, like all similar questions, upon evidence. It can only be determined by practised self-consciousness and self-observation, assisted by observation of others. I believe that these sources of evidence, impartially consulted, will declare that desiring a thing and finding it pleasant, aversion to it and thinking of it as painful, are phenomena entirely inseparable, or rather two parts of the same phenomenon—in strictness of language, two different modes of naming the same psychological fact: that to think of an object as desirable (unless for the sake of its consequences), and to think of it as pleasant, are one and the same thing; and that to desire anything, except in proportion as the idea of it is pleasant, is a physical and metaphysical impossibility.

So obvious does this appear to me, that I expect it will hardly be disputed: and the objection made will be, not that desire can possibly be directed to anything ultimately except pleasure and exemption from pain, but that the will is a different thing from desire; that a person of confirmed virtue, or any other person whose purposes are fixed, carries out his purposes without any thought of the pleasure he has in contemplating

them, or expects to derive from their fulfilment; and persists in acting on them, even though these pleasures are much diminished, by changes in his character or decay of his passive sensibilities, or are out weighed by the pains which the pursuit of the purposes may bring upon him. All this I fully admit, and have stated it elsewhere, as positively and emphatically as any one. Will, the active phenomenon, is a different thing from desire, the state of passive sensibility, and though originally an offshoot from it, may in time take root and detach itself from the parent stock; so much so, that in the case of an habitual purpose, instead of willing the thing because we desire it, we often desire it only because we will it. This, however, is but an instance of that familiar fact, the power of habit, and is no wise confined to the case of virtuous actions. Many indifferent things, which men originally did from a motive of some sort, they continue to do from habit. Sometimes this is done unconsciously, the consciousness coming only after the action: at other times with conscious volition, but volition which has become habitual, and is put in operation by the force of habit, in opposition perhaps to the deliberate preference, as often happens with those who have contracted habits of vicious or hurtful indulgence. Third and last comes the case in which the habitual act of will in the individual instance is not in contradiction to the general intention prevailing at other times, but in fulfilment of it; as in the case of the person of confirmed virtue, and of all who pursue deliberately and consistently any determinate end. The distinction between will and desire thus understood is an authentic and highly important psychological fact; but the fact consists solely in this—that will, like all other parts of our constitution, is amenable to habit, and that we may will from habit what we no longer desire for itself, or desire only because we will it. It is not the less true that will, in the beginning, is entirely produced by desire; including in that term the repelling influence of pain as well as the attractive one of pleasure. Let us take into consideration, no longer the person who has a confirmed will to do right, but him in whom that virtuous will is still feeble, conquerable by temptation, and not to be fully relied on; by what means can it be strengthened? How can the will to be virtuous, where it does not exist in sufficient force, be implanted or awakened? Only by making the person *desire* virtue—by making him think of it in a pleasurable light, or of its absence in a painful one. It is by associating the doing right with pleasure, or the doing wrong with pain, or by eliciting and impressing and bringing home to the person's experience the pleasure naturally involved in the one or the pain in the other, that it is possible to call forth that will to be virtuous, which, when confirmed, acts without any thought of either pleasure or pain. Will is the child of desire, and passes out of the dominion of its parent only to come under that of habit. That which is the result of habit affords no presumption of being intrinsically good; and there would be no reason for wishing that the purpose of virtue should become independent of pleasure and pain, were it not that the influence of the pleasurable and painful associations which prompt to virtue is not sufficiently to be depended on for unerring constancy of action until it has acquired the support of habit. Both in feeling and in conduct, habit is the only thing which imparts certainty; and it is because of the importance to others of being able to rely absolutely on one's feelings and conduct, and to oneself of being able to rely on one's own, that the will to do right ought to be cultivated into this habitual independence. In other words, this state of the will is a means to good, not intrinsically a good; and does not contradict the doctrine that nothing is a good to human beings but in so far as it is either itself pleasurable, or a means of attaining pleasure or averting pain.

But if this doctrine be true, the principle of utility is proved. Whether it is so or not, must now be left to the consideration of the thoughtful reader.

CHAPTER 5: ON THE CONNECTION BETWEEN JUSTICE AND UTILITY

In all ages of speculation, one of the strongest obstacles to the reception of the doctrine that Utility or Happiness is the criterion of right and wrong, has been drawn from the idea of Justice. The powerful sentiment, and apparently clear perception, which that word recalls with a rapidity and certainty resembling an instinct, have seemed to the majority of thinkers to point to an inherent quality in things; to show that the Just must have an existence in Nature as something absolute, generically distinct from every variety of the Expedient, and, in idea, opposed to it, though (as is commonly acknowledged) never, in the long run, disjoined from it in fact.

In the case of this, as of our other moral sentiments, there is no necessary connection between the question of its origin, and that of its binding force. That a feeling is bestowed on us by Nature, does not necessarily legitimate all its promptings. The feeling of justice might be a peculiar instinct, and might yet require, like our other instincts, to be controlled and enlightened by a higher reason. If we have intellectual instincts, leading us to judge in a particular way, as well as animal instincts that prompt us to act in a particular way, there is no necessity that the former should be more infallible in their sphere than the latter in theirs: it may as well happen that wrong judgments are occasionally suggested by those, as wrong actions by these. But though it is one thing to believe that we have natural feelings of justice, and another to acknowledge them as an ultimate criterion of conduct, these two opinions are very closely connected in point of fact. Mankind are always predisposed to believe that any subjective feeling, not otherwise accounted for, is a revelation of some objective reality. Our present object is to determine whether the reality, to which the feeling of justice corresponds, is one which needs any such special revelation; whether the justice or injustice of an action is a thing intrinsically peculiar, and distinct from all its other qualities, or only a combination of certain of those qualities, presented under a peculiar aspect. For the purpose of this inquiry it is practically important to consider whether the feeling itself, of justice and injustice, is *sui generis* like our sensations of colour and taste, or a derivative feeling, formed by a combination of others. And this it is the more essential to examine, as people are in general willing enough to allow, that objectively the dictates of Justice coincide with a part of the field of General Expediency; but inasmuch as the subjective mental feeling of Justice is different from that which commonly attaches to simple expediency, and, except in the extreme cases of the latter, is far more imperative in its demands, people find it difficult to see, in Justice, only a particular kind or branch of general utility, and think that its superior binding force requires a totally different origin.

To throw light upon this question, it is necessary to attempt to ascertain what is the distinguishing character of justice, or of injustice: what is the quality, or whether there is any quality, attributed in common to all modes of conduct designated as unjust (for justice, like many other moral attributes, is best defined by its opposite), and distinguishing them from such modes of conduct as are disapproved, but without having that particular epithet of disapprobation applied to them. If in everything which men are accustomed to characterise as just or unjust, some one common attribute or collection of attributes is always present, we may judge whether this particular attribute or combination of attributes would be capable of gathering round it a sentiment of that peculiar character and intensity by virtue of the general laws of our emotional constitution, or whether the sentiment is inexplicable, and requires to be regarded as a special provision of Nature. If we find the former to be the case, we shall, in resolving this question, have

resolved also the main problem: if the latter, we shall have to seek for some other mode of investigating it.

To find the common attributes of a variety of objects, it is necessary to begin by surveying the objects themselves in the concrete. Let us therefore advert successively to the various modes of action, and arrangements of human affairs, which are classed, by universal or widely spread opinion, as Just or as Unjust. The things well known to excite the sentiments associated with those names are of a very multifarious character. I shall pass them rapidly in review, without studying any particular arrangement.

In the first place, it is mostly considered unjust to deprive any one of his personal liberty, his property, or any other thing which belongs to him by law. Here, therefore, is one instance of the application of the terms “just” and “unjust” in a perfectly definite sense, namely, that it is just to respect, unjust to violate, the *legal rights* of any one. But this judgment admits of several exceptions, arising from the other forms in which the notions of justice and injustice present themselves. For example, the person who suffers the deprivation may (as the phrase is) have *forfeited* the rights which he is so deprived of: a case to which we shall return presently. But also—

Secondly; the legal rights of which he is deprived, may be rights which *ought* not to have belonged to him; in other words, the law which confers on him these rights, may be a bad law. When it is so, or when (which is the same thing for our purpose) it is supposed to be so, opinions will differ as to the justice or injustice of infringing it. Some maintain that no law, however bad, ought to be disobeyed by an individual citizen; that his opposition to it, if shown at all, should only be shown in endeavouring to get it altered by competent authority. This opinion (which condemns many of the most illustrious benefactors of mankind, and would often protect pernicious institutions against the only weapons which, in the state of things existing at the time, have any chance of succeeding against them) is defended, by those who hold it, on grounds of expediency; principally on that of the importance, to the common interest of mankind, of maintaining inviolate the sentiment of submission to law. Other persons, again, hold the directly contrary opinion, that any law, judged to be bad, may blamelessly be disobeyed, even though it be not judged to be unjust, but only inexpedient; while others would confine the licence of disobedience to the case of unjust laws: but again, some say, that all laws which are inexpedient are unjust; since every law imposes some restriction on the natural liberty of mankind, which restriction is an injustice, unless legitimated by tending to their good. Among these diversities of opinion, it seems to be universally admitted that there may be unjust laws, and that law, consequently, is not the ultimate criterion of justice, but may give to one person a benefit, or impose on another an evil, which justice condemns. When, however, a law is thought to be unjust, it seems always to be regarded as being so in the same way in which a breach of law is unjust, namely, by infringing somebody’s right; which, as it cannot in this case be a legal right, receives a different appellation, and is called a moral right. We may say, therefore, that a second case of injustice consists in taking or withholding from any person that to which he has a *moral right*.

Thirdly, it is universally considered just that each person should obtain that (whether good or evil) which he *deserves* and unjust that he should obtain a good, or be made to undergo an evil, which he does not deserve. This is, perhaps, the clearest and most emphatic form in which the idea of justice is conceived by the general mind. As it involves the notion of desert, the question arises, what constitutes desert? Speaking in a general way, a person is understood to deserve good if he does right, evil if he does wrong; and in a more particular sense, to deserve good from those to whom he does or

has done good, and evil from those to whom he does or has done evil. The precept of returning good for evil has never been regarded as a case of the fulfilment of justice, but as one in which the claims of justice are waived, in obedience to other considerations.

Fourthly, it is confessedly unjust to *break faith* with any one: to violate an engagement, either express or implied, or disappoint expectations raised by our own conduct, at least if we have raised those expectations knowingly and voluntarily. Like the other obligations of justice already spoken of, this one is not regarded as absolute, but as capable of being overruled by a stronger obligation of justice on the other side; or by such conduct on the part of the person concerned as is deemed to absolve us from our obligation to him, and to constitute a *forfeiture* of the benefit which he has been led to expect.

Fifthly, it is, by universal admission, inconsistent with justice to be *partial*—to show favour or preference to one person over another, in matters to which favour and preference do not properly apply. Impartiality, however, does not seem to be regarded as a duty in itself, but rather as instrumental to some other duty; for it is admitted that favour and preference are not always censurable, and indeed the cases in which they are condemned are rather the exception than the rule. A person would be more likely to be blamed than applauded for giving his family or friends no superiority in good offices over strangers, when he could do so without violating any other duty; and no one thinks it unjust to seek one person in preference to another as a friend, connection, or companion. Impartiality where rights are concerned is of course obligatory, but this is involved in the more general obligation of giving to every one his right. A tribunal, for example, must be impartial, because it is bound to award, without regard to any other consideration, a disputed object to the one of two parties who has the right to it. There are other cases in which impartiality means, being solely influenced by desert; as with those who, in the capacity of judges, preceptors, or parents, administer reward and punishment as such. There are cases, again, in which it means, being solely influenced by consideration for the public interest; as in making a selection among candidates for a government employment. Impartiality, in short, as an obligation of justice, may be said to mean, being exclusively influenced by the considerations which it is supposed ought to influence the particular case in hand; and resisting the solicitation of any motives which prompt to conduct different from what those considerations would dictate.

Nearly allied to the idea of impartiality is that of *equality*, which often enters as a component part both into the conception of justice and into the practice of it, and, in the eyes of many persons, constitutes its essence. But in this, still more than in any other case, the notion of justice varies in different persons, and always conforms in its variations to their notion of utility. Each person maintains that equality is the dictate of justice, except where he thinks that expediency requires inequality. The justice of giving equal protection to the rights of all, is maintained by those who support the most outrageous inequality in the rights themselves. Even in slave countries it is theoretically admitted that the rights of the slave, such as they are, ought to be as sacred as those of the master; and that a tribunal which fails to enforce them with equal strictness is wanting in justice; while, at the same time, institutions which leave to the slave scarcely any rights to enforce, are not deemed unjust, because they are not deemed inexpedient. Those who think that utility requires distinctions of rank, do not consider it unjust that riches and social privileges should be unequally dispensed; but those who think this inequality inexpedient, think it unjust also. Whoever thinks that government is necessary, sees no injustice in as much inequality as is constituted by giving to the magistrate powers not granted to other people. Even among those who hold levelling doctrines,

there are as many questions of justice as there are differences of opinion about expediency. Some Communists consider it unjust that the produce of the labour of the community should be shared on any other principle than that of exact equality; others think it just that those should receive most whose wants are greatest; while others hold that those who work harder, or who produce more, or whose services are more valuable to the community, may justly claim a larger quota in the division of the produce. And the sense of natural justice may be plausibly appealed to in behalf of every one of these opinions.

Among so many diverse applications of the term "justice," which yet is not regarded as ambiguous, it is a matter of some difficulty to seize the mental link which holds them together, and on which the moral sentiment adhering to the term essentially depends. Perhaps, in this embarrassment, some help may be derived from the history of the word, as indicated by its etymology.

In most, if not in all, languages, the etymology of the word which corresponds to "just" points distinctly to an origin connected with the ordinances of law. *Justum* is a form of *jussum*, that which has been ordered. (*Dikaion*) comes directly from (*dike*), a suit at law. *Recht*, from which came *right* and *righteous*, is synonymous with law. The courts of justice, the administration of justice, are the courts and the administration of law. *La justice*, in French, is the established term for judicature. I am not committing the fallacy imputed with some show of truth to Horne Tooke,* of assuming that a word must still continue to mean what it originally meant. Etymology is slight evidence of what the idea now signified is, but the very best evidence of how it sprang up. There can, I think, be no doubt that the *idée mère*, the primitive element, in the formation of the notion of justice, was conformity to law. It constituted the entire idea among the Hebrews, up to the birth of Christianity; as might be expected in the case of a people whose laws attempted to embrace all subjects on which precepts were required, and who believed those laws to be a direct emanation from the Supreme Being. But other nations, and in particular the Greeks and Romans, who knew that their laws had been made originally, and still continued to be made, by men, were not afraid to admit that those men might make bad laws; might do, by law, the same things, and from the same motives, which if done by individuals without the sanction of law, would be called unjust. And hence the sentiment of injustice came to be attached, not to all violations of law, but only to violations of such laws as *ought* to exist, including such as ought to exist, but do not; and to laws themselves, if supposed to be contrary to what ought to be law. In this manner the idea of law and of its injunctions was still predominant in the notion of justice, even when the laws actually in force ceased to be accepted as the standard of it.

It is true that mankind consider the idea of justice and its obligations as applicable to many things which neither are, nor is it desired that they should be, regulated by law. Nobody desires that laws should interfere with the whole detail of private life; yet every one allows that in all daily conduct a person may and does show himself to be either just or unjust. But even here, the idea of the breach of what ought to be law, still lingers in a modified shape. It would always give us pleasure, and chime in with our feelings of fitness, that acts which we deem unjust should be punished, though we do not always think it expedient that this should be done by the tribunals. We forego that gratification on account of incidental inconveniences. We should be glad to see just conduct enforced and injustice repressed, even in the minutest details, if we were not, with reason, afraid of trusting the magistrate with so unlimited an amount of power over individuals. When

*[John Tooke (1736–1812), a radical writer and close friend of Bentham.]

we think that a person is bound in justice to do a thing, it is an ordinary form of language to say, that he ought to be compelled to do it. We should be gratified to see the obligation enforced by anybody who had the power. If we see that its enforcement by law would be inexpedient, we lament the impossibility, we consider the impunity given to injustice as an evil, and strive to make amends for it by bringing a strong expression of our own and the public disapprobation to bear upon the offender. Thus the idea of legal constraint is still the generating idea of the notion of justice, though undergoing several transformations before that notion, as it exists in an advanced state of society, becomes complete.

The above is, I think, a true account, as far as it goes, of the origin and progressive growth of the idea of justice. But we must observe, that it contains, as yet, nothing to distinguish that obligation from moral obligation in general. For the truth is, that the idea of penal sanction, which is the essence of law, enters not only into the conception of injustice, but into that of any kind of wrong. We do not call anything wrong, unless we mean to imply that a person ought to be punished in some way or other for doing it; if not by law, by the opinion of his fellow-creatures; if not by opinion, by the reproaches of his own conscience. This seems the real turning point of the distinction between morality and simple expediency. It is a part of the notion of Duty in every one of its forms, that a person may rightfully be compelled to fulfil it. Duty is a thing which may be *exacted* from a person, as one exacts a debt. Unless we think that it may be exacted from him, we do not call it his duty. Reasons of prudence, or the interest of other people, may militate against actually exacting it; but the person himself, it is clearly understood, would not be entitled to complain. There are other things, on the contrary, which we wish that people should do, which we like or admire them for doing, perhaps dislike or despise them for not doing, but yet admit that they are not bound to do; it is not a case of moral obligation; we do not blame them, that is, we do not think that they are proper objects of punishment. How we come by these ideas of deserving and not deserving punishment, will appear, perhaps, in the sequel; but I think there is no doubt that this distinction lies at the bottom of the notions of right and wrong; that we call any conduct wrong, or employ, instead, some other term of dislike or disparagement, according as we think that the person ought, or ought not, to be punished for it; and we say, it would be right to do so and so, or merely that it would be desirable or laudable, according as we would wish to see the person whom it concerns, compelled, or only persuaded and exhorted, to act in that manner.*

This, therefore, being the characteristic difference which marks off, not justice, but morality in general, from the remaining provinces of Expediency and Worthiness; the character is still to be sought which distinguishes justice from other branches of morality. Now it is known that ethical writers divide moral duties into two classes, denoted by the ill-chosen expressions, duties of perfect and of imperfect obligation; the latter being those in which, though the act is obligatory, the particular occasions of performing it are left to our choice; as in the case of charity or beneficence, which we are indeed bound to practise, but not towards any definite person, nor at any prescribed time. In the more precise language of philosophic jurists, duties of perfect obligation are those duties in virtue of which a correlative *right* resides in some person or persons; duties of imperfect obligation are those moral obligations which do not give birth to any

*I see this point enforced and illustrated by Professor Bain, in an admirable chapter (entitled "The Ethical Emotions, or the Moral Sense"), of the second of the two treatises composing his elaborate and profound work on the Mind.

right. I think it will be found that this distinction exactly coincides with that which exists between justice and the other obligations of morality. In our survey of the various popular acceptations of justice, the term appeared generally to involve the idea of a personal right—a claim on the part of one or more individuals, like that which the law gives when it confers a proprietary or other legal right. Whether the injustice consists in depriving a person of a possession, or in breaking faith with him, or in treating him worse than he deserves, or worse than other people who have no greater claims, in each case the supposition implies two things—a wrong done, and some assignable person who is wronged. Injustice may also be done by treating a person better than others; but the wrong in this case is to his competitors, who are also assignable persons. It seems to me that this feature in the case—a right in some person, correlative to the moral obligation—constitutes the specific difference between justice, and generosity or beneficence. Justice implies something which it is not only right to do, and wrong not to do, but which some individual person can claim from us as his moral right. No one has a moral right to our generosity or beneficence, because we are not morally bound to practise those virtues towards any given individual. And it will be found with respect to this as to every correct definition, that the instances which seem to conflict with it are those which most confirm it. For if a moralist attempts, as some have done, to make out that mankind generally, though not any given individual, have a right to all the good we can do them, he at once, by that thesis, includes generosity and beneficence within the category of justice. He is obliged to say, that our utmost exertions are due to our fellow-creatures, thus assimilating them to a debt; or that nothing less can be a sufficient return for what society does for us, thus classing the case as one of gratitude; both of which are acknowledged cases of justice. Wherever there is a right, the case is one of justice, and not of the virtue of beneficence: and whoever does not place the distinction between justice and morality in general, where we have now placed it, will be found to make no distinction between them at all, but to merge all morality in justice.

Having thus endeavoured to determine the distinctive elements which enter into the composition of the idea of justice, we are ready to enter on the inquiry, whether the feeling, which accompanies the idea, is attached to it by a special dispensation of nature, or whether it could have grown up, by any known laws, out of the idea itself; and in particular, whether it can have originated in considerations of general expediency.

I conceive that the sentiment itself does not arise from anything which would commonly, or correctly, be termed an idea of expediency; but that though the sentiment does not, whatever is moral in it does.

We have seen that the two essential ingredients in the sentiment of justice are, the desire to punish a person who has done harm and the knowledge or belief that there is some definite individual or individuals to whom harm has been done.

Now it appears to me, that the desire to punish a person who has done harm to some individual is a spontaneous outgrowth from two sentiments, both in the highest degree natural, and which either are or resemble instincts; the impulse of self-defence, and the feeling of sympathy.

It is natural to resent, and to repel or retaliate, any harm done or attempted against ourselves, or against those with whom we sympathise. The origin of this sentiment it is not necessary here to discuss. Whether it be an instinct or a result of intelligence, it is, we know, common to all animal nature; for every animal tries to hurt those who have hurt, or who it thinks are about to hurt, itself or its young. Human beings, on this point, only differ from other animals in two particulars. First, in being capable of sympathising, not solely with their offspring, or, like some of the more noble animals, with some superior

animal who is kind to them, but with all human, and even with all sentient, beings. Secondly, in having a more developed intelligence, which gives a wider range to the whole of their sentiments, whether self-regarding or sympathetic. By virtue of his superior intelligence, even apart from his superior range of sympathy, a human being is capable of apprehending a community of interest between himself and the human society of which he forms a part, such that any conduct which threatens the security of the society generally, is threatening to his own, and calls forth his instinct (if instinct it be) of self-defence. The same superiority of intelligence, joined to the power of sympathising with human beings generally, enables him to attach himself to the collective idea of his tribe, his country, or mankind, in such a manner that any act hurtful to them, raises his instinct of sympathy, and urges him to resistance.

The sentiment of justice, in that one of its elements which consists of the desire to punish, is thus, I conceive, the natural feeling of retaliation or vengeance, rendered by intellect and sympathy applicable to those injuries, that is, to those hurts, which wound us through, or in common with, society at large. This sentiment, in itself, has nothing moral in it; what is moral is, the exclusive subordination of it to the social sympathies, so as to wait on and obey their call. For the natural feeling would make us resent indiscriminately whatever any one does that is disagreeable to us; but when moralised by the social feeling, it only acts in the directions conformable to the general good: just persons resenting a hurt to society, though not otherwise a hurt to themselves, and not resenting a hurt to themselves, however painful, unless it be of the kind which society has a common interest with them in the repression of.

It is no objection against this doctrine to say, that when we feel our sentiment of justice outraged, we are not thinking of society at large, or of any collective interest, but only of the individual case. It is common enough certainly, though the reverse of commendable, to feel resentment merely because we have suffered pain; but a person whose resentment is really a moral feeling, that is, who considers whether an act is blamable before he allows himself to resent it—such a person, though he may not say expressly to himself that he is standing up for the interest of society, certainly does feel that he is asserting a rule which is for the benefit of others as well as for his own. If he is not feeling this—if he is regarding the act solely as it affects him individually—he is not consciously just; he is not concerning himself about the justice of his actions. This is admitted even by anti-utilitarian moralists. When Kant (as before remarked) propounds as the fundamental principle of morals, “So act, that thy rule of conduct might be adopted as a law by all rational beings,” he virtually acknowledges that the interest of mankind collectively, or at least of mankind indiscriminately, must be in the mind of the agent when conscientiously deciding on the morality of the act. Otherwise he uses words without a meaning: for, that a rule even of utter selfishness could not *possibly* be adopted by all rational beings—that there is any insuperable obstacle in the nature of things to its adoption—cannot be even plausibly maintained. To give any meaning to Kant’s principle, the sense put upon it must be, that we ought to shape our conduct by a rule which all rational beings might adopt *with benefit to their collective interest*.

To recapitulate: the idea of justice supposes two things—a rule of conduct, and a sentiment which sanctions the rule. The first must be supposed common to all mankind, and intended for their good. The other (the sentiment) is a desire that punishment may be suffered by those who infringe the rule. There is involved, in addition, the conception of some definite person who suffers by the infringement; whose rights (to use the expression appropriated to the case) are violated by it. And the sentiment of justice appears to me to be, the animal desire to repel or retaliate a hurt or damage to oneself, or to those with whom one sympathises, widened so as to include all persons, by the

human capacity of enlarged sympathy, and the human conception of intelligent self-interest. From the latter elements, the feeling derives its morality; from the former, its peculiar impressiveness, and energy of self-assertion.

I have, throughout, treated the idea of a *right* residing in the injured person, and violated by the injury, not as a separate element in the composition of the idea and sentiment, but as one of the forms in which the other two elements clothe themselves. These elements are, a hurt to some assignable person or persons on the one hand, and a demand for punishment on the other. An examination of our own minds, I think, will show, that these two things include all that we mean when we speak of violation of a right. When we call anything a person's right, we mean that he has a valid claim on society to protect him in the possession of it, either by the force of law, or by that of education and opinion. If he has what we consider a sufficient claim, on whatever account, to have something guaranteed to him by society, we say that he has a right to it. If we desire to prove that anything does not belong to him by right, we think this done as soon as it is admitted that society ought not to take measures for securing it to him, but should leave him to chance, or to his own exertions. Thus, a person is said to have a right to what he can earn in fair professional competition; because society ought not to allow any other person to hinder him from endeavouring to earn in that manner as much as he can. But he has not a right to three hundred a year, though he may happen to be earning it; because society is not called on to provide that he shall earn that sum. On the contrary, if he owns ten thousand pounds three percent stock, he *has* a right to three hundred a year because society has come under an obligation to provide him with an income of that amount.

To have a right, then, is, I conceive, to have something which society ought to defend me in the possession of. If the objector goes on to ask, why it ought? I can give him no other reason than general utility. If that expression does not seem to convey a sufficient feeling of the strength of the obligation, nor to account for the peculiar energy of the feeling, it is because there goes to the composition of the sentiment, not a rational only, but also an animal element, the thirst for retaliation; and this thirst derives its intensity, as well as its moral justification, from the extraordinarily important and impressive kind of utility which is concerned. The interest involved is that of security, to every one's feelings the most vital of all interests. All other earthly benefits are needed by one person, not needed by another; and many of them can, if necessary, be cheerfully foregone, or replaced by something else; but security no human being can possibly do without; on it we depend for all our immunity from evil, and for the whole value of all and every good, beyond the passing moment; since nothing but the gratification of the instant could be of any worth to us, if we could be deprived of anything the next instant by whoever was momentarily stronger than ourselves. Now this most indispensable of all necessities, after physical nutriment, cannot be had, unless the machinery for providing it is kept unintermittedly in active play. Our notion, therefore, of the claim we have on our fellowcreatures to join in making safe for us the very groundwork of our existence, gathers feelings around it so much more intense than those concerned in any of the more common cases of utility, that the difference in degree (as is often the case in psychology) becomes a real difference in kind. The claim assumes that character of absoluteness, that apparent infinity, and incommensurability with all other considerations, which constitute the distinction between the feeling of right and wrong and that of ordinary expediency and in expediency. The feelings concerned are so powerful, and we count so positively on finding a responsive feeling in others (all being alike interested), that *ought* and *should* grow into *must*, and recognised indispensability becomes a moral necessity, analogous to physical, and often not inferior to it in binding force.

If the preceding analysis, or something resembling it, be not the correct account of the notion of justice; if justice be totally independent of utility, and be a standard per se, which the mind can recognise by simple introspection of itself; it is hard to understand why that internal oracle is so ambiguous, and why so many things appear either just or unjust, according to the light in which they are regarded.

We are continually informed that Utility is an uncertain standard, which every different person interprets differently, and that there is no safety but in the immutable, ineffaceable, and unmistakable dictates of Justice, which carry their evidence in themselves, and are independent of the fluctuations of opinion. One would suppose from this that on questions of justice there could be no controversy; that if we take that for our rule, its application to any given case could leave us in as little doubt as a mathematical demonstration. So far is this from being the fact, that there is as much difference of opinion, and as much discussion, about what is just, as about what is useful to society. Not only have different nations and individuals different notions of justice, but in the mind of one and the same individual, justice is not some one rule, principle, or maxim, but many, which do not always coincide in their dictates, and in choosing between which, he is guided either by some extraneous standard, or by his own personal predilections.

For instance, there are some who say, that it is unjust to punish any one for the sake of example to others; that punishment is just, only when intended for the good of the sufferer himself. Others maintain the extreme reverse, contending that to punish persons who have attained years of discretion, for their own benefit, is despotism and injustice, since if the matter at issue is solely their own good, no one has a right to control their own judgment of it; but that they may justly be punished to prevent evil to others, this being the exercise of the legitimate right of self-defence. Mr. Owen,* again, affirms that it is unjust to punish at all; for the criminal did not make his own character; his education, and the circumstances which surrounded him, have made him a criminal, and for these he is not responsible. All these opinions are extremely plausible; and so long as the question is argued as one of justice simply, without going down to the principles which lie under justice and are the source of its authority, I am unable to see how any of these reasoners can be refuted. For in truth every one of the three builds upon rules of justice confessedly true. The first appeals to the acknowledged injustice of singling out an individual, and making him a sacrifice, without his consent, for other people's benefit. The second relies on the acknowledged justice of self-defence, and the admitted injustice of forcing one person to conform to another's notions of what constitutes his good. The Owenite invokes the admitted principle, that it is unjust to punish any one for what he cannot help. Each is triumphant so long as he is not compelled to take into consideration any other maxims of justice than the one he has selected; but as soon as their several maxims are brought face to face, each disputant seems to have exactly as much to say for himself as the others. No one of them can carry out his own notion of justice without trampling upon another equally binding. These are difficulties; they have always been felt to be such; and many devices have been invented to turn rather than to overcome them. As a refuge from the last of the three, men imagined what they called the freedom of the will; fancying that they could not justify punishing a man whose will is in a thoroughly hateful state, unless it be supposed to have come into that state through no influence of anterior circumstances. To escape from the other difficulties, a favourite contrivance has been the fiction of a contract, whereby at some unknown period all the members of society engaged to obey the laws, and consented to be

*[Robert Owen (1771–1858), a British reformer who argued for environmental determinism.]

punished for any disobedience to them; thereby giving to their legislators the right, which it is assumed they would not otherwise have had, of punishing them, either for their own good or for that of society. This happy thought was considered to get rid of the whole difficulty, and to legitimate the infliction of punishment, in virtue of another received maxim of justice, *volenti non fit injuria*; that is not unjust which is done with the consent of the person who is supposed to be hurt by it. I need hardly remark, that even if the consent were not a mere fiction, this maxim is not superior in authority to the others which it is brought in to supersede. It is, on the contrary, an instructive specimen of the loose and irregular manner in which supposed principles of justice grow up. This particular one evidently came into use as a help to the coarse exigencies of courts of law, which are sometimes obliged to be content with very uncertain presumptions, on account of the greater evils which would often arise from any attempt on their part to cut finer. But even courts of law are not able to adhere consistently to the maxim, for they allow voluntary engagements to be set aside on the ground of fraud, and sometimes on that of mere mistake or misinformation.

Again, when the legitimacy of inflicting punishment is admitted, how many conflicting conceptions of justice come to light in discussing the proper apportionment of punishments to offences. No rule on the subject recommends itself so strongly to the primitive and spontaneous sentiment of justice, as the *lex talionis*, an eye for an eye and a tooth for a tooth. Though this principle of the Jewish and of the Mohammedan law has been generally abandoned in Europe as a practical maxim, there is, I suspect, in most minds, a secret hankering after it; and when retribution accidentally falls on an offender in that precise shape, the general feeling of satisfaction evinced bears witness how natural is the sentiment to which this repayment in kind is acceptable. With many, the test of justice in penal infliction is that the punishment should be proportioned to the offence; meaning that it should be exactly measured by the moral guilt of the culprit (whatever be their standard for measuring moral guilt): the consideration, what amount of punishment is necessary to deter from the offence, having nothing to do with the question of justice, in their estimation: while there are others to whom that consideration is all in all; who maintain that it is not just, at least for man, to inflict on a fellow-creature, whatever may be his offences, any amount of suffering beyond the least that will suffice to prevent him from repeating, and others from imitating, his misconduct.

To take another example from a subject already once referred to. In a co-operative industrial association, is it just or not that talent or skill should give a title to superior remuneration? On the negative side of the question it is argued, that whoever does the best he can, deserves equally well, and ought not in justice to be put in a position of inferiority for no fault of his own; that superior abilities have already advantages more than enough, in the admiration they excite, the personal influence they command, and the internal sources of satisfaction attending them, without adding to these a superior share of the world's goods; and that society is bound in justice rather to make compensation to the less favoured, for this unmerited inequality of advantages, than to aggravate it. On the contrary side it is contended, that society receives more from the more efficient labourer; that his services being more useful, society owes him a larger return for them; that a greater share of the joint result is actually his work, and not to allow his claim to it is a kind of robbery; that if he is only to receive as much as others, he can only be justly required to produce as much, and to give a smaller amount of time and exertion, proportioned to his superior efficiency. Who shall decide between these appeals to conflicting principles of justice? Justice has in this case two sides to it, which it is impossible to bring into harmony, and the two disputants have chosen opposite sides; the one looks

to what it is just that the individual should receive, the other to what it is just that the community should give. Each, from his own point of view, is unanswerable; and any choice between them, on grounds of justice, must be perfectly arbitrary. Social utility alone can decide the preference.

How many, again, and how irreconcilable, are the standards of justice to which reference is made in discussing the repartition of taxation. One opinion is, that payment to the State should be in numerical proportion to pecuniary means. Others think that justice dictates what they term graduated taxation; taking a higher percentage from those who have more to spare. In point of natural justice a strong case might be made for disregarding means altogether, and taking the same absolute sum (whenever it could be got) from every one: as the subscribers to a mess, or to a club, all pay the same sum for the same privileges, whether they can all equally afford it or not. Since the protection (it might be said) of law and government is afforded to, and is equally required by all, there is no injustice in making all buy it at the same price. It is reckoned justice, not injustice, that a dealer should charge to all customers the same price for the same article, not a price varying according to their means of payment. This doctrine, as applied to taxation, finds no advocates, because it conflicts so strongly with man's feelings of humanity and of social expediency; but the principle of justice which it invokes is as true and as binding as those which can be appealed to against it. Accordingly it exerts a tacit influence on the line of defence employed for other modes of assessing taxation. People feel obliged to argue that the State does more for the rich than for the poor, as a justification for its taking more from them: though this is in reality not true, for the rich would be far better able to protect themselves, in the absence of law or government, than the poor, and indeed would probably be successful in converting the poor into their slaves. Others, again, so far defer to the same conception of justice, as to maintain that all should pay an equal capitation tax for the protection of their persons (these being of equal value to all), and an unequal tax for the protection of their property, which is unequal. To this others reply, that the all of one man is as valuable to him as the all of another. From these confusions there is no other mode of extrication than the utilitarian.

Is, then, the difference between the Just and the Expedient a merely imaginary distinction? Have mankind been under a delusion in thinking that justice is a more sacred thing than policy, and that the latter ought only to be listened to after the former has been satisfied? By no means. The exposition we have given of the nature and origin of the sentiment, recognises a real distinction; and no one of those who profess the most sublime contempt for the consequences of actions as an element in their morality, attaches more importance to the distinction than I do. While I dispute the pretensions of any theory which sets up an imaginary standard of justice not grounded on utility, I account the justice which is grounded on utility to be the chief part, and incomparably the most sacred and binding part, of all morality. Justice is a name for certain classes of moral rules, which concern the essentials of human well-being more nearly, and are therefore of more absolute obligation, than any other rules for the guidance of life; and the notion which we have found to be of the essence of the idea of justice, that of a right residing in an individual, implies and testifies to this more binding obligation.

The moral rules which forbid mankind to hurt one another (in which we must never forget to include wrongful interference with each other's freedom) are more vital to human well-being than any maxims, however important, which only point out the best mode of managing some department of human affairs. They have also the peculiarity, that they are the main element in determining the whole of the social feelings of mankind. It is their observance which alone preserves peace among human

beings: if obedience to them were not the rule, and disobedience the exception, every one would see in every one else an enemy, against whom he must be perpetually guarding himself. What is hardly less important, these are the precepts which mankind have the strongest and the most direct inducements for impressing upon one another. By merely giving to each other prudential instruction or exhortation, they may gain, or think they gain, nothing: in inculcating on each other the duty of positive beneficence they have an unmistakable interest, but far less in degree: a person may possibly not need the benefits of others; but he always needs that they should not do him hurt. Thus the moralities which protect every individual from being harmed by others, either directly or by being hindered in his freedom of pursuing his own good, are at once those which he himself has most at heart, and those which he has the strongest interest in publishing and enforcing by word and deed. It is by a person's observance of these that his fitness to exist as one of the fellowship of human beings is tested and decided; for on that depends his being a nuisance or not to those with whom he is in contact. Now it is these moralities primarily which compose the obligations of justice. The most marked cases of injustice, and those which give the tone to the feeling of repugnance which characterises the sentiment, are acts of wrongful aggression, or wrongful exercise of power over some one; the next are those which consist in wrongfully withholding from him something which is his due; in both cases, inflicting on him a positive hurt, either in the form of direct suffering, or of the privation of some good which he had reasonable ground, either of a physical or of a social kind, for counting upon.

The same powerful motives which command the observance of these primary moralities, enjoin the punishment of those who violate them; and as the impulses of self-defence, of defence of others, and of vengeance, are all called forth against such persons, retribution, or evil for evil, becomes closely connected with the sentiment of justice, and is universally included in the idea. Good for good is also one of the dictates of justice; and this, though its social utility is evident, and though it carries with it a natural human feeling, has not at first sight that obvious connection with hurt or injury, which, existing in the most elementary cases of just and un-just, is the source of the characteristic intensity of the sentiment. But the connection, though less obvious, is not less real. He who accepts benefits, and denies a return of them when needed, inflicts a real hurt, by disappointing one of the most natural and reasonable of expectations, and one which he must at least tacitly have encouraged, otherwise the benefits would seldom have been conferred. The important rank, among human evils and wrongs, of the disappointment of expectation, is shown in the fact that it constitutes the principal criminality of two such highly immoral acts as a breach of friendship and a breach of promise. Few hurts which human beings can sustain are greater, and none wound more, than when that on which they habitually and with full assurance relied, fails them in the hour of need; and few wrongs are greater than this mere withholding of good; none excite more resentment, either in the person suffering, or in a sympathising spectator. The principle, therefore, of giving to each what they deserve, that is, good for good as well as evil for evil, is not only included within the idea of Justice as we have defined it, but is a proper object of that intensity of sentiment, which places the Just, in human estimation, above the simply Expedient.

Most of the maxims of justice current in the world, and commonly appealed to in its transactions, are simply instrumental to carrying into effect the principles of justice which we have now spoken of. That a person is only responsible for what he has done voluntarily, or could voluntarily have avoided; that it is unjust to condemn any person

unheard; that the punishment ought to be proportioned to the offence, and the like, are maxims intended to prevent the just principle of evil for evil from being perverted to the infliction of evil without that justification. The greater part of these common maxims have come into use from the practice of courts of justice, which have been naturally led to a more complete recognition and elaboration than was likely to suggest itself to others, of the rules necessary to enable them to fulfil their double function, of inflicting punishment when due, and of awarding to each person his right.

That first of judicial virtues, impartiality, is an obligation of justice, partly for the reason last mentioned; as being a necessary condition of the fulfilment of the other obligations of justice. But this is not the only source of the exalted rank, among human obligations, of those maxims of equality and impartiality, which, both in popular estimation and in that of the most enlightened, are included among the precepts of justice. In one point of view, they may be considered as corollaries from the principles already laid down. If it is a duty to do to each according to his deserts, returning good for good as well as repressing evil by evil, it necessarily follows that we should treat all equally well (when no higher duty forbids) who have deserved equally well of *us*, and that society should treat all equally well who have deserved equally well of *it*, that is, who have deserved equally well absolutely. This is the highest abstract standard of social and distributive justice; towards which all institutions, and the efforts of all virtuous citizens, should be made in the utmost possible degree to converge. But this great moral duty rests upon a still deeper foundation, being a direct emanation from the first principle of morals, and not a mere logical corollary from secondary or derivative doctrines. It is involved in the very meaning of Utility, or the Greatest Happiness Principle. That principle is a mere form of words without rational signification, unless one person's happiness, supposed equal in degree (with the proper allowance made for kind), is counted for exactly as much as another's. Those conditions being supplied, Bentham's dictum, "everybody to count for one, nobody for more than one," might be written under the principle of utility as an explanatory commentary.* The equal claim of everybody to

*This implication, in the first principle of the utilitarian scheme, of perfect impartiality between persons, is regarded by Mr. Herbert Spencer (in his *Social Statics*) as a disproof of the pretensions of utility to be a sufficient guide to right, since (he says) the principle of utility presupposes the anterior principle that everybody has an equal right to happiness. It may be more correctly described as supposing that equal amounts of happiness are equally desirable whether felt by the same or by different persons. This, however, is not a pre-supposition; not a premise needful to support the principle of utility, but the very principle itself; for what is the principle of utility, if it be not that "happiness" and "desirable" are synonymous terms? If there is any anterior principle implied, it can be no other than this, that the truths of arithmetic are applicable to the valuation of happiness, as of all other measurable quantities.

(Mr. Herbert Spencer in a private communication on the subject of the preceding note, objects to being considered an opponent of utilitarianism, and states that he regards happiness as the ultimate end of morality; but deems that end only partially attainable by empirical generalisations from the observed results of conduct, and completely attainable only by deducing, from the laws of life and the conditions of existence, what kinds of action necessarily tend to produce happiness, and what kinds to produce unhappiness. With the exception of the word "necessarily," I have no dissent to express from this doctrine; and (omitting that word) I am not aware that any modern advocate of utilitarianism is of a different opinion. Bentham, certainly, to whom in the *Social Statics* Mr. Spencer particularly referred, is, least of all writers, chargeable with unwillingness to deduce the effect of actions on happiness from the laws of human nature and the universal conditions of human life. The common charge against him is of relying too exclusively upon such deductions, and declining altogether to be bound by the generalisations from specific experience which Mr. Spencer thinks that utilitarians generally confine themselves to. My own opinion (and, as I collect, Mr. Spencer's) is, that in ethics, as in all other branches of scientific study, the consilience of the results of both these processes, each corroborating and verifying the other, is requisite to give to any general proposition the kind and degree of evidence which constitutes scientific proof.)

happiness in the estimation of the moralist and of the legislator, involves an equal claim to all the means of happiness, except in so far as the inevitable conditions of human life, and the general interest, in which that of every individual is included, set limits to the maxim; and those limits ought to be strictly construed. As every other maxim of justice, so this is by no means applied or held applicable universally; on the contrary, as I have already remarked, it bends to every person's ideas of social expediency. But in whatever case it is deemed applicable at all, it is held to be the dictate of justice. All persons are deemed to have a *right* to equality of treatment, except when some recognised social expediency requires the reverse. And hence all social inequalities which have ceased to be considered expedient, assume the character not of simple inexpediency, but of injustice, and appear so tyrannical, that people are apt to wonder how they ever could have been tolerated; forgetful that they themselves perhaps tolerate other inequalities under an equally mistaken notion of expediency, the correction of which would make that which they approve seem quite as monstrous as what they have at last learnt to condemn. The entire history of social improvement has been a series of transitions, by which one custom or institution after another, from being a supposed primary necessity of social existence, has passed into the rank of a universally stigmatised injustice and tyranny. So it has been with the distinctions of slaves and freemen, nobles and serfs, patricians and plebeians; and so it will be, and in part already is, with the aristocracies of colour, race, and sex.

It appears from what has been said, that justice is a name for certain moral requirements, which, regarded collectively, stand higher in the scale of social utility, and are therefore of more paramount obligation, than any others; though particular cases may occur in which some other social duty is so important, as to overrule any one of the general maxims of justice. Thus, to save a life, it may not only be allowable, but a duty, to steal, or take by force, the necessary food or medicine, or to kidnap, and compel to officiate, the only qualified medical practitioner. In such cases, as we do not call anything justice which is not a virtue, we usually say, not that justice must give way to some other moral principle, but that what is just in ordinary cases is, by reason of that other principle, not just in the particular case. By this useful accommodation of language, the character of indefeasibility attributed to justice is kept up, and we are saved from the necessity of maintaining that there can be laudable injustice.

The considerations which have now been adduced resolve, I conceive, the only real difficulty in the utilitarian theory of morals. It has always been evident that all cases of justice are also cases of expediency: the difference is in the peculiar sentiment which attaches to the former, as contradistinguished from the latter. If this characteristic sentiment has been sufficiently accounted for; if there is no necessity to assume for it any peculiarity of origin; if it is simply the natural feeling of resentment, moralised by being made coextensive with the demands of social good; and if this feeling not only does but ought to exist in all the classes of cases to which the idea of justice corresponds; that idea no longer presents itself as a stumbling-block to the utilitarian ethics. Justice remains the appropriate name for certain social utilities which are vastly more important, and therefore more absolute and imperative, than any others are as a class (though not more so than others may be in particular cases); and which, therefore, ought to be, as well as naturally are, guarded by a sentiment not only different in degree, but also in kind; distinguished from the milder feeling which attaches to the mere idea of promoting human pleasure or convenience, at once by the more definite nature of its commands, and by the sterner character of its sanctions.

SØREN KIERKEGAARD

1813–1855

Søren Aabye Kierkegaard was born in Copenhagen, Denmark, the youngest child of middle-aged parents. His father, Michael, had been an impoverished serf in a bleak area of northern Denmark. While still a boy, Michael had cursed God for the dreariness of his life and from that point on considered himself and his descendants to be under God's condemnation. The external events of Michael's life gave little indication of such a curse, however, as he worked his way to great wealth as a merchant in Copenhagen. Following the death of his first wife, and before the period of mourning was over, Michael was forced to marry his first wife's maid, Anne Lund, and five months later she bore the first of their five children.

Michael was already 56 and retired from business when Søren was born in 1813. Like James Mill, Michael educated Søren at home and also put his son through rigorous intellectual endeavors. But unlike his predecessor, Michael also communicated to his son a strong religious sentiment and deep, though perhaps warped, emotional feelings. Michael often took Søren on "trips of fantasy" while conversing in the family library.

In 1830, at his father's urging, Kierkegaard entered the University of Copenhagen to study theology. While there, he encountered the work of Hegel and reacted strongly against it. Kierkegaard objected to the implicit optimism and the "swallowing up" of contradictions in Hegel's dialectic. But more important, Kierkegaard claimed that even though Hegel's "System" was an impressive philosophical *tour de force*, it did not relate to the lived existence of the individual—it did not give any guidance as to what a person should *do*. A famous entry from Kierkegaard's journal at this time is worth quoting at length:

What I really lack is to be clear in my mind *what I am to do*, not what I am to know, except in so far as a certain understanding must precede every action. The thing is to understand myself, to see what God really wishes *me* to do; the thing is to find a truth which is true *for me*, to find *the idea for which I can live and die*. What would be the use of discovering so-called objective truth, of working through all the systems of philosophy and of being able, if required, to review them all and show up the inconsistencies within each system;—what good would it do me to be able to develop a theory of the state and combine all the details into a single whole, and so construct a world in which I did not live, but only held up to the view of others;—what good would it do me to be able to explain the meaning of Christianity if it had *no* deeper significance *for me and for my life*;—what good would it do me if truth stood before me, cold and naked, not caring whether I recognised her or not, and producing in me a shudder of fear rather than a trusting devotion? I certainly do not deny that I still recognise an *imperative of understanding* and that through it one can work upon men, *but it must be taken up into my life*, and that is what I now recognise as the most important thing.*

Kierkegaard did not find the answer for “what to do” in his studies in theology and soon began living what he would later call an “aesthetic” life as a rich merchant’s son. He spent large sums of money on food, drink, and clothing. He frequented parties and appeared to be having a great time. But hedonistic indulgence did not really give an answer for “what to do” either, and he plunged into despair. Another entry from his journals makes this clear:

I have just returned from a party of which I was the life and soul; wit poured from my lips, everyone laughed and admired me—but I went away—and the dash should be as long as the earth’s orbit —

and wanted to shoot myself.**

On his son’s 25th birthday, May 15, 1838, Michael revealed to Søren his own sexual sins as well as his understanding of God’s condemnation of their family. Four days later, Søren Kierkegaard underwent a religious conversion and was reconciled to his father, who died shortly afterward. Kierkegaard now had an answer for “what to do”—he would live as a penitent seeking to “become a Christian.” Kierkegaard finished his theological studies, prepared to become a Lutheran pastor, and became engaged to marry 17-year-old Regine Olsen.

But by 1841, Kierkegaard realized that he could never live the life of a Lutheran pastor and devoted husband. He came to believe that the Danish Lutheran church had made religion a matter of intellectual assent to certain objective truths and no longer deserved to be called “Christian.” For the rest of his life, Kierkegaard opposed institutional Christianity. The decision to break his engagement to Regine Olsen was a torturous one, but one he believed he had to make. He decided that a “divine veto” had been cast against this marriage, that his role as penitent was incompatible with that of husband.

*Søren Kierkegaard, *The Journals of Søren Kierkegaard*, edited and translated by Alexander Dru (London: Oxford University Press, 1938), p. 15 [entry from August 1, 1835].

***Ibid.*, p. 27 [entry from early spring, 1836].

Kierkegaard spent the rest of his short life as a writer, publishing a number of books including *Either/Or* (1843), *Fear and Trembling* (1843), *Philosophical Fragments* (1844), *Stages on Life's Way* (1845), *Concluding Unscientific Postscript* (1846), *The Sickness unto Death* (1849), *Training in Christianity* (1850), and *The Attack upon "Christendom"* (1854–1855). All but the last of these works were written under various pseudonyms, and virtually all of them included attacks on the prevailing Hegelian philosophy of his time. In 1855, while returning from the bank with the last of his considerable inheritance, Kierkegaard collapsed on the street and died soon thereafter.

* * *

Kierkegaard's biography is reflected in his philosophical quest to establish what it means to be an individual. In works such as *Either/Or*, *Stages on Life's Way*, and *Fear and Trembling*, he describes a process of self-actualization through three stages in life: the aesthetic, the ethical, and the religious. At the aesthetic stage, an individual's life centers on either hedonistic pleasure or abstract philosophical speculation. The hedonist lives for the immediate pleasures of the moment without concern for the future. The abstract intellectual (Hegel being the prime example) lives in a theoretical world removed from concrete existence. The hedonist reduces existence to immediate pleasure, whereas the abstract speculator reduces existence to thought; but in both cases, the aesthete has avoided the either/or decisions of real life, and authentic selfhood has not been achieved. The result, says Kierkegaard, is a life of boredom—and the pointless pursuit of diversions to alleviate such boredom. This was the life Kierkegaard himself lived in his early years at the university.

Those who move beyond the aesthetic to the ethical level choose to accept moral standards and attempt to do their duty. By choosing decisively and accepting responsibility for that choice, an individual's life becomes centralized and unified. For example, the seducing man operates on the aesthetic level where every woman he meets is merely a general source of momentary pleasure. He has no past, no future, only the present desire for fulfillment. He is not really a complete person because he is living life as a series of disconnected "nows." On the other hand, the man who has chosen to fulfill the duties of a faithful husband operates on the ethical level. He has a memory of the past and a hope for the future based on his commitments, which give an integrated wholeness to his present.

But even though universal moral standards can become personal when chosen by an individual, the ethical stage is not sufficient to bring a person to complete self-actualization. The ethical stage leads to a point at which one realizes that one cannot entirely fulfill the moral law, that one is sinful in the presence of God. Only in the religious stage, where one "leaps" to passionate commitment to God, is one totally free from meaninglessness and dread. In the religious stage, a person must be willing to give up everything—even abstract ethical universals—to God. In the selection reprinted here from *Fear and Trembling*, in the Howard and Edna Hong translation, Kierkegaard illustrates this movement from the ethical to the religious stage by contrasting the stories of Agamemnon and Abraham. Although both were called upon by a divinity to sacrifice a child, Agamemnon's sacrifice would serve a higher ethical purpose whereas Abraham's would not. In fact, Abraham was in the odd position of being *tempted* to do the ethical: to not murder/sacrifice Isaac.

Yet Abraham had faith in God, rather than Agamemnon's resignation to the gods, and continued to believe that God would return his son to him. Abraham performed a "teleological [i.e., considering the end or goal] suspension of the ethical," giving up what was most dear to him, and by virtue of the absurd, God gave it all back. It is interesting to note that Kierkegaard wrote this work right after he had given up to God what was most dear to him: Regine Olsen. Apparently believing that God would give her back to him, Kierkegaard was shocked when she became engaged to another man.

In the selection from *Concluding Unscientific Postscript*, reprinted here in the Howard and Edna Hong translation, Kierkegaard argues that whereas a logical system is possible, an existential system is not. Hegel's entire systematic enterprise is misguided because it assumes a finality that lived existence never has. When it comes to the important issues of life, such as knowledge of God, no system, no set of objective truths will give any real guidance. According to Kierkegaard, only subjective truth, "An objective uncertainty, held fast through appropriation with the most passionate inwardness," can be the truth for an existing person. Whereas one can never have objective certainty that God exists, one can make it true in one's own life by committing oneself completely and living as if it were true.

Written in Danish and presenting a pessimistic view of objective reason that was out of touch with the spirit of his time, it is not surprising that Kierkegaard's works were ignored for decades. The horror of World War I, together with the work done by Martin Heidegger in philosophy and Karl Barth in theology, brought Kierkegaard's pessimistic assessment of objectivism to prominence. Today Kierkegaard is acknowledged as the "father of existentialism" and is studied widely.

FEAR AND TREMBLING (in part)

IS THERE A TELEOLOGICAL SUSPENSION OF THE ETHICAL?

The ethical as such is the universal, and as the universal it applies to everyone, which from another angle means that it applies at all times. It rests immanent in itself, has nothing outside itself that is its *(telos)* [end, purpose] but is itself the *(telos)* for everything outside itself, and when the ethical has absorbed this into itself, it goes not further. The single individual, sensately and psychically qualified in immediacy, is the individual who has his *(telos)* in the universal, and it is his ethical task continually to express himself in this, to annul his singularity in order to become the universal. As soon as the single individual asserts himself in his singularity before the universal, he sins, and only by acknowledging this can he be reconciled again with the universal. Every time the single

individual, after having entered the universal, feels an impulse to assert himself as the single individual, he is in a spiritual trial [*Anfægtelse*], from which he can work himself only by repentantly surrendering as the single individual in the universal. If this is the highest that can be said of man and his existence, then the ethical is of the same nature as a person's eternal salvation, which is his *(telos)* forevermore and at all times, since it would be a contradiction for this to be capable of being surrendered (that is, teleologically suspended), because as soon as this is suspended it is relinquished, whereas that which is suspended is not relinquished but is preserved in the higher, which is its *(telos)*.

If this is the case, then Hegel is right in "The Good and Conscience," where he qualifies man only as the individual and considers this qualification as a "moral form of evil" (see especially *The Philosophy of Right*), which must be annulled [*ophævet*] in the teleology of the moral in such a way that the single individual who remains in that stage either sins or is immersed in spiritual trial. But Hegel is wrong in speaking about faith; he is wrong in not protesting loudly and clearly against Abraham's enjoying honor and glory as a father of faith when he ought to be sent back to a lower court and shown up as a murderer.

Faith is namely this paradox that the single individual is higher than the universal—yet, please note, in such a way that the movement repeats itself, so that after having been in the universal he as the single individual isolates himself as higher than the universal. If this is not faith, then Abraham is lost, then faith has never existed in the world precisely because it has always existed. For if the ethical—that is, social morality—is the highest and if there is in a person no residual incommensurability in some way such that this incommensurability is not evil (i.e., the single individual, who is to be expressed in the universal), then no categories are needed other than what Greek philosophy had or what can be deduced from them by consistent thought. Hegel should not have concealed this, for, after all, he had studied Greek philosophy.

People who are profoundly lacking in learning and are given to clichés are frequently heard to say that a light shines over the Christian world, whereas a darkness enshrouds paganism. This kind of talk has always struck me as strange, inasmuch as every more thorough thinker, every more earnest artist still regenerates himself in the eternal youth of the Greeks. The explanation for such a statement is that one does not know what one should say but only that one must say something. It is quite right to say that paganism did not have faith, but if something is supposed to have been said thereby, then one must have a clearer understanding of what faith is, for otherwise one falls into such clichés. It is easy to explain all existence, faith along with it, without having a conception of what faith is, and the one who counts on being admired for such an explanation is not such a bad calculator, for it is as Boileau says: *Un sot trouve toujours un plus sot, qui l'admire* [One fool always finds a bigger fool, who admires him].

Faith is precisely the paradox that the single individual as the single individual is higher than the universal, is justified before it, not as inferior to it but as superior—yet in such a way, please note, that it is the single individual who, after being subordinate as the single individual to the universal, now by means of the universal becomes the single individual who as the single individual is superior, that the single individual as the single individual stands in an absolute relation to the absolute. This position cannot be mediated, for all mediation takes place only by virtue of the universal; it is and remains for all eternity a paradox, impervious to thought. And yet faith is this paradox, or else (and I ask the reader to bear these consequences *in mente* [in mind] even though it would be too prolix for me to write them all down) or else faith has never existed simply because it has always existed, or else Abraham is lost.

Wanderer Above the Mist. 1817–1818, by Caspar David Friedrich (1774–1840). "Faith is precisely the paradox that the single individual as the single individual is higher than the universal. . . . This position cannot be mediated . . . it is and remains for all eternity a paradox, impervious to thought." Kierkegaard, *Fear and Trembling*. (©Foto Marburg/Art Resource, NY)

It is certainly true that the single individual can easily confuse this paradox with spiritual trial [*Anfægtelse*], but it ought not to be concealed for that reason. It is certainly true that many persons may be so constituted that they are repulsed by it, but faith ought not therefore to be made into something else to enable one to have it, but one ought rather to admit to not having it, while those who have faith ought to be prepared to set forth some characteristics whereby the paradox can be distinguished from a spiritual trial.

The story of Abraham contains just such a teleological suspension of the ethical. There is no dearth of keen minds and careful scholars who have found analogies to it. What their wisdom amounts to is the beautiful proposition that basically everything is the same. If one looks more closely, I doubt very much that anyone in the whole wide world will find one single analogy, except for a later one, which proves nothing if it is certain that Abraham represents faith and that it is manifested normatively in him, whose life not only is the most paradoxical that can be thought but is also so paradoxical that it simply cannot be thought. He acts by virtue of the absurd, for it is precisely the absurd that he as the single individual is higher than the universal. This paradox

cannot be mediated, for as soon as Abraham begins to do so, he has to confess that he was in a spiritual trial, and if that is the case, he will never sacrifice Isaac, or if he did sacrifice Isaac, then in repentance he must come back to the universal. He gets Isaac back again by virtue of the absurd. Therefore, Abraham is at no time a tragic hero but is something entirely different, either a murderer or a man of faith. Abraham does not have the middle term that saves the tragic hero. This is why I can understand a tragic hero but cannot understand Abraham, even though in a certain demented sense I admire him more than all others.

In ethical terms, Abraham's relation to Isaac is quite simply this: the father shall love the son more than himself. But within its own confines the ethical has various gradations. We shall see whether this story contains any higher expression for the ethical that can ethically explain his behavior, can ethically justify his suspending the ethical obligation to the son, but without moving beyond the teleology of the ethical.

When an enterprise of concern to a whole nation is impeded, when such a project is halted by divine displeasure, when the angry deity sends a dead calm that mocks every effort, when the soothsayer carries out his sad task and announces that the deity demands a young girl as sacrifice—then the father must heroically bring this sacrifice. He must nobly conceal his agony, even though he could wish he were “the lowly man who dares to weep” and not the king who must behave in a kingly manner. Although the lonely agony penetrates his breast and there are only three persons in the whole nation who know his agony, soon the whole nation will be initiated into his agony and also into his deed, that for the welfare of all he will sacrifice her, his daughter, this lovely young girl. O bosom! O fair cheeks, flaxen hair (v. 687). And the daughter's tears will agitate him, and the father will turn away his face, but the hero must raise the knife. And when the news of it reaches the father's house, the beautiful Greek maidens will blush with enthusiasm, and if the daughter was engaged, her betrothed will not be angry but will be proud to share in the father's deed, for the girl belonged more tenderly to him than to the father.

When the valiant judge who in the hour of need saved Israel binds God and himself in one breath by the same promise, he will heroically transform the young maiden's jubilation, the beloved daughter's joy to sorrow, and all Israel will sorrow with her over her virginal youth. But every freeborn man will understand, every resolute woman will admire Jephthah, and every virgin in Israel will wish to behave as his daughter did, because what good would it be for Jephthah to win the victory by means of a promise if he did not keep it—would not the victory be taken away from the people again?

When a son forgets his duty, when the state entrusts the sword of judgment to the father, when the laws demand punishment from the father's hand, then the father must heroically forget that the guilty one is his son, he must nobly hide his agony, but no one in the nation, not even the son, will fail to admire the father, and every time the Roman laws are interpreted, it will be remembered that many interpreted them more learnedly but no one more magnificently than Brutus.

But if Agamemnon, while a favorable wind was taking the fleet under full sail to its destination, had dispatched that messenger who fetched Iphigenia to be sacrificed; if Jephthah, without being bound by any promise that decided the fate of the nation, had said to his daughter: Grieve now for two months over your brief youth, and then I will sacrifice you; if Brutus had had a righteous son and yet had summoned the lictors to put him to death—who would have understood them? If, on being asked why they did this, these three men had answered: It is an ordeal in which we are being tried [*forsøges*]¹—would they have been better understood?

When in the crucial moment Agamemnon, Jephthah, and Brutus heroically have overcome the agony, heroically have lost the beloved, and have only to complete the task externally, there will never be a noble soul in the world without tears of compassion for their agony, of admiration for their deed. But if in the crucial moment these three men were to append to the heroic courage with which they bore the agony the little phrase: But it will not happen anyway—who then would understand them? If they went on to explain: This we believe by virtue of the absurd—who would understand them any better, for who would not readily understand that it was absurd, but who would understand that one could then believe it?

The difference between the tragic hero and Abraham is very obvious. The tragic hero is still within the ethical. He allows an expression of the ethical to have its *(telos)* in a higher expression of the ethical; he scales down the ethical relation between father and son or daughter and father to a feeling that has its dialectic in its relation to the idea of moral conduct. Here there can be no question of a teleological suspension of the ethical itself.

Abraham's situation is different. By his act he transgressed the ethical altogether and had a higher *(telos)* outside it, in relation to which he suspended it. For I certainly would like to know how Abraham's act can be related to the universal, whether any point of contact between what Abraham did and the universal can be found other than that Abraham transgressed it. It is not to save a nation, not to uphold the idea of the state that Abraham does it; it is not to appease the angry gods. If it were a matter of the deity's being angry, then he was, after all, angry only with Abraham, and Abraham's act is totally unrelated to the universal, is a purely private endeavor. Therefore, while the tragic hero is great because of his moral virtue, Abraham is great because of a purely personal virtue. There is no higher expression for the ethical in Abraham's life than that the father shall love the son. The ethical in the sense of the moral is entirely beside the point. Insofar as the universal was present, it was cryptically in Isaac, hidden, so to speak, in Isaac's loins, and must cry out with Isaac's mouth: Do not do this, you are destroying everything.

Why, then, does Abraham do it? For God's sake and—the two are wholly identical—for his own sake. He does it for God's sake because God demands this proof of his faith; he does it for his own sake so that he can prove it. The unity of the two is altogether correctly expressed in the word already used to describe this relationship. It is an ordeal, a temptation. A temptation—but what does that mean? As a rule, what tempts a person is something that will hold him back from doing his duty, but here the temptation is the ethical itself, which would hold him back from doing God's will. But what is duty? Duty is simply the expression for God's will.

Here the necessity of a new category for the understanding of Abraham becomes apparent. Paganism does not know such a relationship to the divine. The tragic hero does not enter into any private relationship to the divine, but the ethical is the divine, and thus the paradox therein can be mediated in the universal.

Abraham cannot be mediated; in other words, he cannot speak. As soon as I speak, I express the universal, and if I do not do so, no one can understand me. As soon as Abraham wants to express himself in the universal, he must declare that his situation is a spiritual trial [*Anfægtelse*], for he has no higher expression of the universal that ranks above the universal he violates.

Therefore, although Abraham arouses my admiration, he also appalls me. The person who denies himself and sacrifices himself because of duty gives up the finite in order to grasp the infinite and is adequately assured; the tragic hero gives up the

certain for the even more certain, and the observer's eye views him with confidence. But the person who gives up the universal in order to grasp something even higher that is not the universal—what does he do? Is it possible that this can be anything other than a spiritual trial? And if it is possible, but the individual makes a mistake, what salvation is there for him? He suffers all the agony of the tragic hero, he shatters his joy in the world, he renounces everything, and perhaps at the same time he barricades himself from the sublime joy that was so precious to him that he would buy it at any price. The observer cannot understand him at all; neither can his eye rest upon him with confidence. Perhaps the believer's intention cannot be carried out at all, because it is inconceivable. Or if it could be done but the individual has misunderstood the deity—what salvation would there be for him? The tragic hero needs and demands tears, and where is the envious eye so arid that it could not weep with Agamemnon, but where is the soul so gone astray that it has the audacity to weep for Abraham? The tragic hero finishes his task at a specific moment in time, but as time passes he does what is no less significant: he visits the person encompassed by sorrow, who cannot breathe because of his anguished sighs, whose thoughts oppress him, heavy with tears. He appears to him, breaks the witchcraft of sorrow, loosens the bonds, evokes the tears, and the suffering one forgets his own sufferings in those of the tragic hero. One cannot weep over Abraham. One approaches him with a *horror religiosus*, as Israel approached Mount Sinai. What if he himself is distraught, what if he had made a mistake, this lonely man who climbs Mount Moriah, whose peak towers sky-high over the flatlands of Aulis, what if he is not a sleepwalker safely crossing the abyss while the one standing at the foot of the mountain looks up, shakes with anxiety, and then in his deference and horror does not even dare to call to him?—Thanks, once again thanks, to a man who, to a person overwhelmed by life's sorrows and left behind naked, reaches out the words, the leafage of language by which he can conceal his misery. Thanks to you, great Shakespeare, you who can say everything, everything, everything just as it is—and yet, why did you never articulate this torment? Did you perhaps reserve it for yourself, like the beloved's name that one cannot bear to have the world utter, for with his little secret that he cannot divulge the poet buys this power of the word to tell everybody else's dark secrets. A poet is not an apostle; he drives out devils only by the power of the devil.

But if the ethical is teleologically suspended in this manner, how does the single individual in whom it is suspended exist? He exists as the single individual in contrast to the universal. Does he sin, then, for from the point of view of the idea, this is the form of sin. Thus, even though the child does not sin, because it is not conscious of its existence as such, its existence, from the point of view of the idea, is nevertheless sin, and the ethical makes its claim upon it at all times. If it is denied that this form can be repeated in such a way that it is not sin, then judgment has fallen upon Abraham. How did Abraham exist? He had faith. This is the paradox by which he remains at the apex, the paradox that he cannot explain to anyone else, for the paradox is that he as the single individual places himself in an absolute relation to the absolute. Is he justified? Again, his justification is the paradoxical, for if he is, then he is justified not by virtue of being something universal but by virtue of being the single individual.

How does the single individual reassure himself that he is legitimate? It is a simple matter to level all existence to the idea of the state or the idea of a society. If this is done, it is also simple to mediate, for one never comes to the paradox that the single individual as the single individual is higher than the universal, something I can also express symbolically in a statement by Pythagoras to the effect that the odd number is more perfect than the even number. If occasionally there is any response at all these

days with regard to the paradox, it is likely to be: One judges it by the result. Aware that he is a paradox who cannot be understood, a hero who has become a *(skandalon)* [offense] to his age will shout confidently to his contemporaries: The result will indeed prove that I was justified. This cry is rarely heard in our age, inasmuch as it does not produce heroes—this is its defect—and it likewise has the advantage that it produces few caricatures. When in our age we hear these words: It will be judged by the result—then we know at once with whom we have the honor of speaking. Those who talk this way are a numerous type whom I shall designate under the common name of assistant professors. With security in life, they live in their thoughts: they have a *permanent* position and a *secure* future in a well-organized state. They have hundreds, yes, even thousands of years between them and the earthquakes of existence; they are not afraid that such things can be repeated, for then what would the police and the newspapers say? Their life task is to judge the great men, judge them according to the result. Such behavior toward greatness betrays a strange mixture of arrogance and wretchedness—arrogance because they feel called to pass judgment, wretchedness because they feel that their lives are in no way allied with the lives of the great. Anyone with even a smattering *erectioris ingenii* [of nobility of nature] never becomes an utterly cold and clammy worm, and when he approaches greatness, he is never devoid of the thought that since the creation of the world it has been customary for the result to come last and that if one is truly going to learn something from greatness one must be particularly aware of the beginning. If the one who is to act wants to judge himself by the result, he will never begin. Although the result may give joy to the entire world, it cannot help the hero, for he would not know the result until the whole thing was over, and he would not become a hero by that but by making a beginning.

Moreover, in its dialectic the result (insofar as it is finitude's response to the infinite question) is altogether incongruous with the hero's existence. Or should Abraham's receiving Isaac by a *marvel* be able to prove that Abraham was justified in relating himself as the single individual to the universal? If Abraham actually had sacrificed Isaac, would he therefore have been less justified?

But we are curious about the result, just as we are curious about the way a book turns out. We do not want to know anything about the anxiety, the distress, the paradox. We carry on an esthetic flirtation with the result. It arrives just as unexpectedly but also just as effortlessly as a prize in a lottery, and when we have heard the result, we have built ourselves up. And yet no manacled robber of churches is so despicable a criminal as the one who plunders holiness in this way, and not even Judas, who sold his Lord for thirty pieces of silver, is more contemptible than someone who peddles greatness in this way.

It is against my very being to speak inhumanly about greatness, to make it a dim and nebulous far-distant shape or to let it be great but devoid of the emergence of the humanness without which it ceases to be great, for it is not what happens to me that makes me great but what I do, and certainly there is no one who believes that someone became great by winning the big lottery prize. A person might have been born in lowly circumstances, but I would still require him not to be so inhuman toward himself that he could imagine the king's castle only at a distance and ambiguously dream of its greatness, and destroy it at the same time he elevates it because he elevated it so basely. I require him to be man enough to tread confidently and with dignity there as well. He must not be so inhuman that he insolently violates everything by barging right off the street into the king's hall—he loses more thereby than the king. On the contrary, he should find a joy in observing every bidding of propriety with a happy and confident enthusiasm, which is precisely what makes him a free spirit. This is merely a metaphor,

for that distinction is only a very imperfect expression of the distance of spirit. I require every person not to think so inhumanly of himself that he does not dare to enter those palaces where the memory of the chosen ones lives or even those where they themselves live. He is not to enter rudely and foist his affinity upon them. He is to be happy for every time he bows before them, but he is to be confident, free of spirit, and always more than a charwoman, for if he wants to be no more than that, he will never get in. And the very thing that is going to help him is the anxiety and distress in which the great were tried, for otherwise, if he has any backbone, they will only arouse his righteous envy. And anything that can be great only at a distance, that someone wants to make great with empty and hollow phrases—is destroyed by that very person.

Who was as great in the world as that favored woman, the mother of God, the Virgin Mary? And yet how do we speak of her? That she was the favored one among women does not make her great, and if it would not be so very odd for those who listen to be able to think just as inhumanly as those who speak, then every young girl might ask: Why am I not so favored? And if I had nothing else to say, I certainly would not dismiss such a question as stupid, because, viewed abstractly, *vis-à-vis* a favor, every person is just as entitled to it as the other. We leave out the distress, the anxiety, the paradox. My thoughts are as pure as anybody's, and he who can think this way surely has pure thoughts, and, if not, he can expect something horrible, for anyone who has once experienced these images cannot get rid of them again, and if he sins against them, they take a terrible revenge in a silent rage, which is more terrifying than the stridency of ten ravenous critics. To be sure, Mary bore the child wondrously, but she nevertheless did it "after the manner of women," and such a time is one of anxiety, distress, and paradox. The angel was indeed a ministering spirit, but he was not a meddling spirit who went to the other young maidens in Israel and said: Do not scorn Mary, the extraordinary is happening to her. The angel went only to Mary, and no one could understand her. Has any woman been as infringed upon as was Mary, and is it not true here also that the one whom God blesses he curses in the same breath? This is the spirit's view of Mary, and she is by no means—it is revolting to me to say it but even more so that people have inanely and unctuously made her out to be thus—she is by no means a lady idling in her finery and playing with a divine child. When, despite this, she said: Behold, I am the handmaid of the Lord—then she is great, and I believe it should not be difficult to explain why she became the mother of God. She needs worldly admiration as little as Abraham needs tears, for she was no heroine and he was no hero, but both of them became greater than these, not by being exempted in any way from the distress and the agony and the paradox, but became greater by means of these.

It is great when the poet in presenting his tragic hero for public admiration dares to say: Weep for him, for he deserves it. It is great to deserve the tears of those who deserve to shed tears. It is great that the poet dares to keep the crowd under restraint, dares to discipline men to examine themselves individually to see if they are worthy to weep for the hero, for the slop water of the snivellers is a debasement of the sacred.—But even greater than all this is the knight of faith's daring to say to the noble one who wants to weep for him: Do not weep for me, but weep for yourself.

We are touched, we look back to those beautiful times. Sweet sentimental longing leads us to the goal of our desire, to see Christ walking about in the promised land. We forget the anxiety, the distress, the paradox. Was it such a simple matter not to make a mistake? Was it not terrifying that this man walking around among the others was God? Was it not terrifying to sit down to eat with him? Was it such an easy matter to become an apostle? But the result, the eighteen centuries—that helps, that contributes to this

mean deception whereby we deceive ourselves and others. I do not feel brave enough to wish to be contemporary with events like that, but I do not for that reason severely condemn those who made a mistake, nor do I depreciate those who saw what was right.

But I come back to Abraham. During the time before the result, either Abraham was a murderer every minute or we stand before a paradox that is higher than all mediations.

The story of Abraham contains, then, a teleological suspension of the ethical. As the single individual he became higher than the universal. This is the paradox, which cannot be mediated. How he entered into it is just as inexplicable as how he remains in it. If this is not Abraham's situation, then Abraham is not even a tragic hero but a murderer. It is thoughtless to want to go on calling him the father of faith, to speak of it to men who have an interest only in words. A person can become a tragic hero through his own strength—but not the knight of faith. When a person walks what is in one sense the hard road of the tragic hero, there are many who can give him advice, but he who walks the narrow road of faith has no one to advise him—no one understands him. Faith is a marvel, and yet no human being is excluded from it; for that which unites all human life is passion, and faith is a passion.

CONCLUDING UNSCIENTIFIC POSTSCRIPT (in part)

SECTION II, CHAPTER 2: SUBJECTIVE TRUTH, INWARDNESS; TRUTH IS SUBJECTIVITY

* * *

*When the question about truth is asked objectively, truth is reflected upon objectively as an object to which the knower relates himself. What is reflected upon is not the relation but that what he relates himself to is the truth, the true. If only that to which he relates himself is the truth, the true, then the subject is in the truth. When the question about truth is asked subjectively, the individual's relation is reflected upon subjectively. If only the how of this relation is in truth, the individual is in truth, even if he in this way were to relate himself to untruth.**

*The reader will note that what is being discussed here is essential truth, or the truth that is related essentially to existence, and that it is specifically in order to clarify it as inwardness or as subjectivity that the contrast is pointed out.

Søren Kierkegaard, *Concluding Unscientific Postscript*, Section II, Chapter 2, "Subjective Truth, Inwardness; Truth is Subjectivity;" edited and translated by Howard V. Hong and Edna H. Hong (Princeton: Princeton University Press). Copyright © 1992 by Princeton University Press. Reprinted by permission of Princeton University Press.

Let us take the knowledge of God as an example. Objectively, what is reflected upon is that this is the true God; subjectively, that the individual relates himself to a something in *such a way* that his relation is in truth a God-relation. Now, on which side is the truth? Alas, must we not at this point resort to mediation and say: It is on neither side; it is in the mediation? Superbly stated, if only someone could say how an existing person goes about being in mediation, because to be in mediation is to be finished; to exist is to become. An existing person cannot be in two places at the same time, cannot be subject-object. When he is closest to being in two places at the same time, he is in passion; but passion is only momentary, and passion is the highest pitch of subjectivity.

The existing person who chooses the objective way now enters upon all approximating deliberation intended to bring forth God objectively, which is not achieved in all eternity, because God is a subject and hence only for subjectivity in inwardness. The existing person who chooses the subjective way instantly comprehends the whole dialectical difficulty because he must use some time, perhaps a long time, to find God objectively. He comprehends this dialectical difficulty in all its pain, because he must resort to God at that very moment, because every moment in which he does not have God is wasted.* At that very moment he has God, not by virtue of any objective deliberation but by virtue of the infinite passion of inwardness. The objective person is not bothered by dialectical difficulties such as what it means to put a whole research period into finding God, since it is indeed possible that the researcher would die tomorrow, and if he goes on living, he cannot very well regard God as something to be taken along at his convenience, since God is something one takes along a *tout prix* [at any price], which, in passion's understanding, is the true relationship of inwardness with God.

It is at this point, dialectically so very difficult, that the road swings off for the person who knows what it means to think dialectically and, existing, to think dialectically, which is quite different from sitting as a fantastical being at a desk and writing about something one has never done oneself, quite different from writing *de omnibus dubitandum* and then as an existing person being just as credulous as the most sensate human being. It is here that the road swings off, and the change is this: whereas objective knowledge goes along leisurely on the long road of approximation, itself not actuated by passion, to subjective knowledge every delay is a deadly peril and the decision so infinitely important that it is immediately urgent, as if the opportunity had already passed by unused.

Now, if the problem is to calculate where there is more truth (and, as stated, simultaneously to be on both sides equally is not granted to an existing person but is only a beatifying delusion for a deluded *I-I*), whether on the side of the person who only objectively seeks the true God and the approximating truth of the God-idea or on the side of the person who is infinitely concerned that he in truth relate himself to God with the infinite passion of need—then there can be no doubt about the answer for anyone who is not totally botched by scholarship and science. If someone who lives in the midst of Christianity enters, with knowledge of the true idea of God, the house of God, the house of the true God, and prays, but prays in untruth, and if someone lives in an idolatrous land but prays with all the passion of infinity, although his eyes are resting upon the image of an idol—where, then, is there more truth? The one prays in truth to

*In this way God is indeed a postulate, but not in the loose sense in which it is ordinarily taken. Instead, it becomes clear that this is the only way an existing person enters into a relationship with God: when the dialectical contradiction brings passion to despair and assists him in grasping God with "the category of despair" (faith), so that the postulate, far from being the arbitrary, is in fact *necessary* defense [*Nødværge*], self defense; in this way God is not a postulate, but the existing person's postulating of God is—a necessity [*Nødvendighed*].

God although he is worshiping an idol; the other prays in untruth to the true God and is therefore in truth worshiping an idol.

If someone objectively inquires into immortality, and someone else stakes the passion of the infinite on the uncertainty—where, then, is there more truth, and who has more certainty? The one has once and for all entered upon an approximation that never ends, because the certainty of immortality is rooted in subjectivity; the other is immortal and therefore struggles by contending with the uncertainty.

Let us consider Socrates. These days everyone is dabbling in a few proofs or demonstrations—one has many, another fewer. But Socrates! He poses the question objectively, problematically: if there is an immortality. So, compared with one of the modern thinkers with the three demonstrations, was he a doubter? Not at all. He stakes his whole life on this “if”; he dares to die, and with the passion of the infinite he has so ordered his whole life that it might be acceptable—if there is an immortality. Is there any better demonstration for the immortality of the soul? But those who have the three demonstrations do not order their lives accordingly. If there is an immortality, it must be nauseated by their way of living—is there any better counter-demonstration to the three demonstrations? The “fragment” of uncertainty helped Socrates, because he himself helped with the passion of infinity. The three demonstrations are of no benefit whatever to those others, because they are and remain slugs and, failing to demonstrate anything else, have demonstrated it by their three demonstrations.

In the same way a girl has perhaps possessed all the sweetness of being in love through a weak hope of being loved by the beloved, because she herself staked everything on this weak hope; on the other hand, many a wedded matron, who more than once has submitted to the strongest expression of erotic love, has certainly had demonstrations and yet, strangely enough, has not possessed *quod erat demonstrandum* [that which was to be demonstrated]. The Socratic ignorance was thus the expression, firmly maintained with all the passion of inwardness, of the relation of the eternal truth to an existing person, and therefore it must remain for him a paradox as long as he exists. Yet it is possible that in the Socratic ignorance there was more truth in Socrates than in the objective truth of the entire system that flirts with the demands of the times and adapts itself to assistant professors.

Objectively the emphasis is on what is said; subjectively the emphasis is on how it is said. This distinction applies even esthetically and is specifically expressed when we say that in the mouth of this or that person something that is truth can become untruth. Particular attention should be paid to this distinction in our day, for if one were to express in a single sentence the difference between ancient times and our time, one would no doubt have to say: In ancient times there were only a few individuals who knew the truth; now everyone knows it, but inwardness has an inverse relation to it. Viewed esthetically, the contradiction that emerges when truth becomes untruth in this and that person’s mouth is best interpreted comically. Ethically-religiously, the emphasis is again on: *how*. But this is not to be understood as manner, modulation of voice, oral delivery, etc., but it is to be understood as the relation of the existing person, in his very existence, to what is said. Objectively, the question is only about categories of thought; subjectively, about inwardness. At its maximum, this “how” is the passion of the infinite, and the passion of the infinite is the very truth. But the passion of the infinite is precisely subjectivity, and thus subjectivity is truth. From the objective point of view, there is no infinite decision, and thus it is objectively correct that the distinction between good and evil is canceled, along with the principle of contradiction, and thereby also the infinite distinction between truth and falsehood. Only in subjectivity is there decision, whereas wanting to become objective is untruth. The passion of the

infinite, not its content, is the deciding factor, for its content is precisely itself. In this way the subjective “how” and subjectivity are the truth.

But precisely because the subject is existing, the “how” that is subjectively emphasized is dialectical also with regard to time. In the moment of the decision of passion, where the road swings off from objective knowledge, it looks as if the infinite decision were thereby finished. But at the same moment, the existing person is in the temporal realm, and the subjective “how” is transformed into a striving that is motivated and repeatedly refreshed by the decisive passion of the infinite, but it is nevertheless a striving.

When subjectivity is truth, the definition of truth must also contain in itself an expression of the antithesis to objectivity, a memento of that fork in the road, and this expression will at the same time indicate the resilience of the inwardness. Here is such a definition of truth: *An objective uncertainty, held fast through appropriation with the most passionate inwardness, is the truth*, the highest truth there is for an existing person. At the point where the road swings off (and where that is cannot be stated objectively, since it is precisely subjectivity), objective knowledge is suspended. Objectively he then has only uncertainty, but this is precisely what intensifies the infinite passion of inwardness, and truth is precisely the daring venture of choosing the objective uncertainty with the passion of the infinite. I observe nature in order to find God, and I do indeed see omnipotence and wisdom, but I also see much that troubles and disturbs. The *summa summarum* [sum total] of this is an objective uncertainty, but the inwardness is so very great, precisely because it grasps this objective uncertainty with all the passion of the infinite. In a mathematical proposition, for example, the objectivity is given, but therefore its truth is also an indifferent truth.

But the definition of truth stated above is a paraphrasing of faith. Without risk, no faith. Faith is the contradiction between the infinite passion of inwardness and the objective uncertainty. If I am able to apprehend God objectively, I do not have faith; but because I cannot do this, I must have faith. If I want to keep myself in faith, I must continually see to it that I hold fast the objective uncertainty, see to it that in the objective uncertainty I am “out on 70,000 fathoms of water” and still have faith.

The thesis that subjectivity, inwardness, is truth contains the Socratic wisdom, the undying merit of which is to have paid attention to the essential meaning of existing, of the knower’s being an existing person. That is why, in his ignorance, Socrates was in the truth in the highest sense within paganism. To comprehend this, that the misfortune of speculative thought is simply that it forgets again and again that the knower is an existing person, can already be rather difficult in our objective age. “But to go beyond Socrates when one has not even comprehended the Socratic—that, at least, is not Socratic.” See “The Moral” in *Fragments*.

Just as in *Fragments*, let us from this point try a category of thought that actually does go beyond. Whether it is true or false is of no concern to me, since I am only imaginatively constructing, but this much is required, that it be clear that the Socratic is presupposed in it, so that I at least do not end up behind Socrates again.

When subjectivity, inwardness, is truth, then truth, objectively defined, is a paradox; and that truth is objectively a paradox shows precisely that subjectivity is truth, since the objectivity does indeed thrust away, and the objectivity’s repulsion, or the expression for the objectivity’s repulsion, is the resilience and dynamometer of inwardness. The paradox is the objective uncertainty that is the expression for the passion of inwardness that is truth. So much for the Socratic. The eternal, essential truth, that is, the truth that is related essentially to the existing person by pertaining

essentially to what it means to exist (viewed Socratically, all other knowledge is accidental, its degree and scope indifferent), is a paradox. Nevertheless the eternal, essential truth is itself not at all a paradox, but it is a paradox by being related to an existing person. Socratic ignorance is an expression of the objective uncertainty; the inwardness of the existing person is truth. In anticipation of what will be discussed later, the following comment is made here: Socratic ignorance is an analogue to the category of the absurd, except that there is even less objective certainty in the repulsion exerted by the absurd, since there is only the certainty that it is absurd, and for that very reason there is infinitely greater resilience in the inwardness. The Socratic inwardness in existing is an analogue to faith, except that the inwardness of faith, corresponding not to the repulsion exerted by ignorance but to the repulsion exerted by the absurd, is infinitely deeper.

Viewed Socratically, the eternal essential truth is not at all paradoxical in itself, but only by being related to an existing person. This is expressed in another Socratic thesis: that all knowing is a recollecting. This thesis is an intimation of the beginning of speculative thought, but for that very reason Socrates did not pursue it; essentially it became Platonic. This is where the road swings off, and Socrates essentially emphasizes existing, whereas Plato, forgetting this, loses himself in speculative thought. Socrates' infinite merit is precisely that of being an *existing* thinker, not a speculative thinker who forgets what it means to exist. To Socrates, therefore, the thesis that all knowing is a recollecting has, at the moment of parting and as a continually annulled possibility of speculating, a double significance: (1) that the knower is essentially *integer* [uncorrupted] and that for him there is no other dubiousness with regard to knowledge of the eternal truth than this, that he exists, a dubiousness so essential and decisive to him that it signifies that existing, the inward deepening in and through existing, is truth; (2) that existence in temporality has no decisive significance, because there is continually the possibility of taking oneself back into eternity by recollecting, even though this possibility is continually annulled because the inward deepening in existing fills up time.*

*This may be the proper place to elucidate a dubiousness in the design of *Fragments*, a dubiousness that was due to my not wanting immediately to make the matter as dialectically difficult as it is, because in our day terminologies and the like are so muddled that it is almost impossible to safeguard oneself against confusion. In order, if possible, to elucidate properly the difference between the Socratic (which was supposed to be the philosophical, the pagan philosophical position) and the category of imaginatively constructed thought, which actually goes beyond the Socratic, I carried the Socratic back to the thesis that all knowing is a recollecting. It is commonly accepted as such, and only for the person who with a very special interest devotes himself to the Socratic, always returning to the sources, only for him will it be important to distinguish between Socrates and Plato on this point. The thesis certainly belongs to both of them, but Socrates continually parts with it because he wants to exist. By holding Socrates to the thesis that all knowing is recollecting, one turns him into a speculative philosopher instead of what he was, an existing thinker who understood existing as the essential. The thesis that all knowing is recollecting belongs to speculative thought, and recollecting is immanence, and from the point of view of speculation and the eternal there is no paradox. The difficulty, however, is that no human being is speculation, but the speculating person is an existing human being, subject to the claims of existence. To forget this is no merit, but to hold this fast is indeed a merit and that is precisely what Socrates did. To emphasize existence, which contains within it the qualification of inwardness, is the Socratic, whereas the Platonic is to pursue recollection and immanence. Basically Socrates is thereby beyond all speculation, because he does not have a fantastical beginning where the speculating person changes clothes and then goes on and on and speculates, forgetting the most important thing, to exist. But precisely because Socrates is in this way beyond speculative thought, he acquires, when rightly depicted, a certain analogous likeness to what the imaginary construction set forth as that which truly goes beyond the Socratic: the truth as paradox is an analog to the paradox *sensu eminentiori* [in the more eminent sense]; the passion of inwardness in existing is then an analog to faith *sensu eminentiori*. That the difference is infinite nevertheless, that the designations in *Fragments* of that which truly goes beyond the Socratic are unchanged,

The great merit of the Socratic was precisely to emphasize that the knower is an existing person and that to exist is the essential. To go beyond Socrates by failing to understand this is nothing but a mediocre merit. This we must keep *in mente* [in mind] and then see whether the formula cannot be changed in such a way that one actually does go beyond the Socratic.

So, then, subjectivity, inwardness, is truth. Is there a *more inward* expression for it? Yes, if the discussion about "Subjectivity, inwardness, is truth" begins in this way: "Subjectivity is untruth." But let us not be in a hurry. Speculative thought also says that subjectivity is untruth but says it in the very opposite direction, namely, that objectivity is truth. Speculative thought defines subjectivity negatively in the direction of objectivity. The other definition, however, puts barriers in its own way at the very moment it wants to begin, which makes the inwardness so much more inward. Viewed Socratically, subjectivity is untruth if it refuses to comprehend that subjectivity is truth but wants, for example, to be objective. Here, on the other hand, in wanting to begin to become truth by becoming subjective, subjectivity is in the predicament of being untruth. Thus the work goes backward, that is, backward in inwardness. The way is so far from being in the direction of the objective that the beginning only lies even deeper in subjectivity.

But the subject cannot be untruth eternally or be presupposed to have been untruth eternally; he must have become that in time or he becomes that in time. The Socratic paradox consisted in this, that the eternal truth was related to an existing person. But now existence has accentuated the existing person a second time; a change so essential has taken place in him that he in no way can take himself back into eternity by Socratically recollecting. To do this is to speculate; to be able to do this but, by grasping the inward deepening in existence, to annul the possibility of doing it is the Socratic. But now the difficulty is that what accompanied Socrates as an annulled possibility has become an impossibility. If speculating was already of dubious merit in connection with the Socratic, it is now only confusion.

The paradox emerges when the eternal truth and existing are placed together, but each time existing is accentuated, the paradox becomes clearer and clearer. Viewed Socratically, the knower was an existing person, but now the existing person is accentuated in such a way that existence has made an essential change in him.

Let us now call the individual's untruth *sin*. Viewed eternally, he cannot be in sin or be presupposed to have been eternally in sin. Therefore, by coming into existence (for the beginning was that subjectivity is untruth), he becomes a sinner. He is not born as a sinner in the sense that he is presupposed to be a sinner before he is born, but he is born in sin and as a sinner. Indeed, we could call this *hereditary sin*. But if existence has in this way obtained power over him, he is prevented from taking himself back into eternity through recollection. If it is already paradoxical that the eternal truth is related to an existing person, now it is absolutely paradoxical that it is related to such an existing person. But the more difficult it is made for him, recollecting, to

I can easily show, but I was afraid to make complications by promptly using what seem to be the same designations, at least the same words, about the different things when the imaginary construction was to be presented as different from these. Now, I think there would be no objection to speaking of the paradox in connection with Socrates and faith, since it is quite correct to do so, provided that it is understood correctly. Besides, the ancient Greeks also use the word (*pistis*) [Faith], although by no means in the sense of the imaginary construction, and use it so as to make possible some very illuminating observations bearing upon its dissimilarity to faith *sensu eminentiori*, especially with reference to one of Aristotle's works where the term is employed.

take himself out of existence, the more inward his existing can become in existence; and when it is made impossible for him, when he is lodged in existence in such a way that the back door of recollection is forever closed, then the inwardness becomes the deepest. But let us never forget that the Socratic merit was precisely to emphasize that the knower is existing, because the more difficult the matter becomes, the more one is tempted to rush along the easy road of speculative thought, away from terrors and decisions, to fame, honor, a life of ease, etc. If even Socrates comprehended the dubiousness of taking himself speculatively out of existence back into eternity, when there was no dubiousness for the existing person except that he existed and, of course, that existing was the essential—now it is impossible. He must go forward; to go backward is impossible.

Subjectivity is truth. The paradox came into existence through the relating of the eternal, essential truth to the existing person. Let us now go further; let us assume that the eternal, essential truth is itself the paradox. How does the paradox emerge? By placing the eternal, essential truth together with existing. Consequently, if we place it together in the truth itself, the truth becomes a paradox. The eternal truth has come into existence in time. That is the paradox. If the subject just mentioned was prevented by sin from taking himself back into eternity, now he is not to concern himself with this, because now the eternal, essential truth is not behind him but has come in front of him by existing itself or by having existed, so that if the individual, existing, does not lay hold of the truth in existence, he will never have it.

Existence can never be accentuated more sharply than it has been here. The fraud of speculative thought in wanting to recollect itself out of existence has been made impossible. This is the only point to be comprehended here, and every speculation that insists on being speculation shows *eo ipso* [precisely thereby] that it has not comprehended this. The individual can thrust all this away and resort to speculation, but to accept it and then want to cancel it through speculation is impossible, because it is specifically designed to prevent speculation.

When the eternal truth relates itself to an existing person, it becomes the paradox. Through the objective uncertainty and ignorance, the paradox thrusts away in the inwardness of the existing person. But since the paradox is not in itself the paradox, it does not thrust away intensely enough, for without risk, no faith; the more risk, the more faith; the more objective reliability, the less inwardness (since inwardness is subjectivity); the less objective reliability, the deeper is the possible inwardness. When the paradox itself is the paradox, it thrusts away by virtue of the absurd, and the corresponding passion of inwardness is faith.

But subjectivity, inwardness, is truth; if not, we have forgotten the Socratic merit. But when the retreat out of existence into eternity by way of recollection has been made impossible, then, with the truth facing one as the paradox, in the anxiety of sin and its pain, with the tremendous risk of objectivity, there is no stronger expression for inwardness than—to have faith. But without risk, no faith, not even the Socratic faith, to say nothing of the kind we are discussing here.

When Socrates believed that God is, he held fast the objective uncertainty with the entire passion of inwardness, and faith is precisely in this contradiction, in this risk. Now it is otherwise. Instead of the objective uncertainty, there is here the certainty that, viewed objectively, it is the absurd, and this absurdity, held fast in the passion of inwardness, is faith. Compared with the earnestness of the absurd, the Socratic ignorance is like a witty jest, and compared with the strenuousness of faith, the Socratic existential inwardness resembles Greek nonchalance.

What, then, is the absurd? The absurd is that the eternal truth has come into existence in time, that God has come into existence, has been born, has grown up, etc., has come into existence exactly as an individual human being, indistinguishable from any other human being, inasmuch as all immediate recognizability is pre-Socratic paganism and from the Jewish point of view is idolatry. Every qualification of that which actually goes beyond the Socratic must essentially have a mark of standing in relation to the god's having come into existence, because faith, *sensu strictissimo* [in the strictest sense], as explicated in *Fragments*, refers to coming into existence. When Socrates believed that God is [*er til*], he no doubt perceived that where the road swings off there is a road of objective approximation, for example, the observation of nature, world history, etc. His merit was precisely to shun this road, where the quantifying siren song spellbinds and tricks the existing person. In relation to the absurd, the objective approximation resembles the comedy *Misforstaaelse paa Misforstaaelse* [Misunderstanding upon Misunderstanding], which ordinarily is played by assistant professors and speculative thinkers.

It is by way of the objective repulsion that the absurd is the dynamometer of faith in inwardness. So, then, there is a man who wants to have faith; well, let the comedy begin. He wants to have faith, but he wants to assure himself with the aid of objective deliberation and approximation. What happens? With the aid of approximation, the absurd becomes something else; it becomes probable, it becomes more probable, it may become to a high-degree and exceedingly probable. Now he is all set to believe it, and he dares to say of himself that he does not believe as shoemakers and tailors and simple folk do, but only after long deliberation. Now he is all set to believe it, but, lo and behold, now it has indeed become impossible to believe it. The almost probable, the probable, the to-a-high-degree and exceedingly probable—that he can almost know, or as good as know, to a higher degree and exceedingly almost *know*—but *believe* it, that cannot be done, for the absurd is precisely the object of faith and only that can be believed.

Or there is a man who says he has faith, but now he wants to make his faith clear to himself; he wants to understand himself in his faith. Now the comedy begins again. The object of faith becomes almost probable, it becomes as good as probable, it becomes probable, it becomes to a high degree and exceedingly probable. He has finished; he dares to say of himself that he does not believe as shoemakers and tailors or other simple folk do but that he has also understood himself in his believing. What wondrous understanding! On the contrary, he has learned to know something different about faith than he believed and has learned to know that he no longer has faith, since he almost knows, as good as knows, to a high degree and exceedingly almost knows.

Inasmuch as the absurd contains the element of coming into existence, the road of approximation will also be that which confuses the absurd fact of coming into existence, which is the object of faith, with a simple historical fact, and then seeks historical certainty for that which is absurd precisely because it contains the contradiction that something that can become historical only in direct opposition to all human understanding has become historical. This contradiction is the absurd, which can only be believed. If a historical certainty is obtained, one obtains merely the certainty that what is certain is not what is the point in question. A witness can testify that he has believed it and then testify that, far from being a historical certainty, it is in direct opposition to his understanding, but such a witness repels in the same sense as the absurd repels, and a witness who does not repel in this way is *eo ipso* a deceiver or a man who is talking about something altogether different; and such a witness can be of no help except in

obtaining certainty about something altogether different. One hundred thousand individual witnesses, who by the special nature of their testimony (that they have believed the absurd) remain individual witnesses, do not become something else en masse so that the absurd becomes less absurd. Why? Because one hundred thousand people individually have believed that it was absurd? Quite the contrary, those one hundred thousand witnesses repel exactly as the absurd does.

But I do not need to develop this further here. In *Fragments* (especially where the difference between the follower at first hand and the follower at second hand is annulled) and in Part One of this book, I have with sufficient care shown that all approximation is futile, since the point is rather to do away with introductory observations, reliabilities, demonstrations from effects, and the whole mob of pawnbrokers and guarantors, in order to get the absurd clear—so that one can believe if one will—I merely say that this must be extremely strenuous.

If speculative thought wants to become involved in this and, as always, say: From the point of view of the eternal, the divine, the theocentric, there is no paradox—I shall not be able to decide whether the speculative thinker is right, because I am only a poor existing human being who neither eternally nor divinely nor theocentrically is able to observe the eternal but must be content with existing. This much, however, is certain, that with speculative thought everything goes backward, back past the Socratic, which at least comprehended that for an existing person existing is the essential; and much less has speculative thought taken the time to comprehend what it means to be *situated* in existence the way the existing person is in the imaginary construction.

The difference between the Socratic position and the position that goes beyond the Socratic is clear enough and is essentially the same as in *Fragments*, for in the latter nothing has changed, and in the former the matter has only been made somewhat more difficult, but nevertheless not more difficult than it is. It has also become somewhat more difficult because, whereas in *Fragments* I set forth the thought-category of the paradox only in an imaginary construction, here I have also latently made an attempt to make clear the necessity of the paradox, and even though the attempt is somewhat weak, it is still something different from speculatively canceling the paradox.

Christianity has itself proclaimed itself to be the eternal, essential truth that has come into existence in time; it has proclaimed itself as *the paradox* and has required the inwardness of faith with regard to what is an offense to the Jews, foolishness to the Greeks—and an absurdity to the understanding. It cannot be expressed more strongly that subjectivity is truth and that objectivity only thrusts away, precisely by virtue of the absurd, and it seems strange that Christianity should have come into the world in order to be explained, alas, as if it were itself puzzled about itself and therefore came into the world to seek out the wise man, the speculative thinker, who can aid with the explanation. It cannot be expressed more inwardly that subjectivity is truth than when subjectivity is at first untruth, and yet subjectivity is truth.

KARL MARX

1818–1883

It is hard to think of a more influential—or more controversial—nineteenth-century thinker than Karl Marx. Not content simply to develop a theory, Marx sought fundamental change in social, economic, and political structures. As he put it, “The philosophers have only *interpreted* the world in various ways; the point is, to *change it*.”

Marx was the third of nine children born to Heinrich and Henrietta Marx in the Rhineland town of Trier. His parents were of Jewish ancestry but had converted to Protestant Christianity to protect Heinrich’s job as a government lawyer. In 1835, Karl went to the University of Bonn to study law. Hardly the model student, he spent much of his time drinking or writing love letters to his childhood sweetheart and then fiancée, Jenny von Westphalen. At his father’s insistence, Marx transferred to the University of Berlin and began to focus on his studies. While there, he abandoned his legal training and began preparing for an academic career as a philosophy professor. He wrote a dissertation contrasting Democritus and Epicurus that was accepted by the University of Jena, and in 1841 Marx received his doctorate in philosophy.

But the leftist politics Marx had adopted while in Berlin made it impossible for him to obtain a university post, so in 1842 he took a position as editor of the *Rheinische Zeitung* (*Rhenish Gazette*), a liberal middle-class newspaper in Cologne. Marx was a successful editor—too successful for the government censors who suppressed the paper after an article by Marx on the poverty of the Mosel winemakers. Marx moved to Paris where he became co-editor of the new journal, the *Deutsch-Französische Jahrbücher* (*German-French Annals*). With his future seeming secure, Marx finally felt free to marry Jenny in 1843. But the *Jahrbücher* closed almost immediately and once again he was unemployed. Fortunately, at about the same

time, Marx received a sizable settlement from the shareholders of the *Rheinische Zeitung*, and he and his new bride were able to live comfortably. Freed from his editing duties, Marx wrote extensively on economic and political matters. He also met the man who was to be his lifelong friend, collaborator, and financial backer: Friedrich Engels (1820–1895). Engels came from a family of wealthy textile industrialists and was, himself, the manager of his family's Manchester, England, branch. Together Marx and Engels produced *The Holy Family* (1845), Marx's first published book, which criticized a number of their fellow leftists.

While pursuing his writing projects, Marx was politically active among German communists living in Paris—activity that led to his expulsion from France in 1845. Living for a time in Brussels, Marx produced *The German Ideology* (1846) and *The Poverty of Philosophy* (1847) while continuing his political involvement. In 1847, he attended the congress of the newly formed Communist League in London. He and Engels were commissioned to produce an easy-to-read pamphlet outlining the league's doctrines. The result was the immensely influential *Manifesto of the Communist Party* (1848).

Following another attempt at editing an opposition newspaper in Cologne—and another expulsion by the government—Marx eventually settled in London. The next two decades were a time of poverty and hardship for the Marx family due as much to financial mismanagement as to lack of income. (Marx reflected often on the irony of his extensive work on capital when he had so little talent for managing it personally.) Marx received some income as a correspondent for the *New York Tribune*; but for the rest of his life, his primary source of income was Engels's gifts. In London, Marx became a fixture in the reading room of the British Museum, where he pored over government records, histories, and the writings of other economists, gathering data to document his thought. There he wrote *Critique of Political Economy* (1859) and began his *magnum opus*, *Das Kapital* (*Capital*; 1867). He also continued his political involvement, becoming the leader of the International Working Men's Association. He worked with the International until factional strife, particularly conflict with the anarchist Mikhail Aleksandrovich Bakunin (1814–1876), led Marx to dismantle the organization in 1872.

It wasn't until Marx's final years that he managed to gain some financial stability and to live the life of a bourgeois Victorian gentleman. But these years also brought tragedy and hardship of a different kind. Marx developed boils over his entire body and used creosote, opium, and arsenic, among other remedies, in a futile attempt to effect a cure. His beloved Jenny died in 1881 and his eldest daughter two years later. Shortly thereafter, Marx himself developed bronchitis and also died in 1883.

* * *

While a student in Berlin, Marx was influenced by Hegelian philosophy. Hegel had understood *history* as a progressive actualization of the Absolute, but he was somewhat ambiguous about the future. One group of followers, the Old Hegelians, argued in a reactionary way that this progressive actualization was now complete and that Christianity was the Absolute Religion, Hegelianism the Absolute Philosophy, and Prussia the Absolute State. Another group, the Young Hegelians, led by Bruno Bauer (1809–1882), argued that the dialectical movement of history was continuing. To move to the next stage in this historical dialectic, they sought to expose the contradictions of the existing order.

Although Marx accepted Hegel's dialectical understanding of history, he became convinced that Hegel's philosophy (and that of the Young Hegelians) devalued humanity by its emphasis on the Absolute. Marx then drew on the materialism espoused in Ludwig Feuerbach's work, *The Essence of Christianity* (1841). Feuerbach had argued that Hegel's philosophy was nothing more than rationalized religion, asserting that humans were merely the "self-alienation," or loss of identity, of God. Instead, Feuerbach advocated an atheistic materialism that claimed that "God" was simply the self-alienation of humans. That is, all the divine characteristics were nothing more than idealized human characteristics objectified and projected onto an imagined deity.

Marx used Feuerbach's work to present his criticism of Hegel. Marx expressed appreciation for Hegel's dialectical understanding of the "self-creation of man as a process" and pointed out that Hegel conceives of "objective man" as the result of "his own labor." But Hegel understood labor as being "abstract mental" labor, not the natural, embodied interaction with real objects that concerned Marx. On the other hand, although he appreciated Feuerbach's materialism, Marx held that his predecessor did not tie his criticism to historical development. "As far as Feuerbach is a materialist he does not deal with history, and as far as he considers history he is not a materialist," wrote Marx. Synthesizing the historical development of Hegel and the materialism of Feuerbach, Marx's theory has often been called "dialectical materialism" (though Marx himself did not use that term).

Marx also adapted Feuerbach's concept of alienation, applying it to political, social, and economic interactions. In the section on "Alienated Labor" from the *Economic and Philosophic Manuscripts of 1844* (given here in the Loyd D. Easton and Kurt H. Guddat translation), Marx explains how a capitalist system results in alienation for the worker. The worker's labor is alien to the worker because it belongs to the capitalist. In return for the worker's labor, the capitalist pays the worker a wage—a wage that competition keeps at a subsistence level. Yet the worker must continue to labor in order to survive. This means the worker is now self-alienated since the life activity, the essence of the worker, becomes "only a means for his existence." But alienation is not limited to individuals. Because they have different interests, workers, as an economic class, are alienated from those who own the means of production. This, in turn, gives rise to class struggle because the interests of one class are always in opposition to the interests of other economic classes. Only by having communal ownership of the means of production, that is, by abolishing private property, will such conflict be overcome. Only then will those who work control both the process and the product of their labor. The selection from *Manifesto of the Communist Party*, co-authored by Friedrich Engels and given here in the Samuel Moore translation, calls on the workers of the world to bring about such a revolutionary change in the modes of production.

Throughout his analysis of the human situation, Marx continually returned to these material forces of production, distribution, exchange, and consumption. In the preface to *A Contribution to the Critique of Political Economy*, reprinted here in the N.I. Stone translation, Marx explains how the real foundations of society are the productive forces and the relations of production. His brief overview of these forces serves as a helpful introduction to his method and program.

Marx's thought, particularly his economic theory, has faced harsh criticism since he first formulated his ideas. One recurring criticism is that Marx's theory fails to acknowledge basic human nature. Marx's nemesis within the International, Mikhail Bakunin, was one of the first to raise this objection in his book *Statehood*

and *Anarchy*. Our final selection from Marx presents a portion of Bakunin's criticism, along with Marx's response.

* * *

Isaiah Berlin's *Karl Marx: His Life and Environment* (1963; reprinted Oxford: Oxford University Press, 1996) is still considered by many to be the best general introduction to Marx's life and philosophy, whereas more recent studies include David McLellan, *Karl Marx: His Life and Thought* (New York: Harper & Row, 1973); David McLellan, *Karl Marx* (New York: Penguin Books, 1975); Peter Singer, *Marx* (Oxford: Oxford University Press, 1980); Allen W. Wood, *Karl Marx* (London: Routledge & Kegan Paul, 1981); Jon Elster, *An Introduction to Karl Marx* (Cambridge: Cambridge University Press, 1986); and Terry Eagleton, *Marx* (London: Routledge, 1999). The following are samples of the many more recent studies in particular areas of Marx's thought: Nicholas Lash, *A Matter of Hope: A Theologian's Reflections on the Thought of Karl Marx* (Notre Dame, IN: University of Notre Dame Press, 1982); Nancy Sue Love, *Marx, Nietzsche, and Modernity* (New York: Columbia University Press, 1986); Harold Mah, *The End of Philosophy, The Origin of "Ideology": Karl Marx and the Crisis of the Young Hegelians* (Berkeley: University of California Press, 1987); Robert Meister, *Political Identity: Thinking Through Marx* (Cambridge, MA: Basil Blackwell, 1990); and G.A. Cohen, *Karl Marx's Theory of History: A Defense* (Princeton, NJ: Princeton University Press, 2000). For the complete text of Bakunin's criticism, see *Bakunin on Anarchy: Selected Works by the Activist-Founder of World Anarchism*, edited and translated by Sam Dolgoff (New York: Knopf, 1972). For collections of critical essays, see Tom Bottomore, ed., *Modern Interpretations of Marx* (Oxford: Basil Blackwell, 1981); David McLellan, ed., *Marx: The First Hundred Years* (New York: St. Martin's Press, 1983); Terence Ball and James Farr, eds., *After Marx* (Cambridge: Cambridge University Press, 1984); Terrell Carver, ed., *The Cambridge Companion to Marx* (Cambridge: Cambridge University Press, 1991); and Scott Meikle, ed., *Marx* (New York: Ashgate, 2001).

ECONOMIC AND PHILOSOPHIC MANUSCRIPTS OF 1844 (in part)

ALIENATED LABOR

We have proceeded from the presuppositions of political economy. We have accepted its language and its laws. We presupposed private property, the separation of labor, capital and land, hence of wages, profit of capital and rent, likewise the division of labor, competition, the concept of exchange value, etc. From political economy itself, in its own words, we have shown that the worker sinks to the level of a commodity, the most

Karl Marx, "Economic and Philosophic Manuscripts (1844)," translated by Lloyd D. Easton and KJurt H. Guddat, from Allen W. Wood, ed., *Marx: Selections* (New York: Macmillan, 1988).

miserable commodity; that the misery of the worker is inversely proportional to the power and volume of his production; that the necessary result of competition is the accumulation of capital in a few hands and thus the revival of monopoly in a more frightful form; and finally that the distinction between capitalist and landowner, between agricultural laborer and industrial worker, disappears and the whole society must divide into the two classes of *proprietors* and *propertyless* workers.

Political economy proceeds from the fact of private property. It does not explain private property. It grasps the actual, *material* process of private property in abstract and general formulae which it then takes as *laws*. It does not *comprehend* these laws, that is, does not prove them as proceeding from the nature of private property. Political economy does not disclose the reason for the division between capital and labor, between capital and land. When, for example, the relation of wages to profits is determined, the ultimate basis is taken to be the interest of the capitalists; that is, political economy assumes what it should develop. Similarly, competition is referred to at every point and explained from external circumstances. Political economy teaches us nothing about the extent to which these external, apparently accidental circumstances are simply the expression of a necessary development. We have seen how political economy regards exchange itself as an accidental fact. The only wheels which political economy puts in motion are *greed* and the *war among the greedy, competition*.

Just because political economy does not grasp the interconnections within the movement, the doctrine of competition could stand opposed to the doctrine of monopoly, the doctrine of freedom of craft to that of the guild, the doctrine of the division of landed property to that of the great estate. Competition, freedom of craft, and division of landed property were developed and conceived only as accidental, deliberate, forced consequences of monopoly, the guild, and feudal property, rather than necessary, inevitable, natural consequences.

We now have to grasp the essential connection among private property, greed, division of labor, capital and landownership, and the connection of exchange with competition, of value with the devaluation of men, of monopoly with competition, etc., and of this whole alienation with the *money-system*.

Let us not put ourselves in a fictitious primordial state like a political economist trying to clarify things. Such a primordial state clarifies nothing. It merely pushes the issue into a gray, misty distance. It acknowledges as a fact or event what it should deduce, namely, the necessary relation between two things for example, between division of labor and exchange. In such a manner theology explains the origin of evil by the fall of man. That is, it asserts as a fact in the form of history what it should explain.

We proceed from a *present* fact of political economy.

The worker becomes poorer the more wealth he produces, the more his production increases in power and extent. The worker becomes a cheaper commodity the more commodities he produces. The *increase in value* of the world of things is directly proportional to the *decrease in value* of the human world. Labor not only produces commodities. It also produces itself and the worker as a *commodity*, and indeed in the same proportion as it produces commodities in general.

This fact simply indicates that the object which labor produces, its product, stands opposed to it as an *alien thing*, as a *power independent* of the producer. The product of labor is labor embodied and made objective in a thing. It is the *objectification* of labor. The realization of labor is its objectification. In the viewpoint of political economy this realization of labor appears as the *diminution* of the worker, the objectification as the *loss of and subservience to the object*, and the appropriation as *alienation* [*Entfremdung*], as externalization [*Entäusserung*].

So much does the realization of labor appear as diminution that the worker is diminished to the point of starvation. So much does objectification appear as loss of the object that the worker is robbed of the most essential objects not only of life but also of work. Indeed, work itself becomes a thing of which he can take possession only with the greatest effort and with the most unpredictable interruptions. So much does the appropriation of the object appear as alienation that the more objects the worker produces, the fewer he can own and the more he falls under the domination of his product, of capital.

All these consequences follow from the fact that the worker is related to the *product of his labor* as to an *alien* object. For it is clear according to this premise: The more the worker exerts himself, the more powerful becomes the alien objective world which he fashions against himself, the poorer he and his inner world become, the less there is that belongs to him. It is the same in religion. The more man attributes to God, the less he retains in himself. The worker puts his life into the object; then it no longer belongs to him but to the object. The greater this activity, the poorer is the worker. What the product of his work is, he is not. The greater this product is, the smaller he is himself. The *externalization* of the worker in his product means not only that his work becomes an object, an *external* existence, but also that it exists *outside him* independently, alien, an autonomous power, opposed to him. The life he has given to the object confronts him as hostile and alien.

Let us now consider more closely the *objectification*, the worker's production and with it the *alienation* and *loss* of the object, his product.

The worker can make nothing without *nature*, without the *sensuous external world*. It is the material wherein his labor realizes itself, wherein it is active, out of which and by means of which it produces.

But as nature furnishes to labor the *means of life* in the sense that labor cannot *live* without objects upon which labor is exercised, nature also furnishes the *means of life* in the narrower sense, namely, the means of physical subsistence of the worker himself.

The more the worker *appropriates* the external world and sensuous nature through his labor, the more he deprives himself of the *means of life* in two respects: first, that the sensuous external world gradually ceases to be an object belonging to his labor, a *means of life* of his work; secondly, that it gradually ceases to be a *means of life* in the immediate sense, a means of physical subsistence of the worker.

In these two respects, therefore, the worker becomes a slave to his objects; first, in that he receives an *object of labor*; that is, he receives *labor*, and secondly that he receives the *means of subsistence*. The first enables him to exist as a *worker* and the second as a *physical subject*. The terminus of this slavery is that he can only maintain himself as a *physical subject* so far as he is a *worker*; and only as a *physical subject* is he a worker.

(The alienation of the worker in his object is expressed according to the laws of political economy as follows: the more the worker produces, the less he has to consume; the more values he creates the more worthless and unworthy he becomes; the better shaped his product, the more misshapen is he; the more civilized his product, the more barbaric is the worker; the more powerful the work, the more powerless becomes the worker; the more intelligence the work has, the more witless is the worker and the more he becomes a slave of nature.)

Political economy conceals the alienation in the nature of labor by ignoring the direct relationship between the worker (labor) and production. To be sure, labor produces marvels for the wealthy but it produces deprivation for the worker. It produces palaces, but hovels for the worker. It produces beauty, but mutilation for the worker. It displaces labor through machines, but it throws some workers back into barbarous

labor and turns others into machines. It produces intelligence, but for the worker it produces imbecility and cretinism.

The direct relationship of labor to its products is the relationship of the worker to the objects of his production. The relationship of the rich to the objects of production and to production itself is only a *consequence* of this first relationship and confirms it. Later we shall observe the latter aspect.

Thus, when we ask, What is the essential relationship of labor? we ask about the relationship of the worker to production.

Up to now we have considered the alienation, the externalization of the *worker* only from one side: his *relationship to the products of his labor*. But alienation is shown not only in the result but also in the *process of production*, in the *producing activity* itself. How could the worker stand in an alien relationship to the product of his activity if he did not alienate himself from himself in the very act of production? After all, the product is only the résumé of activity, of production. If the product of work is externalization, production itself must be active externalization, externalization of activity, activity of externalization. Only alienation—and externalization in the activity of labor itself—is summarized in the alienation of the object of labor.

What constitutes the externalization of labor?

First is the fact that labor is *external* to the laborer—that is, it is not part of his nature—and that the worker does not affirm himself in his work but denies himself, feels miserable and unhappy, develops no free physical and mental energy but mortifies

Child factory labor, 1908, North Carolina. Young children were often used in textile mills because of their agility and dexterity. According to Marx, factory workers such as this child are alienated or cut off from (1) the products they produce, (2) their own work activities, (3) themselves, and (4) each other. (Lewis W. Hine/Courtesy George Eastman House, International Museum of Photography.)

his flesh and ruins his mind. The worker, therefore feels at ease only outside work, and during work he is outside himself. He is at home when he is not working and when he is working he is not at home. His work, therefore, is not voluntary, but coerced, *forced labor*. It is not the satisfaction of a need but only a *means* to satisfy other needs. Its alien character is obvious from the fact that as soon as no physical or other pressure exists, labor is avoided like the plague. External labor, labor in which man is externalized, is labor of self-sacrifice, of penance. Finally, the external nature of work for the worker appears in the fact that it is not his own but another person's, that in work he does not belong to himself but to someone else. In religion the spontaneity of human imagination, the spontaneity of the human brain and heart, acts independently of the individual as an alien, divine or devilish activity. Similarly, the activity of the worker is not his own spontaneous activity. It belongs to another. It is the loss of his own self.

The result, therefore, is that man (the worker) feels that he is acting freely only in his animal functions—eating, drinking, and procreating, or at most in his shelter and finery—while in his human functions he feels only like an animal. The animalistic becomes the human and the human the animalistic.

To be sure, eating, drinking, and procreation are genuine human functions. In abstraction, however, and separated from the remaining sphere of human activities and turned into final and sole ends, they are animal functions.

We have considered labor, the act of alienation of practical human activity, in two aspects: (1) the relationship of the worker to the *product of labor* as an alien object dominating him. This relationship is at the same time the relationship to the sensuous external world, to natural objects as an alien world hostile to him; (2) the relationship of labor to the *act of production in labor*. This relationship is that of the worker to his own activity as alien and not belonging to him, activity as passivity, power as weakness, procreation as emasculation, the worker's own physical and spiritual energy, his personal life—for what else is life but activity—as an activity turned against him, independent of him, and not belonging to him. *Self-alienation*, as against the alienation of the *object*, stated above.

We have now to derive a third aspect of *alienated labor* from the two previous ones.

Man is a species-being [*Gattungswesen*] not only in that he practically and theoretically makes his own species as well as that of other things his object, but also—and this is only another expression for the same thing—in that as present and living species he considers himself to be a *universal* and consequently free being.

The life of the species in man as in animals is physical in that man, (like the animal) lives by inorganic nature. And as man is more universal than the animal, the realm of inorganic nature by which he lives is more universal. As plants, animals, minerals, air, light, etc., in theory form a part of human consciousness, partly as objects of natural science, partly as objects of art—his spiritual inorganic nature or spiritual means of life which he first must prepare for enjoyment and assimilation—so they also form in practice a part of human life and human activity. Man lives physically only by these products of nature; they may appear in the form of food, heat, clothing, housing, etc. The universality of man appears in practice in the universality which makes the whole of nature his inorganic body: (1) as a direct means of life, and (2) as the matter, object, and instrument of his life activity. Nature is the *inorganic body* of man, that is, nature insofar as it is not the human body. Man *lives* by nature. This means that nature is his *body* with which he must remain in perpetual process in order not to die. That the physical and spiritual life of man is tied up with nature is another way of saying that nature is linked to itself, for man is a part of nature.

In alienating (1) nature from man, and (2) man from himself, his own active function, his life activity, alienated labor also alienates the *species* from him; it makes

species-life the means of individual life. In the first place it alienates *species-life* and the individual life, and secondly it turns the latter in its abstraction into the purpose of the former, also in its abstract and alienated form.

For labor, *life activity*, and *productive life* appear to man at first only as a *means* to satisfy a need, the need to maintain physical existence. Productive life, however, is *species-life*. It is life begetting life. In the mode of life activity lies the entire character of a species, its species-character; and free conscious activity is the species-character of man. Life itself appears only as a *means of life*.

The animal is immediately one with its life activity, not distinct from it. The animal is *its life activity*. Man makes his life activity itself into an object of will and consciousness. He has conscious life activity. It is not a determination with which he immediately identifies. Conscious life activity distinguishes man immediately from the life activity of the animal. Only thereby is he a species-being. Or rather, he is only a conscious being—that is, his own life is an object for him—since he is a species-being. Only on that account is his activity free activity. Alienated labor reverses the relationship in that man; since he is a conscious being, makes his life activity, his *essence*, only a means for his existence.

The practical creation of an *objective world*, the *treatment* of inorganic nature, is proof that man is a conscious species-being, that is, a being which is related to its species as to its own essence or is related to itself as a species-being. To be sure animals also produce. They build themselves nests, dwelling places, like the bees, beavers, ants, etc. But the animal produces only what is immediately necessary for itself or its young. It produces in a one-sided way while man produces universally. The animal produces under the domination of immediate physical need while man produces free of physical need and only genuinely so in freedom from such need. The animal only produces itself while man reproduces the whole of nature. The animal's product belongs immediately to its physical body while man is free when he confronts his product. The animal builds only according to the standard and need of the species to which it belongs while man knows how to produce according to the standard of any species and at all times knows how to apply an intrinsic standard to the object. Thus man creates also according to the laws of beauty.

In the treatment of the objective world, therefore, man proves himself to be genuinely a *species-being*. This production is his active species-life. Through it nature appears as *his work* and his actuality. The object of labor is thus the *objectification of man's species-life*: he produces himself not only intellectually, as in consciousness, but also actively in a real sense and sees himself in a world he made. In taking from man the object of his production, alienated labor takes from his *species-life*, his actual and objective existence as a species. It changes his superiority to the animal to inferiority, since he is deprived of nature, his inorganic body.

By degrading free spontaneous activity to the level of a means, alienated labor makes the species-life of man a means of his physical existence.

The consciousness which man has from his species is altered through alienation, so that species-life becomes a means for him.

(3) Alienated labor hence turns the *species-existence of man*, and also nature as his mental species-capacity, into an existence *alien* to him, into the *means* of his *individual existence*. It alienates his spiritual nature, his *human essence*, from his own body and likewise from nature outside him.

(4) A direct consequence of man's alienation from the product of his work, from his life activity, and from his species-existence, is the *alienation of man from man*. When man confronts himself, he confronts *other* men. What holds true of man's relationship to his work, to the product of his work, and to himself, also holds true of man's relationship to other men, to their labor, and the object of their labor.

In general, the statement that man is alienated from his species-existence means that one man is alienated from another just as each man is alienated from human nature.

The alienation of man, the relation of man to himself, is realized and expressed in the relation between man and other men.

Thus in the relation of alienated labor every man sees the others according to the standard and the relation in which he finds himself as a worker.

We began with an economic fact, the alienation of the worker and his product. We have given expression to the concept of this fact: *alienated, externalized* labor. We have analyzed this concept and have thus analyzed merely a fact of political economy.

Let us now see further how the concept of alienated, externalized labor must express and represent itself in actuality.

If the product of labor is alien to me, confronts me as an alien power, to whom then does it belong?

If my own activity does not belong to me, if it is an alien and forced activity, to whom then does it belong?

To a being *other* than myself.

Who is this being?

Gods? To be sure, in early times the main production, for example, the building of temples in Egypt, India, and Mexico, appears to be in the service of the gods, just as the product belongs to the gods. But gods alone were never workmasters. The same is true of *nature*. And what a contradiction it would be if the more man subjugates nature through his work and the more the miracles of gods are rendered superfluous by the marvels of industry, man should renounce his joy in producing and the enjoyment of his product for love of these powers.

The *alien* being who owns labor and the product of labor, whom labor serves and whom the product of labor satisfies can only be *man* himself.

That the product of labor does not belong to the worker and an alien power confronts him is possible only because this product belongs to *a man other than the worker*. If his activity is torment for him, it must be the pleasure and the lifeenjoyment for another. Not gods, not nature, but only man himself can be this alien power over man.

Let us consider the statement previously made, that the relationship of man to himself is *objective* and *actual* to him only through his relationship to other men. If man is related to the product of his labor, to his objectified labor, as to an *alien*, hostile, powerful object independent of him, he is so related that another alien, hostile, powerful man independent of him is the lord of this object. If he is unfree in relation to his own activity, he is related to it as bonded activity, activity under the domination, coercion, and yoke of another man.

Every self-alienation of man, from himself and from nature, appears in the relationship which he postulates between other men and himself and nature. Thus religious self-alienation appears necessarily in the relation of laity to priest, or also to a mediator, since we are here now concerned with the spiritual world. In the practical real world self-alienation can appear only in the practical real relationships to other men. The means whereby the alienation proceeds is a *practical* means. Through alienated labor man thus not only produces his relationship to the object and to the act of production as an alien man at enmity with him. He also creates the relation in which other men stand to his production and product, and the relation in which he stands to these other men. just as he begets his own production as loss of his reality, as his punishment; just as he begets his own product, as a loss, a product not belonging to him, so he begets the domination of the nonproducer over production and over product. As he alienates his own activity from himself, he confers upon the stranger an activity which is not his own.

Up to this point, we have investigated the relationship only from the side of the worker and will later investigate it also from the side of the non-worker.

Thus through *alienated externalized* labor does the worker create the relation to this work of man alienated to labor and standing outside it. The relation of the worker to labor produces the relation of the capitalist to labor, or whatever one wishes to call the lord of labor. *Private property* is thus product, result, and necessary consequence of *externalized labor*; of the external relation of the worker to nature and to himself.

Private property thus is derived, through analysis, from the concept of *externalized labor*; that is, *externalized man*, alienated labor, alienated life, and *alienated man*.

We have obtained the concept of *externalized labor (externalized life)* from political economy as a result of the *movement of private property*. But the analysis of this idea shows that though private property appears to be the ground and cause of externalized labor, it is rather a consequence of externalized labor, just as gods are *originally* not the cause but the effect of an aberration of the human mind. Later this relationship reverses.

Only at the final culmination of the development of private property does this, its secret, reappear—namely, that on the one hand it is the *product* of externalized labor and that secondly it is the *means* through which labor externalizes itself, the *realization of this externalization*.

This development throws light on several conflicts hitherto unresolved.

(1) Political economy proceeds from labor as the very soul of production and yet gives labor nothing, private property everything. From this contradiction Proudhon decided in favor of labor and against private property. We perceive, however, that this apparent contradiction is the contradiction of *alienated labor* with itself and that political economy has only formulated the laws of alienated labor.

Therefore we also perceive that *wages* and *private property* are identical: for when the product, the object of labor, pays for the labor itself, wages are only a necessary consequence of the alienation of labor. In wages labor appears not as an end in itself but as the servant of wages. We shall develop this later and now only draw some conclusions.

An enforced *raising of wages* (disregarding all other difficulties, including that this anomaly could only be maintained forcibly) would therefore be nothing but a *better slave-salary* and would not achieve either for the worker or for labor human significance and dignity.

Even the *equality of wages*, as advanced by Proudhon, would only convert the relation of the contemporary worker to his work into the relation of all men to labor.* Society would then be conceived as an abstract capitalist.

Wages are a direct result of alienated labor, and alienated labor is the direct cause of private property. The downfall of one is necessarily the downfall of the other.

(2) From the relation of alienated labor to private property it follows further that the emancipation of society from private property, etc., from servitude, is expressed in its *political* form as the *emancipation of workers*, not as though it is only a question of their emancipation but because in their emancipation is contained universal human emancipation. It is contained in their emancipation because the whole of human servitude is involved in the relation of worker to production, and all relations of servitude are only modifications and consequences of the worker's relation to production.

As we have found the concept of *private property* through *analysis* from the concept of *alienated, externalized labor*, so we can develop all the *categories* of political

*[Pierre-Joseph Proudhon (1809–1865), French socialist writer and precursor of anarchism, author of *What Is Property?* (1841).]

economy with the aid of these two factors, and we shall again find in each category—for example, barter, competition, capital, money—only a *particular* and *developed expression* of these primary foundations.

Before considering this configuration, however, let us try to solve two problems.

(1) To determine the general *nature of private property* as a result of alienated labor in its relation to *truly human* and *social property*.

(2) We have taken the *alienation of labor* and its *externalization* as a fact and analyzed this fact. How, we ask now, does it happen that *man externalizes his labor*; alienates it? How is this alienation rooted in the nature of human development? We have already achieved much in resolving the problem by *transforming* the question concerning the *origin of private property* into the question concerning the relationship of *externalized labor* to evolution of humanity. In talking about *private property* one believes he is dealing with something external to man. Talking of labor, one is immediately dealing with man himself. This new formulation of the problem already contains its solution.

On (1) *The general nature of private property and its relation to truly human property*.

We have resolved alienated labor into two parts which mutually determine each other or rather are only different expressions of one and the same relationship. *Appropriation* appears as *alienation*, as *externalization*; *externalization* as *appropriation*; *alienation* as the true *naturalization*.

We considered the one side, *externalized labor*, in relation to the *worker* himself, that is, the *relation of externalized labor to itself*. We have found the *property relation of the non-worker* to the *worker* and *labor* to be the product, the necessary result, of this relationship. *Private property* as the material, summarized expression of externalized labor embraces both relationships—the *relationship of worker to labor*, *the product of his work*, and *the non-worker*; and the relationship of the *non-worker to the worker* and *the product of his labor*.

As we have seen that in relation to the worker who *appropriates* nature through his labor the appropriation appears as alienation—self-activity as activity for another and of another, living as the sacrifice of life, production of the object as loss of it to an alien power, an *alien* man—we now consider the relationship of this *alien* man to the worker, to labor and its object.

It should be noted first that everything which appears with the worker as an *activity of externalization* and an *activity of alienation* appears with the non-worker as a *condition of externalization*, a *condition of alienation*.

Secondly, that the *actual, practical attitude* of the worker in production and to his product (as a condition of mind) appears as a *theoretical* attitude in the non-worker confronting him.

Thirdly, the non-worker does everything against the worker which the worker does against himself, but he does not do against his own self what he does against the worker.*

Let us consider more closely these three relationships.

[Here the manuscript breaks off, unfinished.]

*[This paragraph is an allusion to Hegel's famous discussion of the "master and servant" in *Phenomenology of Spirit*. "Solely being-for-himself is the [master's] essence; he is the pure negative power to which the thing is nothing, and hence the pure essential doing in this situation; while the servant is not a pure doing, but an inessential one. But for true recognition there is lacking the moment that what the master does to the other he also does to himself, and what the servant does to himself he also does to the other." (See page 914.)]

MANIFESTO OF THE COMMUNIST PARTY (in part)

A spectre is haunting Europe—the spectre of Communism. All the powers of old Europe have entered into a holy alliance to exorcise this spectre: Pope and Czar, Metternich and Guizot, French Radicals and German police spies.

Where is the party in opposition that has not been decried as communistic by its opponents in power? Where the opposition that has not hurled back the branding reproach of Communism against the more advanced opposition parties, as well as against its reactionary adversaries?

Two things result from this fact:

- I. Communism is already acknowledged by all European powers to be itself a power.
- II. It is high time that Communists should openly, in the face of the whole world, publish their views, their aims, their tendencies, and meet this nursery tale of the spectre of Communism with a manifesto of the party itself.

To this end, Communists of various nationalities have assembled in London and sketched the following manifesto, to be published in the English, French, German, Italian, Flemish, and Danish languages.

CHAPTER I: BOURGEOIS AND PROLETARIANS*

The History of all hitherto existing society** is the history of class struggles.

Freeman and slave, patrician and plebeian, lord and serf, guild-master*** and journeyman, in a word, oppressor and oppressed stood in constant opposition to one another, carried on an uninterrupted, now hidden, now open fight, a fight that each time ended either in a revolutionary reconstitution of society at large, or in the common ruin of the contending classes.

In the earlier epochs of history we find almost everywhere a complicated arrangement of society into various orders, a manifold gradation of social rank. In ancient Rome we have patricians, knights, plebeians, slaves; in the Middle Ages, feudal lords, vassals, guild-masters, journeymen, apprentices, serfs; in almost all of these classes, again, subordinate gradations.

*By *bourgeoisie* is meant the class of modern capitalists, owners of the means of social production, and employers of wage labor; by *proletariat*, the class of modern wage laborers who, having no means of production of their own, are reduced to selling their labor power in order to live.

**That is, all *written* history. In 1837, the pre-history of society, the social organization existing previous to recorded history, was all but unknown. Since then Haxthausen discovered common ownership of land in Russia; Maurer proved it to be the social foundation from which all Teutonic races started in history, and, by and by, village communities were found to be, or to have been, the primitive form of society everywhere from India to Ireland. The inner organization of this primitive communistic society was laid bare, in its typical form, by Morgan's crowning discovery of the true nature of the *gens* and its relation to the *tribe*. With the dissolution of these primeval communities society begins to be differentiated into separate and finally antagonistic classes. I have attempted to retrace this process of dissolution in *The Origin of the Family, Private Property and the State*.

***[Guild-master, that is, a full member of a guild, a master within, not a head of a guild.]

The modern bourgeois society that has sprouted from the ruins of feudal society has not done away with class antagonisms. It has but established new classes, new conditions of oppression, new forms of struggle in place of the old ones.

Our epoch, the epoch of the bourgeoisie, possesses, however, this distinctive feature: it has simplified the class antagonisms. Society as a whole is more and more splitting up into two great hostile camps, into two great classes directly facing each other—bourgeoisie and proletariat.

From the serfs of the Middle Ages sprang the chartered burghers of the earliest towns. From these burgesses the first elements of the bourgeoisie were developed.

The discovery of America, the rounding of the Cape, opened up fresh ground for the rising bourgeoisie. The East Indian and Chinese markets, the colonization of America, trade with the colonies, the increase in the means of exchange and in commodities generally, gave to commerce, to navigation, to industry, an impulse never before known, and thereby, to the revolutionary element in the tottering feudal society, a rapid development.

The feudal system of industry, in which industrial production was monopolized by closed guilds, now no longer sufficed for the growing wants of the new markets. The manufacturing system took its place. The guild-masters were pushed aside by the manufacturing middle class; division of labor between the different corporate guilds vanished in the face of division of labor in each single workshop.

Meantime the markets kept ever growing, the demand ever rising. Even manufacture no longer sufficed. Thereupon, steam and machinery revolutionized industrial production. The place of manufacture was taken by the giant, modern industry, the place of the industrial middle class, by industrial millionaires—the leaders of whole industrial armies, the modern bourgeois.

Modern industry has established the world market, for which the discovery of America paved the way. This market has given an immense development to commerce, to navigation, to communication by land. This development has, in its turn, reacted on the extension of industry; and in proportion as industry, commerce, navigation, railways extended, in the same proportion the bourgeoisie developed, increased its capital, and pushed into the background every class handed down from the Middle Ages.

We see, therefore, how the modern bourgeoisie is itself the product of a long course of development, of a series of revolutions in the modes of production and of exchange.

Each step in the development of the bourgeoisie was accompanied by a corresponding political advance of that class. An oppressed class under the sway of the feudal nobility, it became an armed and self-governing association in the medieval commune:* here independent urban republic (as in Italy and Germany); there, taxable “third estate” of the monarchy (as in France); afterwards, in the period of manufacture proper, serving either the semi-feudal or the absolute monarchy as a counterpoise against the nobility, and, in fact, cornerstone of the great monarchies in general. The bourgeoisie has at last, since the establishment of modern industry and of the world market, conquered for itself, in the modern representative state, exclusive political sway. The executive of the modern state is but a committee for managing the common affairs of the whole bourgeoisie.

The bourgeoisie has played a most revolutionary role in history.

*“Commune” was the name taken in France by the nascent towns even before they had conquered from their feudal lords and masters local self-government and political rights as the “Third Estate.” Generally speaking, for the economic development of the bourgeoisie, England is here taken as the typical country; for its political development, France.

The bourgeoisie, wherever it has got the upper hand, has put an end to all feudal, patriarchal, idyllic relations. It has pitilessly torn asunder the motley feudal ties that bound man to his “natural superiors,” and has left no other bond between man and man than naked self-interest, than callous “cash payment.” It has drowned the most heavenly ecstasies of religious fervor, of chivalrous enthusiasm, of philistine sentimentalism, in the icy water of egotistical calculation. It has resolved personal worth into exchange value, and in place of the numberless indefeasible chartered freedoms has set up that single, unconscionable freedom—Free Trade. In one word, for exploitation, veiled by religious and political illusions, it has substituted naked, shameless, direct, brutal exploitation.

The bourgeoisie has stripped of its halo every occupation hitherto honored and looked up to with reverent awe. It has converted the physician, the lawyer, the priest, the poet, the man of science, into its paid wage laborers.

The bourgeoisie has torn away from the family its sentimental veil, and has reduced the family relation to a mere money relation.

The bourgeoisie has disclosed how it came to pass that the brutal display of vigor in the Middle Ages which reactionaries so much admire found its fitting complement in the most slothful indolence. It has been the first to show what man’s activity can bring about. It has accomplished wonders far surpassing Egyptian pyramids, Roman aqueducts, and Gothic cathedrals; it has conducted expeditions that put in the shade all former migrations of nations and crusades.

The bourgeoisie cannot exist without constantly revolutionizing the instruments of production, and thereby the relations of production, and with them the whole relations of society. Conservation of the old modes of production in unaltered form was, on the contrary, the first condition of existence for all earlier industrial classes. Constant revolutionizing of production, uninterrupted disturbance of all social conditions, everlasting uncertainty and agitation distinguish the bourgeois epoch from all earlier ones. All fixed, fast-frozen relations with their train of ancient and venerable prejudices and opinions are swept away; all new-formed ones become antiquated before they can ossify. All that is solid melts in air, all that is holy is profaned, and man is at last compelled to face with sober senses his real conditions of life and his relations with his kind.

The need of a constantly expanding market for its products chases the bourgeoisie over the whole surface of the globe. It must nestle everywhere, settle everywhere, establish connections everywhere.

The bourgeoisie has through its exploitation of the world market given a cosmopolitan character to production and consumption in every country. To the great chagrin of reactionaries it has drawn from under the feet of industry the national ground on which it stood. All old-established national industries have been destroyed or are daily being destroyed. They are dislodged by new industries whose introduction becomes a life and death question for all civilized nations; by industries that no longer work up indigenous raw material, but raw material drawn from the remotest zones; industries whose products are consumed, not only at home, but in every quarter of the globe. In place of the old wants, satisfied by the production of the country, we find new wants, requiring for their satisfaction the products of distant lands and climes. In place of the old local and national seclusion and self-sufficiency we have intercourse in every direction, universal inter-dependence of nations. And as in material, so also in intellectual production. The intellectual creations of individual nations become common property. National one-sidedness and narrow-mindedness become more and more impossible, and from the numerous national and local literatures there arises a world literature.

The bourgeoisie, by the rapid improvement of all instruments of production, by the immensely facilitated means of communication, draws all nations, even the most barbarian, into civilization. The cheap prices of its commodities are the heavy artillery with which it batters down all Chinese walls, with which it forces the barbarians' intensely obstinate hatred of foreigners to capitulate. It compels all nations, on pain of extinction, to adopt the bourgeois mode of production; it compels them to introduce what it calls civilization into their midst, i.e., to become bourgeois themselves. In a word, it creates a world after its own image.

The bourgeoisie has subjected the country to the rule of the towns. It has created enormous cities, has greatly increased the urban population as compared with the rural, and has thus rescued a considerable part of the population from the idiocy of rural life. Just as it has made the country dependent on the towns, so it has made barbarian and semi-barbarian countries dependent on the civilized ones, nations of peasants on nations of bourgeois, the East on the West.

More and more the bourgeoisie keeps doing away with the scattered state of the population, of the means of production, and of property. It has agglomerated population, centralized means of production, and has concentrated property in a few hands. The necessary consequence of this was political centralization. Independent, or but loosely connected provinces, with separate interests, laws, governments and systems of taxation, became lumped together into one nation, with one government, one code of laws, one national class interest, one frontier and one customs tariff.

The bourgeoisie during its rule of scarce one hundred years has created more massive and more colossal productive forces than have all preceding generations together. Subjection of nature's forces to man, machinery, application of chemistry to industry and agriculture, steam-navigation, railways, electric telegraphs, clearing of whole continents for cultivation, canalization of rivers, whole populations conjured out of the ground—what earlier century had even a presentiment that such productive forces slumbered in the lap of social labor?

We see, then, that the means of production and of exchange which served as the foundation for the growth of the bourgeoisie were generated in feudal society. At a certain stage in the development of these means of production and of exchange, the conditions under which feudal society produced and exchanged, the feudal organization of agriculture and manufacturing industry, in a word, the feudal relations of property became no longer compatible with the already developed productive forces; they became so many fetters. They had to be burst asunder; they were burst asunder.

Into their place stepped free competition, accompanied by a social and political constitution adapted to it, and by the economic and political sway of the bourgeois class.

A similar movement is going on before our own eyes. Modern bourgeois society with its relations of production, of exchange and of property, a society that has conjured up such gigantic means of production and of exchange, is like the sorcerer who is no longer able to control the powers of the nether world whom he has called up by his spells. For many a decade past the history of industry and commerce is but the history of the revolt of modern productive forces against modern conditions of production, against the property relations that are the conditions for the existence of the bourgeoisie and of its rule. It is enough to mention the commercial crises that by their periodical return put the existence of the entire bourgeois society on trial, each time more threateningly. In these crises a great part not only of the existing products, but also of the previously created productive forces, are periodically destroyed. In these crises there breaks out an epidemic that, in all earlier epochs, would have seemed an absurdity—the

epidemic of over-production. Society suddenly finds itself put back into a state of momentary barbarism; it appears as if a famine, a universal war of devastation had cut off the supply of every means of subsistence; industry and commerce seem to be destroyed. And why? Because there is too much civilization, too much means of subsistence, too much industry, too much commerce. The productive forces at the disposal of society no longer tend to further the development of the conditions of bourgeois property; on the contrary, they have become too powerful for these conditions, by which they are fettered, and no sooner do they overcome these fetters than they bring disorder into the whole of bourgeois society, endanger the existence of bourgeois property. The conditions of bourgeois society are too narrow to comprise the wealth created by them. And how does the bourgeoisie get over these crises? On the one hand by enforced destruction of a mass of productive forces; on the other, by the conquest of new markets and by the more thorough exploitation of the old ones. That is to say, by paving the way for more extensive and more destructive crises, and by diminishing the means whereby crises are prevented.

The weapons with which the bourgeoisie felled feudalism to the ground are now turned against the bourgeoisie itself.

But not only has the bourgeoisie forged the weapons that bring death to itself; it has also called into existence the men who are to wield those weapons—the modern working class, the proletarians.

In proportion as the bourgeoisie, i.e., capital, is developed, in the same proportion is the proletariat, the modern working class, developed—a class of laborers, who live only so long as they find work, and who find work only so long as their labor increases capital. These laborers, who must sell themselves piecemeal, are a commodity like every other article of commerce, and are consequently exposed to all the vicissitudes of competition, to all the fluctuations of the market.

Owing to the extensive use of machinery and to division of labor, the work of the proletarians has lost all individual character, and, consequently all charm for the workman. He becomes an appendage of the machine, and it is only the most simple, most monotonous, and most easily acquired knack that is required of him. Hence, the cost of production of a workman is restricted almost entirely to the means of subsistence that he requires for his maintenance and for the propagation of his race. But the price of a commodity, and therefore also of labor, is equal to its cost of production. In proportion, therefore, as the repulsiveness of the work increases, the wage decreases. Nay more, in proportion the burden of toil also increases, whether by prolongation of the working hours, by increase of the work exacted in a given time, or by increased speed of the machinery, etc.

Modern industry has converted the little workshop of the patriarchal master into the great factory of the industrial capitalist. Masses of laborers, crowded into the factory, are organized like soldiers. As privates of the industrial army they are placed under the command of a perfect hierarchy of officers and sergeants. Not only are they slaves of the bourgeois class and of the bourgeois state; they are daily and hourly enslaved by the machine, by the overseer, and, above all, by the individual bourgeois manufacturer himself. The more openly this despotism proclaims gain to be its end and aim, the more petty, the more hateful, and the more embittering it is.

The less the skill and exertion of strength implied in manual labor—in other words, the more modern industry develops—the more is the labor of men superseded by that of women. Differences of age and sex have no longer any distinctive social validity for the working class. All are instruments of labor, more or less expensive to use, according to their age and sex.

No sooner has the laborer received his wages in cash, for the moment escaping exploitation by the manufacturer, than he is set upon by the other portions of the bourgeoisie—the landlord, the shopkeeper, the pawnbroker, etc.

The lower strata of the middle class—the small tradespeople, shopkeepers, and retired tradesmen generally, the handicraftsmen and peasants—all these sink gradually into the proletariat, partly because their diminutive capital does not suffice for the scale on which modern industry is carried on and is swamped in the competition with the large capitalists, partly because their specialized skill is rendered worthless by new methods of production. Thus the proletariat is recruited from all classes of the population.

The proletariat goes through various stages of development. With its birth begins its struggle with the bourgeoisie. At first the contest is carried on by individual laborers, then by the workpeople of a factory, then by the operatives of one trade, in one locality, against the individual bourgeois who directly exploits them. They direct their attacks not against the bourgeois conditions of production, but against the instruments of production themselves; they destroy imported wares that compete with their labor, they smash machinery to pieces, they set factories ablaze, they seek to restore by force the vanished status of the workman of the Middle Ages.

At this stage the laborers still form an incoherent mass scattered over the whole country, and broken up by their mutual competition. If anywhere they unite to form more compact bodies, this is not yet the consequence of their own active union, but of the union of the bourgeoisie, which class, in order to attain its own political ends, is compelled to set the whole proletariat in motion, and is, moreover, still able to do so for a time. At this stage, therefore, the proletarians do not fight their enemies, but the enemies of their enemies, the remnants of absolute monarchy, the landowners, the non-industrial bourgeois, the petty bourgeoisie. Thus the whole historical movement is concentrated in the hands of the bourgeoisie; every victory so obtained is a victory for the bourgeoisie.

But with the development of industry the proletariat not only increases in number; it becomes concentrated in greater masses, its strength grows, and it feels that strength more. The various interests and conditions of life within the ranks of the proletariat are more and more equalized, in proportion as machinery obliterates all distinctions of labor and nearly everywhere reduces wages to the same low level. The growing competition among the bourgeois and the resulting commercial crises make the wages of the workers ever more fluctuating. The unceasing improvement of machinery, ever more rapidly developing, makes their livelihood more and more precarious; the collisions between individual workmen and individual bourgeois take more and more the character of collisions between two classes. Thereupon the workers begin to form combinations (trade unions) against the bourgeoisie; they club together in order to keep up the rate of wages; they found permanent associations in order to make provision beforehand for these occasional revolts. Here and there the contest breaks out into riots.

Now and then the workers are victorious, but only for a time. The real fruit of their battles lies not in the immediate result but in the ever expanding union of the workers. This union is furthered by the improved means of communication which are created by modern industry, and which place the workers of different localities in contact with one another. It was just this contact that was needed to centralize the numerous local struggles, all of the same character, into one national struggle between classes. But every class struggle is a political struggle. And that union, which the burghers of the Middle Ages, with their miserable highways, required centuries to attain, the modern proletarians, thanks to railways achieve in a few years.

This organization of the proletarians into a class, and consequently into a political party, is continually being upset again by the competition between the workers

themselves. But it ever rises up again, stronger, firmer, mightier. It compels legislative recognition of particular interests of the workers by taking advantage of the divisions among the bourgeoisie itself. Thus the Ten Hour bill in England was carried.

Altogether, collisions between the classes of the old society further the course of development of the proletariat in many ways. The bourgeoisie finds itself involved in a constant battle—at first with the aristocracy; later on, with those portions of the bourgeoisie itself whose interests have become antagonistic to the progress of industry; at all times with the bourgeoisie of foreign countries. In all these battles it sees itself compelled to appeal to the proletariat, to ask for its help, and thus to drag it into the political arena. The bourgeoisie itself, therefore, supplies the proletariat with its own elements of political and general education; in other words, it furnishes the proletariat with weapons for fighting the bourgeoisie.

Further, as we have already seen, entire sections of the ruling classes are, by the advance of industry, precipitated into the proletariat, or are at least threatened in their conditions of existence. These also supply the proletariat with fresh elements of enlightenment and progress.

Finally, in times when the class struggle nears the decisive hour, the process of dissolution going on within the ruling class, in fact within the whole range of old society, assumes such a violent, glaring character that a small section of the ruling class cuts itself adrift and joins the revolutionary class, the class that holds the future in its hands. Just as, therefore, at an earlier period a section of the nobility went over to the bourgeoisie, so now a portion of the bourgeoisie goes over to the proletariat, and in particular, a portion of the bourgeois ideologists who have raised themselves to the level of comprehending theoretically the historical movement as a whole.

Of all the classes that stand face to face with the bourgeoisie today, the proletariat alone is a really revolutionary class. The other classes decay and finally disappear in the face of modern industry; the proletariat is its special and essential product.

The lower middle class, the small manufacturer, the shopkeeper, the artisan, the peasant—all these fight against the bourgeoisie, to save from extinction their existence as fractions of the middle class. They are, therefore, not revolutionary but conservative. Nay more, they are reactionary, for they try to roll back the wheel of history. If by chance they are revolutionary they are so only in view of their impending transfer into the proletariat; they thus defend not their present but their future interests; they desert their own standpoint to adopt that of the proletariat.

The “dangerous class,” the social scum (*Lumpenproletariat*), that passively rotting mass thrown off by the lowest layers of old society, may here and there be swept into the movement by a proletarian revolution; its conditions of life, however, prepare it far more for the part of a bribed tool of reactionary intrigue.

The social conditions of the old society no longer exist for the proletariat. The proletarian is without property; his relation to his wife and children has no longer anything in common with bourgeois family relations; modern industrial labor, modern subjection to capital, the same in England as in France, in America as in Germany, has stripped him of every trace of national character. Law, morality, religion are to him so many bourgeois prejudices, behind which lurk in ambush just as many bourgeois interests.

All the preceding classes that got the upper hand sought to fortify their already acquired status by subjecting society at large to their conditions of appropriation. The proletarians cannot become masters of the productive forces of society except by abolishing their own previous mode of appropriation, and thereby also every other previous mode of appropriation. They have nothing of their own to secure and to fortify; their mission is to destroy all previous securities for, and insurances of, individual property.

All previous historical movements were movements of minorities, or in the interest of minorities. The proletarian movement is the self-conscious, independent movement of the immense majority, in the interest of the immense majority. The proletariat, the lowest stratum of our present society, cannot stir, cannot raise itself up, without the whole superincumbent strata of official society being sprung into the air.

Though not in substance, yet in form, the struggle of the proletariat with the bourgeoisie is at first a national struggle. The proletariat of each country must, of course, first of all settle matters with its own bourgeoisie.

In depicting the most general phases of the development of the proletariat we traced the more or less veiled civil war raging within existing society, up to the point where that war breaks out into open revolution, and where the violent overthrow of the bourgeoisie lays the foundation for the sway of the proletariat.

Hitherto, every form of society has been based, as we have already seen, on the antagonism of oppressing and oppressed classes. But in order to oppress a class certain conditions must be assured to it under which it can, at least, continue its slavish existence. The serf, in the period of serfdom, raised himself to membership in the commune, just as the petty bourgeois, under the yoke of feudal absolutism, managed to develop into a bourgeois. The modern laborer, on the contrary, instead of rising with the progress of industry, sinks deeper and deeper below the conditions of existence of his own class. He becomes a pauper, and pauperism develops more rapidly than population and wealth. And here it becomes evident that the bourgeoisie is unfit any longer to be the ruling class in society and to impose its conditions of existence upon society as an overriding law. It is unfit to rule because it is incompetent to assure an existence to its slave within his slavery, because it cannot help letting him sink into such a state that it has to feed him, instead of being fed by him. Society can no longer live under this bourgeoisie, in other words, its existence is no longer compatible with society.

The essential condition for the existence and sway of the bourgeois class is the formation and augmentation of capital; the condition for capital is wage labor. Wage labor rests exclusively on competition between the laborers. The advance of industry, whose involuntary promoter is the bourgeoisie, replaces the isolation of the laborers, due to competition, by their revolutionary combination, due to association. The development of modern industry, therefore, cuts from under its feet the very foundation on which the bourgeoisie produces and appropriates products. What the bourgeoisie, therefore, produces above all are its own grave-diggers. Its fall and the victory of the proletariat are equally inevitable.

* * *

[The specific measures called for by the Communist Party] will, of course, be different in different countries.

Nevertheless, in the most advanced countries the following will be pretty generally applicable:

1. Abolition of property in land and application of all rents of land to public purposes.
2. A heavy progressive or graduated income tax.
3. Abolition of all right of inheritance.
4. Confiscation of the property of all emigrants and rebels.

5. Centralization of credit in the hands of the state by means of a national bank with state capital and an exclusive monopoly.
6. Centralization of the means of communication and transport in the hands of the state.
7. Extension of factories and instruments of production owned by the state; the bringing into cultivation of waste lands, and the improvement of the soil generally in accordance with a common plan.
8. Equal obligation of all to work. Establishment of industrial armies, especially for agriculture.
9. Combination of agriculture with manufacturing industries; gradual abolition of the distinction between town and country by a more equable distribution of the population over the country.
10. Free education for all children in public schools. Abolition of child factory labor in its present form. Combination of education with industrial production, etc.

* * *

The Communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by the forcible overthrow of all existing social conditions. Let the ruling classes tremble at a Communist revolution. The proletarians have nothing to lose but their chains. They have a world to win.

Workingmen of all countries, unite!

"Capital and Labour," cartoon from *Punch* magazine, 1843. The cartoon shows the suffering of the workers and their families that makes possible the bourgeois capitalists' high life. It was in response to conditions such as this that Marx and Engels wrote in *The Communist Manifesto* (1848), "The proletarians have nothing to lose but their chains. They have a world to win. Workingmen of all countries, unite!" (©Iberfoto/Iberfoto)

A CONTRIBUTION TO THE CRITIQUE OF POLITICAL ECONOMY (in part)

AUTHOR'S PREFACE

In the social production which men carry on they enter into definite relations that are indispensable and independent of their will; these relations of production correspond to a definite stage of development of their material powers of production. The sum total of these relations of production constitutes the economic structure of society—the real foundation, on which rise legal and political superstructures and to which correspond definite forms of social consciousness. The mode of production in material life determines the general character of the social, political and spiritual processes of life. It is not the consciousness of men that determines their existence, but, on the contrary, their social existence determines their consciousness. At a certain stage of their development, the material forces of production in society come in conflict with the existing relations of production, or—what is but a legal expression for the same thing—with the property relations within which they had been at work before. From forms of development of the forces of production these relations turn into their fetters. Then comes the period of social revolution. With the change of the economic foundation the entire immense superstructure is more or less rapidly transformed. In considering such transformations the distinction should always be made between the material transformation of the economic conditions of production which can be determined with the precision of natural science, and the legal, political, religious, aesthetic or philosophic—in short ideological forms in which men become conscious of this conflict and fight it out. Just as our opinion of an individual is not based on what he thinks of himself, so can we not judge of such a period of transformation by its own consciousness; on the contrary, this consciousness must rather be explained from the contradictions of material life, from the existing conflict between the social forces of production and the relations of production. No social order ever disappears before all the productive forces, for which there is room in it, have been developed; and new higher relations of production never appear before the material conditions of their existence have matured in the womb of the old society. Therefore, mankind always takes up only such problems as it can solve; since, looking at the matter more closely, we will always find that the problem itself arises only when the material conditions necessary for its solution already exist or are at least in the process of formation. In broad outlines we can designate the Asiatic, the ancient, the feudal, and the modern bourgeois methods of production as so many epochs in the progress of the economic formation of society. The bourgeois relations of production are the last antagonistic form of the social process of production—antagonistic not in the sense of individual antagonism, but of one arising from conditions surrounding the life of individuals in society; at the same time the productive forces developing in the womb of bourgeois society create the material conditions for the solution of that antagonism. This social formation constitutes, therefore, the closing chapter of the prehistoric stage of human society.

NOTES ON BAKUNIN'S STATEHOOD AND ANARCHY

BAKUNIN: "Where there is a state, there is inevitably domination and consequently there is also slavery; domination without slavery, open or masked, is unthinkable—that is why we are enemies of the state.

What does it mean to talk of the proletariat 'raised to the level of the ruling estate'?"

MARX: It means that the proletariat, instead of fighting in individual instances against the economically privileged classes, has gained sufficient strength and organization to use general means of coercion in its struggle against them; but it can only make use of such economic means as abolish its own character as wage laborer and hence as a class; when its victory is complete, its rule too is therefore at an end, since its class character will have disappeared.

BAKUNIN: "Will perhaps the entire proletariat stand at the head of the government?"

MARX: In a TRADES UNION, for example, does the entire union form its executive committee? Will all division of labor in the factory come to an end as well as the various functions arising from it? And with Bakunin's constitution "from below," will everyone be "at the top?" If so, there will be no one "at the bottom." Will all the members of the community at the same time administer the common interests of the "region?" If so, there will be no distinction between community and "region."

BAKUNIN: "There are about 40 million Germans. Does this mean that all 40 million will be members of the government?"

MARX: CERTAINLY! For the system starts with the self-government of the communities.

BAKUNIN: "The entire people will rule, and no one will be ruled."

MARX: When a person rules himself, he does not do so according to this principle; for he is only himself and not another.

BAKUNIN: "Then there will be no government, no state, but if there is a state, there will be both rulers and slaves."

MARX: That just means when class rule has disappeared there [will] be no state in the present political sense.

BAKUNIN: "The dilemma in the theory of the Marxists is easily resolved. By people's government they . . . understand the government of the people by means of a small number of representatives chosen (elected) by the people."

MARX: Asine! This is democratic twaddle, political claptrap! Elections—a political form found in the tiniest Russian commune and in the *artel*. The character of an election does not depend on this name but on the economic foundation, the economic interrelations of the voters, and as soon as the functions have ceased to be political, 1) government functions no longer exist; 2) the distribution of general functions has become a routine matter which entails no domination; 3) elections lose their present political character.

BAKUNIN: "The universal suffrage of the whole people"—

MARX: Such a thing as the whole people, in the present meaning of the word, is an illusion—

BAKUNIN: “To elect its representatives and “rulers of state”—that is the last word of the Marxists and also of the democratic school—is a lie which conceals the despotism of the *ruling minority*, a lie that is all the more dangerous as it appears as the expression of the so-called will of the people.”

MARX: With collective ownership the so-called will of the people disappears and makes way for the genuine will of the cooperative.

BAKUNIN: “So the result is the control of the vast majority of the people by a privileged minority. But this minority, the Marxists say,”

MARX: Where?

BAKUNIN: “will consist of workers. Yes, quite possibly of former workers, but, as soon as they have become the representatives or rulers of the people, *they cease to be workers*”—

MARX: No more than a factory owner today ceases to be a capitalist when he becomes a municipal councilor—

BAKUNIN: “And will gaze down upon the whole world of the common workers from the eminence of “statehood”; they will no longer represent the people, but only themselves and their “claims” to govern the people. Anyone who can doubt this knows nothing of human nature”

MARX: If Mr. Bakunin were familiar even with the position of a manager in a workers’ co-operative factory, all his fantasies about domination would go to the devil. He should have asked himself: what forms could management functions assume within such a workers’ state, if he wants to call it that?

CHARLES SANDERS PEIRCE

1839–1914

Charles Sanders Peirce (pronounced “Purse”) was born in Cambridge, Massachusetts, to Benjamin and Sarah Hunt Mills Peirce. His father was a noted mathematician and professor of astronomy and mathematics at Harvard. Like John Stuart Mill and Søren Kierkegaard, Charles Peirce received his most significant schooling from his father. From an early age, his father taught him mathematics and science, encouraging Peirce in his youthful laboratory experiments. Though Peirce did graduate from both Cambridge High School and Harvard, he did not distinguish himself academically at either institution and had trouble adapting socially. During his college years, he spent much of his time with his father, discussing the elder Peirce’s mathematical studies. Following graduation from Harvard in 1859, Peirce studied chemistry at the Lawrence Scientific School. There he met and then married his first wife, Harriet Melusina Fay. In addition to this change in his social life, Peirce’s academic performance improved, and in 1863 he graduated from Lawrence *summa cum laude*.

While Peirce was still in school, his father arranged a job for him with the United States Coast and Geodetic Survey. Peirce worked for this agency over the next thirty years but nevertheless found time for a number of other pursuits. He worked as an astronomer at Harvard, continued to perform scientific experiments, read and wrote extensively in philosophy, and lectured on logic at Johns Hopkins University. Peirce also helped form the Metaphysical Club, an informal gathering of friends to discuss philosophical matters. The club included such well-known thinkers as William James and Oliver Wendell Holmes. Though esteemed by his fellow philosophers, Peirce’s difficult personality and reputation for “loose living” kept him from a professorship. Peirce’s “inability to exercise the proper moral self-control” (James’s description) eventually led to a divorce from Harriet Fay in 1883. The following year Peirce married a French woman named Juliette Froisy.

In 1891, Peirce received a small legacy, retired from his job with the U.S. Coast and Geodetic Survey, and moved to Milford, Pennsylvania, where he lived a reclusive life while writing on philosophical themes. His works received virtually no recognition during his lifetime, and on his death his second wife sold all his papers to Harvard for \$500.

* * *

Peirce has been called a “philosopher’s philosopher.” His writings are often difficult for beginning students, partly because of the technical way in which he expresses his ideas. In addition, he developed four more-or-less complete systems, abandoning each in favor of the next. Despite his esoteric and variegated writing, in 1877 and 1878 Peirce published a pair of essays for a general audience in *Popular Science Monthly*. These became his most important works.

The first of these essays, “The Fixation of Belief,” is given here (complete). This essay develops Peirce’s famous theory of pragmatism. Peirce begins with a brief history of knowledge, concluding that all inquiry begins with doubt. In order to lead to belief, this doubt must be “real and living,” the actual state in which we find ourselves. This state of doubt causes us to “struggle to attain a state of belief,” which we then try to “fix” in some way.

Peirce explains four methods of moving from doubt to belief: (1) tenacity, accepting one alternative to the doubt and rejecting all possible criticism of it; (2) authority, submitting to the state’s or the church’s tenaciously held beliefs; (3) the *a priori* method, relying on the inclination to believe; and (4) science. Peirce argues for the scientific method because “it is the only one of the four methods which presents any distinction of a right and a wrong way.”

Peirce has been called the father of pragmatism, and his work clearly influenced William James and John Dewey. Apart from the pragmatists, echoes of Peirce’s writing can be heard in the verification criterion of meaning of the logical positivists and in the mandate of the later Wittgenstein that “the meaning is the use.” Since the publication of his collected essays in the middle of the century, there has been renewed interest in Peirce’s thought.

* * *

For general works on pragmatism (which include sections on Peirce and which place his thought in a wider context), see Edward C. Moore, *American Pragmatism: Peirce, James and Dewey* (New York: Columbia University Press, 1961); H.S. Thayer, “Pragmatism,” in D.J. O’Connor, ed., *A Critical History of Western Philosophy* (New York: The Free Press, 1964); Amelie O. Rorty, ed., *Pragmatic Philosophy* (New York: Anchor Doubleday, 1966); Frederick Copleston, *A History of Philosophy*, Vol. VIII (Garden City, NY: Anchor Doubleday, 1967); A.J. Ayer, *The Origins of Pragmatism: Studies in the Philosophy of Charles Sanders Peirce and William James* (San Francisco: Freeman, Cooper, 1968); H.S. Thayer, *Meaning and Action: A Critical History of Pragmatism* (Indianapolis, IN: Bobbs-Merrill, 1968); Charles Moore, *The Pragmatic Movement in America* (New York: George Braziller, 1970); Israel Scheffler, *Four Pragmatists: A Critical Introduction to Peirce, James, Mead, and Dewey* (New York: Humanities Press, 1974); John E. Smith, *Purpose and Thought: The Meaning of Pragmatism* (New Haven, CT: Yale University Press,

1978); and Richard Rorty, *The Consequences of Pragmatism* (Minneapolis: University of Minnesota Press, 1982).

All of Peirce's works have been collected in the eight-volume set, *Collected Papers of Charles Sanders Peirce*, edited by Charles Hartshorne and Paul Weiss (Cambridge, MA: Harvard University Press, 1931–1935, 1958)—Volumes I, V, and VI contain the most important philosophical material. For a biography of Peirce, see Joseph Brent, *Charles Sanders Peirce: A Life* (Bloomington: Indiana University Press, 1993). The most comprehensive study of Peirce is James Feibleman, *An Introduction to Peirce's Philosophy* (New York: Harper & Brothers, 1946), whereas Manley Thompson, *The Pragmatic Philosophy of C.S. Peirce* (Chicago: University of Chicago Press, 1953); W.B. Gallie, *Peirce and Pragmatism* (New York: Dover, 1966); Robert F. Almeder, *The Philosophy of Charles S. Peirce: A Critical Introduction* (Totowa, NJ: Rowman and Littlefield, 1980); and Christopher Hookway, *Peirce* (New York: Routledge, 1985) provide helpful introductions. For collections of essays, see Philip P. Wiener and Frederic H. Young, eds., *Studies in the Philosophy of Charles Sanders Peirce* (Cambridge, MA: Harvard University Press, 1952); Edward C. Moore and Richard S. Robin, eds., *Studies in the Philosophy of Charles Sanders Peirce, Second Series* (Amherst: University of Massachusetts Press, 1964); and Richard J. Bernstein, ed., *Perspectives on Peirce* (New Haven, CT: Yale University Press, 1965).

THE FIXATION OF BELIEF

Few persons care to study logic, because everybody conceives himself to be proficient enough in the art of reasoning already. But I observe that this satisfaction is limited to one's own ratiocination, and does not extend to that of other men.

We come to the full possession of our power of drawing inferences, the last of all our faculties; for it is not so much a natural gift as a long and difficult art. The history of its practice would make a grand subject for a book. The medieval schoolman, following the Romans, made logic the earliest of a boy's studies after grammar, as being very easy. So it was as they understood it. Its fundamental principle, according to them, was, that all knowledge rests either on authority or reason; but that whatever is deduced by reason depends ultimately on a premiss derived from authority. Accordingly, as soon as a boy was perfect in the syllogistic procedure, his intellectual kit of tools was held to be complete.

To Roger Bacon, that remarkable mind who in the middle of the thirteenth century was almost a scientific man, the schoolmen's conception of reasoning appeared only an obstacle to truth. He saw that experience alone teaches anything—a proposition which to us seems easy to understand, because a distinct conception of experience has been handed down to us from former generations; which to him likewise seemed perfectly clear, because its difficulties had not yet unfolded themselves. Of all kinds of experience, the best, he thought, was interior illumination, which teaches many things about Nature which the external senses could never discover, such as the transubstantiation of bread.

Four centuries later, the more celebrated Bacon, in the first book of his *Novum Organum*, gave his clear account of experience as something which must be open to verification and reexamination. But, superior as Lord Bacon's conception is to earlier

notions, a modern reader who is not in awe of his grandiloquence is chiefly struck by the inadequacy of his view of scientific procedure. That we have only to make some crude experiments, to draw up briefs of the results in certain blank forms, to go through these by rule, checking off everything disproved and setting down the alternatives, and that thus in a few years physical science would be finished up—what an idea! “He wrote on science like a Lord Chancellor,” indeed, as Harvey, a genuine man of science said.

The early scientists, Copernicus, Tycho Brahe, Kepler, Galileo, Harvey, and Gilbert, had methods more like those of their modern brethren. Kepler undertook to draw a curve through the places of Mars, and to state the times occupied by the planet in describing the different parts of the curve; but perhaps his greatest service to science was in impressing on men’s minds that this was the thing to be done if they wished to improve astronomy; that they were not to content themselves with inquiring whether one system of epicycles was better than another but that they were to sit down to the figures and find out what the curve, in truth, was. He accomplished this by his incomparable energy and courage, blundering along in the most inconceivable way (to us), from one irrational hypothesis to another, until, after trying twenty-two of these, he fell, by the mere exhaustion of his invention, upon the orbit which a mind well furnished with the weapons of modern logic would have tried almost at the outset.

In the same way, every work of science great enough to be well remembered for a few generations affords some exemplification of the defective state of the art of reasoning of the time when it was written; and each chief step in science has been a lesson in logic. It was so when Lavoisier and his contemporaries took up the study of Chemistry. The old chemist’s maxim had been, “*Lege, lege, lege, labora, ora, et relege.*” Lavoisier’s method was not to read and pray, but to dream that some long and complicated chemical process would have a certain effect, to put it into practice with dull patience, after its inevitable failure, to dream that with some modification it would have another result, and to end by publishing the last dream as a fact: his way was to carry his mind into his laboratory, and literally to make of his alembics and cucurbits instruments of thought, giving a new conception of reasoning as something which was to be done with one’s eyes open, in manipulating real things instead of words and fancies.

The Darwinian controversy is, in large part, a question of logic. Mr. Darwin proposed to apply the statistical method to biology. The same thing has been done in a widely different branch of science, the theory of gases. Though unable to say what the movements of any particular molecule of gas would be on a certain hypothesis regarding the constitution of this class of bodies, Clausius and Maxwell were yet able, eight years before the publication of Darwin’s immortal work, by the application of the doctrine of probabilities, to predict that in the long run such and such a proportion of the molecules would, under given circumstances, acquire such and such velocities; that there would take place, every second, such and such a number of collisions, etc.; and from these propositions were able to deduce certain properties of gases, especially in regard to their heat-relations. In like manner, Darwin, while unable to say what the operation of variation and natural selection in any individual case will be, demonstrates that in the long run they will, or would, adapt animals to their circumstances. Whether or not existing animal forms are due to such action, or what position the theory ought to take, forms the subject of a discussion in which questions of fact and questions of logic are curiously interlaced.

The object of reasoning is to find out, from the consideration of what we already know, something else which we do not know. Consequently, reasoning is good if it be such as to give a true conclusion from true premisses, and not otherwise. Thus, the question of validity is purely one of fact and not of thinking. A being the facts stated in the premisses and B being that concluded, the question is, whether these facts are really

so related that if A were B would generally be. If so, the inference is valid; if not, not. It is not in the least the question whether, when the premisses are accepted by the mind, we feel an impulse to accept the conclusion also. It is true that we do generally reason correctly by nature. But that is an accident; the true conclusion would remain true if we had no impulse to accept it; and the false one would remain false, though we could not resist the tendency to believe in it.

We are, doubtless, in the main logical animals, but we are not perfectly so. Most of us, for example, are naturally more sanguine and hopeful than logic would justify. We seem to be so constituted that in the absence of any facts to go upon we are happy and self-satisfied; so that the effect of experience is continually to contract our hopes and aspirations. Yet a lifetime of the application of this corrective does not usually eradicate our sanguine disposition. Where hope is unchecked by any experience, it is likely that our optimism is extravagant. Logicality in regard to practical matters (if this be understood, not in the old sense, but as consisting in a wise union of security with fruitfulness of reasoning) is the most useful quality an animal can possess, and might, therefore, result from the action of natural selection; but outside of these it is probably of more advantage to the animal to have his mind filled with pleasing and encouraging visions, independently of their truth; and thus, upon unpractical subjects, natural selection might occasion a fallacious tendency of thought.

That which determines us, from given premisses, to draw one inference rather than another, is some habit of mind, whether it be constitutional or acquired. The habit is good or otherwise, according as it produces true conclusions from true premisses or not; and an inference is regarded as valid or not, without reference to the truth or falsity of its conclusion specially, but according as the habit which determines it is such as to produce true conclusions in general or not. The particular habit of mind which governs this or that inference may be formulated in a proposition whose truth depends on the validity of the inferences which the habit determines; and such a formula is called a *guiding principle* of inference. Suppose, for example, that we observe that a rotating disk of copper quickly comes to rest when placed between the poles of a magnet, and we infer that this will happen with every disk of copper. The guiding principle is, that what is true of one piece of copper is true of another. Such a guiding principle with regard to copper would be much safer than with regard to many other substances—brass, for example.

A book might be written to signalize all the most important of these guiding principles of reasoning. It would probably be we must confess, of no service to a person whose thought is directed wholly to practical subjects, and whose activity moves along thoroughly-beaten paths. The problems that present themselves to such a mind are matters of routine which he has learned once for all to handle in learning his business. But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will go, or even carry him entirely astray. He is like a ship in the open sea, with no one on board who understands the rules of navigation. And in such a case some general study of the guiding principles of reasoning would be sure to be found useful.

The subject could hardly be treated, however, without being first limited; since almost any fact may serve as a guiding principle. But it so happens that there exists a division among facts, such that in one class are all those which are absolutely essential as guiding principles, while in the others are all which have any other interest as objects of research. This division is between those which are necessarily taken for granted in asking why a certain conclusion is thought to follow from certain premisses, and those which are not implied in such a question. A moment's thought will show that a variety of facts are already assumed when the logical question is first asked. It is implied, for instance, that

there are such states of mind as doubt and belief—that a passage from one to the other is possible, the object of thought remaining the same, and that this transition is subject to some rules by which all minds are alike bound. As these are facts which we must already know before we can have any clear conception of reasoning at all, it cannot be supposed to be any longer of much interest to inquire into their truth or falsity. On the other hand, it is easy to believe that those rules of reasoning which are deduced from the very idea of the process are the ones which are the most essential; and, indeed, that so long as it conforms to these it will, at least, not lead to false conclusions from true premisses. In point of fact, the importance of what may be deduced from the assumptions involved in the logical question turns out to be greater than might be supposed, and this for reasons which it is difficult to exhibit at the outset. The only one which I shall here mention is, that conceptions which are really products of logical reflection, without being readily seen to be so, mingle with our ordinary thoughts, and are frequently the causes of great confusion. This is the case, for example, with the conception of quality. A quality, as such, is never an object of observation. We can see that a thing is blue or green, but the quality of being blue and the quality of being green are not things which we see; they are products of logical reflections. The truth is, that common-sense, or thought as it first emerges above the level of the narrowly practical, is deeply imbued with that bad logical quality to which the epithet *metaphysical* is commonly applied; and nothing can clear it up but a severe course of logic.

We generally know when we wish to ask a question and when we wish to pronounce a judgment, for there is a dissimilarity between the sensation of doubting and that of believing.

But this is not all which distinguishes doubt from belief. There is a practical difference. Our beliefs guide our desires and shape our actions. The Assassins, or followers of the Old Man of the Mountain, used to rush into death at his least command, because they believed that obedience to him would insure everlasting felicity. Had they doubted this, they would not have acted as they did. So it is with every belief, according to its degree. The feeling of believing is a more or less sure indication of there being established in our nature some habit which will determine our actions. Doubt never has such an effect.

Nor must we overlook a third point of difference. Doubt is an uneasy and dissatisfied state from which we struggle to free ourselves and pass into the state of belief; while the latter is a calm and satisfactory state which we do not wish to avoid, or to change to a belief in anything else. On the contrary, we cling tenaciously, not merely to believing, but to believing just what we do believe.

Thus, both doubt and belief have positive effects upon us, though very different ones. Belief does not make us act at once, but puts us into such a condition that we shall behave in some certain way, when the occasion arises. Doubt has not the least such active effect, but stimulates us to inquiry until it is destroyed. This reminds us of the irritation of a nerve and the reflex action produced thereby; while for the analogue of belief, in the nervous system, we must look to what are called nervous associations—for example, to that habit of the nerves in consequence of which the smell of a peach will make the mouth water.

The irritation of doubt causes a struggle to attain a state of belief. I shall term this struggle *Inquiry*, though it must be admitted that this is sometimes not a very apt designation.

The irritation of doubt is the only immediate motive for the struggle to attain belief. It is certainly best for us that our beliefs should be such as may truly guide our actions so as to satisfy our desires; and this reflection will make us reject every belief which does not seem to have been so formed as to insure this result. But it will only do so by creating a doubt in the place of that belief. With the doubt, therefore, the struggle begins, and with the cessation of doubt it ends. Hence, the sole object of inquiry is the settlement of

opinion. We may fancy that this is not enough for us, and that we seek, not merely an opinion, but a true opinion. But put this fancy to the test, and it proves groundless; for as soon as a firm belief is reached we are entirely satisfied, whether the belief be true or false. And it is clear that nothing out of the sphere of our knowledge can be our object, for nothing which does not affect the mind can be the motive for mental effort. The most that can be maintained is, that we seek for a belief that we shall *think* to be true. But we think each one of our beliefs to be true, and, indeed, it is mere tautology to say so.

That the settlement of opinion is the sole end of inquiry is a very important proposition. It sweeps away, at once, various vague and erroneous conceptions of proof. A few of these may be noticed here.

1. Some philosophers have imagined that to start an inquiry it was only necessary to utter a question whether orally or by setting it down upon paper, and have even recommended us to begin our studies with questioning everything! But the mere putting of a proposition into the interrogative form does not stimulate the mind to any struggle after belief. There must be a real and living doubt, and without this all discussion is idle.

2. It is a very common idea that a demonstration must rest on some ultimate and absolutely indubitable propositions. These, according to one school, are first principles of a general nature; according to another, are first sensations. But, in point of fact, an inquiry, to have that completely satisfactory result called demonstration, has only to start with propositions perfectly free from all actual doubt. If the premisses are not in fact doubted at all, they cannot be more satisfactory than they are.

3. Some people seem to love to argue a point after all the world is fully convinced of it. But no further advance can be made. When doubt ceases, mental action on the subject comes to an end; and, if it did go on, it would be without a purpose.

If the settlement of opinion is the sole object of inquiry, and if belief is of the nature of a habit, why should we not attain the desired end, by taking as answer to a question any we may fancy, and constantly reiterating it to ourselves, dwelling on all which may conduce to that belief, and learning to turn with contempt and hatred from anything that might disturb it? This simple and direct method is really pursued by many men. I remember once being entreated not to read a certain newspaper lest it might change my opinion upon free-trade. "Lest I might be entrapped by its fallacies and misstatements," was the form of expression. "You are not," my friend said, "a special student of political economy. You might, therefore, easily be deceived by fallacious arguments upon the subject. You might, then, if you read this paper, be led to believe in protection. But you admit that free-trade is the true doctrine; and you do not wish to believe what is not true." I have often known this system to be deliberately adopted. Still oftener, the instinctive dislike of an undecided state of mind, exaggerated into a vague dread of doubt, makes men cling spasmodically to the views they already take. The man feels that, if he only holds to his belief without wavering, it will be entirely satisfactory. Nor can it be denied that a steady and immovable faith yields great peace of mind. It may, indeed, give rise to inconveniences, as if a man should resolutely continue to believe that fire would not burn him, or that he would the man who adopts this method will not allow that its inconveniences are greater than its advantages. He will say, "I hold steadfastly to the truth, and the truth is always wholesome." And in many cases it may very well be that the pleasure he derives from his calm faith overbalances any inconveniences resulting from its deceptive character. Thus, if it be true that death is annihilation, then the man who believes that he will certainly go straight to heaven when he dies, provided he has fulfilled certain simple observances in this life, has a cheap pleasure which will not be followed by the least disappointment. A similar consideration seems to have weight with many persons in religious topics, for we frequently hear it said, "Oh, I could

not believe so-and-so, because I should be wretched if I did." When an ostrich buries its head in the sand as danger approaches, it very likely takes the happiest course. It hides the danger, and then calmly says there is no danger; and, if it feels perfectly sure there is none, why should it raise its head to see? A man may go through life, systematically keeping out of view all that might cause a change in his opinions, and if he only succeeds—basing his method, as he does, on two fundamental psychological laws—I do not see what can be said against his doing so. It would be an egotistical impertinence to object that his procedure is irrational, for that only amounts to saying that his method of settling belief is not ours. He does not propose to himself to be rational, and, indeed, will often talk with scorn of man's weak and illusive reason. So let him think as he pleases.

But this method of fixing belief, which may be called the method of tenacity, will be unable to hold its ground in practice. The social impulse is against it. The man who adopts it will find that other men think differently from him, and it will be apt to occur to him, in some saner moment, that their opinions are quite as good as his own, and this will shake his confidence in his belief. This conception, that another man's thought or sentiment may be equivalent to one's own, is a distinctly new step, and a highly important one. It arises from an impulse too strong in man to be suppressed without danger of destroying the human species. Unless we make ourselves hermits we shall necessarily influence each other's opinions; so that the problem becomes how to fix belief, not in the individual merely, but in the community.

Let the will of the state act, then? instead of that of the individual. Let an institution be created which shall have for its object to keep correct doctrines before the attention of the people, to reiterate them perpetually, and to teach them to the young; having at the same time power to prevent contrary doctrines from being taught, advocated, or expressed. Let all possible causes of a change of mind be removed from men's apprehensions. Let them be kept ignorant, lest they should learn of some reason to think otherwise than they do. Let their passions be enlisted, so that they may regard private and unusual opinions with hatred and horror. Then, let all men who reject the established belief be terrified into silence. Let the people turn out and tar-and-feather such men, or let inquisitions be made into the manner of thinking of suspected persons, and when they are found guilty of forbidden beliefs, let them be subjected to some signal punishment. When complete agreement could not otherwise be reached, a general massacre of all who have not thought in a certain way has proved a very effective means of settling opinion in a country. If the power to do this be wanting, let a list of opinions be drawn up, to which no man of the least independence of thought can assent, and let the faithful be required to accept all these propositions, in order to segregate them as radically as possible from the influence of the rest of the world.

This method has, from the earliest times, been one of the chief means of upholding correct theological and political doctrines, and of preserving their universal or catholic character. In Rome, especially, it has been practised from the days of Numa Pompilius to those of Pius Nonus. This is the most perfect example in history; but wherever there is a priesthood—and no religion has been without one—this method has been more or less made use of. Wherever there is an aristocracy, or a guild, or any association of a class of men whose interests depend, or are supposed to depend, on certain propositions, there will be inevitably found some traces of this natural product of social feeling. Cruelties always accompany this system; and when it is consistently carried out, they become atrocities of the most horrible kind in the eyes of any rational man. Nor should this occasion surprise, for the officer of a society does not feel justified in surrendering the interests of that society for the sake of mercy, as he might his own private interests. It is natural, therefore, that sympathy and fellowship should thus produce a most ruthless power.

In judging this method of fixing belief, which may be called the method of authority, we must, in the first place, allow its immeasurable mental and moral superiority to the method of tenacity. Its success is proportionately greater; and, in fact, it has over and over again worked the most majestic results. The mere structures of stone which it has caused to be put together—in Siam, for example, in Egypt, and in Europe—have many of them a sublimity hardly more than rivaled by the greatest works of Nature. And, except the geological epochs, there are no periods of time so vast as those which are measured by some of these organized faiths. If we scrutinize the matter closely, we shall find that there has not been one of their creeds which has remained always the same; yet the change is so slow as to be imperceptible during one person's life, so that individual belief remains sensibly fixed. For the mass of mankind, then, there is perhaps no better method than this. If it is their highest impulse to be intellectual slaves, then slaves they ought to remain.

But no institution can undertake to regulate opinions upon every subject. Only the most important ones can be attended to, and on the rest men's minds must be left to the action of natural causes. This imperfection will be no source of weakness so long as men are in such a state of culture that one opinion does not influence another—that is, so long as they cannot put two and two together. But in the most priest ridden states some individuals will be found who are raised above that condition. These men possess a wider sort of social feeling; they see that men in other countries and in other ages have held to very different doctrines from those which they themselves have been brought up to believe; and they cannot help seeing that it is the mere accident of their having been taught as they have, and of their having been surrounded with the manners and associations they have, that has caused them to believe as they do and not far differently. Nor can their candour resist the reflection that there is no reason to rate their own views at a higher value than those of other nations and other centuries; thus giving rise to doubts in their minds.

They will further perceive that such doubts as these must exist in their minds with reference to every belief which seems to be determined by the caprice either of themselves or of those who originated the popular opinions. The willful adherence to a belief, and the arbitrary forcing of it upon others, must, therefore, both be given up. A different new method of settling opinions must be adopted, that shall not only produce an impulse to believe, but shall also decide what proposition it is which is to be believed. Let the action of natural preferences be unimpeded, then, and under their influence let men, conversing together and regarding matters in different lights, gradually develop beliefs in harmony with natural causes. This method resembles that by which conceptions of art have been brought to maturity. The most perfect example of it is to be found in the history of metaphysical philosophy. Systems of this sort have not usually rested upon any observed facts, at least not in any great degree. They have been chiefly adopted because their fundamental propositions seemed "agreeable to reason." This is an apt expression; it does not mean that which agrees with experience, but that which we find ourselves inclined to believe. Plato, for example, finds it agreeable to reason that the distances of the celestial spheres from one another should be proportional to the different lengths of strings which produce harmonious chords. Many philosophers have been led to their main conclusions by considerations like this; but this is the lowest and least developed form which the method takes, for it is clear that another man might find Kepler's theory, that the celestial spheres are proportional to the inscribed and circumscribed spheres of the different regular solids, more agreeable to *his* reason. But the shock of opinions will soon lead men to rest on preferences of a far more universal nature. Take, for example, the doctrine that man only acts selfishly—that is, from the consideration that acting in

one way will afford him more pleasure than acting in another. This rests on no fact in the world, but it has had a wide acceptance as being the only reasonable theory.

This method is far more intellectual and respectable from the point of view of reason than either of the others which we have noticed. Indeed, as long as no better method can be applied, it ought to be followed, since it is then the expression of instinct which must be the ultimate cause of belief in all cases. But its failure has been the most manifest. It makes of inquiry something similar to the development of taste; but taste, unfortunately, is always more or less a matter of fashion, and accordingly metaphysicians have never come to any fixed agreement, but the pendulum has swung backward and forward between a more material and a more spiritual philosophy, from the earliest times to the latest. And so from this, which has been called the *a priori* method, we are driven, in Lord Bacon's phrase, to a true induction. We have examined this *a priori* method as something which promised to deliver our opinions from their accidental and capricious element. But development, while it is a process which eliminates the effect of some casual circumstances, only magnifies that of others. This method, therefore, does not differ in a very essential way from that of authority. The government may not have lifted its finger to influence my convictions; I may have been left outwardly quite free to choose, we will say, between monogamy and polygamy, and, appealing to my conscience only, I may have concluded that the latter practice is in itself licentious. But when I come to see that the chief obstacle to the spread of Christianity among a people of as high culture as the Hindoos has been a conviction of the immorality of our way of treating women, I cannot help seeing that, though governments do not interfere, sentiments in their development will be very greatly determined by accidental causes. Now, there are some people, among whom I must suppose that my reader is to be found, who, when they see that any belief of theirs is determined by any circumstance extraneous to the facts, will from that moment not merely admit in words that that belief is doubtful, but will experience a real doubt of it, so that it ceases in some degree at least to be a belief.

To satisfy our doubts, therefore, it is necessary that a method should be found by which our beliefs may be determined by nothing human, but by some external permanency—by something upon which our thinking has no effect. Some mystics imagine that they have such a method in a private inspiration from on high. But that is only a form of the method of tenacity, in which the conception of truth as something public is not yet developed. Our external permanency would not be external, in our sense, if it was restricted in its influence to one individual. It must be something which affects, or might affect, every man. And, though these affections are necessarily as various as are individual conditions, yet the method must be such that the ultimate conclusion of every man shall be the same. Such is the method of science. Its fundamental hypothesis, restated in more familiar language, is this: There are Real things, whose characters are entirely independent of our opinions about them; those Reals affect our senses according to regular laws, and, though our sensations are as different as our relations to the objects, yet, by taking advantage of the laws of perception, we can ascertain by reasoning how things really and truly are; and any man, if he have sufficient experience and he reason enough about it, will be led to the one True conclusion. The new conception here involved is that of Reality. It may be asked how I know that there are any Reals. If this hypothesis is the sole support of my method of inquiry, my method of inquiry must not be used to support my hypothesis. The reply is this: 1. If investigation cannot be regarded as proving that there are Real things, it at least does not lead to a contrary conclusion; but the method and the conception on which it is based remain ever in harmony. No doubts of the method, therefore, necessarily arise from its practice, as is the case

with all the others. 2. The feeling which gives rise to any method of fixing belief is a dissatisfaction at two repugnant propositions. But here already is a vague concession that there is some *one* thing which a proposition should represent. Nobody, therefore, can really doubt that there are Reals, for, if he did, doubt would not be a source of dissatisfaction. The hypothesis, therefore, is one which every mind admits. So that the social impulse does not cause men to doubt it. 3. Everybody uses the scientific method about a great many things, and only ceases to use it when he does not know how to apply it. 4. Experience of the method has not led us to doubt it, but, on the contrary, scientific investigation has had the most wonderful triumphs in the way of settling opinion. These afford the explanation of my not doubting the method or the hypothesis which it supposes; and not having any doubt, nor believing that anybody else whom I could influence has, it would be the merest babble for me to say more about it. If there be anybody with a living doubt upon the subject, let him consider it.

To describe the method of scientific investigation is the object of this series of papers. At present I have only room to notice some points of contrast between it and other methods of fixing belief.

This is the only one of the four methods which presents any distinction of a right and a wrong way. If I adopt the method of tenacity, and shut myself out from all influences, whatever I think necessary to doing this, is necessary according to that method. So with the method of authority: the state may try to put down heresy by means which, from a scientific point of view, seem very ill-calculated to accomplish its purposes; wrongly. So with the *a priori* method. The very essence of it is to think as one is inclined to think. All metaphysicians will be sure to do that, however they may be inclined to judge each other to be perversely wrong. The Hegelian system recognizes every natural tendency of thought as logical, although it be certain to be abolished by counter-tendencies. Hegel thinks there is a regular system in the succession of these tendencies, in consequence of which, after drifting one way and the other for a long time, opinion will at last go right. And it is true that metaphysicians do get the right ideas at last; Hegel's system of Nature represents tolerably the science of his day; and one may be sure that whatever scientific investigation shall have put out of doubt will presently receive *a priori* demonstration on the part of the metaphysicians. But with the scientific method the case is different. I may start with known and observed facts to proceed to the unknown; and yet the rules which I follow in doing so may not be such as investigation would approve. The test of whether I am truly following the method is not an immediate appeal to my feelings and purposes, but, on the contrary, itself involves the application of the method. Hence it is that bad reasoning as well as good reasoning is possible; and this fact is the foundation of the practical side of logic.

It is not to be supposed that the first three methods of settling opinion present no advantage whatever over the scientific method. On the contrary, each has some peculiar convenience of its own. The *a priori* method is distinguished for its comfortable conclusions. It is the nature of the process to adopt whatever belief we are inclined to, and there are certain flatteries to the vanity of man which we all believe by nature, until we are awakened from our pleasing dream by rough facts. The method of authority will always govern the mass of mankind; and those who wield the various forms of organized force in the state will never be convinced that dangerous reasoning ought not to be suppressed in some way. If liberty of speech is to be untrammelled from the grosser forms of constraint, then uniformity of opinion will be secured by a moral terrorism to which the respectability of society will give its thorough approval. Following the method of authority is the path of peace. Certain non-conformities are permitted; certain others (considered unsafe) are forbidden. These are different in different countries and in different ages; but, wherever

you are, let it be known that you seriously hold a tabooed belief, and you may be perfectly sure of being treated with a cruelty less brutal but more refined than hunting you like a wolf. Thus, the greatest intellectual benefactors of mankind have never dared, and dare not now, to utter the whole of their thought; and thus a shade of *prima facie* doubt is cast upon every proposition which is considered essential to the security of society. Singularly enough, the persecution does not all come from without; but a man torments himself and is oftentimes most distressed at finding himself believing propositions which he has been brought up to regard with aversion. The peaceful and sympathetic man will, therefore, find it hard to resist the temptation to submit his opinions to authority. But most of all I admire the method of tenacity for its strength, simplicity, and directness. Men who pursue it are distinguished for their decision of character, which becomes very easy with such a mental rule. They do not waste time in trying to make up their minds what they want, but, fastening like lightning upon whatever alternative comes first, they hold to it to the end, whatever happens, without an instant's irresolution. This is one of the splendid qualities which generally accompany brilliant, unlasting success. It is impossible not to envy the man who can dismiss reason, although we know how it must turn out at last.

Such are the advantages which the other methods of settling opinion have over scientific investigation. A man should consider well of them; and then he should consider that, after all, he wishes his opinions to coincide with the fact, and that there is no reason why the results of those three first methods should do so. To bring about this effect is the prerogative of the method of science. Upon such considerations he has to make his choice—a choice which is far more than the adoption of any intellectual opinion, which is one of the ruling decisions of his life, to which, when once made, he is bound to adhere. The force of habit will sometimes cause a man to hold on to old beliefs, after he is in a condition to see that they have no sound basis. But reflection upon the state of the case will overcome these habits, and he ought to allow reflection its full weight. People sometimes shrink from doing this, having an idea that beliefs are wholesome which they cannot help feeling rest on nothing. But let such persons suppose an analogous though different case from their own. Let them ask themselves what they would say to a reformed Mussulman who should hesitate to give up his old notions in regard to the relations of the sexes; or to a reformed Catholic who should still shrink from reading the Bible. Would they not say that these persons ought to consider the matter fully, and clearly understand the new doctrine, and then ought to embrace it, in its entirety? But, above all, let it be considered that what is more wholesome than any particular belief is integrity of belief, and that to avoid looking into the support of any belief from a fear that it may turn out rotten is quite as immoral as it is disadvantageous. The person who confesses that there is such a thing as truth, which is distinguished from falsehood simply by this, that if acted on it should, on full consideration, carry us to the point we aim at and not astray, and then, though convinced of this, dares not know the truth and seeks to avoid it, is in a sorry state of mind indeed.

Yes, the other methods do have their merits: a clear logical conscience does cost something—just as any virtue, just as all that we cherish, costs us dear. But we should not desire it to be otherwise. The genius of a man's logical method should be loved and revered as his bride, whom he has chosen from all the world. He need not condemn the others; on the contrary, he may honor them deeply, and in doing so he only honors her the more. But she is the one that he has chosen, and he knows that he was right in making that choice. And having made it, he will work and fight for her, and will not complain that there are blows to take, hoping that there may be as many and as hard to give, and will strive to be the worthy knight and champion of her from the blaze of whose splendors he draws his inspiration and his courage.

WILLIAM JAMES

1842–1910

William James was born into one of the leading families of New York City. His grandfather, a strict Calvinist and also named William, was an Irish immigrant who had amassed a fortune in real estate. His father, Henry, rejected the grandfather's religion and became an unorthodox mystic. His mother, Mary, was also a child of wealth, and his brother, Henry Jr., became a famous novelist. The life of the James family was one of creative anarchy. Their dinner table was animated with lively debate in which the children were expected to hold their own with guests such as Ralph Waldo Emerson, Washington Irving, and Oliver Wendell Holmes. To encourage intellectual freedom, and to avoid the rigidity of his own joyless upbringing, Henry Sr. put his children into as many different schools as possible. The family moved often, restlessly wandering back and forth across the Atlantic, alighting temporarily in London, Paris, New York, Geneva, Newport, Bonn, and Albany.

William James reflected his family's wanderlust in his academic pursuits. He studied art for a time before joining an expedition to the Amazon basin as an apprentice naturalist. He then traveled to Germany to study physiology, before returning to the United States to complete a degree in medicine at Harvard Medical School in 1869. In 1872, James was appointed to teach physiology and anatomy at Harvard. His intellectual roving and his unwillingness to be bound by the usual academic disciplines continued when he moved in 1875 to psychology and later to philosophy. He subsequently marveled at his audacity:

I originally studied medicine in order to be a physiologist, but I drifted into psychology and philosophy from a sort of fatality. I never had any philosophic instruction and the first lecture on psychology I ever heard was the first one I ever gave.

In 1878, James married Alice Howe Gibbens, and they had five children. Although James had experienced ill health as a young man (including smallpox contracted in Brazil), his strength seemed to improve following marriage.

In 1890, William James published his first major work, *The Principles of Psychology*. A two-volume work, *Principles* was one of the first attempts to treat psychology as a legitimate, experimental science, and it quickly became the standard work in the field. James did intense philosophical research over the next seventeen years and published his results: *The Will to Believe and Other Essays* (1897), *Varieties of Religious Experience* (1902), and *Pragmatism* (1907). During this period, he continued to teach at Harvard and to lecture throughout the United States and Europe. Resigning from Harvard in 1907, James gave a series of lectures published as *A Pluralistic Universe* (1909) and *The Meaning of Truth* (1909). James died in 1910, and his last complete work, *Essays in Radical Empiricism*, was published posthumously.

At the time of his death, James was considered the embodiment of American philosophy. All accounts indicate that in addition to his large intellect and breadth of learning, James was a generous, open-minded, and sociable person. One historian of philosophy went so far as to describe him as “one of the sweetest men who ever lived.”

* * *

In his most famous work, the series of lectures published as *Pragmatism*, James develops pragmatism as “a method of settling metaphysical disputes that otherwise might be interminable.” As a theory of meaning, pragmatism asks what practical effects a belief has, whether that belief is tough- or tender-minded. To discover what a belief *means* is to find what difference such a belief makes “in concrete fact and in conduct consequent upon that fact, imposed on somebody, somehow, somewhere, and somewhen.” The proper goal of philosophy is to discover “what definite difference it will make to you and me, at definite instants of our life, if this world-formula or that world-formula be the true one.”

But James went further than Peirce and claims that pragmatism provides a theory of *truth* as well as of meaning. Peirce had continued to hold a traditional correspondence theory of truth: An assertion was true if it corresponded with a fact. Instead, James says that an idea *becomes* true if it allows the individual to gain “satisfactory relations with other parts of our experience.” These relations are not fixed—they are dynamic, just as our experience is dynamic.

Critics have pointed out that James’s theory of pragmatism could be used to make any belief true—provided it produced beneficial results. As H.S. Thayer pointed out, “Standards of veracity thus go slack on the very occasions in which, ordinarily, they need the tightest rein, where passion and personal interests are most in play.”* This fact, along with a number of other objections, led Peirce to change the name of *his* philosophy to “pragmaticism,” to distinguish it from James’s thought. For his part, James claimed that he was only presenting a way of discovering truth, not redefining it.

*H.S. Thayer, “Pragmatism,” in D.J. O’Connor, ed., *A Critical History of Western Philosophy* (New York: The Free Press, 1964), p. 451.

For general works on pragmatism, see the introduction to Peirce (page 1008). For biographies of James, see Gay Wilson Allen, *William James: A Biography* (New York: Viking Press, 1967); Jacques Barzun, *A Stroll with William James* (New York: Harper & Row, 1983); and Daniel W. Bjork, *William James: The Center of His Vision* (New York: Columbia University Press, 1988). The standard study of James's thought is Ralph Barton Perry, *The Thought and Character of William James*, 2 vols. (Boston: Little, Brown, 1935). Other general introductions to his thought include Ellen Kappy Suckiel, *The Pragmatic Philosophy of William James* (Notre Dame, IN: University of Notre Dame Press, 1982); Graham Bird, *William James* (London: Routledge & Kegan Paul, 1986); and Gerald E. Myers, *William James: His Life and Thought* (New Haven, CT: Yale University Press, 1986). Collections of essays include Doris Olin, ed., *William James Pragmatism in Focus* (London: Routledge, 1992); Ruth Anna Putnam, ed., *The Cambridge Companion to William James* (Cambridge: Cambridge University Press, 1997); and Phil Oliver, ed., *William James's "Spring of Delight": The Return to Life* (Nashville, TN: Vanderbilt University Press, 2000).

PRAGMATISM (in part)

LECTURE II: WHAT PRAGMATISM MEANS

Some years ago, being with a camping party in the mountains, I returned from a solitary ramble to find every one engaged in a ferocious metaphysical dispute. The *corpus* of the dispute was a squirrel—a live squirrel supposed to be clinging to one side of a tree-trunk; while over against the tree's opposite side a human being was imagined to stand. This human witness tries to get sight of the squirrel by moving rapidly round the tree, but no matter how fast he goes, the squirrel moves as fast in the opposite direction, and always keeps the tree between himself and the man, so that never a glimpse of him is caught. The resultant metaphysical problem now is this: *Does the man go round the squirrel or not?* He goes round the tree, sure enough, and the squirrel is on the tree; but does he go round the squirrel? In the unlimited leisure of the wilderness, discussion had been worn threadbare. Everyone had taken sides, and was obstinate; and the numbers on both sides were even. Each side, when I appeared therefore appealed to me to make it a majority. Mindful of the scholastic adage that whenever you meet a contradiction you must make a distinction, I immediately sought and found one, as follows: "Which party is right," I said, "depends on what you *practically mean* by 'going round' the squirrel. If you mean passing from the north of him to the east, then to the south, then to the west, and then to the north of him again, obviously the man does go round him, for he occupies these successive positions. But if on the contrary you mean being first in front of him, then on the right of him, then behind him, then on his left, and finally in front again, it is quite as obvious that the man fails to go round him, for by the compensating movements the squirrel makes, he keeps his belly turned towards the man all the time, and his back turned away. Make the distinction, and there is no occasion for any

Guaranty Building, Buffalo, New York, 1895, designed by Louis Sullivan (1856–1924). Sullivan's building epitomizes the pragmatic approach to architecture summarized in his famous dictum, "form follows function." Both the exterior and interior designs complement the purpose for which this building was constructed.

farther dispute. You are both right and both wrong according as you conceive the verb 'to go round' in one practical fashion or the other."

Although one or two of the hotter disputants called my speech a shuffling evasion, saying they wanted no quibbling or scholastic hair-splitting, but meant just plain honest English "round," the majority seemed to think that the distinction had assuaged the dispute.

I tell this trivial anecdote because it is a peculiarly simple example of what I wish now to speak of as *the pragmatic method*. The pragmatic method is primarily a method of settling metaphysical disputes that otherwise might be interminable. Is the world one or many?—fated or free?—material or spiritual?—here are notions either of which may or may not hold good of the world; and disputes over such notions are unending. The pragmatic method in such cases is to try to interpret each notion by tracing its respective practical consequences. What difference would it practically make to any one if this notion rather than that notion were true? If no practical difference whatever can be traced, then the alternatives mean practically the same thing, and all dispute is idle. Whenever a dispute is serious, we ought to be able to show some practical difference that must follow from one side or the other's being right.

A glance at the history of the idea will show you still better what pragmatism means. The term is derived from the same Greek word *pragma*, meaning action, from which our words "practice" and "practical" come. It was first introduced into philosophy by Mr. Charles Peirce in 1878. In an article entitled "How to Make Our Ideas Clear," in the "Popular Science Monthly" for January of that year. Mr. Peirce, after pointing out that our beliefs are really rules for action, said that, to develop a thought's meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance. And the tangible fact at the root of all our thought-distinctions, however subtle, is that there is no one of them so fine as to consist in anything but a possible difference of practice. To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve—what sensations we are to expect from it, and what reactions we must prepare. Our conception of these effects, whether immediate or remote, is then for us the whole of our conception of the object, so far as that conception has positive significance at all.

This is the principle of Peirce, the principle of pragmatism. It lay entirely unnoticed by any one for twenty years, until I, in an address before Professor Howison's philosophical union at the University of California, brought it forward again and made a special application of it to religion. By that date (1898) the times seemed ripe for its reception. The word "pragmatism" spread, and at present it fairly spots the pages of the philosophic journals. On all hands we find the "pragmatic movement" spoken of, sometimes with respect, sometimes with contumely, seldom with clear understanding. It is evident that the term applies itself conveniently to a number of tendencies that hitherto have lacked a collective name, and that it has "come to stay."

To take in the importance of Peirce's principle, one must get accustomed to applying it to concrete cases. I found a few years ago that Ostwald, the illustrious Leipzig chemist, had been making perfectly distinct use of the principle of pragmatism in his lectures on the philosophy of science, though he had not called it by that name.

"All realities influence our practice," he wrote me, "and that influence is their meaning for us. I am accustomed to put questions to my classes in this way: In what respects would the world be different if this alternative or that were true? If I can find nothing that would become different, then the alternative has no sense."

That is, the rival views mean practically the same thing, and meaning, other than practical, there is for us none. Ostwald in a published lecture gives this example of what he means. Chemists have long wrangled over the inner constitution of certain bodies called “tautomers.” Their properties seemed equally consistent with the notion that an instable hydrogen atom oscillates inside of them, or that they are instable mixtures of two bodies. Controversy raged, but never was decided. “It would never have begun,” says Ostwald, “if the combatants had asked themselves what particular experimental fact could have been made different by one or the other view being correct. For it would then have appeared that no difference of fact could possibly ensue; and the quarrel was as unreal as if, theorizing in primitive times about the raising of dough by yeast, one party should have invoked a ‘brownie,’ while another insisted on an ‘elf’ as the true cause of the phenomenon.”*

It is astonishing to see how many philosophical disputes collapse into insignificance the moment you subject them to this simple test of tracing a concrete consequence. There can be no difference anywhere that doesn’t *make* a difference elsewhere—no difference in abstract truth that doesn’t express itself in a difference in concrete fact and in conduct consequent upon that fact, imposed on somebody, somehow, somewhere, and sometime. The whole function of philosophy ought to be to find out what definite difference it will make to you and me, at definite instants of our life, if this world-formula or that world-formula be the true one.

There is absolutely nothing new in the pragmatic method. Socrates was an adept at it. Aristotle used it methodically. Locke, Berkeley, and Hume made momentous contributions to truth by its means. Shadworth Hodgson keeps insisting that realities are only what they are “known as.” But these forerunners of pragmatism used it in fragments: they were preluders only. Not until in our time has it generalized itself, become conscious of a universal mission, pretended to a conquering destiny. I believe in that destiny, and I hope I may end by inspiring you with my belief.

Pragmatism represents a perfectly familiar attitude in philosophy, the empiricist attitude, but it represents it, as it seems to me, both in a more radical and in a less objectionable form than it has ever yet assumed. A pragmatist turns his back resolutely and once for all upon a lot of inveterate habits dear to professional philosophers. He turns away from abstraction and insufficiency, from verbal solutions, from bad *a priori* reasons, from fixed principles, closed systems, and pretended absolutes and origins. He turns towards concreteness and adequacy, towards facts, towards action and towards power. That means the empiricist temper regnant and the rationalist temper sincerely given up. It means the open air and possibilities of nature, as against dogma, artificiality, and the pretence of finality in truth.

At the same time it does not stand for any special results. It is a method only. But the general triumph of that method would mean an enormous change in what I called in my last lecture the “temperament” of philosophy. Teachers of the ultra-rationalistic type would be frozen out, much as the courtier type is frozen out in republics, as the ultra-montane type of priest is frozen out in protestant lands. Science and metaphysics would come much nearer together, would in fact work absolutely hand in hand.

*“Theorie und Praxis,” *Zeitsch. Des Oesterreichischen Ingenieur u. Architekten-Vereines*, 1905, Nr. 4 u. 6. I find a still more radical pragmatism than Ostwald’s in an address by Professor W.S. Franklin: “I think that the sickliest notion of physics, even if a student gets it, is that it is ‘the science of masses, molecules, and the ether.’ And I think that the healthiest notion, even if a student does not wholly get it, is that physics is the science of the ways of taking hold of bodies and pushing them!” (*Science*, January 2, 1903).

Metaphysics has usually followed a very primitive kind of quest. You know how men have always hankered after unlawful magic, and you know what a great part in magic *words* have always played. If you have his name, or the formula of incantation that binds him, you can control the spirit, genie, afrite, or whatever the power may be. Solomon knew the names of all the spirits, and having their names, he held them subject to his will. So the universe has always appeared to the natural mind as a kind of enigma, of which the key must be sought in the shape of some illuminating or power-bringing word or name. That word names the universe's *principle*, and to possess it is after a fashion to possess the universe itself. "God," "Matter," "Reason," "the Absolute," "Energy," are so many solving names. You can rest when you have them. You are at the end of your metaphysical quest.

But if you follow the pragmatic method, you cannot look on any such word as closing your quest. You must bring out of each word its practical cash-value, set it at work within the stream of your experience. It appears less as a solution, then, than as a program for more work, and more particularly as an indication of the ways in which existing realities may be *changed*.

Theories thus become instruments, not answers to enigmas, in which we can rest. We don't lie back upon them, we move forward, and, on occasion, make nature over again by their aid. Pragmatism unstiffens all our theories, limbers them up and sets each one at work. Being nothing essentially new, it harmonizes with many ancient philosophic tendencies. It agrees with nominalism for instance, in always appealing to particulars; with utilitarianism in emphasizing practical aspects; with positivism in its disdain for verbal solutions, useless questions and metaphysical abstractions.

All these, you see, are *anti-intellectualist* tendencies. Against rationalism as a pretension and a method pragmatism is fully armed and militant. But, at the outset, at least, it stands for no particular results. It has no dogmas, and no doctrines save its method. As the young Italian pragmatist Papini has well said, it lies in the midst of our theories, like a corridor in a hotel. Innumerable chambers open out of it. In one you may find a man writing an atheistic volume; in the next some one on his knees praying for faith and strength; in a third a chemist investigating a body's properties. In a fourth a system of idealistic metaphysics is being excogitated; in a fifth the impossibility of metaphysics is being shown. But they all own the corridor, and all must pass through it if they want a practicable way of getting into or out of their respective rooms.

No particular results then, so far, but only an attitude of orientation, is what the pragmatic method means. *The attitude of looking away from first things, principles, "categories," supposed necessities; and of looking towards last things, fruits, consequences, facts.*

So much for the pragmatic method! You may say that I have been praising it rather than explaining it to you, but I shall presently explain it abundantly enough by showing how it works on some familiar problems. Meanwhile the word pragmatism has come to be used in a still wider sense, as meaning also a certain *theory of truth*. I mean to give a whole lecture to the statement of that theory, after first paving the way, so I can be very brief now. But brevity is hard to follow, so I ask for your redoubled attention for a quarter of an hour. If much remains obscure, I hope to make it clearer in the later lectures.

One of the most successfully cultivated branches of philosophy in our time is what is called inductive logic, the study of the conditions under which our sciences have evolved. Writers on this subject have begun to show a singular unanimity as to what the laws of nature and elements of fact mean, when formulated by mathematicians, physicists and chemists. When the first mathematical, logical, and natural uniformities, the

first *laws*, were discovered, men were so carried away by the clearness, beauty and simplification that resulted, that they believed themselves to have deciphered authentically the eternal thoughts of the Almighty. His mind also thundered and reverberated in syllogisms. He also thought in conic sections, squares and roots and ratios, and geometrized like Euclid. He made Kepler's laws for the planets to follow; he made velocity increase proportionally to the time in falling bodies; he made the law of the sines for light to obey when refracted; he established the classes, orders, families and genera of plants and animals, and fixed the distances between them. He thought the archetypes of all things, and devised their variations; and when we rediscover any one of these his wondrous institutions, we seize his mind in its very literal intention.

But as the sciences have developed farther, the notion has gained ground that most, perhaps all, of our laws are only approximations. The laws themselves, moreover, have grown so numerous that there is no counting them; and so many rival formulations are proposed in all the branches of science that investigators have become accustomed to the notion that no theory is absolutely a transcript of reality, but that any one of them may from some point of view be useful. Their great use is to summarize old facts and to lead to new ones. They are only a man-made language, a conceptual shorthand, as some one calls them, in which we write our reports of nature; and languages, as is well known, tolerate much choice of expression and many dialects.

Thus human arbitrariness has driven divine necessity from scientific logic. If I mention the names of Sigwart, Mach, Ostwald, Pearson, Milhaud, Poincare, Duhem, Ruysen, those of you who are students will easily identify the tendency I speak of, and will think of additional names.

Riding now on the front of this wave of scientific logic Messrs. Schiller and Dewey appear with their pragmatistic account of what truth everywhere signifies. Everywhere, these teachers say, "truth" in our ideas and beliefs means the same thing that it means in science. It means, they say, nothing but this, *that ideas (which themselves are but parts of our experience) become true just in so far as they help us to get into satisfactory relation with other parts of our experience*, to summarize them and get about among them by conceptual short-cuts instead of following the interminable succession of particular phenomena. Any idea upon which we can ride, so to speak; any idea that will carry us prosperously from any one part of our experience to any other part, linking things satisfactorily, working securely, simplifying, saving labor; is true for just so much, true in so far forth, true *instrumentally*. This is the "instrumental" view of truth taught so successfully at Chicago, the view that truth in our ideas means their power to "work," promulgated so brilliantly at Oxford.

Messrs. Dewey, Schiller and their allies, in reaching this general conception of all truth, have only followed the example of geologists, biologists and philologists. In the establishment of these other sciences, the successful stroke was always to take some simple process actually observable in operation—as denudation by weather, say, or variation from parental type, or change of dialect by incorporation of new words and pronunciations—and then to generalize it, making it apply to all times, and produce great results by summing its effects through the ages.

The observable process which Schiller and Dewey particularly singled out for generalization is the familiar one by which any individual settles into *new opinions*. The process here is always the same. The individual has a stock of old opinions already, but he meets a new experience that puts them to a strain. Somebody contradicts them; or in a reflective moment he discovers that they contradict each other; or he hears of facts with which they are incompatible; or desires arise in him which they cease to satisfy.

The result is an inward trouble to which his mind till then had been a stranger, and from which he seeks to escape by modifying his previous mass of opinions. He saves as much of it as he can, for in this matter of belief we are all extreme conservatives. So he tries to change first this opinion, and then that (for they resist change very variously), until at last some new idea comes up which he can graft upon the ancient stock with a minimum of disturbance of the latter, some idea that mediates between the stock and the new experience and runs them into one another most felicitously and expeditiously.

This new idea is then adopted as the true one. It preserves the older stock of truths with a minimum of modification, stretching them just enough to make them admit the novelty, but conceiving that in ways as familiar as the case leaves possible. An *outrée* [exaggerated] explanation, violating all our preconceptions, would never pass for a true account of a novelty. We should scratch round industriously till we found something less excentric. The most violent revolutions in an individual's beliefs leave most of his old order standing. Time and space, cause and effect, nature and history, and one's own biography remain untouched. New truth is always a go-between, a smoother-over of transitions. It marries old opinion to new fact so as ever to show a minimum of jolt, a maximum of continuity. We hold a theory true just in proportion to its success in solving this "problem of maxima and minima." But success in solving this problem is eminently a matter of approximation. We say this theory solves it on the whole more satisfactorily than that theory; but that means more satisfactorily to ourselves, and individuals will emphasize their points of satisfaction differently. To a certain degree, therefore, everything here is plastic.

The point I now urge you to observe particularly is the part played by the older truths. Failure to take account of it is the source of much of the unjust criticism levelled against pragmatism. Their influence is absolutely controlling. Loyalty to them is the first principle—in most cases it is the only principle; for by far the most usual way of handling phenomena so novel that they would make for a serious rearrangement of our preconception is to ignore them altogether, or to abuse those who bear witness for them.

You doubtless wish examples of this process of truth's growth, and the only trouble is their superabundance. The simplest case of new truth is of course the mere numerical addition of new kinds of facts, or of new single facts of old kinds, to our experience—an addition that involves no alteration in the old beliefs. Day follows day, and its contents are simply added. The new contents themselves are not true, they simply *come* and *are*. Truth is *what we say about them*, and when we say that they have come, truth is satisfied by the plain additive formula.

But often the day's contents oblige a rearrangement. If I should now utter piercing shrieks and act like a maniac on this platform, it would make many of you revise your ideas as to the probable worth of my philosophy. "Radium" came the other day as part of the day's content, and seemed for a moment to contradict our ideas of the whole order of nature, that order having come to be identified with what is called the conservation of energy. The mere sight of radium paying heat away indefinitely out of its own pocket seemed to violate that conservation. What to think? If the radiations from it were nothing but an escape of unsuspected "potential" energy, pre-existent inside of the atoms, the principle of conservation would be saved. The discovery of "helium" as the radiation's outcome, opened a way to this belief. So Ramsay's view is generally held to be true, because, although it extends our old ideas of energy, it causes a minimum of alteration in their nature.

I need not multiply instances. A new opinion counts as "true" just in proportion as it gratifies the individual's desire to assimilate the novel in his experience to his beliefs

in stock. It must both lean on old truth and grasp new fact; and its success (as I said a moment ago) in doing this, is a matter for the individual's appreciation. When old truth grows, then, by new truth's addition, it is for subjective reasons. We are in the process and obey the reasons. That new idea is truest which performs most felicitously its function of satisfying our double urgency. It makes itself true, gets itself classed as true, by the way it works; grafting itself then upon the ancient body of truth, which thus grows much as a tree grows by the activity of a new layer of cambium.

Now Dewey and Schiller proceed to generalize this observation and to apply it to the most ancient parts of truth. They also once were plastic. They also were called true for human reasons. They also mediated between still earlier truths and what in those days were novel observations. Purely objective truth, truth in whose establishment the function of giving human satisfaction in marrying previous parts of experience with newer parts played no role whatever, is nowhere to be found. The reasons why we call things true is the reason why they are true, for "to be true" means only to perform this marriage-function.

The trail of the human serpent is thus over everything. Truth independent; truth that we *find* merely; truth no longer malleable to human need; truth incorrigible, in a word; such truth exists indeed superabundantly—or is supposed to exist by rationalistically minded thinkers; but then it means only the dead heart of the living tree, and its being there means only that truth also has its paleontology, and its "prescription," and may grow stiff with years of veteran service and petrified in men's regard by sheer antiquity. But how plastic even the oldest truths nevertheless really are has been vividly shown in our day by the transformation of logical and mathematical ideas, a transformation which seems even to be invading physics. The ancient formulas are reinterpreted as special expressions of much wider principles, principles that our ancestors never got a glimpse of in their present shape and formulation.

Mr. Schiller still gives to all this view of truth the name of "Humanism," but, for this doctrine too, the name of pragmatism seems fairly to be in the ascendant, so I will treat it under the name of pragmatism in these lectures.

Such then would be the scope of pragmatism—first, a method; and second, a genetic theory of what is meant by truth. And these two things must be our future topics.

What I have said of the theory of truth will, I am sure, have appeared obscure and unsatisfactory to most of you by reason of its brevity. I shall make amends for that hereafter. In a lecture on "common sense" I shall try to show what I mean by truths grown petrified by antiquity. In another lecture I shall expatiate on the idea that our thoughts become true in proportion as they successfully exert their go between function. In a third I shall show how hard it is to discriminate subjective from objective factors in Truth's development. You may not follow me wholly in these lectures; and if you do, you may not wholly agree with me. But you will, I know, regard me at least as serious, and treat my effort with respectful consideration.

You will probably be surprised to learn, then, that Messrs. Schiller's and Dewey's theories have suffered a hailstorm of contempt and ridicule. All rationalism has risen against them. In influential quarters Mr. Schiller, in particular, has been treated like an impudent schoolboy who deserves a spanking. I should not mention this, but for the fact that it throws so much sidelight upon that rationalistic temper to which I have opposed the temper of pragmatism. Pragmatism is uncomfortable away from facts. Rationalism is comfortable only in the presence of abstractions. This pragmatist talk about truths in the plural, about their utility and satisfactoriness, about the success with which they "work," etc., suggests to the typical intellectualist mind a

sort of coarse lame second-rate makeshift article of truth. Such truths are not real truth. Such tests are merely subjective. As against this, objective truth must be something non-utilitarian, haughty, refined, remote, august, exalted. It must be an absolute correspondence of our thoughts with an equally absolute reality. It must be what we ought to think unconditionally. The conditioned ways in which we do think are so much irrelevance and matter for psychology. Down with psychology, up with logic, in all this question!

See the exquisite contrast of the types of mind! The pragmatist clings to facts and concreteness, observes truth at its work in particular cases, and generalizes. Truth, for him, becomes a class-name for all sorts of definite working-values in experience. For the rationalist it remains a pure abstraction, to the bare name of which we must defer. When the pragmatist undertakes to show in detail just why we must defer, the rationalist is unable to recognize the concretes from which his own abstraction is taken. He accuses us of *denying* truth; whereas we have only sought to trace exactly why people follow it and always ought to follow it. Your typical ultra-abstractionist fairly shudders at concreteness: other things equal, he positively prefers the pale and spectral. If the two universes were offered, he would always choose the skinny outline rather than the rich thicket of reality. It is so much purer, clearer, nobler.

I hope that as these lectures go on, the concreteness and closeness to facts of the pragmatism which they advocate may be what approves itself to you as its most satisfactory peculiarity. It only follows here the example of the sister-sciences, interpreting the unobserved by the observed. It brings old and new harmoniously together. It converts the absolutely empty notion of a static relation of "correspondence" (what that may mean we must ask later) between our minds and reality, into that of a rich and active commerce (that any one may follow in detail and understand) between particular thoughts of ours, and the great universe of other experiences in which they play their parts and have their uses.

But enough of this at present? The justification of what I say must be postponed. I wish now to add a word in further explanation of the claim I made at our last meeting, that pragmatism may be a happy harmonizer of empiricist ways of thinking with the more religious demands of human beings.

Men who are strongly of the fact-loving temperament, you may remember me to have said, are liable to be kept at a distance by the small sympathy with facts which that philosophy from the present-day fashion of idealism offers them. It is far too intellectualistic. Old fashioned theism was bad enough, with its notion of God as an exalted monarch, made up of a lot of unintelligible or preposterous "attributes"; but, so long as it held strongly by the argument from design, it kept some touch with concrete realities. Since, however, Darwinism has once for all displaced design from the minds of the "scientific," theism has lost that foothold; and some kind of an immanent or pantheistic deity working in things rather than above them is, if any, the kind recommended to our contemporary imagination. Aspirants to a philosophic religion turn, as a rule, more hopefully nowadays towards idealistic pantheism than towards the older dualistic theism, in spite of the fact that the latter still counts able defenders.

But, as I said in my first lecture, the brand of pantheism offered is hard for them to assimilate if they are lovers of facts, or empirically minded. It is the absolutistic brand, spurning the dust and reared upon pure logic. It keeps no connexion whatever with concreteness. Affirming the Absolute Mind, which is its substitute for God, to be the rational presupposition of all particulars of fact, whatever they may be, it remains supremely indifferent to what the particular facts in our world actually are. Be they

what they may, the Absolute will father them. Like the sick lion in Esop's fable, all footprints lead into his den, but *nulla vestigia retrorsum* [no footprints were left]. You cannot redescend into the world of particulars by the Absolute's aid, or deduce any necessary consequences of detail important for your life from your idea of his nature. He gives you indeed the assurance that all is well with *Him*, and for his eternal way of thinking; but thereupon he leaves you to be finitely saved by your own temporal devices.

Far be it from me to deny the majesty of this conception, or its capacity to yield religious comfort to a most respectable class of minds. But from the human point of view, no one can pretend that it doesn't suffer from the faults of remoteness and abstractness. It is eminently a product of what I have ventured to call the rationalistic temper. It disdains empiricism's needs. It substitutes a pallid outline for the real world's richness. It is dapper, it is noble in the bad sense, in the sense in which to be noble is to be inapt for humble service. In this real world of sweat and dirt, it seems to me that when a view of things is "noble," that ought to count as a presumption against its truth, and as a philosophic disqualification. The prince of darkness may be a gentleman, as we are told he is, but whatever the God of earth and heaven is, he can surely be no gentleman. His menial services are needed in the dust of our human trials, even more than his dignity is needed in the empyrean.

Now pragmatism, devoted though she be to facts, has no such materialistic bias as ordinary empiricism labors under. Moreover, she has no objection whatever to the realizing of abstractions, so long as you get about among particulars with their aid and they actually carry you somewhere. Interested in no conclusions but those which our minds and our experiences work out together, she has no a priori prejudices against theology. *If theological ideas prove to have a value for concrete life, they will be true, for pragmatism, in the sense of being good for so much. For how much more they are true, will depend entirely on their relations to the other truths that also have to be acknowledged.*

What I said just now about the Absolute, of transcendental idealism, is a case in point. First, I called it majestic and said it yielded religious comfort to a class of minds, and then I accused it of remoteness and sterility. But so far as it affords such comfort, it surely is not sterile; it has that amount of value; it performs a concrete function. As a good pragmatist, I myself ought to call the Absolute true "in so far forth," then; and I unhesitatingly now do so.

But what does *true in so far forth* mean in this case? To answer, we need only apply the pragmatic method. What do believers in the Absolute mean by saying that their belief affords them comfort? They mean that since, in the Absolute finite evil is "overruled" already, we may, therefore, whenever we wish, treat the temporal as if it were potentially the eternal, be sure that we can trust its outcome, and, without sin, dismiss our fear and drop the worry of our finite responsibility. In short, they mean that we have a right ever and anon to take a moral holiday, to let the world wag in its own way, feeling that its issues are in better hands than ours and are none of our business.

The universe is a system of which the individual members may relax their anxieties occasionally, in which the don't-care mood is also right for men, and moral holidays in order,—that, if I mistake not, is part, at least, of what the Absolute is "known-as," that is the great difference in our particular experiences which his being true makes, for us, that is his cash-value when he is pragmatically interpreted. Farther than that the ordinary lay-reader in philosophy who thinks favorably of absolute idealism does not venture to sharpen his conceptions. He can use the Absolute for so much, and so much is very precious. He is pained at hearing you

speak incredulously of the Absolute, therefore, and disregards your criticisms because they deal with aspects of the conception that he fails to follow.

If the Absolute means this, and means no more than this, who can possibly deny the truth of it? To deny it would be to insist that men should never relax, and that holidays are never in order.

I am well aware how odd it must seem to some of you to hear me say that an idea is "true" so long as to believe it is profitable to our lives. That it is good, for as much as it profits, you will gladly admit. If what we do by its aid is good, you will allow the idea itself to be good in so far forth, for we are the better for possessing it. But is it not a strange misuse of the word "truth," you will say, to call ideas also "true" for this reason?

To answer this difficulty fully is impossible at this stage of my account. You touch here upon the very central point of Messrs. Schiller's, Dewey's and my own doctrine of truth, which I can not discuss with detail until my sixth lecture. Let me now say only this, that truth is *one species of good*, and not, as is usually supposed, a category distinct from good, and co-ordinate with it. *The true is the name of whatever proves itself to be good in the way of belief, and good, too, for definite, assignable reasons.* Surely you must admit this, that if there were *no* good for life in true ideas, or if the knowledge of them were positively disadvantageous and false ideas the only useful ones, then the current notion that truth is divine and precious, and its pursuit a duty, could never have grown up or become a dogma. In a world like that, our duty would be to *shun* truth, rather. But in this world, just as certain foods are not only agreeable to our taste, but good for our teeth, our stomach, and our tissues; so certain ideas are not only agreeable to think about, or agreeable as supporting other ideas that we are fond of, but they are also helpful in life's practical struggles. If there be any life that it is really better we should lead, and if there be any idea which, if believed in, would help us to lead that life, then it would be really *better for us* to believe in that idea, *unless, indeed, belief in it incidentally clashed with other greater vital benefits.*

"What would be better for us to believe!" This sounds very like a definition of truth. It comes very near to saying "what we *ought* to believe": and in *that* definition none of you would find any oddity. Ought we ever not to believe what it is *better for us* to believe? And can we then keep the notion of what is better for us, and what is true for us, permanently apart?

Pragmatism says no, and I fully agree with her. Probably you also agree, so far as the abstract statement goes, but with a suspicion that if we practically did believe everything that made for good in our own personal lives, we should be found indulging all kinds of fancies about this world's affairs, and all kinds of sentimental superstitions about a world hereafter. Your suspicion here is undoubtedly well founded, and it is evident that something happens when you pass from the abstract to the concrete that complicates the situation.

I said just now that what is better for us to believe is true *unless the belief incidentally clashes with some other vital benefit.* Now in real life what vital benefits is any particular belief of ours most liable to clash with? What indeed except the vital benefits yielded by *other beliefs* when these prove incompatible with the first ones? In other words, the greatest enemy of any one of our truths may be the rest of our truths. Truths have once for all this desperate instinct of self-preservation and of desire to extinguish whatever contradicts them. My belief in the Absolute, based on the good it does me, must run the gauntlet of all my other beliefs. Grant that it may be true in giving me a moral holiday. Nevertheless, as I conceive it,—and let me speak now confidentially, as

it were, and merely in my own private person,—it clashes with other truths of mine whose benefits I hate to give up on its account. It happens to be associated with a kind of logic of which I am the enemy, I find that it entangles me in metaphysical paradoxes that are unacceptable, etc., etc. But as I have enough trouble in life already without adding the trouble of carrying these intellectual inconsistencies, I personally just give up the Absolute. I just *take* my moral holidays; or else as a professional philosopher, I try to justify them by some other principle.

If I could restrict my notion of the Absolute to its bare holiday-giving value, it wouldn't clash with my other truths. But we can not easily thus restrict our hypotheses. They carry supernumerary features, and these it is that clash so. My disbelief in the Absolute means then disbelief in those other supernumerary features, for I fully believe in the legitimacy of taking moral holidays.

You see by this what I meant when I called pragmatism a mediator and reconciler and said, borrowing the word from Papini, that she “unstiffens” our theories. She has in fact no prejudices whatever, no obstructive dogmas, no rigid canons of what shall count as proof. She is completely genial. She will entertain any hypothesis, she will consider any evidence. It follows that in the religious field she is at a great advantage both over positivistic empiricism, with its anti-theological bias, and over religious rationalism, with its exclusive interest in the remote, the noble, the simple, and the abstract in the way of conception.

In short, she widens the field of search for God. Rationalism sticks to logic and the empyrean. Empiricism sticks to the external senses. Pragmatism is willing to take anything, to follow either logic or the senses and to count the humblest and most personal experiences. She will count mystical experiences if they have practical consequences. She will take a God who lives in the very dirt of private fact—if that should seem a likely place to find him.

Her only test of probable truth is what works best in the way of leading us, what fits every part of life best and combines with the collectivity of experience's demands, nothing being omitted. If theological ideas should do this, if the notion of God, in particular, should prove to do it, how could pragmatism possibly deny God's existence? She could see no meaning in treating as “not true” a notion that was pragmatically so successful. What other kind of truth could there be, for her, than all this agreement with concrete reality?

In my last lecture I shall return again to the relations of pragmatism with religion. But you see already how democratic she is. Her manners are as various and flexible, her resources as rich and endless, and her conclusions as friendly as those of mother nature.

FRIEDRICH NIETZSCHE

1844–1900

Friedrich Wilhelm Nietzsche was born in Röcken, Prussia, in 1844. He was named in honor of the Prussian king, Friedrich Wilhelm IV, whose birthday, October 15, he shared. Nietzsche's father, Ludwig Nietzsche, was a Lutheran minister and his mother, Franziska Oehler Nietzsche, was the daughter of a Lutheran minister. When Nietzsche was only 5 years old, his father died from what was called "softening of the brain," after a year of mental instability. The rest of Nietzsche's childhood was spent in a household of women, including his widowed mother, his sister, his anxiety-prone paternal grandmother, and two maiden aunts.

Following grade school, Nietzsche attended a famous boarding school at Pforta, where he did outstanding work. However, while there, Nietzsche suffered migraine headaches, which continued to afflict him until he experienced a mental breakdown in 1889. The medicine he took to relieve the headaches upset his stomach and left him nauseous. For much of his adult life, he alternated between the extremes of headaches and nausea with only short periods of health in between.

In 1864, he enrolled at the University of Bonn to study theology and classical philology (linguistics), but he left within a year. By this time, he had given up whatever religious faith he had and was no longer interested in theology. He then moved to the University of Leipzig to continue his studies in philology. His professor at Leipzig, Friedrich Ritschl, was so impressed with Nietzsche's work that he published some of his papers and later recommended him for a chair of classical philology at the University of Basel. In 1869, at the unusual age of only 24, Nietzsche was given the chair as an associate professor. He had produced neither a doctoral dissertation nor the additional book normally required of an associate

professor, but Leipzig immediately awarded him a doctorate without examination or thesis, and within a year he was promoted to full professor at Basel.

In 1872, Nietzsche published his first book, *The Birth of Tragedy*, which included a laudatory section on Richard Wagner's music. Over the next four years, Nietzsche wrote four meditations (published collectively in English as *Thoughts Out of Season*), the last of which was another tribute to Wagner. During this period, Nietzsche and Wagner were close friends; and Nietzsche often visited Wagner's villa on Lake Lucerne. But by 1878, they had broken relations over Wagner's nationalism and anti-Semitism.

Nietzsche's health began to deteriorate, and he was forced to resign from the university in 1879. Over the next ten years, Nietzsche traveled and devoted all his remaining energy to writing, publishing books such as *The Gay Science* (1882), *Thus Spoke Zarathustra* (1883–1885), *Beyond Good and Evil* (1886), *On the Genealogy of Morality* (1887), and his final denunciation of his former friend *The Case of Wagner* (1888).

By the end of 1888, Nietzsche showed signs of oncoming madness, and in January 1889 he collapsed in the street in Turin, Italy, while hugging the neck of a horse. For the next eleven years until his death in 1900, he lived in the care of his mother and sister. Works that he had written in 1888, including *The Will to Power*, *Twilight of the Idols*, *The Anti-Christ*, and his outrageous autobiography *Ecco Homo* (which includes chapter headings such as "Why I Am So Clever"), were published after distorted editing by his sister. Only in the twentieth century have unedited versions of these works become available.

The cause of Nietzsche's insanity has been vigorously debated. Critics have held that his ideas caused it and claim to have found evidence of insanity in many of his writings. His sister romanticized that he went mad because Germany spurned him. More likely explanations are that he contracted syphilis during a rare sexual escapade while a young man or that he simply inherited a brain disease from his father.

* * *

Nietzsche's style of writing in epigrams, aphorisms, stories, poetry, and essays virtually defies an editor to systematically summarize his thought. Nevertheless, even though Nietzsche never sought to build a system, there are recurring, interwoven themes represented by the selections given here.

In *The Birth of Tragedy*, translated by Francis Golffing, Nietzsche presents a distinction between Apollonian and Dionysian tendencies in art. The Apollonian tendency (named for the Greek god of the sun, Apollo) represents the harmony and restraint exemplified by Greek sculpture and architecture. The Dionysian tendency (named for the Greek god of wine and revelry, Dionysos) represents wild abandonment as exemplified by the drunken sexual frenzies of the Dionysian cult festivals or the music of Beethoven's Ninth Symphony. Greek tragedy arises as a synthesis of Apollonian form and Dionysian urges. But Greek tragedy is in turn superseded by Greek rationalism as exemplified by Socrates: the theoretical man who optimistically sees knowledge as the panacea to the problems of life. What is needed now, Nietzsche argues, is a new synthesis of these Dionysian and Apollonian tendencies by an "artistic" Socrates. Such a Socratic figure would be a creative genius who would honestly face the harshness of life without losing a clear rational analytic perspective.

In order to face life honestly and clearly, the creative genius must begin by proclaiming the death of God. With the death of God, slave morality—and all values dependent on some external lawgiver—collapses and the individual is free to create self-defined values. By the “death of God,” Nietzsche does not mean that there once was a deity who got old and passed away, nor that people no longer should live holy lives. Rather, Nietzsche claims that all *absolutes* have collapsed, and there is no transcendent basis in any area—whether religion, philosophy, science, or politics—for making meaning out of life. The brief selection here from *The Gay Science*, translated by Walter Kaufmann, is one of several passages in which Nietzsche announces the death of God.

In our selection from *Twilight of the Idols*, also translated by Kaufmann, Nietzsche examines how philosophers have tried to find something transcendent, something permanent. Beginning with the Pre-Socratic thinker Parmenides, philosophers have been unwilling to accept the actual transitory world of “becoming.” Instead they have denigrated this world, labeling it “apparent,” and have in its place invented an immutable world of “being.” But, as Nietzsche explains, “Any distinction between a ‘true’ and an ‘apparent’ world—whether in the Christian manner or in the manner of Kant . . . is only a suggestion of decadence, a symptom of the *decline of life*.”

The genius who can embrace “becoming,” who acknowledges the death of all external values, could become an *Übermensch* (“overman” or “superman”). Such an overman would be a this-world antithesis to God and would affirm life without any resentment. The overman would be to humans as humans are to apes. But, most important, the overman would be one who acknowledges and celebrates the *will to power*.

According to Nietzsche, all human behavior can be understood in terms of the will to power and every relationship between persons is a power relationship. In master morality, the hero asserts the will to power by taking direct action. In slave morality, as explicated in our final selection from Kaufmann’s translation of *The Anti-Christ*, the will to power is perverted into resentment in order to gain the imaginary powers of revenge and pity.

But the will to power can also be expressed *within* the person. That is, more than gaining power over others, the will to power can lead to power over the self. The overman will be the one who uses power in this way to “overcome his animal nature, organize the chaos of his passions, sublimate his impulses, and give style to his character,”* becoming completely free and self-created.

Ironically, despite his distaste for anti-Semitism and his emphasis on the *self*-overcoming aspects of the will to power, Nietzsche was hailed as a hero by the Nazis. They used his emphases on the master morality and the will to power as a justification for their atrocities. Nietzsche’s sister, Elisabeth, married a German anti-Semite and in her old age eagerly received Adolph Hitler at the Nietzsche Archives. However, despite its unfortunate association with the Nazis, Nietzsche’s thought has continued to be influential, as his insights have been developed by existentialists, phenomenologists, psychoanalysts, post-structuralists, and deconstructionists, as well as poets and novelists.

* * *

*Walter Kaufmann, *Nietzsche: Philosopher, Psychologist, Antichrist* (Princeton: Princeton University Press, 1950), p. 316.

A representative sampling of Nietzsche's thought can be found in *The Portable Nietzsche*, edited by Walter A. Kaufmann (New York: Viking Press, 1968). The best general introduction to Nietzsche's thought remains Walter A. Kaufmann, *Nietzsche: Philosopher, Psychologist, Antichrist* (Princeton: Princeton University Press, 1968). Recent overviews include Graham Parke, *Composing the Soul* (Chicago: University of Chicago Press, 1994); John Richardson, *Nietzsche's System* (Oxford: Oxford University Press, 1995); Michael Tanner, *Nietzsche* (Oxford: Oxford University Press, 1995); Ronald Hayman, *Nietzsche* (London: Routledge, 1999); Brian Leiter, *Routledge Philosophy Guidebook to Nietzsche on Morality* (London: Routledge, 2002); Robert C. Solomon, *Living with Nietzsche: What the Great "Immoralist" Has to Teach Us* (Oxford: Oxford University Press, 2003); and R. Kevin Hill, *Nietzsche: A Guide for the Perplexed* (London: Continuum, 2007). Ivo Frenzel, *Friedrich Nietzsche: An Illustrated Biography*, translated by Joachim Neugroschel (New York: Pegasus, 1967); and Sander L. Gilman, ed., *Conversations with Nietzsche: A Life in the Words of His Contemporaries*, translated by David J. Parent (New York: Oxford University Press, 1987), provide general biographies, whereas H.F. Peters, *Zarathustra's Sister: The Case of Elisabeth and Friedrich Nietzsche* (New York: Crown, 1977), presents a fascinating history of the expropriation of Nietzsche's thought in the service of German anti-Semitism. Jacob Golomb and Robert S. Wistrich, eds., *Nietzsche, Godfather of Fascism?: On the Uses and Abuses of a Philosophy* (Princeton: Princeton University Press, 2002) present essays on the same topic. Walter A. Kaufmann, *Nietzsche, Heidegger, and Buber* (New York: McGraw-Hill, 1980); Allan Megill, *Prophets of Extremity: Nietzsche, Heidegger, Foucault, Derrida* (Berkeley: University of California Press, 1985); and Paul S. Miklowitz, *Metaphysics to Metafictions: Hegel, Nietzsche, and the End of Philosophy* (Albany, NY: SUNY Press, 1999) show the connections between Nietzsche and other important thinkers, whereas Ishay Landa, *The Overman in the Marketplace: Nietzschean Heroism in Popular Culture* (Lanham, MD: Lexington Books, 2009) shows how Nietzsche's ideas have played out in popular culture. For collections of critical essays, see Robert C. Solomon, ed., *Nietzsche: A Collection of Critical Essays* (Garden City, NY: Anchor Doubleday, 1973); Harold Bloom, ed., *Friedrich Nietzsche* (New York: Chelsea House, 1987); Richard Schacht, ed., *Nietzsche, Genealogy, Morality: Essays on Nietzsche's On the Genealogy of Morals* (Berkeley: University of California Press, 1994); Peter Sedgwick, ed., *Nietzsche: A Critical Reader* (Oxford: Basil Blackwell, 1995); Bernd Magnus and Kathleen Higgins, *The Cambridge Companion to Nietzsche* (Cambridge: Cambridge University Press, 1996); Kelly Oliver and Marilyn Pearsall, eds., *Feminist Interpretations of Nietzsche* (College Park, PA: Pennsylvania State University Press, 1998); Daniel W. Conway, *Nietzsche: Critical Assessments*, four volumes (London: Routledge, 1998); Richard White, ed., *Nietzsche* (New York: Ashgate, 2001); Ken Gemes and Simon May, eds., *Nietzsche on Freedom and Autonomy* (Oxford: Oxford University Press, 2009); and Tracy Strong, ed., *Friedrich Nietzsche* (Burlington, VT: Ashgate, 2009). Finally, Robert C. Solomon and Kathleen M. Higgins, eds., *Reading Nietzsche* (New York: Oxford University Press, 1988) provide helpful introductory essays on several of Nietzsche's works, while Daniel W. Conway, *Nietzsche's Dangerous Game: Philosophy in the Twilight of the Idols* (Cambridge: Cambridge University Press, 1997) focuses on Nietzsche's later work.

THE BIRTH OF TRAGEDY (in part)

I. Much will have been gained for esthetics once we have succeeded in apprehending directly—rather than merely *ascertaining*—that art owes its continuous evolution to the Apollonian-Dionysiac duality, even as the propagation of the species depends on the duality of the sexes, their constant conflicts and periodic acts of reconciliation. I have borrowed my adjectives from the Greeks, who developed their mystical doctrines of art through plausible *embodiments*, not through purely conceptual means. It is by those two art-sponsoring deities, Apollo and Dionysos, that we are made to recognize the tremendous split, as regards both origins and objectives, between the plastic, Apollonian arts and the non-visual art of music inspired by Dionysos. The two creative tendencies developed alongside one another, usually in fierce opposition, each by its taunts forcing the other to more energetic production, both perpetuating in a discordant concord that agon which the term art but feebly denominates: until at last, by the thaumaturgy of an Hellenic act of will, the pair accepted the yoke of marriage and, in this condition, begot Attic tragedy, which exhibits the salient features of both parents.

To reach a closer understanding of both these tendencies, let us begin by viewing them as the separate art realms of *dream* and *intoxication*, two physiological phenomena standing toward one another in much the same relationship as the Apollonian and Dionysiac. It was in a dream, according to Lucretius, that the marvelous gods and goddesses first presented themselves to the minds of men. That great sculptor, Phidias, beheld in a dream the entrancing bodies of more-than-human beings, and likewise, if anyone had asked the Greek poets about the mystery of poetic creation, they too would have referred him to dreams and instructed him much as Hans Sachs instructs us in *Die Meistersinger*:

My friend, it is the poet's work
Dreams to interpret and to mark.
Believe me that man's true conceit
In a dream becomes complete:
All poetry we ever read
Is but true dreams interpreted.

The fair illusion of the dream sphere, in the production of which every man proves himself an accomplished artist, is a precondition not only of all plastic art, but even, as we shall see presently, of a wide range of poetry. Here we enjoy an immediate apprehension of form, all shapes speak to us directly, nothing seems indifferent or redundant. Despite the high intensity with which these dream realities exist for us, we still have a residual sensation that they are illusions; at least such has been my experience—and the frequency, not to say normality, of the experience is borne out in many passages of the poets. Men of philosophical disposition are known for their constant premonition that our everyday reality, too, is an illusion, hiding another, totally different kind of reality. It was Schopenhauer who considered the ability to view at certain times all men and things as mere phantoms or dream images to be the true mark of philosophic talent. The person

who is responsive to the stimuli of art behaves toward the reality of dream much the way the philosopher behaves toward the reality of existence: he observes exactly and enjoys his observations, for it is by these images that he interprets life, by these processes that he rehearses it. Nor is it by pleasant images only that such plausible connections are made: the whole divine comedy of life, including its somber aspects, its sudden balkings, impish accidents, anxious expectations, moves past him, not quite like a shadow play—for it is he himself, after all, who lives and suffers through these scenes—yet never without giving a fleeting sense of illusion; and I imagine that many persons have reassured themselves amidst the perils of dream by calling out, “It is a dream! I want it to go on.” I have even heard of people spinning out the causality of one and the same dream over three or more successive nights. All these facts clearly bear witness that our innermost being, the common substratum of humanity, experiences dreams with deep delight and a sense of real necessity. This deep and happy sense of the necessity of dream experiences was expressed by the Greeks in the image of Apollo. Apollo is at once the god of all plastic powers and the soothsaying god. He who is etymologically the “luculent” one, the god of light, reigns also over the fair illusion of our inner world of fantasy. The perfection of these conditions in contrast to our imperfectly understood waking reality, as well as our profound awareness of nature’s healing powers during the interval of sleep and dream, furnishes a symbolic analogue to the soothsaying faculty and quite generally to the arts, which make life possible and worth living. But the image of Apollo must incorporate that thin line which the dream image may not cross, under penalty of becoming pathological, of imposing itself on us as crass reality: a discreet limitation, a freedom from all extravagant urges, the sapient tranquillity of the plastic god. His eye must be sunlike, in keeping with his origin. Even at those moments when he is angry and ill-tempered there lies upon him the consecration of fair illusion. In an eccentric way one might say of Apollo what Schopenhauer says, in the first part of *The World as Will and Idea*, of man caught in the veil of Maya: “Even as on an immense, raging sea, assailed by huge wave crests, a man sits in a little rowboat trusting his frail craft, so, amidst the furious torments of this world, the individual sits tranquilly, supported by the *principium individuationis* and relying on it.” One might say that the unshakable confidence in that principle has received its most magnificent expression in Apollo, and that Apollo himself may be regarded as the marvelous divine image of the *principium individuationis*, whose looks and gestures radiate the full delight, wisdom, and beauty of “illusion.”

In the same context Schopenhauer has described for us the tremendous awe which seizes man when he suddenly begins to doubt the cognitive modes of experience, in other words, when in a given instance the law of causation seems to suspend itself. If we add to this awe the glorious transport which arises in man, even from the very depths of nature, at the shattering of the *principium individuationis*, then we are in a position to apprehend the essence of Dionysiac rapture, whose closest analogy is furnished by physical intoxication. Dionysiac stirrings arise either through the influence of those narcotic potions of which all primitive races speak in their hymns, or through the powerful approach of spring, which penetrates with joy the whole frame of nature. So stirred, the individual forgets himself completely. It is the Same Dionysiac power which in medieval Germany drove ever increasing crowds of people singing and dancing from place to place; we recognize in these St. John’s and St. Vitus’ dancers the bacchic choruses of the Greeks, who had their precursors in Asia Minor and as far back as Babylon and the orgiastic Sacaea. There are people who, either from lack of experience or out of sheer stupidity, turn away from such phenomena, and, strong in the sense of their own sanity, label them either mockingly or pityingly “endemic diseases.” These benighted

souls have no idea how cadaverous and ghostly their "sanity" appears as the intense throng of Dionysiac revelers sweeps past them.

Not only does the bond between man and man come to be forged once more by the magic of the Dionysiac rite, but nature itself, long alienated or subjugated, rises again to celebrate the reconciliation with her prodigal son, man. The earth offers its gifts voluntarily, and the savage beasts of mountain and desert approach in peace. The chariot of Dionysos is bedecked with flowers and garlands; panthers and tigers stride beneath his yoke. If one were to convert Beethoven's "Paeon to Joy" into a painting, and refuse to curb the imagination when that multitude prostrates itself reverently in the dust, one might form some apprehension of Dionysiac ritual. Now the slave emerges as a freeman; all the rigid, hostile walls which either necessity or despotism has erected between men are shattered. Now that the gospel of universal harmony is sounded, each individual becomes not only reconciled to his fellow but actually at one with him—as though the veil of Maya had been torn apart and there remained only shreds floating before the vision of mystical Oneness. Man now expresses himself through song and dance as the member of a higher community; he has forgotten how to walk, how to speak, and is on the brink of taking wing as he dances. Each of his gestures betokens enchantment; through him sounds a supernatural power, the same power which makes the animals speak and the earth render up milk and honey. He feels himself to be godlike and strides with the same elation and ecstasy as the gods he has seen in his dreams. No longer the *artist*, he has himself become a *work of art*: *the productive power of the whole universe is now manifest in his transport, to the glorious satisfaction of the primordial One. The finest clay, the most precious marble—man—is here kneaded and hewn, and the chisel blows of the Dionysiac world artist are accompanied by the cry of the Eleusinian mystagogues: "Do you fall on your knees, multitudes, do you divine your creator?"*

II. So far we have examined the Apollonian and Dionysiac states as the product of formative forces arising directly from nature without the mediation of the human artist. At this stage artistic urges are satisfied directly, on the one hand through the imagery of dreams, whose perfection is quite independent of the intellectual rank, the artistic development of the individual; on the other hand, through an ecstatic reality which once again takes no account of the individual and may even destroy him, or else redeem him through a mystical experience of the collective. In relation to these immediate creative conditions of nature every artist must appear as "imitator," either as the Apollonian dream artist or the Dionysiac ecstatic artist, or, finally (as in Greek tragedy, for example) as dream and ecstatic artist in one. We might picture to ourselves how the last of these, in a state of Dionysiac intoxication and mystical self-abrogation, wandering apart from the reveling throng, sinks upon the ground, and how there is then revealed to him his own condition—complete oneness with the essence of the universe—in a dream similitude.

Having set down these general premises and distinctions, we now turn to the Greeks in order to realize to what degree the formative forces of nature were developed in them. Such an inquiry will enable us to assess properly the relation of the Greek artist to his prototypes or, to use Aristotle's expression, his "imitation of nature." Of the dreams the Greeks dreamed it is not possible to speak with any certainty, despite the extant dream literature and the large number of dream anecdotes. But considering the incredible accuracy of their eyes, their keen and unabashed delight in colors, one can hardly be wrong in assuming that their dreams too showed a strict consequence of lines and contours, hues and groupings, a progression of scenes similar to their best

Starry Night, 1889, by Vincent van Gogh (1853–1890). It is hard not to think of the paintings of Nietzsche's contemporary Vincent van Gogh when reading Nietzsche's words: "If one were to convert Beethoven's 'Paean to Joy' into a painting, and refuse to curb the imagination when that multitude prostrates itself reverently in the dust, one might form some apprehension of Dionysiac ritual." (© *The Museum of Modern Art, NY./Scale, Florence. Acquired through the Lillie P. Bliss Bequest*)

bas-reliefs. The perfection of these dream scenes might almost tempt us to consider the dreaming Greek as a Homer and Homer as a dreaming Greek; which would be as though the modern man were to compare himself in his dreaming to Shakespeare.

Yet there is another point about which we do not have to conjecture at all: I mean the profound gap separating the Dionysiac Greeks from the Dionysiac barbarians. Throughout the range of ancient civilization (leaving the newer civilizations out of account for the moment) we find evidence of Dionysiac celebrations which stand to the Greek type in much the same relation as the bearded satyr, whose name and attributes are derived from the he-goat, stands to the god Dionysos. The central concern of such celebrations was, almost universally, a complete sexual promiscuity overriding every form of established tribal law; all the savage urges of the mind were unleashed on those occasions until they reached that paroxysm of lust and cruelty which has always struck me as the "witches' cauldron" *par excellence*. It would appear that the Greeks were for a while quite immune from these feverish excesses which must have reached them by every known land or sea route. What kept Greece safe was the proud, imposing image of Apollo, who in holding up the head of the Gorgon to those brutal and grotesque

Dionysiac forces subdued them. Doric art has immortalized Apollo's majestic rejection of all license. But resistance became difficult, even impossible, as soon as similar urges began to break forth from the deep substratum of Hellenism itself. Soon the function of the Delphic god developed into something quite different and much more limited: all he could hope to accomplish now was to wrest the destructive weapon, by a timely gesture of pacification, from his opponent's hand. That act of pacification represents the most important event in the history of Greek ritual; every department of life now shows symptoms of a revolutionary change. The two great antagonists have been reconciled. Each feels obliged henceforth to keep to his bounds, each will honor the other by the bestowal of periodic gifts, while the cleavage remains fundamentally the same. And yet, if we examine what happened to the Dionysiac powers under the pressure of that treaty we notice a great difference: in the place of the Babylonian Sacaea, with their throwback of men to the condition of apes and tigers, we now see entirely new rites celebrated: rites of universal redemption, of glorious transfiguration. Only now has it become possible to speak of nature's celebrating an aesthetic triumph; only now has the abrogation of the *principium individuationis* become an aesthetic event. That terrible witches' brew concocted of lust and cruelty has lost all power under the new conditions. Yet the peculiar blending of emotions in the heart of the Dionysiac reveler—his ambiguity if you will—seems still to hark back (as the medicinal drug harks back to the deadly poison) to the days when the infliction of pain was experienced as joy while a sense of supreme triumph elicited cries of anguish from the heart. For now in every exuberant joy there is heard an undertone of terror, or else a wistful lament over an irrecoverable loss. It is as though in these Greek festivals a sentimental trait of nature were coming to the fore, as though nature were bemoaning the fact of her fragmentation, her decomposition into separate individuals. The chants and gestures of these revelers, so ambiguous in their motivation, represented an absolute *novum* in the world of the Homeric Greeks; their Dionysiac music, in especial, spread abroad terror and a deep shudder. It is true: music had long been familiar to the Greeks as an Apollonian art, as a regular beat like that of waves lapping the shore, a plastic rhythm expressly developed for the portrayal of Apollonian conditions. Apollo's music was a Doric architecture of sound—of barely hinted sounds such as are proper to the cithara. Those very elements which characterize Dionysiac music and, after it, music quite generally: the heart-shaking power of tone, the uniform stream of melody, the incomparable resources of harmony—all those elements had been carefully kept at a distance as being inconsonant with the Apollonian norm. In the Dionysiac dithyramb man is incited to strain his symbolic faculties to the utmost; something quite unheard of is now clamoring to be heard: the desire to tear asunder the veil of Maya, to sink back into the original oneness of nature; the desire to express the very essence of nature symbolically. Thus an entirely new set of symbols springs into being. First all the symbols pertaining to physical features: mouth, face, the spoken word, the dance movement which coordinates the limbs and bends them to its rhythm. Then suddenly all the rest of the symbolic forces—music and rhythm as such, dynamics, harmony—assert themselves with great energy. In order to comprehend this total emancipation of all the symbolic powers one must have reached the same measure of inner freedom those powers themselves were making manifest; which is to say that the votary of Dionysos could not be understood except by his own kind. It is not difficult to imagine the awed surprise with which the Apollonian Greek must have looked on him. And that surprise would be further increased as the latter realized, with a shudder, that all this was not so alien to him after all, that his Apollonian consciousness was but a thin veil hiding from him the whole Dionysiac realm.

III. In order to comprehend this we must take down the elaborate edifice of Apollonian culture stone by stone until we discover its foundations. At first the eye is struck by the marvelous shapes of the Olympian gods who stand upon its pediments, and whose exploits, in shining bas-relief, adorn its friezes. The fact that among them we find Apollo as one god among many, making no claim to a privileged position, should not mislead us. The same drive that found its most complete representation in Apollo generated the whole Olympian world, and in this sense we may consider Apollo the father of that world. But what was the radical need out of which that illustrious society of Olympian beings sprang?

Whoever approaches the Olympians with a different religion in his heart, seeking moral elevation, sanctity, spirituality, loving-kindness, will presently be forced to turn away from them in ill-humored disappointment. Nothing in these deities reminds us of asceticism, high intellect, or duty: we are confronted by luxuriant, triumphant *existence*, which deifies the good and the bad indifferently. And the beholder may find himself dismayed in the presence of such overflowing life and ask himself what potion these heady people must have drunk in order to behold, in whatever direction they looked, Helen laughing back at them, the beguiling image of their own existence. But we shall call out to this beholder, who has already turned his back: Don't go! Listen first to what the Greeks themselves have to say of this life, which spreads itself before you with such puzzling serenity. An old legend has it that King Midas hunted a long time in the woods for the wise Silenus, companion of Dionysos, without being able to catch him. When he had finally caught him the king asked him what he considered man's greatest good. The daemon remained sullen and uncommunicative until finally, forced by the king, he broke into a shrill laugh and spoke: "Ephemeral wretch, begotten by accident and toil, why do you force me to tell you what it would be your greatest boon not to hear? What would be best for you is quite beyond your reach: not to have been born, not to be, to be *nothing*. But the second best is to die soon."

What is the relation of the Olympian gods to this popular wisdom? It is that of the entranced vision of the martyr to his torment.

Now the Olympian magic mountain opens itself before us, showing us its very roots. The Greeks were keenly aware of the terrors and horrors of existence; in order to be able to live at all they had to place before them the shining fantasy of the Olympians. Their tremendous distrust of the titanic forces of nature: *Moira*, mercilessly enthroned beyond the knowable world; the vulture which fed upon the great philanthropist Prometheus; the terrible lot drawn by wise Oedipus; the curse on the house of Atreus which brought Orestes to the murder of his mother: that whole Panic philosophy, in short, with its mythic examples, by which the gloomy Etruscans perished, the Greeks conquered—or at least hid from view—again and again by means of this artificial Olympus. In order to live at all the Greeks had to construct these deities. The Apollonian need for beauty had to develop the Olympian hierarchy of joy by slow degrees from the original titanic hierarchy of terror, as roses are seen to break from a thorny thicket. How else could life have been borne by a race so hypersensitive, so emotionally intense, so equipped for suffering? The same drive which called art into being as a completion and consummation of existence, and as a guarantee of further existence, gave rise also to that Olympian realm which acted as a transfiguring mirror to the Hellenic will. The gods justified human life by living it themselves—the only satisfactory theodicy ever invented. To exist in the clear sunlight of such deities was now felt to be the highest good, and the only real grief suffered by Homeric man was inspired by the thought of leaving that sunlight, especially when the departure seemed imminent. Now it became possible to stand the wisdom of Silenus on its head and proclaim that it was the worst evil for man to die soon, and second worst for him

to die at all. Such laments as arise now arise over short-lived Achilles, over the generations ephemeral as leaves, the decline of the heroic age. It is not unbecoming to even the greatest hero to yearn for an afterlife, though it be as a day laborer. So impetuously, during the Apollonian phase, does man's will desire to remain on earth, so identified does he become with existence, that even his lament turns to a song of praise.

It should have become apparent by now that the harmony with nature which we late-comers regard with such nostalgia, and for which Schiller has coined the cant term naïve, is by no means a simple and inevitable condition to be found at the gateway to every culture, a kind of paradise. Such a belief could have been endorsed only by a period for which Rousseau's *Emile* was an artist and Homer just such an artist nurtured in the bosom of nature. Whenever we encounter "naïveté" in art, we are face to face with the ripest fruit of Apollonian culture—which must always triumph first over titans, kill monsters, and overcome the somber contemplation of actuality, the intense susceptibility to suffering, by means of illusions strenuously and zestfully entertained. But how rare are the instances of true naïveté, of that complete identification with the beauty of appearance! It is this achievement which makes Homer so magnificent—Homer, who, as a single individual, stood to Apollonian popular culture in the same relation as the individual dream artist to the oneiric capacity of a race and of nature generally. The naïveté of Homer must be viewed as a complete victory of Apollonian illusion. Nature often uses illusions of this sort in order to accomplish its secret purposes. The true goal is covered over by a phantasm. We stretch out our hands to the latter, while nature, aided by our deception, attains the former. In the case of the Greeks it was the will wishing to behold itself in the work of art, in the transcendence of genius; but in order so to behold itself its creatures had first to view themselves as glorious, to transpose themselves to a higher sphere, without having that sphere of pure contemplation either challenge them or upbraid them with insufficiency. It was in that sphere of beauty that the Greeks saw the Olympians as their mirror images; it was by means of that aesthetic mirror that the Greek will opposed suffering and the somber wisdom of suffering which always accompanies artistic talent. As a monument to its victory stands Homer, the naïve artist.

THE GAY SCIENCE (selections)

108. *New struggles*.—After Buddha was dead, his shadow was still shown for centuries in a cave—a tremendous, gruesome shadow. God is dead; but given the way of men, there may still be caves for thousands of years in which his shadow will be shown.—And we—we still have to vanquish his shadow, too.

124. *In the horizon of the infinite*.—We have left the land and have embarked. We have burned our bridges behind us—indeed, we have gone farther and destroyed the land behind us. Now, little ship, look out! Beside you is the ocean: to be sure, it does not always roar, and at times it lies spread out like silk and gold and reveries of graciousness.

But hours will come when you will realize that it is infinite and that there is nothing more awesome than infinity. Oh, the poor bird that felt free and now strikes the walls of this cage! Woe, when you feel homesick for the land as if it had offered more *freedom*—and there is no longer any “land.”

125. *The madman*.— Have you not heard of that madman who lit a lantern in the bright morning hours, ran to the market place, and cried incessantly: “I seek God! I seek God!”—As many of those who did not believe in God were standing around just then, he provoked much laughter. Has he got lost? asked one. Did he lose his way like a child? asked another. Or is he hiding? Is he afraid of us? Has he gone on a voyage? emigrated?—Thus they yelled and laughed.

The madman jumped into their midst and pierced them with his eyes. “Whither is God?” he cried; “I will tell you. *We have killed him*—you and I. All of us are his murderers. But how did we do this? How could we drink up the sea? Who gave us the sponge to wipe away the entire horizon? What were we doing when we unchained this earth from its sun? Whither is it moving now? Whither are we moving? Away from all suns? Are we not plunging continually? Backward, sideward, forward, in all directions? Is there still any up or down? Are we not straying as through an infinite nothing? Do we not feel the breath of empty space? Has it not become colder? Is not night continually closing in on us? Do we not need to light lanterns in the morning? Do we hear nothing as yet of the noise of the gravediggers who are burying God? Do we smell nothing as yet of the divine decomposition? Gods, too, decompose. God is dead. God remains dead. And we have killed him.

“How shall we comfort ourselves, the murderers of all murderers? What was holiest and mightiest of all that the world has yet owned has bled to death under our knives: who will wipe this blood off us? What water is there for us to clean ourselves? What festivals of atonement, what sacred games shalt we have to invent? Is not the greatness of this deed too great for us? Must we ourselves not become gods simply to appear worthy of it? There has never been a greater deed: and whoever is born after us—for the sake of this deed he will belong to a higher history than all history hitherto.”

Here the madman fell silent and looked again at his listeners; and they, too, were silent and stared at him in astonishment. At last he threw his lantern on the ground, and it broke into pieces and went out. “I have come too early,” he said then; “my time is not yet. This tremendous event is still on its way, still wandering; it has not yet reached the ears of men. Lightning and thunder require time; the light of the stars requires time; deeds, though done, still require time to be seen and heard. This deed is still more distant from them than the most distant *stars*—and yet they have done it themselves.”

It has been related further that on the same day the madman forced his way into several churches and there struck up his *requiem aeternam deo*. Led out and called to account, he is said always to have replied nothing but: “What after all are these churches now if they are not the tombs and sepulchers of God?”

TWILIGHT OF THE IDOLS (selections)

THE PROBLEM OF SOCRATES

[1] Concerning life, the wisest men of all ages have judged alike: *it is no good*. Always and everywhere one has heard the same sound from their mouths—a sound full of doubt, full of melancholy, full of weariness of life, full of resistance to life. Even Socrates said, as He died; “To live—that means to be sick a long time: I owe Asclepius the Savior a rooster.” Even Socrates was tired of it. What does that evidence? What does it evince? Formerly one would have said (—oh, it has been said, and loud enough, and especially by our pessimists): “At least something of all this must be true! The consensus of the sages evidences the truth.” Shall we still talk like that today? *May* we? “At least something must be *sick* here,” *we* retort. These wisest men of all ages—they should first be scrutinized closely. Were they all perhaps shaky on their legs? late? tottery? decadents? Could it be that wisdom appears on earth as a raven, inspired by a little whiff of carrion?

[2] This irreverent thought that the great sages are *types of decline* first occurred to me precisely in a case where it is most strongly opposed by both scholarly and unscholarly prejudice: I recognized Socrates and Plato to be symptoms of degeneration, tools of the Greek dissolution, pseudo-Greek, anti-Greek (*Birth of Tragedy*, 1872). The consensus of the sages—I comprehended this ever more clearly—proves least of all that they were right in what they agreed on: it shows rather that they themselves, these wisest men, agreed in some *physiological* respect, and hence adopted the same negative attitude to life—*had to* adopt it. Judgments, judgments of value, concerning life, for it or against it, can, in the end, never be true: they have value only as symptoms, they are worthy of consideration only as symptoms; in themselves such judgments are stupidities. One must by all means stretch out one’s fingers and make the attempt to grasp this amazing finesse, *that the value of life cannot be estimated*. Not by the living, for they are an interested party, even a bone of contention, and not judges; not by the dead, for a different reason. For a philosopher to see a problem in the value of life is thus an objection to him, a question mark concerning his wisdom, an un-wisdom. Indeed? All these great wise men—they were not only decadents but not wise at all? But I return to the problem of Socrates.

[3] In origin, Socrates belonged to the lowest class: Socrates was plebs. We know, we can still see for ourselves, how ugly he was. But ugliness, in itself an objection, is among the Greeks almost a refutation. Was Socrates a Greek at all? Ugliness is often enough the expression of a development that has been crossed, *thwarted* by crossing. Or it appears as declining development. The anthropologists among the criminologists tell us that the typical criminal is ugly: *monstrum in fronte, monstrum in animo*. But the criminal is a decadent. Was Socrates a typical criminal? At least that would not be contradicted by the famous judgment of the physiognomist which sounded so offensive to the friends of Socrates. A foreigner who knew about faces once passed through Athens and told Socrates to his face that he *was a monstrum*—that he harbored in himself all the bad vices and appetites. And Socrates merely answered: “You know me, sir!”

[4] Socrates' decadence is suggested not only by the admitted wantonness and anarchy of his instincts, but also by the hypertrophy of the logical faculty and that *sarcasm of the rachitic* which distinguishes him. Nor should we forget those auditory hallucinations which, as "the *daimonion* of Socrates," have been interpreted religiously. Everything in him is exaggerated, *buffo*, a caricature, everything is at the same time concealed, ulterior, subterranean. I seek to comprehend what idiosyncrasy begot that Socratic equation of reason, virtue, and happiness: that most bizarre of all equations, which, moreover, is opposed to all the instincts of the earlier Greeks.

[5] With Socrates, Greek taste changes in favor of dialectics. What really happened there? Above all, a *noble* taste is thus vanquished; with dialectics the plebs come to the top. Before Socrates, dialectic manners were repudiated in good society: they were considered bad manners, they were compromising. The young were warned against them. Furthermore, all such presentations of one's reasons were distrusted. Honest things, like honest men, do not carry their reasons in their hands like that. It is indecent to show all five fingers. What must first be proved is worth little. Wherever authority still forms part of good bearing, where one does not give reasons but commands, the dialectician is a kind of buffoon: one laughs at him, one does not take him seriously. Socrates was the buffoon who *got himself taken seriously*: what really happened there?

[6] One chooses dialectic only when one has no other means. One knows that one arouses mistrust with it, that it is not very persuasive. Nothing is easier to erase than a dialectical effect: the experience of every meeting at which there are speeches proves this. It can only be *self-defense* for those who no longer have other weapons. One must have to *enforce* one's right: until one reaches that point, one makes no use of it. The Jews were dialecticians for that reason; Reynard the Fox was one—and Socrates too?

[7] Is the irony of Socrates an expression of revolt? Of plebeian *ressentiment*? Does he, as one oppressed, enjoy his own ferocity in the knife-thrusts of his syllogisms? Does he *avenge* himself on the noble people whom he fascinates? As a dialectician, one holds a merciless tool in one's hand; one can become a tyrant by means of it; one compromises those one conquers. The dialectician leaves it to his opponent to prove that he is no idiot: he makes one furious and helpless at the same time. The dialectician renders the intellect of his opponent powerless. Indeed? Is dialectic only, a form of *revenge* in Socrates?

[8] I have given to understand how it was that Socrates could repel: it is therefore all the more necessary to explain his fascination. That he discovered a new kind of *agon* ["contest"], that he became its first fencing master for the noble circles of Athens, is one point. He fascinated by appealing to the agonistic impulse of the Greeks—he introduced a variation into the wrestling match between young men and youths. Socrates was also a great *erotic*.

[9] But Socrates guessed even more. He saw *through* his noble Athenians; he comprehended that his own case, his idiosyncrasy, was no longer exceptional. The same kind of degeneration was quietly developing everywhere: old Athens was coming to an end. And Socrates understood that all the world *needed* him—his means, his cure, his personal artifice of self-preservation. Everywhere the instincts were in anarchy; everywhere one was within five paces of excess: *monstrum in animo* was the general danger. "The impulses want to play the tyrant; one must invent a *counter-tyrant* who is stronger." When the physiognomist had revealed to Socrates who he was—a cave of bad appetites—the great master of irony let slip another word which is the key to his character. "This is true," he said, "but I mastered them all." *How* did Socrates become master over *himself*? His case was, at bottom, merely the extreme case only the most striking instance of what was then beginning to be a universal distress: no one was any longer master over himself, the instincts turned *against* each other. He fascinated, being this

extreme case; his awe-inspiring ugliness proclaimed him as such to all who could see; he fascinated, of course, even more as an answer, a solution, an apparent *cure* of this case.

[10] When one finds it necessary to turn *reason* into a tyrant, as Socrates did, the danger cannot be slight that something else will play the tyrant. Rationality was then hit upon as the savior; neither Socrates nor his “patients” had any choice about being rational: it was *de rigueur*; it was their last resort. The fanaticism with which all Greek reflection throws itself upon rationality betrays a desperate situation; there was danger, there was but one choice: either to perish or—to be *absurdly rational*. The moralism of the Greek philosophers from Plato on is pathologically conditioned; so is their esteem of dialectics. Reason-virtue-happiness, that means merely that one must imitate Socrates and counter the dark appetites with a permanent daylight—the daylight of reason. One must be clever, clear, bright at any price: any concession to the instincts, to the unconscious, leads *downward*.

[11] I have given to understand how it was that Socrates fascinated he seemed to be a physician, a savior. Is it necessary to go on to demonstrate the error in his faith in “rationality at any price”? It is a self-deception on the part of philosophers and moralists if they believe that they are extricating themselves from decadence when they merely wage war against it. Extrication lies beyond their strength: what they choose as a means, as salvation, is itself but another expression of decadence; they change its expression, but they do not get rid of decadence itself. Socrates was a misunderstanding; *the whole improvement—morality, including the Christian, was a misunderstanding*. The most blinding daylight; rationality at any price; life, bright, cold, cautious, conscious, without instinct, in opposition to the instincts—all this too was a mere disease, another disease, and by no means a return to “virtue,” to “health,” to happiness. To *have* to fight the instincts—that is the formula of decadence: as long as life is *ascending*, happiness equals instinct.

[12] Did he himself still comprehend this, this most brilliant of all self-outwitters? Was this what he said to himself in the end, in the *wisdom* of his courage to die? Socrates *wanted* to die: not Athens, but he himself chose the hemlock; he forced Athens to sentence him. “Socrates is no physician,” he said softly to himself; “here death alone is the physician. Socrates himself has merely been sick a long time.”

“REASON” IN PHILOSOPHY

[1] You ask me which of the philosophers’ traits are really idiosyncrasies? For example, their lack of historical sense, their hatred of the very idea of becoming, their Egypticism. They think that they show their *respect* for a subject when they de-historicize it, *sub specie aeterni*—when they turn it into a mummy. All that philosophers have handled for thousands of years have been concept-mummies; nothing real escaped their grasp alive. When these honorable idolators of concepts worship something, they kill it and stuff it; they threaten the life of everything they worship. Death, change, old age, as well as procreation and growth, are to their minds objections—even refutations. Whatever has being does not become; whatever becomes does not have being. Now they all believe, desperately even, in what has being. But since they never grasp it, they seek for reasons why it is kept from them. “There must be mere appearance, there must be some deception which prevents us from perceiving that which has being: where is the deceiver?”

“We have found him,” they cry ecstatically; “it is the senses! These senses, which are so immoral in other ways too, deceive us concerning the *true* world. Moral: let us free ourselves from the deception of the senses, from becoming, from history, from lies; history is nothing but faith in the senses, faith in lies. Moral: let us say No to all who have faith in the senses, to all the rest of mankind; they are all ‘mob.’ Let us be philosophers! Let us be mummies! Let us represent monotonous-theism by adopting the expression of a gravedigger! And above all, away with the body, this wretched *idée fixe* of the senses, disfigured by all the fallacies of logic, refuted, even impossible, although it is impudent enough to behave as if it were real!”

[2] With the highest respect, I except the name of *Heraclitus*. When the rest of the philosophic folk rejected the testimony of the senses because they showed multiplicity and change, he rejected their testimony because they showed things as if they had permanence and unity. Heraclitus too did the senses an injustice. They lie neither in the way the Eleatics believed, nor as he believed—they do not lie at all. What we *make* of their testimony, that alone introduces lies; for example, the lie of unity, the lie of thinghood, of substance, of permanence. “Reason” is the cause of our falsification of the testimony of the senses. Insofar as the senses show becoming, passing away, and change, they do not lie. But Heraclitus will remain eternally right with his assertion that being is an empty fiction. The “apparent” world is the only one: the “true” world is merely added by a lie.

[3] And what magnificent instruments of observation we possess in our senses! This nose, for example, of which no philosopher has yet spoken with reverence and gratitude, is actually the most delicate instrument so far at our disposal: it is able to detect minimal differences of motion which even a spectroscope cannot detect. Today we possess science precisely to the extent to which we have decided to *accept* the testimony of the senses—to the extent to which we sharpen them further, arm them, and have learned to think them through. The rest is miscarriage and not-yet-science—in other words, metaphysics, theology, psychology, epistemology—or formal science, a doctrine of signs, such as logic and that applied logic which is called mathematics. In them reality is not encountered at all, not even as a problem—no more than the question of the value of such a sign-convention as logic.

[4] The other idiosyncrasy of the philosophers is no less dangerous; it consists in confusing the last and the first. They place that which comes at the end—unfortunately! for it ought not to come at all!—namely, the “highest concepts,” which means the most general, the emptiest concepts, the last smoke of evaporating reality, in the beginning, *as the beginning*. This again is nothing but their way of showing reverence: the higher *may* not grow out of the lower, *may* not have grown at all. Moral: whatever is of the first rank must be *causa sui* [self-caused]. Origin out of something else is considered an objection, a questioning of value. All the highest values are of the first rank; all the highest concepts, that which has being, the unconditional, the good, the true, the perfect—all these cannot have become and must therefore be *causa sui*. All these, moreover, cannot be unlike each other or in contradiction to each other. Thus they arrive at their stupendous concept, “God.” That which is last, thinnest, and emptiest is put first, as *the cause*, as *ens realissimum* [the most real being]. Why did mankind have to take seriously the brain afflictions of sick web-spinners? They have paid dearly for it!

[5] At long last, let us contrast the very different manner in which we conceive the problem of error and appearance. (I say “we” for politeness’ sake.) Formerly, alteration, change, any becoming at all, were taken as proof of mere appearance, as an indication that there must be something which led us astray. Today, conversely, precisely insofar as

the prejudice of reason forces us to posit unity, identity, permanence, substance, cause, thinghood, being, we see ourselves somehow caught in error, compelled into error. So certain are we, on the basis of rigorous examination, that this is where the error lies.

It is no different in this case than with the movement of the sun: there our eye is the constant advocate of error, here it is our language. In its origin language belongs in the age of the most rudimentary form of psychology. We enter a realm of crude fetishism when we summon before consciousness the basic presuppositions of the metaphysics of language, in plain talk, the presuppositions of reason. Everywhere it sees a doer and doing; it believes in will as *the* cause; it believes in the ego, in the ego as being, in the ego as substance, and it projects this faith in the ego-substance upon all things—only thereby does it first *create* the concept of “thing.” Everywhere “being” is projected by thought, pushed underneath, as the cause; the concept of being follows, and is a derivative of, the concept of ego. In the beginning there is that great calamity of an error that the will is something which is effective, that will is a capacity. Today we know that it is only a word.

Very much later, in a world which was in a thousand ways more enlightened, philosophers, to their great surprise, became aware of the sureness, the subjective certainty, in our handling of the categories of reason: they concluded that these categories could not be derived from anything empirical—for everything empirical plainly contradicted them. Whence, then, were they derived?

And in India, as in Greece, the same mistake was made: “We must once have been at home in a higher world (instead of a very much lower one, which would have been the truth); we must have been divine, for we have reason!” Indeed, nothing has yet possessed a more naive power of persuasion than the error concerning being, as it has been formulated by the Eleatics, for example. After all, every word we say and every sentence speak in its favor. Even the opponents of the Eleatics still succumbed to the seduction of their concept of being: Democritus, among others, when he invented his atom. “Reason” in language—oh, what an old deceptive female she is! I am afraid we are not rid of God because we still have faith in grammar.

[6] It will be appreciated if I condense so essential and so new an insight into four theses. In that way I facilitate comprehension; in that way I provoke contradiction.

First proposition. The reasons for which “this” world has been characterized as “apparent” are the very reasons which indicate its reality; any other kind of reality is absolutely indemonstrable.

Second proposition. The criteria which have been bestowed on the “true being” of things are the criteria of not-being, of *naught*; the “true world” has been constructed out of contradiction to the actual world: indeed an apparent world, insofar as it is merely a moral-optical illusion.

Third proposition. To invent fables about a world “other” than this one has no meaning at all, unless an instinct of slander, detraction, and suspicion against life has gained the upper hand in us: in that case, we avenge ourselves against life with a phantasmagoria of “another,” a “better” life.

Fourth proposition. Any distinction between a “true” and an “apparent” world—whether in the Christian manner or in the manner of Kant (in the end, an underhanded Christian)—is only a suggestion of decadence, a symptom of the *decline of life*. That the artist esteems appearance higher than reality is no objection to this proposition. For “appearance” in this case means reality *once more*, only by way of selection, reinforcement, and correction. The tragic artist is no pessimist: he is precisely the one who says Yes to everything questionable, even to the terrible—he is *Dionysian*.

HOW THE “TRUE WORLD” FINALLY BECAME A FABLE

THE HISTORY OF AN ERROR

1. The true world—attainable for the sage, the pious, the virtuous man; he lives in it, *he is it*.

(The oldest form of the idea, relatively sensible, simple, and persuasive. A circumlocution for the sentence, “I, Plato, *am* the truth.”)

2. The true world—unattainable for now, but promised for the sage, the pious, the virtuous man (“for the sinner who repents”)

(Progress of the idea: it becomes more subtle, insidious, incomprehensible—it *becomes female*, it becomes Christian.)

3. The true world—unattainable, indemonstrable, unpromisable; but the very thought of it—a consolation, an obligation, an imperative.

(At bottom, the old sun, but seen through mist and skepticism. The idea has become elusive, pale, Nordic, Königsbergian [i.e., Kantian].)

4. The true world—unattainable? At any rate, unattained. And being unattained, also *unknown*. Consequently, not *consoling*, redeeming, or obligating: how could something unknown obligate us?

(Gray morning. The first yawn of reason. The cockcrow of positivism.)

5. The “true” world—an idea which is no longer good for anything, not even obligating—an idea which has become useless and superfluous—*consequently*, a refuted idea: let us abolish it!

(Bright day; breakfast; return of *bon sens* and cheerfulness; Plato’s embarrassed blush; pandemonium of all free spirits.)

6. The true world—we have abolished. What world has remained? The apparent one perhaps? But no! *With the true world we have also abolished the apparent one*.

(Noon; moment of the briefest shadow; end of the longest error; high point of humanity; INCIPIT ZARATHUSTRA.)

MORALITY AS ANTI-NATURE

[1] All passions have a phase when they are merely disastrous, when they drag down their victim with the weight of stupidity—and a later, very much later phase when they wed the spirit, when they “spiritualize” themselves. Formerly, in view of the element of stupidity in passion, war was declared on passion itself, its destruction was plotted; all the old moral monsters are agreed on this: *il faut tuer les passions* [one must kill the passions]. The most famous formula for this is to be found in the New Testament, in that Sermon on the Mount, where, incidentally, things are by no means looked at from a height. There it is said, for example, with particular reference to sexuality: “If thy eye offend thee, pluck it out.” Fortunately, no Christian acts in accordance with this precept. *Destroying* the passions and cravings, merely as a preventive measure against their stupidity and the unpleasant consequences of this stupidity—today this itself strikes us as merely another acute form of stupidity. We no longer admire dentists who “pluck out” teeth so that they will not hurt any more.

To be fair, it should be admitted, however, that on the ground out of which Christianity grew, the concept of the “*spiritualization* of passion” could never have been formed. After all the first church, as is well known, fought against the “intelligent” in favor of the “poor in spirit.” How could one expect from it an intelligent war against passion? The church fights passion with excision in every sense: its practice, its “cure,” is *castratism*. It never asks: “How can one spiritualize, beautify, deify a craving?” It has at all times laid the stress of discipline on extirpation (of sensuality, of pride, of the lust to rule, of avarice, of vengefulness). But an attack on the roots of passion means an attack on the roots of life: the practice of the church is *hostile to life*.

[2] The same means in the fight against a craving—castration, extirpation—is instinctively chosen by those who are too weak-willed, too degenerate, to be able to impose moderation on themselves; by those who are so constituted that they require *La Trappe* [The Trappist Order] to use a figure of speech, or (without any figure of speech) some kind of definitive declaration of hostility, a *cleft* between themselves and the passion. Radical means are indispensable only for the degenerate; the weakness of the will—or, to speak more definitely, the inability not to respond to a stimulus—is itself merely another form of degeneration. The radical hostility, the deadly hostility against sensuality, is always a symptom to reflect on: it entitles us to suppositions concerning the total state of one who is excessive in this manner.

This hostility, this hatred, by the way, reaches its climax only when such types lack even the firmness for this radical cure, for this renunciation of their “devil.” One should survey the whole history of the priests and philosophers, including the artists: the most poisonous things against the senses have been said not by the impotent, nor by ascetics, but by the impossible ascetics, by those who really were in dire need of being ascetics.

[3] The spiritualization of sensuality is called *love*: it represents a great triumph over Christianity. Another triumph is our spiritualization of *hostility*. It consists in a profound appreciation of the value of having enemies: in short, it means acting and thinking in the opposite way from that which has been the rule. The church always wanted the destruction of its enemies; we, we immoralists and Antichristians, find our advantage in this, that the church exists. In the political realm too, hostility has now become more spiritual—much more sensible, much more thoughtful, much more *considerate*. Almost every party understands how it is in the interest of its own self-preservation that the opposition should not lose all strength; the same is true of power politics. A new creation in particular—the new *Reich*, for example—needs enemies more than friends: in opposition alone does it *feel* itself necessary, in opposition alone does it *become* necessary.

Our attitude to the “internal enemy” is no different: here too we have spiritualized hostility; here too we have come to appreciate its value. The price of fruitfulness is to be rich in internal opposition; one remains young only as long as the soul does not stretch itself and desire peace. Nothing has become more alien to us than that desideratum of former times, “peace of soul,” the *Christian* desideratum; there is nothing we envy less than the moralistic cow and the fat happiness of the good conscience. One has renounced the *great* life when one renounces war.

In many cases, to be sure, “peace of soul” is merely a misunderstanding—something else, which lacks only a more honest name. Without further ado or prejudice, a few examples. “Peace of soul” can be, for one, the gentle radiation of a rich animality into the moral (or religious) sphere. Or the beginning of weariness, the first shadow of evening, of any kind of evening. Or a sign that the air is humid, that south

winds are approaching. Or unrecognized gratitude for a good digestion (sometimes called “love of man”). Or the attainment of calm by a convalescent who feels a new relish in all things and waits. Or the state which follows a thorough satisfaction of our dominant passion, the well-being of a rare repletion. Or the senile weakness of our will, our cravings, our vices. Or laziness, persuaded by vanity to give itself moral airs. Or the emergence of certainty, even a dreadful certainty, after long tension and torture by uncertainty. Or the expression of maturity and mastery in the midst of doing, creating, working, and willing—calm breathing, *attained* “freedom of the will.” *Twilight of the Idols*— who knows? perhaps also only a kind of “peace of soul.”

[4] I reduce a principle to a formula. Every naturalism in morality—that is, every healthy morality—is dominated by an instinct of life; some commandment of life is fulfilled by a determinate canon of “shalt” and “shalt not”; some inhibition and hostile element on the path of life is thus removed. *Anti-natural* morality—that is, almost every morality which has so far been taught, revered, and preached—turns, conversely, *against* the instincts of life: it is *condemnation* of these instincts, now secret, now outspoken and impudent. When it says, “God looks at the heart,” it says No to both the lowest and the highest desires of life, and posits God as the *enemy* of *life*. The saint in whom God delights is the ideal eunuch. Life has come to an end where the “kingdom of God” begins.

[5] Once one has comprehended the outrage of such a revolt against life as has become almost sacrosanct in Christian morality, one has, fortunately, also comprehended something else: the futility, apparentness, absurdity, and *mendaciousness* of such a revolt. A condemnation of life by the living remains in the end a mere symptom of a certain kind of life: the question whether it is justified or unjustified is not even raised thereby. One would require a position *outside* of life, and yet have to know it as well as one, as many, as all who have lived it, in order to be permitted even to touch the problem of the *value* of life: reasons enough to comprehend that this problem is for us an unapproachable problem. When we speak of values, we speak with the inspiration, with the way of looking at things, which is part of life: life itself forces us to posit values; life itself values through us when we posit values. From this it follows that even that anti-natural morality which conceives of God as the counter-concept and condemnation of life is only a value judgment of life—but of what life? of what kind of life? I have already given the answer: of declining, weakened, weary, condemned life. Morality, as it has so far been understood—as it has in the end been formulated once more by Schopenhauer, as “negation of the will to life”—is; the very *instinct of decadence*, which makes an imperative of itself. It says: “*Perish!*” It is a condemnation pronounced by the condemned.

[6] Let us finally consider how naive it is altogether to say: “Man *ought* to be such and such!” Reality shows us an enchanting wealth of types, the abundance of a lavish play and change of forms—and some wretched loafer of a moralist comments: “No! Man ought to be different.” He even knows what man should be like, this wretched bigot and prig: he paints himself on the wall and comments, “*Ecce homo!*” But even when the moralist addresses himself only to the single human being and says to him, “You ought to be such and such!” he does not cease to make himself ridiculous. The single human being is a piece of *fatum* from the front and from the rear, one law more, one necessity more for all that is yet to come and to be. To say to him, “Change yourself!” is to demand that everything be changed, even retroactively. And indeed there have been consistent moralists who wanted man to be different, that is, virtuous—they wanted him remade in their own image as a prig: to that end, they *negated* the world! No small madness! No modest kind of immodesty!

Morality, insofar as it *condemns* for its own sake, and not out of regard for the concerns, considerations, and contrivances of life, is a specific error with which one ought to have no pity—an *idiosyncrasy of degenerates* which has caused immeasurable harm.

We others, we immoralists, have, conversely, made room in our hearts for every kind of understanding, comprehending, and *approving*. We do not easily negate; we make it a point of honor to be *affirmers*. More and more, our eyes have opened to that economy which needs and knows how to utilize all that the holy witlessness of the priest, of the *diseased* reason in the priest, rejects—that economy in the law of life which finds an advantage even in the disgusting species of the prigs, the priests, the virtuous. *What* advantage? But we ourselves, we immoralists, are the answer.

THE FOUR GREAT ERRORS

[1] *The error of confusing cause and effect.* There is no more dangerous error than that of mistaking the effect for the cause. I call it the real corruption of reason. Yet this error belongs among the most ancient and recent habits of mankind. It is even hallowed among us and goes by the name of “religion” or “morality.” Every single sentence which religion and morality formulate contains it; priests and legislators of moral codes are the originators of this corruption of reason.

I give an example. Everybody knows the book of the famous Cornaro in which he recommends his slender diet as a recipe for a long and happy life—a virtuous one too. Few books have been read so much; even now thousands of copies are sold in England every year. I do not doubt that scarcely any book (except the Bible, as is meet) has done as much harm, has *shortened* as many lives, as this well-intentioned *curiosum*. The reason: the mistaking of the effect for the cause. The worthy Italian thought his diet was the *cause* of his long life, whereas the precondition for a long life, the extraordinary slowness of his metabolism, the consumption of so little, was the cause of his slender diet. He was not free to eat little *or* much; his frugality was not a matter of “free will”: he became sick when he ate more. But whoever is no carp not only does well to eat properly, but needs to. A scholar in our time, with his rapid consumption of nervous energy, would simply destroy himself with Cornaro’s diet. *Crede experto* [“Believe him who has tried!”]

[2] The most general formula on which every religion and morality is founded is: “Do this and that, refrain from this and that—then you will be happy! Otherwise . . .” Every morality, every religion, is this imperative; I call it the great original sin of reason, the *immortal unreason*. In my mouth, this formula is changed into its opposite—first example of my “revaluation of all values”: a well-turned-out human being, a “happy one,” *must* perform certain actions and shrinks instinctively from other actions; he carries the order, which he represents physiologically, into his relations with other human beings and things. In a formula: his virtue is the *effect* of his happiness. A long life, many descendants—this is not the wages of virtue; rather virtue itself is that slowing down of the metabolism which leads, among other things, also to a long life, many descendants—in short, to *Cornarism*.

The church and morality say: “A generation, a people, are destroyed by license and luxury.” My *recovered* reason says: when a people approaches destruction, when it

degenerates physiologically, then license and luxury *follow* from this (namely, the craving for ever stronger and more frequent stimulation, as every exhausted nature knows it). This young man turns pale early and wilts; his friends say; that is due to this or that disease. I say: that he became diseased, that he did not resist the disease, was already the effect of art impoverished life or hereditary exhaustion. The newspaper reader says: this party destroys itself by making such a mistake. My *higher* politics says: a party which makes such mistakes has reached its end; it has lost its sureness of instinct. Every mistake in every sense is the effect of the degeneration of instinct, of the disintegration of the will: one could almost define what is bad in this way. All that is good is instinct—and hence easy, necessary, free. Laboriousness is an objection; the god is typically different from the hero. (In my language light feet are the first attribute of divinity.)

[3] *The error of a false causality.* People have believed at all times that they knew what a cause is; but whence did we take our knowledge—or more precisely, our faith that we had such knowledge? From the realm of the famous “inner facts,” of which not a single one has so far proved to be factual. We believed ourselves to be causal in the act of willing; we thought that here at least we caught causality in the act. Nor did one doubt that all the antecedents of an act, its causes, were to be sought in consciousness and would be found there once sought—as “motives”; else one would not have been free and responsible for it. Finally, who would have denied that a thought is caused? that the ego causes the thought?

Of these three “inward facts” which seem to guarantee causality, the first and most persuasive is that of the will as cause. The conception of a consciousness (“spirit”) as a cause, and later also that of the ego as cause (the “subject”), are only afterbirths: first the causality of the will was firmly accepted as given, as *empirical*.

Meanwhile we have thought better of it. Today we no longer believe a word of all this. The “inner world” is full of phantoms and will-o’-the-wisps: the will is one of them. The will no longer moves anything, hence does not explain anything either—it merely accompanies vents; it can also be absent. The so-called *motive*: another error. Merely a surface phenomenon of consciousness, something alongside the deed that is more likely to cover up the antecedents of the deeds than to represent them. And as for the *ego*! That has become a fable, a fiction, a play on words: it has altogether ceased to think, feel, or will!

What follows from this? There are no mental causes at all. The whole of the allegedly empirical evidence for that has gone to the devil. That is what follows! And what a fine abuse we had perpetrated with this “empirical, evidence”; we *created* the world on this basis as a world of causes, a world of will, a world of spirits. The most ancient and enduring psychology was at work here and did not do anything else: all that happened was considered a doing, all doing the effect of a will; the world became to it a multiplicity of doers; a doer (a “subject”) was slipped under all that happened. It was out of himself that man projected his three “inner facts”—that in which he believed most firmly, the will, the spirit, the ego. He even took the concept of being from, the concept of the ego; he posited “things” as “being,” in his image, in accordance with his concept of the ego as a cause. Small wonder that later he always found in things only that *which he had put into them*. The thing itself, to say it once more, the concept of thing is a mere reflex of the faith in the ego as cause. And even your atom, my dear mechanists and physicists—how much error, how much rudimentary psychology is still

residual in your atom! Not to mention the “thing-in-itself,” the *horrendum pudendum* of the metaphysicians! The error of the spirit as cause mistaken for reality! And made the very measure of reality! And called God!

[4] *The error of Imaginary causes.* To begin with dreams: *ex post facto*, a cause is slipped under a particular sensation (for example, one following a far-off cannon shot)—often a whole little novel in which the dreamer turns up as the protagonist. The sensation endures meanwhile in a kind of resonance: it waits, as it were, until the causal instinct permits it to step into the foreground now no longer as a chance occurrence, but as “meaning.” The cannon shot appears in a *causal* mode, in an apparent reversal of time. What is really later, the motivation, is experienced first—often with a hundred details which pass like lightning—and the shot *follows*. What has happened? The representations which were *produced* by a certain state have been misunderstood as its causes.

In fact, we do the same thing when awake. Most of our general feeling—every kind of inhibition, pressure, tension, and explosion in the play and counterplay of our organs, and particularly the state of the *nervus sympathicus*—excite our causal instinct: we want to have a reason for feeling this way or that—for feeling bad or for feeling good. We are never satisfied merely to state the fact that we feel this way or that; we admit this fact only—become conscious of it only—when we have furnished some kind of motivation. Memory, which swings into action in such cases, unknown to us, brings up earlier states of the same kind, together with the causal interpretations associated with them—not their real causes. The faith, to be sure, that such representations, such accompanying conscious processes, are the causes, is also brought forth by memory. Thus originates a habitual acceptance of a particular causal interpretation, which, as a matter of fact, inhibits any investigation into the real cause—even precludes it.

[5] *The psychological explanation of this.* To derive something unknown from something familiar relieves, comforts, and satisfies, besides giving a feeling of power. With the unknown, one is confronted with danger, discomfort, and care; the first instinct is to abolish these painful states. First principle: any explanation is better than none. Since at bottom it is merely a matter of wishing to be rid of oppressive representations, one is not too particular about the means of getting rid of them: the first representation that explains the unknown as familiar feels so good that one “considers it true.” The proof of pleasure (“of strength”) as a criterion of truth.

The causal instinct is thus conditional upon, and excited by, the feeling of fear. The “why?” shall, if at all possible, not give the cause for its own sake so much as for a *particular kind of cause*—a cause that is comforting, liberating, and relieving. That it is something already familiar, experienced, and inscribed in the memory, which is posited as a cause, that is the first consequence of this need. That which is new and strange and has not been experienced before, is excluded as a cause. Thus one searches not only for some kind of explanation to serve as a cause, but for a particularly selected and preferred kind of explanation—that which has most quickly and most frequently abolished the feeling of the strange, new, and hitherto unexperienced: the *most habitual* explanations. Consequence: one kind of positing of causes predominates more and more, is concentrated into a system, and finally emerges as *dominant*, that is, as simply precluding other causes and explanations. The banker immediately thinks of “business,” the Christian of “sin,” and the girl of her love.

[6] *The whole realm of morality and religion belongs under this concept of imaginary causes.* The “explanation” of *disagreeable* general feelings. They are produced by beings that are hostile to us (evil spirits: the most famous case—the misunderstanding of the hysterical as witches). They are produced by acts which cannot be approved (the feeling of “sin,” of “sinfulness,” is slipped under a physiological discomfort; one always finds reasons for being dissatisfied with oneself). They are produced as punishments, as payment for something we should not have done, for what we should not have *been* (impudently generalized by Schopenhauer into a principle in which morality appears as what it really is—as the very poisoner and slanderer of life: “Every great pain, whether physical or spiritual, declares what we deserve; for it could not come to us if we did not deserve it. (*World as Will and Representation* II, 666). They are produced as effects of ill-considered actions that turn out badly. (Here the affects, the senses, are posited as causes, as “guilty”; and physiological calamities are interpreted with the help of other calamities as “deserved.”)

The “explanation” of *agreeable* general feelings. They are produced by trust in God. They are produced by the consciousness of good deeds (the so-called “good conscience”—a physiological state which at times looks so much like good digestion that it is hard to tell them apart). They are produced by the successful termination of some enterprise (a naïve fallacy: the successful termination of some enterprise does not by any means give a hypochondriac or a Pascal agreeable general feelings). They are produced by faith, charity, and hope—the Christian virtues.

In truth, all these supposed explanations are resultant states and, as it were, translations of pleasurable or unpleasurable feelings into a false dialect: one is in a state of hope *because* the basic physiological feeling is once again strong and rich; one trusts in God *because* the feeling of fullness and strength gives a sense of rest. Morality and religion belong altogether to the *psychology of error*: in every single case, cause and effect are confused; or truth is confused with the effects of *believing* something to be true; or a state of consciousness is confused with its causes.

[7] *The error of free will.* Today we no longer have any pity for the concept of “free will”: we know only too well what it really is—the foulest of all theologians’ artifices, aimed at making mankind “responsible” in their sense, that is, *dependent upon them*. Here I simply supply the psychology of all “making responsible.”

Wherever responsibilities are sought, it is usually the instinct of wanting to judge and punish which is at work. Becoming has been deprived of its innocence when any being-such-and-such is traced back to will, to purposes, to acts of responsibility: the doctrine of the will has been invented essentially for the purpose of punishment, that is, because one wanted to impute guilt. The entire old psychology, the psychology of will, was conditioned by the fact that its originators, the priests at the head of ancient communities, wanted to create for themselves the right to punish—or wanted to create this right for God. Men were considered “free” so that they might be judged and punished—so that they might become *guilty*: consequently, every act had to be considered as willed, and the origin of every act had to be considered as lying within the consciousness (and thus the most fundamental counterfeit in *psychologism* was made the principle of psychology itself).

Today, as we have entered into the reverse movement and we immoralists are trying with all our strength to take the concept of guilt and the concept of punishment out of the world again, and to cleanse psychology, history, nature, and social institutions and sanctions of them, there is in our eyes no more radical opposition than that of the theologians, who continue with the concept of a “moral world-order” to infect the

innocence of becoming by means of “punishment” and “guilt.” Christianity is a meta-physics of the hangman.

[8] What alone can be *our* doctrine? That no one *gives* man his qualities—neither God, nor society, nor his parents and ancestors, nor he himself. (The nonsense of the last idea was taught as “intelligible freedom” by Kant—perhaps by Plato already.) No one is responsible for man’s being there at all, for his being such-and-such, or for his being in these circumstances or in this environment. The fatality of his essence is not to be disentangled from the fatality of all that has been and will be. Man is not the effect of some special purpose, of a will, and end; nor is he the object of an attempt to attain an “ideal of humanity” or an “ideal of happiness” or an “ideal of morality.” It is absurd to wish to devolve one’s essence on some end or other. We have invented the concept of “end”: in reality there is no end.

One is necessary, one is a piece of fatefulness, one belongs to the whole, one is in the whole; there is nothing which could judge, measure, compare, or sentence our being, for that would mean judging, measuring, comparing, or sentencing the whole. But there nothing besides the whole. That nobody is held responsible any longer, that the mode of being may not be traced back to a *causa prima*, that the world does not form a unity either as a sensorium or as “spirit”—alone is the great liberation; with this alone is the innocence of becoming restored. The concept of “God” was until now the greatest objection to existence. We deny God, we deny the responsibility in God: only thereby do we redeem the world.

THE ANTI-CHRIST (selections)

FIRST BOOK: ATTEMPT AT A CRITIQUE OF CHRISTIANITY

* * *

2. What is good? Everything that heightens the feeling of power in man, the will to power, power itself.

What is bad? Everything that is born of weakness.

What is happiness? The feeling that power is *growing*, that resistance is overcome.

Not contentedness but more power; not peace but war; not virtue but fitness (Renaissance virtue, *virtù*, virtue that is moraline*-free).

The weak and the failures shall perish: first principle of our love of man. And they shall even be given every possible assistance.

*The coinage of a man who neither smoked nor drank coffee.

What is more harmful than any vice? Active pity for all the failures and all the weak: Christianity.

3. The problem I thus pose is not what shall succeed mankind in the sequence of living beings (man is an *end*), but what type of man shall be *bred*, shall be *willed*, for being higher in value, worthier of life, more certain of a future.

Even in the past this higher type has appeared often—but as a fortunate accident, as an exception, never as something *willed*. In fact, this has been the type most dreaded—almost *the* dreadful—and from dread the opposite type was willed, bred, and *attained*: the domestic animal, the herd animal, the sick human animal—the Christian.

4. Mankind does *not* represent a development toward something better or stronger or higher in the sense accepted today. “Progress” is merely a modern idea, that is, a false idea. The European of today is vastly inferior in value to the European of the Renaissance: further development is altogether *not* according to any necessity in the direction of elevation, enhancement, or strength.

In another sense, success in individual cases is constantly encountered in the most widely different places and cultures: here we really do find a *higher type*, which is, in relation to mankind as a whole, a kind of overman. Such fortunate accidents of great success have always been possible and will perhaps always be possible. And even whole families, tribes, or peoples may occasionally represent such a *bull’s-eye*.

5. Christianity should not be beautified and embellished: it has waged deadly war against this higher type of man; it has placed all the basic instincts of this type under the ban; and out of these instincts it has distilled evil and the Evil One: the strong man as the typically reprehensible man, the “reprobate.” Christianity has sided with all that is weak and base, with all failures; it has made an ideal of whatever *contradicts* the instinct of the strong life to preserve itself; it has corrupted the reason even of those strongest in spirit by teaching men to consider the supreme values of the spirit as something sinful, as something that leads into error—as temptations. The most pitiful example: the corruption of Pascal, who believed in the corruption of his reason through original sin when it had in fact been corrupted only by his Christianity.

6. It is a painful, horrible spectacle that has dawned on me: I have drawn back the curtain from the *corruption* of man. In my mouth, this word is at least free from one suspicion: that it might involve a moral accusation of man. It is meant—let me emphasize this once more—*moraline-free*. So much so that I experience this corruption most strongly precisely where men have so far aspired most deliberately to “virtue” and “godliness.” I understand corruption, as you will guess, in the sense of decadence: it is my contention that all the values in which mankind now sums up its supreme desiderata are *decadence-values*.

I call an animal, a species, or an individual corrupt when it loses its instincts, when it chooses, when it prefers, what is disadvantageous for it. A history of “lofty sentiments,” of the “ideals of mankind”—and it is possible that I shall have to write it—would almost explain too *why* man is so corrupt. Life itself is to my mind the instinct for growth, for durability, for an accumulation of forces, for *power*: where the will to power is lacking there is decline. It is my contention that all the supreme values of mankind *lack* this will—that the values which are symptomatic of decline, *nihilistic* values, are lording it under the holiest name.

7. Christianity is called the religion of *pity*. Pity stands opposed to the tonic emotions which heighten our vitality: it has a depressing effect. We are deprived of strength when we feel pity. That loss of strength which suffering as such inflicts on life is still

further increased and multiplied by pity. Pity makes suffering contagious. Under certain circumstances, it may engender a total loss of life and vitality out of all proportion to the magnitude of the cause (as in the case of the death of the Nazarene). That is the first consideration, but there is a more important one.

Suppose we measure pity by the value of the reactions it usually produces; then its perilous nature appears in an even brighter light. Quite in general, pity crosses the law of development, which is the law of *selection*. It preserves what is ripe for destruction; it defends those who have been disinherited and condemned by life; and by the abundance of the failures of all kinds which it keeps alive, it gives life itself a gloomy and questionable aspect.

Some have dared to call pity a virtue (in every *noble* ethic it is considered a weakness); and as if this were not enough, it has been made *the* virtue, the basis and source of all virtues. To be sure—one should always keep this in mind—this was done by a philosophy that was nihilistic and had inscribed the *negation of life* upon its shield. Schopenhauer was consistent enough: pity negates life and renders it *more deserving of negation*.

Pity is the *practice* of nihilism. To repeat: this depressive and contagious instinct crosses those instincts which aim at the preservation of life and at the enhancement of its value. It multiplies misery and conserves all that is miserable, and is thus a prime instrument of the advancement of decadence: pity persuades men to *nothingness*! Of course, one does not say “nothingness” but “beyond” or “God,” or “*true* life,” or Nirvana, salvation, blessedness.

This innocent rhetoric from the realm of the religious-moral idiosyncrasy appears much less innocent as soon as we realize which tendency it is that here shrouds itself in sublime words: *hostility against life*. Schopenhauer was hostile to life; therefore pity became a virtue for him.

Aristotle, as is well known, considered pity a pathological and dangerous condition, which one would be well advised to attack now and then with a purge: he understood tragedy as a purge. From the standpoint of the instinct of life, a remedy certainly seems necessary for such a pathological and dangerous accumulation of pity as it is represented by the case of Schopenhauer (and unfortunately by our entire literary and artistic decadence from St. Petersburg to Paris, from Tolstoy to Wagner)—to puncture it and make it *burst*.

In our whole unhealthy modernity there is nothing more unhealthy than Christian pity. To be physicians *here*, to be inexorable *here*, to wield the scalpel *here*—that is *our* part, that is *our* love of man, that is how we are philosophers, we *Hyperboreans*.

* * *

62. With this I am at the end and I pronounce my judgment. I *condemn* Christianity. I raise against the Christian church the most terrible of all accusations that any accuser ever uttered. It is to me the highest of all conceivable corruptions. It has had the will to the last corruption that is even possible. The Christian church has left nothing untouched by its corruption; it has turned every value into an un-value, every truth into a lie, every integrity into a vileness of the soul. Let anyone dare to speak to me of its “humanitarian” blessings! To *abolish* any distress ran counter to its deepest advantages: it lived on distress, it *created* distress to eternalize *itself*.

The worm of sin, for example: with this distress the church first enriched mankind. The “equality of souls before God,” this falsehood, this *pretext* for the rancor of all the base-minded, this explosive of a concept which eventually became revolution, modern

idea, and the principle of decline of the whole order of society—is *Christian* dynamite. “Humanitarian” blessings of Christianity! To breed out of *humanitas* a self-contradiction, an art of self-violation, a will to lie at any price, a repugnance, a contempt for all good and honest instincts! Those are some of the blessings of Christianity!

Parasitism as the *only* practice of the church; with its ideal of anemia, of “holiness,” draining all blood, all love, all hope for life; the beyond as the will to negate every reality; the cross as the mark of recognition for the most subterranean conspiracy that ever existed—against health, beauty, whatever has turned out well, courage, spirit, *graciousness* of the soul, *against life itself*.

This eternal indictment of Christianity I will write on all walls, wherever there are walls—I have letters to make even the blind see.

I call Christianity the one great curse, the one great innermost corruption, the one great instinct of revenge, for which no means is poisonous, stealthy, subterranean, *small* enough—I call it the one immortal blemish of mankind.

And time is reckoned from the *dies nefastus* with which this calamity began—after the *first* day of Christianity! *Why not rather after its last day? After today?* Revaluation of all values!

TWENTIETH- CENTURY PHILOSOPHY

by Hans Bynagle

The major twentieth-century philosophical traditions are notoriously difficult to characterize in a nutshell. Generalizations, especially, are perilous and apt to be misleading. Fortunately, one can begin to sketch a philosophical map, albeit a *very* rough one, in terms that are largely geographical. One of the major lines that can be drawn on our map divides the philosophical tradition that dominates most of the European continent, known accordingly as Continental philosophy, from the dominant philosophical tradition of England, the United States, and some other countries subject to strong British or American influence (such as Canada and Australia) known as Anglo-American philosophy.

I can offer here only the most rudimentary characterizations of a few of the main strands of Continental philosophy beginning with Phenomenology. Founded around the turn of the twentieth century by Edmund Husserl, and developed by Martin Heidegger, Phenomenology is essentially a philosophical method, one that focuses on careful inspection and description of phenomena or appearances, defined as any object of conscious experience, that is, that which we are conscious *of*. The inspection and description are supposed to be effected without any presuppositions, and that includes any presuppositions as to whether such objects of consciousness are “real” or correspond to something “external,” or as to what their causes or consequences may be. It is believed that by this method the essential structures of experience and its objects can be uncovered. The sorts of experiences

Adapted from Hans Bynagle, “A Map of Twentieth-Century Philosophy,” *Philosophy: A Guide to the Reference Literature*, 2nd edition (Littleton, CO: Libraries Unlimited, 1997). Reprinted by permission of the author.

and phenomena that Phenomenologists have sought to describe are highly varied, including, for instance, time consciousness; mathematics and logic; perception; experience of the social world; our experience of our own bodies; and moral, aesthetic, and religious experience.

Existentialism, unlike Phenomenology, is not primarily a philosophical method. Neither is it exactly a set of doctrines (at least not any *one* set) but more an outlook or attitude supported by diverse doctrines centered on certain common themes. These themes include the human condition, or the relation of the individual to the world; the human response to that condition (described often in strongly affective and preponderantly negative terms such as “despair,” “dread,” “anxiety,” “guilt,” “bad faith,” “nausea”); being, especially the difference between the being of persons (which is “existence”) and the being of other kinds of things; human freedom; the significance (and unavoidability) of choice and decision in the absence of certainty; and the concreteness and subjectivity of life as lived, over against abstractions and false objectifications.

Existentialism is often thought to be antireligious (and is, in some of its versions), but there has in fact been a strong current of Christian Existentialism, beginning with the figure often credited with originating Existentialism, the nineteenth-century Danish philosopher Kierkegaard. Existentialism’s relationship to Phenomenology is a matter of some controversy, but at least one can say that many of the later Existentialist thinkers, Sartre among them, have employed Phenomenological methods to arrive at or support their specific variations on Existential themes. Although Existentialism has been on the wane since the 1960s, it has enjoyed exceptional prominence, even popularity, for a philosophical movement, in part because of its literary expressions by writers such as Sartre, Camus, de Beauvoir, and Marcel.

Structuralism is an interdisciplinary movement united by the principle that social and cultural phenomena, including belief systems and every kind of discourse (literary, political, scientific, etc.), are best understood by analogy with language, itself best understood as a structure of relations among its component parts. Just as in language the crucial determinant of meaning (according to the early structural linguist Ferdinand de Saussure) is neither individual words nor their reference to things outside language but their interrelationships within the linguistic structure, so the crucial element in all social and cultural phenomena is the underlying structure that determines the functions of the various parts. A good deal of Structuralist analysis has been concerned with a kind of unmasking, that is, with revealing political, social, or psychological phenomena as (allegedly) not what they seem or what participants believe them to be but as determined by structures often concealed from view.

This unmasking impulse persists with the group of thinkers sometimes designated Post-Structuralists, who both rejected certain presuppositions of Structuralism and added their own more radical ideas about the fundamental role of language in constructing all human perceptions and conceptions of reality. A particular form of this unmasking tendency is Deconstruction, introduced in the work of Jacques Derrida, who is generally counted among Post-Structuralists. Any attempt to define Deconstruction must labor in the shadow of Derrida’s apparent rejection in advance of all such attempts. Nonetheless, it has seemed fair to many interpreters to characterize it as a form of textual criticism or interpretation whose aim is to unmask and overcome hidden “privileging” that occurs in texts of all kinds. This privileging, for example the privileging of reason, the

masculine, the sacred, the literal, or the objective, and so on, entails the exclusion, suppression, or marginalization of their opposites—passion, the feminine, the profane, the metaphorical, the subjective, and so on—while at the same time it must presuppose these opposites to sustain or even to make sense of the privileged concept. In this way, it is maintained, texts regularly undermine their own assumptions. As a reading technique uncovering alleged hidden agendas behind the ostensible meaning of a text, Deconstruction takes the further step of denying that the text has a definite meaning. This has become a key thesis for the currents of literary theorizing and criticism that followed in Derrida's wake.

* * *

Turning to the other dominant twentieth-century philosophical tradition, it is not uncommon to equate Anglo-American philosophy with what is called Analytic or Analytical philosophy. But the term is also used in a broader sense to encompass other movements that have flourished chiefly on British and American soil, for instance, Pragmatism, Naturalism, and Process Philosophy. There is much to be said for the wider meaning, which avoids the suggestion that philosophy in England and America is more monolithic than it really is. The equation of Anglo-American with Analytic is also unfortunate from another point of view, in that Analytic philosophy has become the dominant mode of philosophizing in some other areas as well, notably the Scandinavian countries, to say nothing of the inroads it has made in areas where other approaches still dominate the field (the other side of the blurring and bridging of the Continental/Anglo-American boundary), for example, in Germany. However, given all those qualifications and others, there is no question that Analytic philosophy is the most important philosophical current within the Anglo-American sphere. It is also the one most often contrasted with (and actively opposed to) the Continental movements described earlier.

What Analytic philosophy *is* is not so easy to say. I believe it is possible to distinguish at least three variants, though they probably represent points on a spectrum rather than discrete alternatives. In the widest and loosest sense, Analytic philosophy is hardly more than a philosophical style, one that takes extreme care with the meanings of words (sometimes with precise definitions of terms and consistency in their use, sometimes with the nuances of ordinary language) that tends to present arguments in meticulous step-by-step fashion (often endeavoring to leave nothing implicit), and that pays close, sometimes minute, attention to logical relations (often using logical symbolism or specialized logical terminology to render such relations transparent). In a narrower sense, "Analytic philosophy" designates a philosophical outlook that holds that the primary task or even (in its more extreme version) the only proper task of philosophy—the primary or proper method for attacking philosophical problems—is analysis of one sort or another: of meanings, of concepts, of logical relations, or all of these. We can call this the methodological version. Finally, one may occasionally encounter the term "Analytic philosophy" in contexts in which it is reserved for one or more specific doctrines regarding the outcome of correct philosophical analysis. Even though the Analytic tradition (in either of the two wider senses) owes a great deal to certain specific doctrinal versions—and to major figures who propounded them, such as Bertrand Russell, Ludwig Wittgenstein, and the Logical Positivists—it would be incorrect to say that Analytic philosophy is the dominant orientation among British and American philosophers if one has in mind

this narrower meaning. In fact, it is not clear that this is true under any but the widest meaning distinguished earlier.

Common to those who subscribe to the Analytic approach, whether in the broadest sense or a narrower one, is the conviction that to some significant degree, philosophical problems, puzzles, and errors are rooted in language and can be solved or avoided, as the case may be, by a sound understanding of language and careful attention to its workings. (Willard Van Orman Quine, for example, exhibits this strategy in his careful examination of the analytic-synthetic distinction.) This method has tended to focus much attention on language and on its close relative, logic, as objects of study for their own sake. (The relationship between language and logic is itself a question subjected to considerable inquiry and debate.) Detractors are apt to point to this concern—they might say this obsession—with language and logic as one aspect of the trivialization of philosophy with which they charge the Analytic movement. Many who are generally loyal or sympathetic to Analytic philosophy may agree that it tended to draw philosophy away from “deep” questions. In any case, the past two to three decades have seen, on the one hand, increased self-searching as to the limitations of the Analytic approach, and on the other, more efforts to apply it to deeper questions—about the meaning of life, for instance, or the nature of the moral life—in a way that takes them seriously.

EDMUND HUSSERL

1859–1938

Edmund Husserl was born in Prostějov (Prossnitz), Moravia, in what is now the Czech Republic; at that time, it was part of the Austrian Empire. After attending elementary school in Prostějov, Husserl went to *gymnasias* (high schools) in Vienna and Olmütz before enrolling at the University of Leipzig in 1876. For two years, he studied mathematics, physics, and astronomy, attending philosophy lectures only in his spare time. In 1878, he transferred to the Friedrich-Wilhelm University of Berlin, where he continued his study of mathematics (under the renowned Karl Weierstrass) as well as his hobby of philosophy. After three years, he moved to the University of Vienna, where he received a Ph.D. in mathematics in 1883.

Husserl was offered a teaching position in mathematics at Berlin, but he decided to remain in Vienna so that he could continue studying philosophy. He worked with the philosophical psychologist Franz Brentano (1838–1917) during the next two years. Following Brentano's advice, Husserl then moved to the University of Halle, where he published his first book, *Philosophy of Arithmetic* (1891). In 1901, he moved to the University of Göttingen, where he spent the next sixteen years and published a number of important works, including *Ideas: General Introduction to Pure Phenomenology* (1913). His last post was at the University of Freiburg, where he taught until his retirement in 1928. Among his Freiburg associates was Martin Heidegger. Following retirement, Husserl wrote voluminously—though little was published during his lifetime. Toward the end of his life, the Nazis barred him from formal academic activities because of his Jewish ancestry.

After his death in 1938, the Husserl Archive was established in Louvain, Belgium. The Archive has preserved, transcribed, and, over the decades, published

Husserl's shorthand notes as the *Husserliana series*. The Archive has also hosted congresses on, and published essays in, phenomenology.

* * *

Franz Brentano, Husserl's teacher, criticized British empiricism for its tendency to present consciousness in terms of ideas or representations. Brentano argued that the key constituent of mental states is intentionality—thought's correlation rather than its immobile state. In order to have consciousness, one must be conscious of something. One cannot just think, one must think *about* something; one cannot just desire, one must have desire *for* something; one cannot just be aware, one must be aware *of* something. In each case, the "something" is the "intentional object" of consciousness. Contrary to Kant, Brentano held that consciousness does not *construct* these objects; it only *points to* them.

The end of the nineteenth century brought two quite different responses to Brentano. The Analytic tradition, which tended to dominate English-speaking philosophy, focused almost exclusively on objects of consciousness, ignoring consciousness itself. The Phenomenological tradition, dominant on the European continent, examined the nature of consciousness itself.

Husserl is the acknowledged founder of this Phenomenological response. Like Descartes, Husserl considered consciousness the main topic for philosophy. In examining the form of this consciousness, Husserl discovered what he called "the natural standpoint":

I am aware of a world, spread out in space endlessly, and in time becoming and become, without end. I am aware of it, that means, first of all, I discover it immediately, intuitively, I experience it. Through sight, touch, hearing, etc., . . . corporeal things somehow spatially distributed are *for me simply there*, . . . "present," whether or not I pay them special attention by busying myself with them, considering, thinking, feeling, willing.*

This is the world as it is actually lived by an individual. Although we can develop "worlds" of arithmetic or science by our knowledge of things from a particular standpoint, the natural standpoint—the world as actually lived by individuals—is always prior to, and conditioning of, any particular knowledge possible.

Yet according to Husserl, it is possible to get behind this natural standpoint to identify an invariant intentional structure. Husserl developed a method of "bracketing," which he called *<epochē>* (from the Greek word for noncommitment or suspended judgment). For example, I may look with pleasure at a blossoming apple tree. From the natural standpoint, I can see that the tree exists outside of me in space and time and that I am enjoying my psychical state of pleasure. From this standpoint, moreover, there is an assumed relation between me and the apple tree. But Descartes had shown that this perception could be mistaken—I could be hallucinating. As a result, my knowledge of the tree is uncertain. But I can suspend my judgments about the tree and perform an *<epochē>*. This "bracketing" moves me from a natural to a phenomenological standpoint, from which I now recognize "a

*Edmund Husserl, *Ideas: General Introduction to Pure Phenomenology*, translated by W.R. Boyce Gibson (Atlantic Highlands, NJ: Humanities Press, 1931), Section 2, Chapter 1, ¶27. (Emphasis in original.)

nexus of exotic experiences of perception and pleasure valuation.” Of this nexus of intending tree-experiences I *am* certain. By no longer referring to objective existence, by applying the phenomenological *<epochē>* instead, I have arrived at the pure datum of intending experience.

In the latter part of *Ideas* and in several other works, Husserl developed this method further, showing how to use the newly acquired phenomenological data. For example, in examining the experience of time, Husserl found that “lived time” is not the time of clocks and calendars but is always experienced as now. Similarly, in the experience of “lived space,” one always finds oneself *here*, and everything else at different degrees of *there*. In his article on “Phenomenology” for the *Encyclopædia Britannica*, given here (complete), Husserl explained that it is possible to apply the phenomenological method not only to the *objects* of consciousness but to consciousness itself. When we perform such an *<epochē>* on consciousness, we discover an invariant structure: the transcendental ego. “The ‘I’ and the ‘we,’ which we apprehend, presuppose the hidden ‘I’ and ‘we’ to whom they are ‘present.’”

Husserl’s thought continues to be influential. Martin Heidegger used the phenomenological method to develop his ontology, and Jean-Paul Sartre used the method to develop his own “existential” interpretation of consciousness. Maurice Merleau-Ponty refined and further applied the phenomenological method. Husserl has lived on through his followers.

* * *

For works on phenomenology in general, see Herbert Spiegelberg, *The Phenomenological Movement*, two volumes (The Hague, The Netherlands: Martinus Nijhoff, 1960); Joseph J. Kockelmans, ed., *Phenomenology* (Garden City, NY: Anchor Doubleday, 1967); and Christopher Macann, *Four Phenomenological Philosophers: Husserl, Heidegger, Sartre, Merleau-Ponty* (London: Routledge, 1993). For a clear and concise comparison of phenomenology and the analytic tradition, see W.T. Jones, *The Twentieth Century to Wittgenstein and Sartre*, 2nd edition (New York: Harcourt Brace Jovanovich, 1975), Chapters 7 and 8.

Marvin Farber, *The Foundations of Phenomenology* (Albany, NY: SUNY Press, 1943) provides a standard study of Husserl’s thought, whereas Joseph J. Kockelmans, *A First Introduction to Husserl’s Phenomenology* (Pittsburgh, PA: Duquesne University Press, 1967); David Bell, *Husserl* (New York: Routledge, 1990); Rudolf Bernet, Iso Kern, and Eduard Marbach, *An Introduction to Husserlian Phenomenology* (Evanston, IL: Northwestern University Press, 1993); David Woodruff Smith, *Husserl* (Abingdon, UK: Routledge, 2006); and Matheson Russell, *Husserl: A Guide for the Perplexed* (London: Continuum, 2006) provide more recent introductions. Paul Ricoeur, *Husserl: An Analysis of His Phenomenology*, translated by Edward G. Ballard and Lester E. Embree (Evanston, IL: Northwestern University Press, 1967), and Hans-Georg Gadamer, *Philosophical Hermeneutics*, translated by David E. Linge (Berkeley: University of California Press, 1976) have written studies of Husserl as well as important works of philosophy themselves. Among the many studies of particular areas of Husserl’s thought, see David Carr, *Phenomenology and the Problem of History: A Study of Husserl’s Transcendental Philosophy* (Evanston, IL: Northwestern University Press, 1974); James M. Edie, *Edmund Husserl’s Phenomenology: A Critical Commentary* (Bloomington: Indiana University Press, 1987); and Kenneth Liberman, *Husserl’s Criticism of Reason: With*

Ethnomethodological Specifications (Lanham, MD: Lexington Books, 2007). For collections of essays, see R.O. Elveton, ed., *The Phenomenology of Husserl* (Chicago: Quadrangle Books, 1970); Frederick Elliston and Peter McCormick, eds., *Husserl: Expositions and Appraisals* (Notre Dame, IN: University of Notre Dame Press, 1977)—especially David Carr’s article, “Husserl’s Problematic Concept of the Life-World”; Robert Sokolowski, ed., *Edmund Husserl and the Phenomenological Tradition* (Washington, DC: Catholic University of America Press, 1988); Barry Smith and David Woodruff Smith, eds., *The Cambridge Companion to Husserl* (Cambridge: Cambridge University Press, 1995); and the *Husserl Studies*, an ongoing journal published by Kluwer Academic Publishers, Hingham, MA.

PHENOMENOLOGY

Phenomenology denotes a new, descriptive, philosophical method, which, since the concluding years of the last century, has established (1) an *a priori* psychological discipline, able to provide the only secure basis on which a strong empirical psychology can be built, and (2) a universal philosophy, which can supply an organum for the methodical revision of all the sciences.

I. PHENOMENOLOGICAL PSYCHOLOGY

Present-day psychology, as the science of the “psychical” in its concrete connection with spatio-temporal reality, regards as its material whatever is present in the world as “egoistic”; i.e., “living,” perceiving, thinking, willing, etc., actual, potential and habitual. And as the psychical is known as a certain stratum of existence, proper to men and beasts, psychology may be considered as a branch of anthropology and zoology. But animal nature is a part of physical reality, and that which is concerned with physical reality is natural science. Is it, then, possible to separate the psychical cleanly enough from the physical to establish a pure psychology parallel to natural science? That a purely psychological investigation is practicable within limits is shown by our obligation to it for our fundamental conceptions of the psychical, and most of those of the psycho-physical.

But before determining the question of an unlimited psychology, we must be sure of the characteristics of psychological experience and the psychical data it provides. We turn naturally to our immediate experiences. But we cannot discover the psychical in any experience, except by a “reflection,” or perversion of the ordinary attitude. We are accustomed to concentrate upon the matters, thoughts, and values of the moment, and not upon the psychical “act of experience” in which these are apprehended. This “act” is revealed by a “reflection”; and a reflection can be practised on every experience.

Instead of the matters themselves, the values, goals, utilities, etc., we regard the subjective experiences in which these "appear." These "appearances" are phenomena, whose nature is to be a "consciousness-of" their object, real or unreal as it be. Common language catches this sense of "relativity," saying, I was thinking *of* something, I was frightened *of* something, etc. Phenomenological psychology takes its name from the "phenomena," with the psychological aspect of which it is concerned: and the word "intentional" has been borrowed from the scholastic to denote the essential "reference" character of the phenomena. All consciousness is "intentional."

In unreflective consciousness we are "directed" upon objects, we "intend" them, and reflection reveals this to be an immanent process characteristic of all experience, though infinitely varied in form. To be conscious of something is no empty having of that something in consciousness. Each phenomenon has its own intentional structure, which analysis shows to be an ever-widening system of individually intentional and intentionally related components. The perception of a cube, for example, reveals a multiple and synthesized intention: a continuous variety in the "appearance" of the cube, according to differences in the points of view from which it is seen, and corresponding differences in "perspective," and all the difference between the "front side" actually seen at the moment and the "back-side" which is not seen, and which remains, therefore, relatively "indeterminate," and yet is supposed equally to be existent. Observation of this "stream" of "appearance-aspects" and of the manner of their synthesis, shows that every phase and interval is already in itself a "consciousness-of" something, yet in such a way that with the constant entry of new phases the total consciousness, at any moment, lacks not synthetic unity, and is, in fact, a consciousness of one and the same object. The intentional structure of the train of a perception must conform to a certain type, if any physical object is to be perceived as there! And if the same object be intuited in other modes, if it be imagined, or remembered, or copied, all its intentional forms recur, though modified in character from what they were in the perception, to correspond to their new modes. The same is true of every kind of psychical experience. Judgment, valuation, pursuit, these also are no empty experiences having in consciousness of judgments, values, goals and means, but are likewise experiences compounded of an intentional stream, each conforming to its own fast type.

Phenomenological psychology's comprehensive task is the systematic examination of the types and forms of intentional experience, and the reduction of their structures to the prime intentions, learning thus what is the nature of the psychical, and comprehending the being of the soul.

The validity of these investigations will obviously extend beyond the particularity of the psychologist's own soul. For psychical life may be revealed to us not only in self-consciousness but equally in our consciousness of other selves, and this latter source of experience offers us more than a reduplication of what we find in our self-consciousness, for it establishes the differences between "own" and "other" which we experience, and presents us with the characteristics of the "social-life." And hence the further task accrues to psychology of revealing the intentions of which the "social life" consists.

PHENOMENOLOGICAL-PSYCHOLOGICAL AND EIDETIC REDUCTIONS

The Phenomenological psychology must examine the self's experience of itself and its derivative experience of other selves and of society, but whether, in so doing, it can be free of all psycho-physical admixture, is not yet clear. Can one reach a really pure

Nude Descending a Staircase, Number 2, 1912, by Marcel Duchamp (1887–1968). Duchamp's shattered and reassembled nude figure descending the staircase in robotic rhythm purposely challenges the viewer to derive a personal interpretation of the image—to move beyond the natural standpoint with its judgments concerning spacio-temporal existence. (© Succession Marcel Duchamp/ADAGP, Paris and DACS, London 2016)

self-experience and purely psychical data? This difficulty, even since Brentano's discovery of intentionality, as the fundamental character of the psychical, has blinded psychologists to the possibilities of phenomenological psychology. The psychologist finds his self-consciousness mixed everywhere with "external" experience, and non-psychical realities. For what is experienced as external belongs not to the intentional "internal," though our experience of it belongs there as an experience of the external. The phenomenologist, who will only notice phenomena, and know purely his own "life," must practice an *<epochē>*. He must inhibit every ordinary objective "position," and partake in no judgement concerning the objective world. The experience itself will remain what it was, an experience of this house, of this body, of this world in general, in its particular mode. For one cannot describe any intentional experience, even though it be "illusory," a self-contradicting judgment and the like, without describing what in the experience is, as such, the object of consciousness.

Our comprehensive *<epochē>* puts, as we say, the world between brackets, excludes the world which is simply there! from the subject's field, presenting in its stead the so-and-so-experienced-perceived-remembered-judged-thought-valued-etc., world, as such, the "bracketed" world. Not the world or any part of it appears, but the "sense" of the world. To enjoy phenomenological experience we must retreat from the objects posited in the natural attitude to the multiple modes of their "appearance," to the "bracketed" objects.

The phenomenological reduction to phenomena, to the purely psychical, advances by two steps: (1) systematic and radical *<epochē>* of every objectifying "position" in an experience, practised both upon the regard of particular objects and upon the entire attitude of mind, and (2) expert recognition, comprehension and description of the manifold "appearances" of what are no longer "objects" but "unities" of "sense." So that the phenomenological description will comprise two parts, description of the "noetic" (*<neo>*) or "experiencing" and description of the "noematic" (*<noema>*) or the "experienced." Phenomenological experience, is the only experience which may properly be called "internal" and there is no limit to its practice. And as a similar "bracketing" of objective, and description of what then "appears" (*<noema>* in "*noesis>*"), can be performed upon the "life" of another self which we represent to ourselves, the "reductive" method can be extended from one's own self-experience to one's experience of other selves. And, further, that society, which we experience in a common consciousness, may be reduced not only to the intentional fields of the individual consciousness, but also by the means of an inter-subjective reduction, to that which unites these, namely the phenomenological unity of the social life. Thus enlarged, the psychological concept of internal experience reaches its full extent.

But it takes more than the unity of a manifold "intentional life," with its inseparable complement of "sense-unities," to make a "soul." For from the individual life that "ego-subject" cannot be disjoined, which persists as an identical ego or "pole," to the particular intentions, and the "habits" growing out of these. Thus the "inter-subjective," phenomenologically reduced and concretely apprehended, is seen to be a "society" of "persons," who share a conscious life.

Phenomenological psychology can be purged of every empirical and psycho-physical element, but, being so purged, it cannot deal with "matters of fact." Any closed field may be considered as regards its "essence," its *<eidōs>*, and we may disregard the factual side of our phenomena, and use them as "examples" merely. We shall ignore individual souls and societies, to learn their *a priori*, their "possible" forms. Our thesis will be "theoretical," observing the invariable through variation, disclosing a typical

realm of *a priori*. There will be no psychical existence whose "style" we shall not know. Psychological phenomenology must rest upon eidetic phenomenology.

The phenomenology of the perception of bodies, for example, will not be an account of actually occurring perceptions, or those which may be expected to occur, but of that invariable "structure," apart from which no perception of a body, single or prolonged, can be conceived. The phenomenological reduction reveals the phenomena of actual internal experience; the eidetic reduction, the essential forms constraining psychical existence.

Men now demand that empirical psychology shall conform to the exactness required by modern natural science. Natural science, which was once a vague, inductive empiric, owes its modern character to the *a priori* system of forms, nature as it is "conceivable," which its separate disciplines, pure geometry, laws of motion, time, etc., have contributed. The methods of natural science and psychology are quite distinct, but the latter, like the former, can only reach "exactness" by a rationalization of the "essential."

The psycho-physical has an *a priori* which must be learned by any complete psychology, this *a priori* is not phenomenological, for it depends no less upon the essence of physical, or more particularly organic nature.

II. TRANSCENDENTAL PHENOMENOLOGY

Transcendental philosophy may be said to have originated in Descartes, and phenomenological psychology in Locke, Berkeley and Hume, although the latter did not grow up primarily as a method or discipline to serve psychology, but to contribute to the solution of the transcendental problematic which Descartes had posed. The theme propounded in the *Meditations* was still dominant in a philosophy which it had initiated. All reality, so it ran, and the whole of the world which we perceive as existent, may be said to exist only as the content of our own representations, judged in our judgments, or, at best, proved by our own knowing. There lay impulse enough to rouse all the legitimate and illegitimate problems of transcendence, which we know. Descartes' "Doubting" first disclosed "transcendental subjectivity," and his "Ego Cogito" was its first conceptual handling. But the Cartesian transcendental "Mens" became the "Human Mind," which Locke undertook to explore; and Locke's exploration turned into a psychology of the internal experience. And since Locke thought his psychology could embrace the transcendental problems, in whose interest he had begun his work, he became the founder of a false psychological philosophy which has persisted because men have not analysed their concept of "subjective" into its twofold significance. Once the transcendental problem is fairly stated, the ambiguity of the sense of the "subjective" becomes apparent, and establishes the phenomenological psychology to deal with its one meaning, and the transcendental phenomenology with its other.

Phenomenological psychology has been given the priority in this article, partly because it forms a convenient stepping-stone to the philosophy and partly because it is nearer to the common attitude than is the transcendental. Psychology, both in its eidetic and empirical disciplines, is a "positive" science, promoted in the "natural attitude" with the world before it for the ground of all its themes, while transcendental experience is difficult to realize because it is "supreme" and entirely "unworldly." Phenomenological psychology, although comparatively new, and completely new as far as it uses intentional

analysis, can be approached from the gates of any of the positive sciences: and, being once reached, demands only a reemployment, in a more stringent mode, of its formal mechanism of reduction and analysis, to disclose the transcendental phenomena.

But it is not to be doubted that transcendental phenomenology could be developed independently of all psychology. The discovery of the double relativity of consciousness suggests the practice of both reductions. The psychological reduction does not reach beyond the psychical in animal realities, for psychology subserves real existence, and even its eidetic is confined to the possibilities of real worlds. But the transcendental problem will include the entire world and all its sciences, to "doubt" the whole. The world "originates" in us, as Descartes led men to recognize and within us acquires its habitual influence. The general significance of the world, and the definite sense of its particulars, is something of which we are conscious within our perceiving, representing, thinking, valuing life, and therefore something "constituted" in some subjective genesis.

The world and its property, "in and for itself," exists as it exists, whether I, or we, happen, or not, to be conscious of it. But let once this general world, make its "appearance" in consciousness as "the" world. It is thenceforth related to the subjective, and all its existence and the manner of it, assumes a new dimension, becoming "incompletely intelligible," "questionable." Here, then, is the transcendental problem; this "making its appearance," this "being for us" of the world, which can only gain its significance "subjectively," what is it? We may call the world "internal" because it is related to consciousness, but how can this quite "general" world, whose "immanent" being is as shadowy as the consciousness wherein it "exists," contrive to appear before us in a variety of "particular" aspects, which experience assures us are the aspects of an independent, self-existent world? The problem also touches every "ideal" world, the world of pure number, for example, and the world of "truths in themselves." And no existence, or manner of existence, is less wholly intelligible than ourselves. Each by himself, and in society, we, in whose consciousness the world is valid, being men, belong ourselves to the world. Must we, then, refer ourselves to ourselves to gain a worldly sense, a worldly being? Are we both psychologically to be called men, subjects of a psychical life, and yet be transcendental to ourselves and the whole world, being subjects of a transcendental world-constituting life? Psychical subjectivity, the "I" and "we" of everyday intent, may be experienced as it is in itself under the phenomenological-psychological reduction, and being eidetically treated, may establish a phenomenological psychology. But the transcendental subjectivity, which for want of language we can only call again, "I myself," "we ourselves," cannot be found under the attitude of psychological or natural science, being no part at all of the objective world, but that subjective conscious life itself, wherein the world and all its content is made for "us," for "me." We that are, indeed, men, spiritual and bodily, existing in the world, are, therefore, "appearances" unto ourselves, parcel of what "we" have constituted, pieces of the significance "we" have made. The "I" and "we," which we apprehend, presuppose a hidden "I" and "we" to whom they are "present."

To this transcendental subjectivity transcendental experience gives us direct approach. As the psychical experience was purified, so is the transcendental, by a reduction. The transcendental reduction may be regarded as a certain further purification of the psychological interest. The universal is carried to a further stage. Henceforth the "bracketing" includes not the world only but its "souls" as well. The psychologist reduces the ordinarily valid world to a subjectivity of "souls," which are a part of the world which they inhabit. The transcendental phenomenologist reduces the already

psychologically purified to the transcendental, that most general, subjectivity, which makes the world and its "souls," and confirms them.

I no longer survey my perception experiences, imagination-experiences, the psychological data which my psychological experience reveals: I learn to survey transcendental experience. I am no longer interested in my own existence. I am interested in the pure intentional life, wherein my psychically real experiences have occurred. This step raises the transcendental problem (the transcendental being defined as the quality of that which is consciousness) to its true level. We have to recognize that relativity to consciousness is not only an actual quality of our world, but, from eidetic necessity, the quality of every conceivable world. We may, in a free fancy, vary our actual world, and transmute it to any other which we can imagine, but we are obliged with the world to vary ourselves also, and ourselves we cannot vary except within the limits prescribed to us by the nature of subjectivity. Change worlds as we may, each must ever be a world such as we could experience, prove upon the evidence of our theories and inhabit with our practice. The transcendental problem is eidetic. My psychological experiences, perceptions, imaginations and the like remain in form and content what they were, but I see them as "structures" now, for I am face to face at last with the ultimate structure of consciousness.

It is obvious that, like every other intelligible problem, the transcendental problem derives the means of its solution from an existence-stratum, which it presupposes and sets beyond the reach of its enquiry. This realm is no other than the bare subjectivity of consciousness in general, while the realm of its investigation remains not less than every sphere which can be called "objective," which considered in its totality, and at its root, is the conscious life. No one, then, can justly propose to solve the transcendental problem by psychology either empirical or eidetic-phenomenological, without *petitio principii* [begging the question], for psychology's "subjectivity" and "consciousness" are not that subjectivity and consciousness, which our philosophy will investigate. The transcendental reduction has supplanted the psychological reduction. In the place of the psychological "I" and "we," the transcendental "I" and "we" are comprehended in the concreteness of transcendental consciousness. But though the transcendental "I" is not my psychological "I," it must not be considered as if it were a second "I," for it is no more separated from my psychological "I" in the conventional sense of separation, than it is joined to it in the conventional sense of being joined.

Transcendental self-experience may, at any moment, merely by a change of attitude, be turned back into psychological self-experience. Passing, thus, from the one to the other attitude, we notice a certain "identity" about the ego. What I saw under the psychological reflection as "my" objectification, I see under the transcendental reflection as self-objectifying, or, as we may also say, as objectified by the transcendental "I." We have only to recognize that what makes the psychological and transcendental spheres of experience parallel is an "identity" in their significance, and that what differentiates them is merely a change of attitude, to realize that the psychological and transcendental phenomenologies will also be parallel. Under the more stringent *<epochē>* the psychological subjectivity is transformed into the transcendental subjectivity, and the psychological inter-subjectivity into the transcendental inter-subjectivity. It is this last which is the concrete, ultimate ground, whence all that transcends consciousness, including all that is real in the world, derives the sense of its existence. For all objective existence is essentially "relative," and owes its nature to a unity of intention, which being established according to transcendental laws, produces consciousness with its habit of belief and its conviction.

PHENOMENOLOGY, THE UNIVERSAL SCIENCE

Thus, as phenomenology is developed, the Leibnitzian foreshadowing of a universal ontology, the unification of all conceivable *a priori* sciences, is improved, and realized upon the new and non-dogmatic basis of phenomenological method. For phenomenology as the science of all concrete phenomena proper to subjectivity and intersubjectivity, is *eo ipso* an *a priori* science of all possible existence and existences. Phenomenology is universal in its scope, because there is no *a priori* which does not depend upon its intentional constitution, and derive from this its power of engendering habits in the consciousness that knows it, so that the establishment of any *a priori* must reveal the subjective process by which it is established.

Once the *a priori* disciplines, such as the mathematical sciences, are incorporated within phenomenology, they cannot thereafter be beset by "paradoxes" or disputes concerning principles: and those sciences which have become *a priori* independently of phenomenology, can only hope to set their methods and premises beyond criticism, by founding themselves upon it. For their very claim to be positive, dogmatic sciences bears witness to their dependency, as branches, merely, of that universal, eidetic ontology, which is phenomenology.

The endless task, this exposition of the universum of the *a priori*, by referring all objectives to their transcendental "origin," may be considered as one function in the construction of a universal science of fact, where every department, including the positive, will be settled on its *a priori*. So that our last division of the complete phenomenology is thus: eidetic phenomenology, or the universal ontology, for a first philosophy; and second philosophy as the science of the transcendental intersubjectivity or universum of fact.

Thus the antique conception of philosophy as the universal science, philosophy in the Platonic, philosophy in the Cartesian, sense, that shall embrace all knowledge, is once more justly restored. All rational problems, and all those problems, which for one reason or another, have come to be known as "philosophical," have their place within phenomenology, finding from the ultimate source of transcendental experience or eidetic intuition, their proper form and the means of their solution. Phenomenology itself learns its proper function of transcendental human "living" from an entire relationship to "self." It can intuit life's absolute norms and learn life's original teleological structure. Phenomenology is not less than man's whole occupation with himself in the service of the universal reason. Revealing life's norms, he does in fact, set free a stream of new consciousness intent upon the infinite idea of entire humanity, humanity in fact and truth.

Metaphysical, teleological, ethical problems, and problems of the history of philosophy, the problem of judgment, all significant problems in general, and the transcendental bonds uniting them, lie within phenomenology's capability.

Phenomenological philosophy is but developing the mainsprings of old Greek philosophy, and the supreme motive of Descartes. These have not died. They split into rationalism and empiricism. They stretch over Kant and German idealism, and reach the present, confused day. They must be reassumed, subjected to methodical and concrete treatment. They can inspire a science without bounds.

Phenomenology demands of phenomenologists that they shall forgo particular closed systems of philosophy, and share decisive work with others toward persistent philosophy.

W.E.B. DU BOIS

1868–1963

William Edward Burghardt Du Bois was born and raised in Great Barrington, Massachusetts. His mother, Mary Burghardt, was descended from a West African slave. His father, Alfred Du Bois, came from a long line of French Huguenots (Protestants). As W.E.B. Du Bois himself later put it, he was born “with a flood of Negro blood, a strain of French, a bit of Dutch, but thank God! no Anglo-Saxon.”

The town of Great Barrington had a small African American population and a rather informal color line. The only people explicitly oppressed on the basis of race were Irish immigrants. But, as Du Bois explains in our reading, there was also a deeper, more implicit, kind of racism. Du Bois came to see himself as part of a “problem”: the “problem of the Negro.” He understood that he was different from others in school and that he was “shut out from their world by a vast veil.”

Du Bois’s initial response was to excel at whatever he did, to make himself exhibit A in putting the lie to racial inferiority. While still in high school, Du Bois became a correspondent for the *New York Globe*, a black newspaper. He excelled academically and, following graduation, several local churches collected money to send him to college. In 1885, Du Bois enrolled at Fisk University, an all-black school in Nashville, Tennessee.

Following graduation from Fisk, Du Bois received a Harvard scholarship for a second bachelor’s degree in philosophy. Studying with William James and George Santayana, Du Bois developed a Hegelian philosophy that made sense of the black experience. Du Bois went on to receive an M.A. at Harvard in 1892.

Following travel in Europe, Du Bois taught Greek and Latin at Wilberforce University, a black institution in Xenia, Ohio. At the same time, he completed his doctorate in sociology, becoming the first African American to receive a Ph.D. from Harvard. His dissertation, *The Suppression of the African Slave Trade to the*

United States of America, 1638–1870 (1896), was published as the first in the Harvard Historical Studies Series.

In 1896, Du Bois married Nina Gomer, and together they had two children. That same year, Du Bois accepted a position at the University of Pennsylvania. He was commissioned to produce the first systematic study of blacks, *The Philadelphia Negro*, which was published in 1899. Interviewing more than five thousand people for this study, Du Bois came to the conclusion that hard work, persistence, and patience in seeking reforms were the keys to improving the lot of African Americans in Philadelphia.

Following the study's completion, Du Bois was called to Atlanta University, where he taught for the next thirteen years. In Atlanta, Du Bois's social and political philosophies changed radically. The political climate in the late 1800s grew increasingly antagonistic toward blacks as the remnants of Reconstruction disappeared and *Plessey v. Ferguson* (1896) legalized "separate but equal" segregation. Du Bois himself suffered numerous indignities as he traveled in the South. He was especially repelled by the lynching of a black farm laborer in 1899 and by the anti-black Atlanta riots of 1906.

During this period, Du Bois challenged Booker T. Washington, president of Tuskegee Institute and African American leader. Washington advocated that his people accept a posture of submissiveness and modest aspiration, claiming, "It is at the bottom of life we must begin and not at the top."* In his earlier days, Du Bois might have agreed, but he was no longer willing to wait patiently at the bottom. Instead, Du Bois argued that blacks must assert themselves, particularly the "Talented Tenth" in the African American community, who would "be leaders of thought and missionaries of culture among their people."**

At Atlanta University, Du Bois began putting his ideas into political action. He was the secretary of the first Pan-African Conference in 1900 and helped organize the First Universal Races Congress in 1911 (both in London). In 1905, he was a founder of the Niagara Movement, which led in 1910 to the founding of the National Association for the Advancement of Colored People (NAACP). During this period, Du Bois made a number of sociological studies of blacks in the South. He also published his most famous book, *The Souls of Black Folks: Essays and Sketches* (1903).

With the founding of the NAACP in 1910, Du Bois left teaching to become editor of the organization's monthly organ, *The Crisis*. Du Bois's move from social scientist to political activist was now complete. For the next twenty-four years, Du Bois wrote, edited, organized, and labored tirelessly for racial equality.

In 1926, Du Bois accepted an invitation to the Soviet Union and returned full of praise for the new "Socialist Republic." He was now convinced that African Americans could find liberation in socialism. As his views moved further and further left, his relations with the NAACP were strained. Du Bois now regarded the NAACP's ideal of integration as not only unattainable but as even undesirable. When he publicly supported "nondiscriminatory segregation," he was forced to resign his position with the NAACP. He returned to teaching at Atlanta University, where he remained until retiring in 1943.

*Quoted in Julius Lester, ed., *The Seventh Son: The Thought and Writings of W.E.B. Du Bois*, two volumes (New York: Random House, 1971), vol. 1, p. 42.

***Ibid.*, p. 44.

Du Bois spent a busy “retirement” in political activism. For four years, he returned to the NAACP as director of the department of special research. Among his many other activities in retirement, he was a consultant to the founding of the United Nations, co-chair of the Fifth Pan-African Congress, vice-chair of the Council of African Affairs, and chair of the Peace Information Center. At the age of 87, he even ran for senator of New York on the Progressive Party ticket.

In the late 1940s and early 1950s, Du Bois became even more enthusiastic about the USSR and the People’s Republic of China. In 1951, as the Cold War warmed up, Du Bois was indicted as an “unregistered agent” of the Soviet Union. Though acquitted of all charges, Du Bois was embittered with life in the United States, and for the rest of the 1950s he traveled extensively in Eastern Europe and China. In 1959, Du Bois received the Lenin Peace Prize, and in 1961 he officially joined the Communist Party of the United States. Du Bois left the United States for good in 1961, becoming a citizen of the African state of Ghana. There he died at the age of 95. Following a state funeral led by Ghana’s president Kwame Nkrumah, Du Bois was buried in Accra, Ghana.

* * *

To understand Du Bois’s philosophy, one must begin with the Hegelianism that runs through his work. Hegel had argued that the “the study of world history . . . represents the rationally necessary course of the World Spirit.”* All human history is a dialectical process whereby the World Spirit becomes conscious of itself as free. Whenever a thesis of freedom is asserted, it is opposed by an antithesis. These are then both overcome by a synthesis that incorporates the best of both. In particular, Hegel held that the World Spirit that is coming to a consciousness of freedom is always the spirit of specific world-historical *peoples*, not individuals. Hegel traced the development of this World Spirit through six historical peoples: Chinese, Indians, Egyptians, Greeks, Romans, and Germans.

Du Bois accepted Hegelian history and applied it to the experience of African Americans. In our reading from *The Souls of Black Folks*, Du Bois refers to Hegel’s six historical peoples and adds,

The Negro is a sort of seventh son, born with a veil, and gifted with second-sight in this American world,—a world which yields him no true self-consciousness, but only lets him see himself through the revelation of the other world.

According to Du Bois, “Black folk’s” consciousness of freedom is newer and richer than that of any previous world-historical people because of slavery. As one writer explains,

Out of slavery and out of the later striving of black folk for whiteness in an oppressive white world came a rising sense of black soul. Thus it was that white thesis bred black antithesis, which took the best of white culture and moved it upward toward a new synthesis.**

*Hegel, *Reason in History: A General Introduction to the Philosophy of History*, see Forrest E. Baird and Walter Kaufmann, *Nineteenth-Century Philosophy* (New York: Prentice Hall, 2000), p. 54.

**Joel Williamson, *The Crucible of Race* (New York: Oxford University Press, 1984), p. 405.

While using Hegelian notions, Du Bois noticed something unique about the self-consciousness of black folk. As a “problem,” as an “other,” black folk develop a kind of “double-consciousness.” Black folk have the “sense of always looking at one’s self through the eyes of others.” This “twoness,” this consciousness of “two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body,” means that black folk must uniquely struggle to find true self-consciousness and self-identity.

Although in some ways Du Bois is more activist than philosopher, his thought has been enormously influential. His identification of a “black soul” provided a theoretical base for African American studies. His identification of a unique black culture gave blacks both dignity and an alternative to the assimilationist tendencies of integrationists. His discovery of double-consciousness and his notion of the “other” anticipated some recent debates in Continental philosophy.

* * *

A good place to begin studying Du Bois is Julius Lester, ed., *The Seventh Son: The Thought and Writings of W.E.B. Du Bois*, two volumes (New York: Random House, 1971). For biographies of Du Bois, see Jack B. Moore, *W.E.B. Du Bois* (Boston: Twayne, 1981); and Du Bois’s own autobiographies, *Dusk of Dawn* (New York: Harcourt, Brace, 1940) and *The Autobiography of W.E.B. Du Bois*, edited by Herbert Aptheker (New York: International, 1968). Studies of Du Bois’s social and political involvements include Francis L. Broderick, *W.E.B. Du Bois: Negro Leader in a Time of Crisis* (Stanford, CA: Stanford University Press, 1959); Cary D. Wintz, *African-American Political Thought, 1890–1930: Washington, Du Bois, Garvey, and Randolph* (Armonk, NY: Sharpe, 1996); Charles F. Peterson, *DuBois, Fanon, Cabral: The Margins of Elite Anti-Colonial Leadership* (Lanham, MD: Lexington Books, 2007); and Reiland Rabaka’s books, *W.E.B. Du Bois and the Problems of the Twenty-First Century: An Essay on Africana Critical Theory*; and *Du Bois’s Dialectics: Black Radical Politics and the Reconstruction of Critical Social Theory* (both Lanham, MD: Lexington Books, 2007 and 2008). For a more philosophical treatment of Du Bois, see Joel Williamson, *The Crucible of Race* (New York: Oxford University Press, 1984) and Bernard W. Bell, Emily R. Grosholz, and James B. Stewart, eds., *W.E.B. Du Bois on Race and Culture: Critiques and Extrapolations* (London: Routledge, 1996).

THE SOULS OF BLACK FOLKS (in part)

CHAPTER 1: OF OUR SPIRITUAL STRIVINGS

O water, voice of my heart, crying in the sand,
 All night long crying with a mournful cry,
 As I lie and listen, and cannot understand
 The voice of my heart in my side or the voice of the sea,

O water, crying for rest, is it I, is it I?
All night long the water is crying to me.

Unresting water, there shall never be rest
Till the last moon droop and the last tide fail,
And the fire of the end begin to burn in the west;
And the heart shall be weary and wonder and cry like the sea,
All life long crying without avail,
As the water all night long is crying to me.

—Arthur Symons

Between me and the other world there is ever an unasked question: unasked by some through feelings of delicacy; by others through the difficulty of rightly framing it. All, nevertheless, flutter round it. They approach me in a half-hesitant sort of way, eye me curiously or compassionately, and then, instead of saying directly, How does it feel to be a problem? they say, I know an excellent colored man in my town; or, I fought at Mechanicsville; or, Do not these Southern outrages make your blood boil? At these I smile, or am interested, or reduce the boiling to a simmer, as the occasion may require. To the real question, How does it feel to be a problem? I answer seldom a word.

And yet, being a problem is a strange experience,—peculiar even for one who has never been anything else, save perhaps in babyhood and in Europe. It is in the early days of rollicking boyhood that the revelation first bursts upon one, all in a day, as it were.

W.E.B. Du Bois (on the left) and his high school graduating class, Great Barrington, Massachusetts, 1884.
(W.E.B. Du Bois Library)

I remember well when the shadow swept across me. I was a little thing, away up in the hills of New England, where the dark Housatonic winds between Hoosac and Taghkanic to the sea. In a wee wooden schoolhouse, something put it into the boys' and girls' heads to buy gorgeous visiting-cards—ten cents a package—and exchange. The exchange was merry, till one girl, a tall newcomer, refused my card,—refused it peremptorily, with a glance. Then it dawned upon me with a certain suddenness that I was different from the others; or like, mayhap, in heart and life and longing, but shut out from their world by a vast veil. I had thereafter no desire to tear down that veil, to creep through; I held all beyond it in common contempt, and lived above it in a region of blue sky and great wandering shadows. That sky was bluest when I could beat my mates at examination-time, or beat them at a foot-race, or even beat their stringy heads. Alas, with the years all this fine contempt began to fade; for the worlds I longed for, and all their dazzling opportunities, were theirs, not mine. But they should not keep these prizes, I said; some, all, I would wrest from them. Just how I would do it I could never decide: by reading law, by healing the sick, by telling the wonderful tales that swam in my head,—some way. With other black boys the strife was not so fiercely sunny: their youth shrunk into tasteless sycophancy, or into silent hatred of the pale world about them and mocking distrust of everything white; or wasted itself in a bitter cry, Why did God make me an outcast and a stranger in mine own house? The shades of the prison-house closed round about us all: walls strait and stubborn to the whitest, but relentlessly narrow, tall, and unscalable to sons of night who must plod darkly on in resignation, or beat unavailing palms against the stone, or steadily, half hopelessly, watch the streak of blue above.

After the Egyptian and Indian, the Greek and Roman, the Teuton and Mongolian, the Negro is a sort of seventh son, born with a veil, and gifted with second-sight in this American world,—a world which yields him no true self-consciousness, but only lets him see himself through the revelation of the other world. It is a peculiar sensation, this double-consciousness, this sense of always looking at one's self through the eyes of others, of measuring one's soul by the tape of a world that looks on in amused contempt and pity. One ever feels his twoness,—an American, a Negro; two souls, two thoughts, two unreconciled strivings; two warring ideals in one dark body, whose dogged strength alone keeps it from being torn asunder.

The history of the American Negro is the history of this strife,—this longing to attain self-conscious manhood, to merge his double self into a better and truer self. In this merging he wishes neither of the older selves to be lost. He would not Africanize America, for America has too much to teach the world and Africa. He would not bleach his Negro soul in a flood of white Americanism, for he knows that Negro blood has a message for the world. He simply wishes to make it possible for a man to be both a Negro and an American, without being cursed and spit upon by his fellows, without having the doors of Opportunity closed roughly in his face.

This, then, is the end of his striving: to be a co-worker in the kingdom of culture, to escape both death and isolation, to husband and use his best powers and his latent genius. These powers of body and mind have in the past been strangely wasted, dispersed, or forgotten. The shadow of a mighty Negro past flits through the tale of Ethiopia the Shadowy and of Egypt the Sphinx. Throughout history, the powers of single black men flash here and there like falling stars, and die sometimes before the world has rightly gauged their brightness. Here in America, in the few days since Emancipation, the black man's turning hither and thither in hesitant and doubtful striving has often made his very strength to lose effectiveness, to seem like absence of power, like weakness. And yet it is not weakness,—it is the contradiction of double aims. The double-aimed struggle of the

black artisan—on the one hand to escape white contempt for a nation of mere hewers of wood and drawers of water, and on the other hand to plough and nail and dig for a poverty-stricken horde—could only result in making him a poor craftsman, for he had but half a heart in either cause. By the poverty and ignorance of his people, the Negro minister or doctor was tempted toward quackery and demagoguery; and by the criticism of the other world, toward ideals that made him ashamed of his lowly tasks. The would-be black savant was confronted by the paradox that the knowledge his people needed was a twice-told tale to his white neighbors, while the knowledge which would teach the white world was Greek to his own flesh and blood. The innate love of harmony and beauty that set the ruder souls of his people a-dancing and a-singing raised but confusion and doubt in the soul of the black artist; for the beauty revealed to him was the soul-beauty of a race which his larger audience despised, and he could not articulate the message of another people. This waste of double aims, this seeking to satisfy two unreconciled ideals, has wrought sad havoc with the courage and faith and deeds of ten thousand thousand people,—has sent them often wooing false gods and invoking false means of salvation, and at times has even seemed about to make them ashamed of themselves.

Away back in the days of bondage they thought to see in one divine event the end of all doubt and disappointment; few men ever worshipped Freedom with half such unquestioning faith as did the American Negro for two centuries. To him, so far as he thought and dreamed, slavery was indeed the sum of all villainies, the cause of all sorrow, the root of all prejudice; Emancipation was the key to a promised land of sweeter beauty than ever stretched before the eyes of wearied Israelites. In song and exhortation swelled one refrain—Liberty; in his tears and curses the God he implored had Freedom in his right hand. At last it came,—suddenly, fearfully, like a dream. With one wild carnival of blood and passion came the message in his own plaintive cadences:—

“Shout, O children!
Shout, you’re free!
For God has bought your liberty!”

Years have passed away since then,—ten, twenty, forty; forty years of national life, forty years of renewal and development, and yet the swarthy spectre sits in its accustomed seat at the Nation’s feast. In vain do we cry to this our vastest social problem:—

“Take any shape but that, and my firm nerves
Shall never tremble!”

The Nation has not yet found peace from its sins; the freedman has not yet found in freedom his promised land. Whatever of good may have come in these years of change, the shadow of a deep disappointment rests upon the Negro people,—a disappointment all the more bitter because the unattained ideal was unbounded save by the simple ignorance of a lowly people.

The first decade was merely a prolongation of the vain search for freedom, the boon that seemed ever barely to elude their grasp,—like a tantalizing will-o’-the-wisp, maddening and misleading the headless host. The holocaust of war, the terrors of the Ku Klux Klan, the lies of carpet-baggers, the disorganization of industry, and the contradictory advice of friends and foes, left the bewildered serf with no new watchword beyond the old cry for freedom. As the time flew, however, he began to grasp a new idea. The ideal of liberty demanded for its attainment powerful means, and these the Fifteenth Amendment gave

him. The ballot, which before he had looked upon as a visible sign of freedom, he now regarded as the chief means of gaining and perfecting the liberty with which war had partially endowed him. And why not? Had not votes made war and emancipated millions? Had not votes enfranchised the freedmen? Was anything impossible to a power that had done all this? A million black men started with renewed zeal to vote themselves into the kingdom. So the decade flew away, the revolution of 1876 came, and left the half-free serf weary, wondering, but still inspired. Slowly but steadily, in the following years, a new vision began gradually to replace the dream of political power,—a powerful movement, the rise of another ideal to guide the unguided, another pillar of fire by night after a clouded day. It was the ideal of “book-learning”; the curiosity, born of compulsory ignorance, to know and test the power of the cabalistic letters of the white man, the longing to know. Here at last seemed to have been discovered the mountain path to Canaan; longer than the highway of Emancipation and law, steep and rugged, but straight, leading to heights high enough to overlook life.

Up the new path the advance guard toiled, slowly, heavily, doggedly; only those who have watched and guided the faltering feet, the misty minds, the dull understandings, of the dark pupils of these schools know how faithfully, how piteously, this people strove to learn. It was weary work. The cold statistician wrote down the inches of progress here and there, noted also where here and there a foot had slipped or some one had fallen. To the tired climbers, the horizon was ever dark, the mists were often cold, the Canaan was always dim and far away. If, however, the vistas disclosed as yet no goal, no resting-place, little but flattery and criticism, the journey at least gave leisure for reflection and self-examination; it changed the child of Emancipation to the youth with dawning self-consciousness, self-realization, self-respect. In those sombre forests of his striving his own soul rose before him, and he saw himself,—darkly as through a veil; and yet he saw in himself some faint revelation of his power, of his mission. He began to have a dim feeling that, to attain his place in the world, he must be himself, and not another. For the first time he sought to analyze the burden he bore upon his back, that dead-weight of social degradation partially masked behind a halfnamed Negro problem. He felt his poverty; without a cent, without a home, without land, tools, or savings, he had entered into competition with rich, landed, skilled neighbors. To be a poor man is hard, but to be a poor race in a land of dollars is the very bottom of hardships. He felt the weight of his ignorance,—not simply of letters, but of life, of business, of the humanities; the accumulated sloth and shirking and awkwardness of decades and centuries shackled his hands and feet. Nor was his burden all poverty and ignorance. The red stain of bastardy, which two centuries of systematic legal defilement of Negro women had stamped upon his race, meant not only the loss of ancient African chastity, but also the hereditary weight of a mass of corruption from white adulterers, threatening almost the obliteration of the Negro home.

A people thus handicapped ought not to be asked to race with the world, but rather allowed to give all its time and thought to its own social problems. But alas! while sociologists gleefully count his bastards and his prostitutes, the very soul of the toiling, sweating black man is darkened by the shadow of a vast despair. Men call the shadow prejudice, and learnedly explain it as the natural defence of culture against barbarism, learning against ignorance, purity against crime, the “higher” against the “lower” races. To which the Negro cries Amen! and swears that to so much of this strange prejudice as is founded on just homage to civilization, culture, righteousness, and progress, he humbly bows and meekly does obeisance. But before that nameless prejudice that leaps beyond all this he stands helpless, dismayed, and well-nigh speechless; before that personal disrespect and mockery, the ridicule and systematic

humiliation, the distortion of fact and wanton license of fancy, the cynical ignoring of the better and the boisterous welcoming of the worse, the all-pervading desire to inculcate disdain for everything black, from Toussaint to the devil,—before this there rises a sickening despair that would disarm and discourage any nation save that black host to whom “discouragement” is an unwritten word.

But the facing of so vast a prejudice could not but bring the inevitable self-questioning, self-disparagement, and lowering of ideals which ever accompany repression and breed in an atmosphere of contempt and hate. Whisperings and portents came borne upon the four winds: Lo! we are diseased and dying, cried the dark hosts; we cannot write, our voting is vain; what need of education, since we must always cook and serve? And the Nation echoed and enforced this self-criticism, saying: Be content to be servants, and nothing more; what need of higher culture for half-men? Away with the black man’s ballot, by force or fraud,—and behold the suicide of a race! Nevertheless, out of the evil came something of good,—the more careful adjustment of education to real life, the clearer perception of the Negroes’ social responsibilities, and the sobering realization of the meaning of progress.

So dawned the time of *Sturm und Drang*: storm and stress to-day rocks our little boat on the mad waters of the world-sea; there is within and without the sound of conflict, the burning of body and rending of soul; inspiration strives with doubt, and faith with vain questionings. The bright ideals of the past,—physical freedom, political power, the training of brains and the training of hands,—all these in turn have waxed and waned, until even the last grows dim and overcast. Are they all wrong,—all false? No, not that, but each alone was over-simple and incomplete,—the dreams of a credulous race-childhood, or the fond imaginings of the other world which does not know and does not want to know our power. To be really true, all these ideals must be melted and welded into one. The training of the schools we need to-day more than ever,—the training of deft hands, quick eyes and ears, and above all the broader, deeper, higher culture of gifted minds and pure hearts. The power of the ballot we need in sheer self-defence,—else what shall save us from a second slavery? Freedom, too, the long-sought, we still seek,—the freedom of life and limb, the freedom to work and think, the freedom to love and aspire. Work, culture, liberty,—all these we need, not singly but together, not successively but together, each growing and aiding each, and all striving toward that vaster ideal that swims before the Negro people, the ideal of human brotherhood, gained through the unifying ideal of Race; the ideal of fostering and developing the traits and talents of the Negro, not in opposition to or contempt for other races, but rather in large conformity to the greater ideals of the American Republic, in order that some day on American soil two world-races may give each to each those characteristics both so sadly lack. We the darker ones come even now not altogether empty-handed: there are to-day no truer exponents of the pure human spirit of the Declaration of Independence than the American Negroes; there is no true American music but the wild sweet melodies of the Negro slave; the American fairy tales and folk-lore are Indian and African; and, all in all, we black men seem the sole oasis of simple faith and reverence in a dusty desert of dollars and smartness. Will America be poorer if she replace her brutal dyspeptic blundering with lighthearted but determined Negro humility? or her coarse and cruel wit with loving jovial good-humor? or her vulgar music with the soul of the Sorrow Songs?

Merely a concrete test of the underlying principles of the great republic is the Negro Problem, and the spiritual striving of the freedmen’s sons is the travail of souls whose burden is almost beyond the measure of their strength, but who bear it in the name of an historic race, in the name of this the land of their fathers’ fathers, and in the name of human opportunity.

BERTRAND RUSSELL

1872–1970

Bertrand Arthur William Russell was born into a prestigious family in Trelleck, Wales. His parents, Lord and Lady Amberley, were close friends with John Stuart Mill, and Russell's grandfather, Lord John Russell, had been prime minister to Queen Victoria. Both of Russell's parents died by the time he was 3, and so, with his brother, he was sent to live with his grandparents, Lord and Lady Russell. When his grandfather died a few years later, his grandmother took responsibility for his education. Unlike most privileged English boys, Russell did not attend a boarding school—Lady Russell did not approve of them. Instead, she arranged for a series of Swiss and German governesses, followed by English tutors, to educate her grandsons. Although Russell thus enjoyed virtually every privilege, he later reported that his adolescent life seemed so bleak that he would have committed suicide had he not been “restrained by the desire to know more mathematics.”

In 1890, Russell entered Cambridge University, where he was finally able to study his beloved mathematics on his own. His years at the university were the happiest of his life. He quickly established himself as one of the brightest students, and he formed several close friendships, including a lifelong one with G.E. Moore (1873–1958). Following graduation, Russell served briefly with the British ambassador to France before moving to Berlin to study economics and political theory. In 1895, Russell was elected a fellow of Trinity College, Cambridge, and worked extensively on the foundations of mathematics. He published *Principles of Mathematics* (1903) and, together with Alfred North Whitehead, the epoch-making *Principia Mathematica* (1910–1913). During this time, Russell also made the first of three unsuccessful runs for Parliament.

Russell was appointed lecturer in philosophy at Cambridge in 1910—a position he held until 1916, when he was dismissed for his opposition to the

continued fighting of World War I. He also spent six months in jail for alleging that U.S. troops were used for strikebreaking in America. He was reinstated in his Cambridge position in 1919 but soon resigned and never again assumed permanent teaching duties. During his years as a lecturer, Russell also produced some of his most important works of philosophy and logic, including *The Problems of Philosophy* (1912), *Our Knowledge of the External World* (1914), and *Introduction to Mathematical Philosophy* (written while in prison and published in 1919).

In his post-teaching period, Russell wrote and lectured widely—often taking controversial positions on social and political issues. For example, he alienated many of his socialist friends when, after a visit to the Soviet Union in 1920, he published his observations in *The Theory and Practice of Bolshevism*:

[Russia is] one vast prison in which the jailors were cruel bigots. When I found my friends applauding these men as liberators and regarding the regime that they were creating as a paradise, I wondered . . . whether it was my friends or I that were mad.

His book *Marriage and Morals* (1929) caused a stir by minimizing the seriousness of extramarital affairs and by advocating informal trial marriages. His works on religion, *What I Believe* (1925), *Religion and Science* (1935), and *Why I Am Not a Christian* (1957), made Russell's atheism explicit. Russell also tried his hand at practical social reform. With his second wife Dora, he started a school in 1927 to implement the educational theories of his books *On Education: Especially Early Childhood* (1926) and *Education and the Social Order* (1932).

In 1938, Russell accepted a visiting professorship at the University of Chicago and later at the University of California at Los Angeles. He declined a permanent offer from UCLA in order to accept an invitation from the College of the City of New York; however, before he could begin teaching a judge ruled him unfit, claiming, among other things, that Russell's appointment would constitute "a chair of indecency." Russell mocked the decision on the title page of his *An Inquiry into Meaning and Truth*, published the next year, by listing his many honors and then adding "Judicially pronounced unworthy to be Professor of Philosophy at the College of the City of New York (1940)." To that long list of honors, he would be able to add the Nobel Prize for literature in 1950.

In his later years, Russell continued to write on a variety of topics—and to get into trouble with authorities. At age 89, he served another jail sentence—this time for his part in a nuclear-disarmament rally in London. By the time of his death in 1970, Russell was acknowledged as the leading British philosopher of the century.

* * *

It is difficult to summarize Russell's thought, partly because he developed and abandoned several philosophical theories during his long lifetime. Philosopher C.D. Broad once commented, "As we all know, Mr. Russell produces a different system of philosophy every few years." Even though the specifics of Russell's philosophic enterprise evolved, reflecting his fertile and inventive mind, at least two basic assumptions remained within his mature philosophy.

First, Russell believed philosophy should be scientific and analytical. As he wrote in "Logical Atomism" (1924):

Although . . . comprehensive construction is part of the business of philosophy, I do not believe it is the most important part. The most important part, to my mind, consists in criticizing and clarifying notions which are apt to be regarded as fundamental and accepted uncritically. As instances I might mention: mind, matter, consciousness, knowledge, experience, causality, will, time. I believe all these notions to be inexact and approximate, essentially infected with vagueness, incapable of forming part of any exact science.

Second, in “criticizing and clarifying notions,” Russell was committed to the principle of parsimony known as “Ockham’s Razor” (after the medieval thinker, William of Ockham, see p. 358). Ockham’s injunction asserted that “entities are not to be multiplied beyond necessity,” meaning one should always seek the simplest explanation. Russell’s version of this principle, articulated in several of his works, states that “Whenever possible, substitute constructions out of known entities for inferences to unknown entities.”

In the selection from *The Problems of Philosophy* reprinted here, Russell wields this razor in an analysis of the common objects of our sensory perception and our language about such objects. Russell points out that sense-data are the only “known entities” actually given in experience:

What the senses *immediately* tell us is not the truth about the object as it is apart from us, but only the truth about certain sense-data which, so far as we can see, depend upon the relations between us and the object. (Emphasis in original.)

Rather than inferring some “unknown entity” (such as “being” or “substance”) as the cause of our sense-data, we can consider a given object to be the class or collection of all sense-data we normally associate with that object. Our knowledge of physical objects is not direct but is gained by “acquaintance” with the sense-data that make up the appearance of an object.

The language used to make propositions about such objects also depends on acquaintance. To use language in a meaningful manner, “the meaning we attach to our words must be something with which we are acquainted” either in terms of a thing or a description. Using Russell’s example, a statement about Julius Caesar can be meaningful even though we have no acquaintance with the “thing” (i.e., we have not met Caesar) because we do have in mind some description of Caesar.

Although this selection includes some of Russell’s major themes and gives some sense of his style, his contributions to philosophy go beyond what has been included. His work in mathematics and logic changed both of those disciplines; his theory of logical atomism represented an important step in the philosophy of language; his theories of descriptions and of types helped clear up a number of logical puzzles; and in addition there are his writings on education, sociology, politics, and religion. In short, Russell touched on virtually all areas of human existence, and even those who differ with his conclusions cannot help but be impressed with the breadth and depth of his thought.

* * *

For biographical information, see Ronald William Clark, *The Life of Bertrand Russell* (New York: Knopf, 1976); Katharine Tait, *My Father, Bertrand Russell* (Bristol, UK: Thoemmes, 1996); or Russell’s autobiography, *The Autobiography of Bertrand Russell* (Boston: Little, Brown, 1967). A.J. Ayer, *Russell and Moore*:

The Analytic Heritage (Cambridge, MA: Harvard University Press, 1971) puts Russell's thought in the context of analytic philosophy, whereas J. Watling, *Bertrand Russell* (New York: British Book Center, 1971); A.J. Ayer, *Bertrand Russell* (Chicago: University of Chicago Press, 1988); John Slater, *Bertrand Russell* (Bristol, Gloucester: Thoemmes, 1994); and Ray Monk, *Russell* (London: Routledge, 1999) provide general introductions. Studies on specific areas of Russell's thought include Lillian Woodworth Aiken, *Bertrand Russell's Philosophy of Morals* (New York: Humanities Press, 1963); Robert J. Clack, *Bertrand Russell's Philosophy of Language* (The Hague, The Netherlands: Martinus Nijhoff, 1969); Elizabeth R. Eames, *Bertrand Russell's Theory of Knowledge* (New York: George Braziller, 1969); Michael K. Potter, *Bertrand Russell's Ethics* (London: Continuum, 2006); and Sajahan Miah, *Russell's Theory of Perception* (London: Continuum, 2006). For collections of essays, see Paul A. Schilpp, ed., *The Philosophy of Bertrand Russell* (New York: Tudor, 1951)—part of the Library of Living Philosophers; Ralph Schoenman, ed., *Bertrand Russell: Philosopher of the Century* (Boston: Little, Brown, 1967); E.D. Klerne, ed., *Essays on Bertrand Russell* (Urbana: University of Illinois Press, 1970); D.F. Pears, ed., *Bertrand Russell* (Garden City, NY: Anchor Doubleday, 1972); A.D. Irvine and G.A. Wedeking, eds., *Russell and Analytic Philosophy* (Toronto: University of Toronto Press, 1993); Ray Monk and Anthony Palmer, eds., *Bertrand Russell and the Origins of Analytical Philosophy* (Bristol, UK: Thoemmes, 1996); and Nicholas Griffin, ed., *The Cambridge Companion to Bertrand Russell* (Cambridge: Cambridge University Press, 2003).

THE PROBLEMS OF PHILOSOPHY (selections)

CHAPTER 1: APPEARANCE AND REALITY

Is there any knowledge in the world which is so certain that no reasonable man could doubt it? This question, which at first sight might not seem difficult, is really one of the most difficult that can be asked. When we have realized the obstacles in the way of a straightforward and confident answer, we shall be well launched on the study of philosophy—for philosophy is merely the attempt to answer such ultimate questions, not carelessly and dogmatically, as we do in ordinary life and even in the sciences, but critically, after exploring all that makes such questions puzzling, and after realizing all the vagueness and confusion that underlie our ordinary ideas.

In daily life, we assume as certain many things which, on a closer scrutiny, are found to be so full of apparent contradictions that only a great amount of thought enables us to know what it is that we really may believe. In the search for certainty, it is natural to begin with our present experiences, and in some sense, no doubt, knowledge is to be derived from them. But any statement as to what it is that our immediate experiences make us know is very likely to be wrong. It seems to me that I am now sitting in a chair, at a table of a certain shape, on which I see sheets of paper with writing or print. By turning my head I see out of

the window buildings and clouds and the sun. I believe that the sun is about ninety-three million miles from the earth; that it is a hot globe many times bigger than the earth; that, owing to the earth's rotation, it rises every morning, and will continue to do so for an indefinite time in the future. I believe that, if any other normal person comes into my room, he will see the same chairs and tables and books and papers as I see, and that the table which I see is the same as the table which I feel pressing against my arm. All this seems to be so evident as to be hardly worth stating, except in answer to a man who doubts whether I know anything. Yet all this may be reasonably doubted, and all of it requires much careful discussion before we can be sure that we have stated it in a form that is wholly true.

To make our difficulties plain, let us concentrate attention on the table. To the eye it is oblong, brown, and shiny, to the touch it is smooth and cool and hard; when I tap it, it gives out a wooden sound. Any one else who sees and feels and hears the table will agree with this description, so that it might seem as if no difficulty would arise; but as soon as we try to be more precise our troubles begin. Although I believe that the table is "really" of the same colour all over, the parts that reflect the light look much brighter than the other parts, and some parts look white because of reflected light. I know that, if I move, the parts that reflect the light will be different, so that the apparent distribution of colours on the table will change. It follows that if several people are looking at the table at the same moment, no two of them will see exactly the same distribution of colours, because no two can see it from exactly the same point of view, and any change in the point of view makes some change in the way the light is reflected.

For most practical purposes these differences are unimportant, but to the painter they are all-important: the painter has to unlearn the habit of thinking that things seem to have the colour which common sense says they "really" have, and to learn the habit of seeing things as they appear. Here we have already the beginning of one of the distinctions that cause most trouble in philosophy—the distinction between "appearance" and "reality," between what things seem to be and what they are. The painter wants to know what things seem to be, the practical man and the philosopher want to know what they are; but the philosopher's wish to know this is stronger than the practical man's, and is more troubled by knowledge as to the difficulties of answering the question.

To return to the table. It is evident from what we have found, that there is no colour which preeminently appears to be *the* colour of the table, or even of any one particular part of the table—it appears to be of different colours from different points of view, and there is no reason for regarding some of these as more really its colour than others. And we know that even from a given point of view the colour will seem different by artificial light, or to a colour-blind man, or to a man wearing blue spectacles, while in the dark there will be no colour at all, though to touch and hearing the table will be unchanged. This colour is not something which is inherent in the table, but something depending upon the table and the spectator and the way the light falls on the table. When, in ordinary life, we speak of *the* colour of the table, we only mean the sort of colour which it will seem to have to a normal spectator from an ordinary point of view under usual conditions of light. But the other colours which appear under other conditions have just as good a right to be considered real; and therefore, to avoid favouritism, we are compelled to deny that, in itself, the table has any one particular colour.

The same thing applies to the texture. With the naked eye one can see the grain, but otherwise the table looks smooth and even. If we looked at it through a microscope, we should see roughnesses and hills and valleys, and all sorts of differences that are imperceptible to the naked eye. Which of these is the "real" table? We are naturally tempted to say that what we see through the microscope is more real, but that in turn would be changed by a still more powerful microscope. If, then, we cannot trust what we see with

the naked eye, why should we trust what we see through a microscope? Thus, again, the confidence in our senses with which we began deserts us.

The *shape* of the table is no better. We are all in the habit of judging as to the “real” shapes of things, and we do this so unreflectingly that we come to think we actually see the real shapes. But, in fact, as we all have to learn if we try to draw, a given thing looks different in shape from every different point of view. If our table is “really” rectangular, it will look, from almost all points of view, as if it had two acute angles and two obtuse angles. If opposite sides are parallel, they will look as if they converged to a point away from the spectator; if they are of equal length, they will look as if the nearer side were longer. All these things are not commonly noticed in looking at a table, because experience has taught us to construct the “real” shape from the apparent shape, and the “real” shape is what interests us as practical men. But the “real” shape is not what we see, it is something inferred from what we see. And what we see is constantly changing in shape as we move about the room; so that here again the senses seem not to give us the truth about the table itself, but only about the appearance of the table.

Similar difficulties arise when we consider the sense of touch. It is true that the table always gives us a sensation of hardness, and we feel that it resists pressure. But the sensation we obtain depends upon how hard we press the table and also upon what part of the body we press with; thus the various sensations due to various pressures or various parts of the body cannot be supposed to reveal *directly* any definite property of the table, but at most to be *signs* of some property which perhaps *causes* all the sensations, but is not actually apparent in any of them. And the same applies still more obviously to the sounds which can be elicited by rapping the table.

Thus it becomes evident that the real table, if there is one, is not the same as what we immediately experience by sight or touch or hearing. The real table, if there is one, is not *immediately* known to us all, but must be an inference from what is immediately known. Hence, two very difficult questions at once arise; namely, (1) Is there a real table at all? (2) If so, what sort of object can it be?

It will help us in considering these questions to have a few simple terms of which the meaning is definite and clear. Let us give the name of “sense-data” to the things that are immediately known in sensation: such things as colours, sounds, smells, hardnesses, roughnesses, and so on. We shall give the name “sensation” to the experience of being immediately aware of these things. Thus, whenever we see a colour, we have a sensation of the colour, but the colour itself is a sense-datum, not a sensation. The colour is that *of* which we are immediately aware, and the awareness itself is the sensation. It is plain that if we are to know anything about the table, it must be by means of the sense-data—brown colour, oblong shape, smoothness, etc.—which we associate with the table; but, for the reasons which have been given, we cannot say that the table *is* the sense-data, or even that the sense-data are directly properties of the table. Thus a problem arises as to the relation of the sense-data to the real table, supposing there is such a thing.

The real table, if it exists, we will call a “physical object.” Thus we have to consider the relation of sense-data to physical objects. The collection of all physical objects is called “matter.” Thus our two questions may be re-stated as follows: (1) Is there any such thing as matter? (2) If so, what is its nature?

The philosopher who first brought prominently forward the reasons for regarding the immediate objects of our senses as not existing independently of us was Bishop Berkeley (1685–1753). His *Three Dialogues between Hylas and Philonous*, in *Opposition to Sceptics and Atheists*, undertake to prove that there is no such thing as matter at all, and that the world consists of nothing but minds and their ideas. Hylas has hitherto believed in matter, but he is

no match for Philonous, who mercilessly drives him into contradictions and paradoxes, and makes his own denial of matter seem, in the end, as if it were almost common sense. The arguments employed are of very different value: some are important and sound, others are confused or quibbling. But Berkeley retains the merit of having shown that the existence of matter is capable of being denied without absurdity, and that if there are any things that exist independently of us they cannot be the immediate objects of our sensations.

There are two different questions involved when we ask whether matter exists, and it is important to keep them clear. We commonly mean by "matter" something which is opposed to "mind," something which we think of as occupying space and as radically incapable of any sort of thought or consciousness. It is chiefly in this sense that Berkeley denies matter; that is to say, he does not deny that the sense-data which we commonly take as signs of the existence of the table are really signs of the existence of something independent of us, but he does deny that this something is, non-mental, that it is neither mind nor ideas entertained by some mind. He admits that there must be something which continues to exist when we go out of the room or shut our eyes, and that what we call seeing the table does really give us reason for believing in something which persists even when we are not seeing it. But he thinks that this something cannot be radically different in nature from what we see, and cannot be independent of seeing altogether, though it must be independent of *our* seeing. He is thus led to regard the "real" table as an idea in the mind of God. Such an idea has the required permanence and independence of ourselves, without being—as matter would otherwise be—something quite unknowable, in the sense that we can only infer it, and can never be directly and immediately aware of it.

Other philosophers since Berkeley have also held that, although the table does not depend for its existence upon being seen by me, it does depend upon being seen (or otherwise apprehended in sensation) by *some* mind—not necessarily the mind of God, but more often the whole collective mind of the universe. This they hold, as Berkeley does, chiefly because they think there can be nothing real—or at any rate nothing known to be real—except minds and their thoughts and feelings. We might state the argument by which they support their view in some such way as this: "Whatever can be thought of is an idea in the mind of the person thinking of it; therefore nothing can be thought of except ideas in minds; therefore anything else is inconceivable, and what is inconceivable cannot exist."

Such an argument, in my opinion, is fallacious; and of course those who advance it do not put it so shortly or so crudely. But whether valid or not, the argument has been very widely advanced in one form or another; and very many philosophers, perhaps a majority, have held that there is nothing real except minds and their ideas. Such philosophers are called "idealists." When they come to explaining matter, they either say, like Berkeley, that matter is really nothing but a collection of ideas, or they say, like Leibniz (1646–1716), that what appears as matter is really a collection of more or less rudimentary minds.

But these philosophers, though they deny matter as opposed to mind, nevertheless, in another sense, admit matter. It will be remembered that we asked two questions; namely, (1) Is there a real table at all? (2) If so, what sort of object can it be? Now both Berkeley and Leibniz admit that there is a real table, but Berkeley says it is certain ideas in the mind of God, and Leibniz says it is a colony of souls. Thus both of them answer our first question in the affirmative, and only diverge from the views of ordinary mortals in their answer to our second question. In fact, almost all philosophers seem to be agreed that there is a real table: they almost all agree that, however much our sense-data—colour, shape, smoothness, etc.—may depend upon us, yet their occurrence is a sign of something existing independently of us, something differing, perhaps, completely from

our sense-data, and yet to be regarded as causing those sense-data whenever we are in a suitable relation to the real table.

Now obviously this point in which the philosophers are agreed—the view that there *is* a real table, whatever its nature may be—is vitally important, and it will be worth while to consider what reasons there are for accepting this view before we go on to the further question as to the nature of the real table. Our next chapter, therefore, will be concerned with the reasons for supposing that there is a real table at all.

Before we go farther it will be well to consider for a moment what it is that we have discovered so far. It has appeared that, if we take any common object of the sort that is supposed to be known by the senses, what the senses *immediately* tell us is not the truth about the object as it is apart from us, but only the truth about certain sense-data which, so far as we can see, depend upon the relations between us and the object. Thus what we directly see and feel is merely “appearance,” which we believe to be a sign of some “reality” behind. But if the reality is not what appears, have we any means of knowing whether there is any reality at all? And if so, have we any means of finding out what it is like?

Such questions are bewildering, and it is difficult to know that even the strangest hypotheses may not be true. Thus our familiar table, which has roused but the slightest thoughts in us hitherto, has become a problem full of surprising possibilities. The one thing we know about it is that it is not what it seems. Beyond this modest result, so far, we have the most complete liberty of conjecture. Leibniz tells us it is a community of souls; Berkeley tells us it is an idea in the mind of God; sober science, scarcely less wonderful, tells us it is a vast collection of electric charges in violent motion.

Among these surprising possibilities, doubt suggests that perhaps there is no table at all. Philosophy, if it cannot *answer* so many questions as we could wish, has at least the power of *asking* questions which increase the interest of the world, and show the strangeness and wonder lying just below the surface even in the commonest things of daily life.

* * *

CHAPTER 15: THE VALUE OF PHILOSOPHY

Having now come to the end of our brief and very incomplete review of the problems of philosophy, it will be well to consider, in conclusion, what is the value of philosophy and why it ought to be studied. It is the more necessary to consider this question, in view of the fact that many men, under the influence of science or of practical affairs, are inclined to doubt whether philosophy is anything better than innocent but useless trifling, hair-splitting distinctions, and controversies on matters concerning which knowledge is impossible.

This view of philosophy appears to result, partly from a wrong conception of the ends of life, partly from a wrong conception of the kind of goods which philosophy strives to achieve. Physical science, through the medium of inventions, is useful to innumerable people who are wholly ignorant of it; thus the study of physical science is to be recommended, not only, or primarily, because of the effect on the student, but rather because of the effect on mankind in general. Thus utility does not belong to philosophy. If the study of philosophy has any value at all for others than students of philosophy, it must be only indirectly, through its effects upon the lives of those who study it. It is in these effects, therefore, if anywhere, that the value of philosophy must be primarily sought.

But further, if we are not to fail in our endeavour to determine the value of philosophy, we must first free our minds from the prejudices of what are wrongly called “practical” men. The “practical” man, as this word is often used, is one who recognizes only material needs, who realizes that men must have food for the body, but is oblivious of the necessity of providing food for the mind. If all men were well off, if poverty and disease had been reduced to their lowest possible point, there would still remain much to be done to produce a valuable society; and even in the existing world the goods of the mind are at least as important as the goods of the body. It is exclusively among the goods of the mind that the value of philosophy is to be found; and only those who are not indifferent to these goods can be persuaded that the study of philosophy is not a waste of time.

Philosophy, like all other studies, aims primarily at knowledge. The knowledge it aims at is the kind of knowledge which gives unity and system to the body of sciences, and the kind which results from a critical examination of the grounds of our convictions, prejudices, and beliefs. But it cannot be maintained that philosophy has had any very great measure of success in its attempts to provide definite answers to its questions. If you ask a mathematician, a mineralogist, a historian, or any other man of learning, what definite body of truths has been ascertained by his science, his answer will last as long as you are willing to listen. But if you put the same question to a philosopher, he will, if he is candid, have to confess that his study has not achieved positive results such as have been achieved by other sciences. It is true that this is partly accounted for by the fact that, as soon as definite knowledge concerning any subject becomes possible, this subject ceases to be called philosophy, and now becomes a separate science. The whole study of the heavens, which now belongs to astronomy, was once included in philosophy; Newton’s great work was called “the mathematical principles of natural philosophy.” Similarly, the study of the human mind, which was a part of philosophy, has now been separated from philosophy and has become the science of psychology. Thus, to a great extent, the uncertainty of philosophy is more apparent than real: those questions which are already capable of definite answers are placed in the sciences, while those only to which, at present, no definite answer can be given, remain to form the residue which is called philosophy.

This is, however, only a part of the truth concerning the uncertainty of philosophy. There are many questions—and among them those that are of the profoundest interest to our spiritual life—which, so far as we can see, must remain insoluble to the human intellect unless its powers become of quite a different order from what they are now. Has the universe any unity of plan or purpose, or is it a fortuitous concourse of atoms? Is consciousness a permanent part of the universe, giving hope of indefinite growth in wisdom, or is it a transitory accident on a small planet on which life must ultimately become impossible? Are good and evil of importance to the universe or only to man? Such questions are asked by philosophy, and variously answered by various philosophers. But it would seem that, whether answers be otherwise discoverable or not, the answers suggested by philosophy are none of them demonstrably true. Yet, however slight may be the hope of discovering an answer, it is part of the business of philosophy to continue the consideration of such questions, to make us aware of their importance, to examine all the approaches to them, and to keep alive that speculative interest in the universe which is apt to be killed by confining ourselves to definitely ascertainable knowledge.

Many philosophers, it is true, have held that philosophy could establish the truth of certain answers to such fundamental questions. They have supposed that what is of most importance in religious beliefs could be proved by strict demonstration to be true. In order to judge of such attempts, it is necessary to take a survey of human knowledge, and to form an opinion as to its methods and its limitations. On such a subject it would

be unwise to pronounce dogmatically; but if the investigations of our previous chapters have not led us astray, we shall be compelled to renounce the hope of finding philosophical proofs of religious beliefs. We cannot, therefore, include as part of the value of philosophy any definite set of answers to such questions. Hence, once more, the value of philosophy must not depend upon any supposed body of definitely ascertainable knowledge to be acquired by those who study it.

The value of philosophy is, in fact, to be sought largely in its very uncertainty. The man who has not tincture of philosophy goes through life imprisoned in the prejudices derived from common sense, from the habitual beliefs of his age or his nation, and from convictions which have grown up in his mind without the co-operation or consent of his deliberate reason. To such a man the world tends to become definite, finite, obvious; common objects rouse no questions, and unfamiliar possibilities are contemptuously rejected. As soon as we begin to philosophize, on the contrary, we find, as we saw in our opening chapters, that even the most everyday things lead to problems to which only very incomplete answers can be given. Philosophy, though unable to tell us with certainty what is the true answer to the doubts which it raises, is able to suggest many possibilities which enlarge our thoughts and free them from the tyranny of custom. Thus, while diminishing our feeling of certainty as to what things are, it greatly increases our knowledge as to what they may be; it removes the somewhat arrogant dogmatism of those who have never travelled into the region of liberating doubt, and it keeps alive our sense of wonder by showing familiar things in an unfamiliar aspect.

Apart from its utility in showing unsuspected possibilities, philosophy has a value—perhaps its chief value—through the greatness of the objects which it contemplates, and the freedom from narrow and personal aims resulting from this contemplation. The life of the instinctive man is shut up within the circle of his private interests: family and friends may be included, but the outer world is not regarded except as it may help or hinder what comes within the circle of instinctive wishes. In such a life there is something feverish and confined, in comparison with which the philosophic life is calm and free. The private world of instinctive interests is a small one, set in the midst of a great and powerful world which must, sooner or later, lay our private world in ruins. Unless we can so enlarge our interests as to include the whole outer world, we remain like a garrison in a beleaguered fortress, knowing that the enemy prevents escape and that ultimate surrender is inevitable. In such a life there is no peace, but a constant strife between the insistence of desire and the powerlessness of will. In one way or another, if our life is to be great and free, we must escape this prison and this strife.

One way of escape is by philosophic contemplation. Philosophic contemplation does not, in its widest survey, divide the universe into two hostile camps—friends and foes, helpful and hostile, good and bad—it views the whole impartially. Philosophic contemplation, when it is unalloyed, does not aim at proving that the rest of the universe is akin to man. All acquisition of knowledge is an enlargement of the Self, but this enlargement is best attained when it is not directly sought. It is obtained when the desire for knowledge is alone operative, by a study which does not wish in advance that its objects should have this or that character, but adapts the Self to the characters which it finds in its objects. This enlargement of Self is not obtained when, taking the Self as it is, we try to show that the world is so similar to this Self that knowledge of it is possible without any admission of what seems alien. The desire to prove this is a form of self-assertion and, like all self-assertion, it is an obstacle to the growth of Self which it desires, and of which the Self knows that it is capable. Self-assertion, in philosophic speculation as elsewhere, views the world as a means to its own ends; thus it makes the world of less account than Self, and the Self sets bounds to the

greatness of its goods. In contemplation, on the contrary, we start from the not-Self, and through its greatness the boundaries of Self are enlarged; through the infinity of the universe the mind which contemplates it achieves some share in infinity.

For this reason greatness of soul is not fostered by those philosophies which assimilate the universe to Man. Knowledge is a form of union of Self and not-Self; like all union, it is impaired by dominion, and therefore by any attempt to force the universe into conformity with what we find in ourselves. There is a widespread philosophical tendency towards the view which tells us that Man is the measure of all things, that truth is man-made, that space and time and the world of universals are properties of the mind, and that, if there be anything not created by the mind, it is unknowable and of no account for us. This view, if our previous discussions were correct, is untrue; but in addition to being untrue, it has the effect of robbing philosophic contemplation of all that gives it value, since it fetters contemplation to Self. What it calls knowledge is not a union with the not-Self, but a set of prejudices, habits, and desires, making an impenetrable veil between us and the world beyond. The man who finds pleasure in such a theory of knowledge is like the man who never leaves the domestic circle for fear his word might not be law.

The true philosophic contemplation, on the contrary, finds its satisfaction in every enlargement of the not-Self, in everything that magnifies the objects contemplated, and thereby the subject contemplating. Everything, in contemplation, that is personal or private, everything that depends upon habit, self-interest, or desire, distorts the object, and hence impairs the union which the intellect seeks. By thus making a barrier between subject and object, such personal and private things become a prison to the intellect. The free intellect will see as God might see, without a *here* and *now*, without hopes and fears, without the trammels of customary beliefs and traditional prejudices, calmly, dispassionately, in the sole and exclusive desire of knowledge—knowledge as impersonal, as purely contemplative, as it is possible for man to attain. Hence also the free intellect will value more the abstract and universal knowledge into which the accidents of private history do not enter, than the knowledge brought by the senses, and dependent, as such knowledge must be, upon an exclusive and personal point of view and a body whose sense-organs distort as much as they reveal.

The mind which has become accustomed to the freedom and impartiality of philosophic contemplation will preserve something of the same freedom and impartiality in the world of action and emotion. It will view its purposes and desires as parts of the whole, with the absence of insistence that results from seeing them as infinitesimal fragments in a world of which all the rest is unaffected by any one man's deeds. The impartiality which, in contemplation, is the unalloyed desire for truth, is the very same quality of mind which, in action, is justice, and in emotion is that universal love which can be given to all, and not only to those who are judged useful or admirable. Thus contemplation enlarges not only the objects of our thoughts, but also the objects of our actions and our affections: it makes us citizens of the universe, not only of one walled city at war with all the rest. In this citizenship of the universe consists man's true freedom, and his liberation from the thralldom of narrow hopes and fears.

Thus, to sum up our discussion of the value of philosophy; philosophy is to be studied, not for the sake of any definite answers to its questions, since no definite answers can, as a rule, be known to be true, but rather for the sake of the questions themselves; because these questions enlarge our conception of what is possible, enrich our intellectual imagination and diminish the dogmatic assurance which closes the mind against speculation; but above all because, through the greatness of the universe which philosophy contemplates, the mind also is rendered great, and becomes capable of that union with the universe which constitutes its highest good.

MARTIN HEIDEGGER

1889–1976

Martin Heidegger was born and died in the small German town of Messkirch in the Black Forest region of Baden-Württemberg. His father was the caretaker of the local Catholic church. Heidegger was reared as a Catholic and attended local secondary schools, where he was particularly interested in the ancient Greeks and the classics; this classical heritage remained the bedrock of his intellectual life. As a teenager in a Jesuit seminary, he was captivated by Franz Brentano's work on Aristotle's understanding of "Being." He made the study of Being his life's work and never wavered from that goal.

After a brief period as a Jesuit novice, Heidegger studied philosophy at the University of Freiburg. Excused from World War I for health reasons, he finished his studies in 1916 with a thesis on the medieval thinker John Duns Scotus. For the next seven years, he taught at the university, the last three years as the assistant to Edmund Husserl. During this period of time, Heidegger apprenticed himself to Husserl's phenomenological method, using it on his own special study of Being. In 1923, Heidegger moved to the University of Marburg where, in 1927, he published *Being and Time*, which proved to be his *magnum opus*. This work was dedicated to his teacher and friend Husserl. When Husserl retired in 1928, Heidegger assumed Husserl's chair of philosophy at the University of Freiburg.

What followed is one of the most controversial episodes in recent philosophy. When the Nazis came to power in 1933, the rector of the University of Freiburg was ousted and Heidegger was elected to replace him. In the course of his inaugural lecture as rector, Heidegger made the following remarks:

"Academic Freedom," celebrated so often, is banished from the German university; . . . this freedom was not genuine because it was only negative. . . . The

concept of freedom [for] the German student is now brought back to its truth. From this truth the bond and service of the German student will unfold in [the] future.*

Later that same year Heidegger wrote in the student newspaper:

Doctrine and “ideas” shall no longer govern your existence. The Führer himself, and only he, is the current and future reality of Germany, and his word is your law. Learn to know ever more deeply within you: “From now on every matter demands determination and every action demands responsibility.”

Heil Hitler!

MARTIN HEIDEGGER**

Critics claim that Heidegger had always been sympathetic to the Nazi cause and that he apparently disowned his teacher Husserl (who was Jewish). As late as 1953, Heidegger affirmed the “inner truth and greatness” of the Nazi movement. He once said that philosophy could be done properly only in either the German or the Greek language and that among the moderns, the Germans alone, as a people placed by history between the barbarians of America to the west and Russia to the east, could save Western thought.

Heidegger’s supporters point to his refusal to endorse the firing of two anti-Nazi deans, which led to his resignation as rector within a year. Furthermore, say some, it is unfair to judge Heidegger’s early support for the Nazis from a post–World War II point of view. Heidegger in 1933 could not be expected to know the unspeakable horrors of 1939 to 1945. Finally, supporters ask philosophers especially to avoid the *argumentum ad hominem*: Even if Heidegger were partially compromised, that is not sufficient reason to dismiss a whole body of thought.

Whatever the truth in this debate, Allied occupation powers considered the evidence of Nazi collaboration sufficient to bar Heidegger from teaching between 1945 and 1951. Hence, after the war, Heidegger spent much of his time in his simple hut at Todtnauberg in the Black Forest. He retired permanently from teaching in 1959. Late in life, he visited Greece and France but lived his final years largely in quiet seclusion.

* * *

In his major work, *Being and Time* (*Sein und Zeit*), Heidegger announced the interest that would dominate his writings throughout his life: “The question of the meaning of Being.” According to Heidegger, the Pre-Socratics had understood Being, but subsequent Western thinkers had forgotten Being itself by focusing too intently on individual beings. As a result, contemporary metaphysics no longer recalled the seminal question of Being.

In order to gain some understanding of Being, Heidegger suggests we examine the one being with which we are intimately acquainted: the human being. The

**Die Selbstbehauptung der Deutschen Universität* (*The Self-Affirmation of the German University, 1933*) as quoted in Walter Kaufmann, *Discovering the Mind, Volume II: Nietzsche, Heidegger, and Buber* (New York: McGraw-Hill, 1980), p. 221.

***Freiburger Studentenzeitung*, November 3, 1933, p. 1, quoted in Martin Heidegger, *German Existentialism*, translated with an introduction by Dagobert D. Runes (New York: Philosophical Library, 1965), pp. 27–28.

Troops at the 1934 Nuremberg Rally. The lives of an entire generation of philosophers were directly influenced by Hitler's rise to power in 1934. Husserl died as an outcast because of his Jewish ancestry; Heidegger was an early Nazi sympathizer (though there is a great deal of debate about his later feelings toward and involvement with the party); Sartre was a German prisoner-of-war and together with Merleau-Ponty was later a member of the resistance; Wittgenstein volunteered as a hospital orderly in England; and Quine, Austin, and Davidson served in the Allied war effort. (©CORBIS)

phenomenological method (Husserl), which “unconceals” the data of experience by allowing these data to “show themselves,” provides the way to such an examination. Using this method to examine the self, one discovers one’s self as a “being-in-the-world” or *Dasein* (“being-there”).

Dasein is different from other realities. First, “in its very Being, that Being is an issue for it”; that is, *Dasein* is aware of Being. Second, the kind of Being of which *Dasein* is aware is called “existence.” Human existence is not to be grasped the way one understands the existence of rocks or planets, but in the special ways of anticipation of, and decision for, possibilities. As the self confronts its choices, it especially recognizes that with death, “being-in-the-world” eventually becomes “no-longer-being-there.” This awareness of *Dasein* as “being-toward-death” is filled with *Angst* (dread). Borrowing Kierkegaard’s analysis of dread, Heidegger says that the self can try to avoid this *Angst* by losing the “I” in the “they”—that is, by ignoring its individuality and becoming part of the crowd. But a “they” existence is “inauthentic” and removed from Being. Instead, authentic being—“being-toward-death”—can reveal to *Dasein* a “freedom” that releases it from the “Illusions of the ‘they’” and allows it to embrace *Angst*.

In our selection from *An Introduction to Metaphysics* (1953), given here in the outstanding Gregory Fried and Richard Polt translation, Heidegger puts the

question of Being in stark terms: “Why is there anything at all, rather than nothing?” This might seem an odd question to us, but it is odd (asserts Heidegger) only because we have lost our original amazement in the very presence of Being itself. Following a lengthy discussion of this issue, Heidegger asks the further question, “How is it with being?” Not well at all, he concludes. Heidegger argues that modern “technological frenzy” has led us to the brink of disaster because it induces the awful forgetfulness of Being. But Heidegger does not end with pessimism. It is possible, he concludes,

to *repeat and retrieve* the inception of our historical-spiritual Dasein, in order to transform it into the other inception. . . . The point is to restore the historical Dasein of human beings . . . back to the power of Being that is to be opened up originally.

Heidegger has had more than his share of critics. Analytic philosophers have particularly criticized his use of language. One such philosopher concluded that “Heidegger’s account of human life, where it is not vacuous, is transparently false.”* However, despite the criticisms of his life and thought, Heidegger has profoundly affected philosophy—especially in the field he originated: philosophical hermeneutics. Further, his insights have been developed in psychoanalysis and literary theory and in phenomenology and theology, and they continue to shape contemporary views.

Dreyfus and Harrison Hall, eds., *Heidegger: A Critical Reader* (Oxford: Basil Blackwell, 1992); John Sallis, ed., *Reading Heidegger* (Bloomington: Indiana University Press, 1993); Charles Guignon, ed., *The Cambridge Companion to Heidegger* (Cambridge: Cambridge University Press, 1993); the multivolume Christopher Macann, ed., *Martin Heidegger: Critical Assessments* (Oxford: Routledge, 1993); and Nancy J. Holland and Patricia Huntington, *Feminist Interpretations of Martin Heidegger* (College Park, PA: Pennsylvania State University Press, 2001). For advanced studies on Heidegger, see titles in the series "Northwestern University Studies in Phenomenology & Existential Philosophy."

Finally, out of the large number of books on the controversy surrounding Heidegger's Nazi ties, one may consult Victor Farías, *Heidegger and Nazism*, edited by Joseph Margolis and Tom Rockmore (Philadelphia: Temple University Press, 1989); Joseph Margolis and Tom Rockmore, eds., *The Heidegger Case* (Philadelphia: Temple University Press, 1992); Tom Rockmore, *On Heidegger's Nazism and Philosophy* (Berkeley: University of California Press, 1992); Heinrich Wiegand Petzet, *Encounters and Dialogues with Martin Heidegger 1929–1976*, translated by Parvis Emad and Kenneth Malz (Chicago: University of Chicago Press, 1993); Richard Wolin, ed., *The Heidegger Controversy* (Cambridge, MA: MIT Press, 1993); Leslie Paul Thiele, *Timely Meditations: Martin Heidegger and Postmodern Politics* (Princeton, NJ: Princeton University Press, 1995); Berel Lang, *Heidegger's Silence* (Ithaca, NY: Cornell University Press, 1996); Julian Young, *Heidegger, Philosophy, and Nazism* (Cambridge: Cambridge University Press, 1997); and Emmanuel Faye, *Heidegger: The Introduction of Nazism into Philosophy in Light of the Unpublished Seminars of 1933–1935* (New Haven, CT: Yale University Press, 2009).

INTRODUCTION TO METAPHYSICS (in part)

CHAPTER ONE: THE FUNDAMENTAL QUESTION OF METAPHYSICS*

Why are there beings at all instead of nothing? That is the question. Presumably it is no arbitrary question. “Why are there beings at all instead of nothing?”—this is obviously the first of all questions. Of course, it is not the first question in the chronological sense. Individuals as well as peoples ask many questions in the course of their historical passage through time. They explore, investigate, and test many sorts of things before they run into the question “Why are there beings at all instead of nothing?” Many never run into this question at all, if running into the question means not only hearing and reading the interrogative sentence as uttered, but asking the question, that is, taking a stand on it, posing it, compelling oneself into the state of this questioning.

And yet, we are each touched once, maybe even now and then, by the concealed power of this question, without properly grasping what is happening to us. In great despair, for example, when all weight tends to dwindle away from things and the sense of things grows dark, the question looms. Perhaps it strikes only once, like the muffled tolling of a bell that resounds into Dasein and gradually fades away. The question is there in heartfelt joy, for then all things are transformed and surround us as if for the first time, as if it were easier to grasp that they were not, rather than that they are, and are as they are. The question is there in a spell of boredom, when we are equally distant from despair and joy, but when the stubborn ordinariness of beings lays open a wasteland in which it makes no difference to us whether beings are or are not—and then, in a distinctive form, the question resonates once again: Why are there beings at all instead of nothing?

- A. The why-question as the first of all questions
- B. Philosophy as the asking of the why-question
 - 1. The untimeliness of philosophy
 - 2. Two misinterpretations of philosophy
 - a. Philosophy as a foundation for culture
 - b. Philosophy as providing a picture of the world
 - 3. Philosophy as extra-ordinary questioning about the extra-ordinary
- C. *Phusis*: the fundamental Greek word for beings as such
 - 1. *Phusis* as the emerging, abiding sway
 - 2. The later narrowing of the meaning of *phusis*
- D. The meaning of “introduction to metaphysics”
 - 1. Metaphysics as questioning beyond beings as such
 - 2. The difference between the question of beings as such and the question of Being
 - 3. Introduction to metaphysics as leading into the asking of the fundamental question
- E. Unfolding the why-question by means of the question of Nothing
 - 1. The seeming superfluity of the phrase “instead of nothing”
 - 2. The connection between the question of Nothing and the question of Being
 - 3. The superiority of philosophy and poetry over logic and science

 - b. The failure of traditional ontology to explain the emptiness of Being
 - c. Philosophical questioning as essentially historical
 - d. The darkening of the world and the misinterpretation of spirit
 - e. The genuine essence of spirit: the empowering of the powers of beings
 - f. Our destroyed relation to Being and our misrelation to language

But whether this question is asked explicitly, or whether it merely passes through our Dasein like a fleeting gust of wind, unrecognized as a question, whether it becomes more oppressive or is thrust away by us again and suppressed under some pretext, it certainly is never the first question that we ask.

But it is the first question in another sense—namely, in rank. This can be clarified in three ways. The question “Why are there beings at all instead of nothing?” is first in rank for us as the broadest, as the deepest, and finally as the most originary question.

The question is the broadest in scope. It comes to a halt at no being of any kind whatsoever. The question embraces all that is, and that means not only what is now present at hand in the broadest sense, but also what has previously been and what will be in the future. The domain of this question is limited only by what simply is not and never is: by Nothing. All that is not Nothing comes into the question, and in the end even Nothing itself—not, as it were, because it is something, a being, for after all we are talking about it, but because it “is” Nothing. The scope of our question is so broad that we can never exceed it. We are not interrogating this being or that being, nor all beings, each in turn; instead, we are asking from the start about the whole of what is, or as we say for reasons to be discussed later: beings as a whole and as such.

Just as it is the broadest question, the question is also the deepest: Why are there beings at all . . . ? Why—that is, what is the ground? From what ground do beings come? On what ground do beings stand? To what ground do beings go? The question does not ask this or that about beings—what they are in each case, here and there, how they are put together, how they can be changed, what they can be used for, and so on. The questioning seeks the ground for what is, insofar as it is in being. To seek the ground: this means to get to the bottom *<ergründen>*. What is put into question comes into relation with a ground. But because we are questioning, it remains an open question whether the ground is a truly grounding, foundation-effecting, originary ground; whether the ground refuses to provide a foundation, and so is an abyss; or whether the ground is neither one nor the other, but merely offers the perhaps necessary illusion of a foundation and is thus an unground. However this may be, the question seeks a decision with respect to the ground that grounds the fact that what is, is in being as the being that it is. This why-question does not seek causes for beings, causes of the same kind and on the same level as beings themselves. This why-question does not just skim the surface, but presses into the domains that he “at the ground,” even pressing into the ultimate, to the limit; the question is turned away from all surface and shallowness, striving for depth; as the broadest, it is at the same time the deepest of the deep questions.

Finally, as the broadest and deepest question, it is also the most originary. What do we mean by that? If we consider our question in the whole breadth of what it puts

**Zu Grunde gehen* (literally “go to the ground”) is an idiom meaning “to be ruined.”

into question, beings as such and as a whole, then it strikes us right away that in the question, we keep ourselves completely removed from every particular, individual being as precisely this or that being. We do mean beings as a whole, but without any particular preference. Still, it is remarkable that one being always keeps coming to the fore in this questioning: the human beings who pose this question. And yet the question should not be about some particular, individual being. Given the unrestricted range of the question, every being counts as much as any other. Some elephant in some jungle in India is in being just as much as some chemical oxidation process on the planet Mars, and whatever else you please.

Thus if we properly pursue the question “Why are there beings at all, instead of nothing?” in its sense as a question, we must avoid emphasizing any particular, individual being, not even focusing on the human being. For what is this being, after all! Let us consider the Earth within the dark immensity of space in the universe. We can compare it to a tiny grain of sand; more than a kilometer of emptiness extends between it and the next gram of its size; on the surface of this tiny grain of sand lives a stupefied swarm of supposedly clever animals, crawling all over each other, who for a brief moment have invented knowledge [cf. Nietzsche, “On Truth and Lie in the Extramoral Sense,” 1873, published posthumously]. And what is a human lifespan amid millions of years? Barely a move of the second hand, a breath. Within beings as a whole there is no justification to be found for emphasizing precisely *this* being that is called the human being and among which we ourselves happen to belong.

But if beings as a whole are ever brought into our question, then the questioning does come into a distinctive relation with them—distinctive because it is unique—and beings do come into a distinctive relation with this questioning. For through this questioning, beings as a whole are first opened up *as such* and with regards to their possible ground, and they are kept open in the questioning. The asking of this question is not, in relation to beings as such and as a whole, some arbitrary occurrence amid beings, such as the falling of raindrops. The why-question challenges beings as a whole, so to speak, outstrips them, though never completely. But this is precisely how the questioning gains its distinction. What is asked in this question rebounds upon the questioning itself, for the questioning challenges beings as a whole but does not after all wrest itself free from them. Why the Why? What is the ground of this why question itself, a question that presumes to establish the ground of beings as a whole? Is this Why, too, just asking about the ground as a foreground, so that it is still always a *being* that is sought as what does the grounding? Is this “first” question not the first in rank after all, as measured by the intrinsic rank of the question of Being and its transformations?

To be sure—whether the question “Why are there beings at all instead of nothing?” is posed or not makes no difference whatsoever to beings themselves. The planets move in their orbits without this question. The vigor of life flows through plant and animal without this question.

But *if* this question is posed, and provided that it is actually carried out, then this questioning necessarily recoils back from what is asked and what is interrogated, back upon itself. Therefore this questioning in itself is not some arbitrary process but rather a distinctive occurrence that we call a *happening*.

This question and all the questions immediately rooted in it, in which this one question unfolds—this why-question cannot be compared to any other. It runs up against the search for its own Why. The question “Why the Why?” looks externally and at first like a frivolous repetition of the same interrogative, which can go on forever; it looks like an eccentric and empty rumination about insubstantial meanings of words. Certainly, that is how it looks. The only question is whether we are willing to fall victim to this cheap look

of things and thus take the whole matter as settled, or whether we are capable of experiencing a provocative happening in this recoil of the why-question back upon itself.

But if we do not let ourselves be deceived by the look of things, it will become clear that this why-question, as a question about beings as such and as a whole, immediately leads us away from mere toying with words, provided that we still possess enough force of spirit to make the question truly recoil into its own Why; for the recoil does not, after all, produce itself on its own. Then we discover that this distinctive why-question has its ground in a leap by which human beings leap away from all the previous safety of their Dasein, be it genuine or presumed. The asking of this question happens only in the leap and as the leap, and otherwise not at all. Later, we will clarify what we mean here by "leap." Our questioning is not yet the leap; for that, it must first be transformed; it still stands, unknowing, in the face of beings. For now, let this comment suffice: the leap *<Sprung>* of this questioning attains its own ground by leaping, performs it in leaping *<erspringt, springend erwirkt>*. According to the genuine meaning of the word, we call such a leap that attains itself as ground by leaping an originary leap *<Ursprung>*: an attaining-the-ground-by-leaping. Because the question "Why are there beings at all instead of nothing?" attains the ground for all genuine questioning by leaping and is thus an originary leap, we must recognize it as the most originary *<ursprünglich>* of questions.

As the broadest and deepest question, it is the most originary, and conversely.

In this threefold sense the question is the first in rank, first in rank in the order of questioning within that domain which this first question definitively opens up and grounds, giving it its measure. Our question is the question of all true questions—that is, of those that pose themselves to themselves—and it is necessarily asked, knowingly or not, along with every question. No questioning, and consequently no single scientific "problem" either, understands it self if it does not grasp the question of all questions, that is, if it does not ask it. We want to be clear about this from the start: it can never be determined objectively whether anyone is asking—whether we are actually asking this question, that is, whether we are leaping, or whether we are just mouthing the words. The question loses its rank at once in the sphere of a human-historical Dasein to whom *questioning* as an originary power remains foreign.

For example, anyone for whom the Bible is divine revelation and truth already has the answer to the question "Why are there beings at all instead of nothing?" before it is even asked: beings, with the exception of God Himself, are created by Him. God Himself "is" as the uncreated Creator. One who holds on to such faith as a basis can, perhaps, emulate and participate in the asking of our question in a certain way, but he cannot authentically question without giving himself up as a believer, with all the consequences of this step. He can act only "as if"—On the other hand, if such faith does not continually expose itself to the possibility of unfaith, it is not faith but a convenience. It becomes an agreement with oneself to adhere in the future to a doctrine as something that has somehow been handed down. This is neither having faith nor questioning, but indifference—which can then, perhaps even with keen interest, busy itself with everything, with faith as well as with questioning.

Now by referring to safety in faith as a special way of standing in the truth, we are not saying that citing the words of the Bible, "In the beginning God created heaven and earth, etc." represents an answer to our question. Quite aside from whether this sentence of the Bible is true or untrue for faith, it can represent no answer at all to our question, because it has no relation to this question. It has no relation to it, because it simply cannot come into such a relation. What is really asked in our question is, for faith, foolishness.

Philosophy consists in such foolishness. A "Christian philosophy" is a round square and a misunderstanding. To be sure, one can thoughtfully question and work through the

world of Christian experience—that is, the world of faith. That is then theology. Only ages that really no longer believe in the true greatness of the task of theology arrive at the pernicious opinion that, through a supposed refurbishment with the help of philosophy, a theology can be gained or even replaced, and can be made more palatable to the need of the age. Philosophy, for originally Christian faith, is foolishness. Philosophizing means asking: “Why are there beings at all. instead of nothing?” Actually asking this means venturing to exhaust, to question thoroughly, the inexhaustible wealth of this question, by unveiling what it demands that we question. Whenever such a venture occurs, there is philosophy.

If we now wanted to talk about philosophy, giving a report, in order to say what it is in more detail, this beginning would be fruitless. But whoever engages in philosophy must know a few things. They can be stated briefly.

All essential questioning in philosophy necessarily remains untimely, and this is because philosophy either projects far beyond its own time or else binds its time back to this times earlier and *inceptive* past. Philosophizing always remains a kind of knowing that not only does not allow itself to be made timely but, on the contrary, imposes its measure on the times.*

Philosophy is essentially untimely because it is one of those few things whose fate it remains never to be able to find a direct resonance in their own time, and never to be permitted to find such a resonance. Whenever this seemingly does take place, whenever a philosophy becomes fashion, either there is no actual philosophy or else philosophy is misinterpreted and, according to some intentions alien to it, misused for the needs of the day.

Philosophy, then, is not a kind of knowledge which one could acquire directly, like vocational and technical expertise, and which, like economic and professional knowledge in general, one could apply directly and evaluate according to its usefulness in each case.

But what is useless can nevertheless be a power—a power in the rightful sense. That which has no direct resonance <Widerklang> in everydayness can stand in innermost harmony <Einklang> with the authentic happening in the history of a people. It can even be its prelude <Vorlang>. What is untimely will have its own times. This holds for philosophy. Therefore we cannot determine what the task of philosophy in itself and in general is, and what must accordingly be demanded of philosophy. Every stage and every inception of its unfolding carries within it its own law. One can only say what philosophy cannot be and what it cannot achieve.

A question has been posed: “Why are there beings at all instead of nothing?”—We have claimed that this question is the first. We have explained in what sense it is meant as the first.

Thus we have not yet asked this question; right away we turned aside into a discussion of it. This procedure is necessary, for the asking of this question cannot be compared with customary concerns. There is no gradual transition from the customary by which the question could slowly become more familiar. This is why it must be posed in advance, proposed <vorgestellt>, as it were. On the other hand, in this proposal of and talk about the question, we must not defer, or even forget, the questioning.

We therefore conclude the preliminary remarks with this session discussions.

Every essential form of spirit is open to ambiguity. The more this form resists comparison with others, the more it is misinterpreted.

Philosophy is one of the few autonomous creative possibilities, and occasional necessities, of human-historical Dasein. The current misinterpretations of philosophy,

*[Heidegger puns on *zeitgemäß* (“timely”), meaning literally “in measure with the times.”]

which all have something to them despite their misunderstandings, are innumerable. Here we will mention only two, which are important for clarifying the situation of philosophy today and in the future.

One misinterpretation consists in demanding too much of the essence of philosophy. The other involves a distortion of the sense of what philosophy can achieve.

Roughly speaking, philosophy always aims at the first and last grounds of beings, and it does so in such a way that human beings themselves, with respect to their way of Being, are emphatically interpreted and given an aim. This readily gives the impression that philosophy can and must provide a foundation for the current and future historical Dasein of a people in every age, a foundation for building culture. But such expectations and requirements demand too much of the capability and essence of philosophy. Usually, this excessive demand takes the form of finding fault with philosophy. One says, for example, that because metaphysics did not contribute to preparing the revolution, it must be rejected. That is just as clever as saying that because one cannot fly with a carpenter's bench, it should be thrown away. Philosophy can never *directly* supply the forces and create the mechanisms and opportunities that bring about a historical state of affairs, if only because philosophy is always the direct concern of the few. Which few? The ones who transform creatively, who unsettle things. It spreads only indirectly, on back roads that can never be charted in advance, and then finally—sometime, when it has long since been forgotten as originary philosophy—it sinks away in the form of one of Dasein's truisms.

Against this first misinterpretation, what philosophy can and must be according to its essence, is this: a thoughtful opening of the avenues and vistas of a knowing that establishes measure and rank, a knowing in which and from which a people conceives its Dasein in the historical-spiritual world and brings it to fulfillment—that knowing which ignites and threatens and compels all questioning and appraising.

The second misinterpretation that we mention is a distortion of the sense of what philosophy can achieve. Granted that philosophy is unable to lay the foundation of a culture, one says, philosophy nevertheless makes it easier to build up culture. According to this distortion, philosophy orders the whole of beings into overviews and systems, and readies a world picture for our use—a map of the world, as it were—a picture of the various possible things and domains of things, thereby granting us a universal and uniform orientation. Or, more specifically, philosophy relieves the sciences of their labor by meditating on the presuppositions of the sciences, their basic concepts and propositions. One expects philosophy to promote, and even to accelerate, the practical and technical business of culture by alleviating it, making it easier.

But—according to its essence, philosophy never makes things easier, but only more difficult. And it does so not just incidentally, not just because its manner of communication seems strange or even deranged to everyday understanding. The burdening of historical Dasein, and thereby at bottom of Being itself, is rather the genuine sense of what philosophy can achieve. Burdening gives back to things, to beings, their weight (Being). And why? Because burdening is one of the essential and fundamental conditions for the arising of everything great, among which we include above all else the fate of a historical people and its works. But fate is there only where a true knowing about things rules over Dasein. And the avenues and views of such a knowing are opened up by philosophy.

The misinterpretations by which philosophy remains constantly besieged are mainly promoted by what people like us do, that is, by professors of philosophy. Their customary, and also legitimate and even useful business is to transmit a certain educationally appropriate acquaintance with philosophy as it has presented itself so far. This then looks as though it itself were philosophy, whereas at most it is scholarship about philosophy.

When we mention and correct both of these misinterpretations, we cannot intend that you should now come at one stroke into a clear relation with philosophy. But you should become mindful and be on your guard, precisely when the most familiar judgments, and even supposedly genuine experiences, unexpectedly assail you. This often happens in a way that seems entirely innocuous and is quickly convincing. One believes that one has had the experience oneself, and readily hears it confirmed: “nothing comes” of philosophy; “you can’t do anything with it.” These two turns of phrase, which are especially current among teachers and researchers in the sciences, express observations that have their indisputable correctness. When one attempts to prove that, to the contrary, something does after all “come of philosophy, one merely intensifies and secures the prevailing misinterpretation, which consists in the prejudice that one can evaluate philosophy according to everyday standards that one would otherwise employ to judge the utility of bicycles or the effectiveness of mineral baths.”

It is entirely correct and completely in order to say, “You can’t do anything with philosophy.” The only mistake is to believe that with this, the judgment concerning philosophy is at an end. For a little epilogue arises in the form of a counterquestion: even if we can’t do anything with it, may not philosophy in the end do something *with us*, provided that we engage ourselves with it? Let that suffice for us as an explication of what philosophy is not.

At the outset we spoke of a question: “Why are there beings at all instead of nothing?” We asserted that to ask this question is to philosophize. Whenever we set out in the direction of this question, thinking and gazing ahead, then right away we forgo any sojourn in any of the usual regions of beings. We pass over and surpass what belongs to the order of the day. We ask beyond the usual, beyond the ordinary that is ordered in the everyday. Nietzsche once said (VIII, 269): “A philosopher: that is a human being who constantly experiences, sees, hears, suspects, hopes, dreams extraordinary things. . . .”*

Philosophizing is questioning about the extra-ordinary. Yet as we merely intimated at first, this questioning recoils upon itself, and thus not only what is asked about is extraordinary, but also the questioning itself. This means that this questioning does not lie along our way, so that one day we stumble into it blindly or even by mistake. Nor does it stand in the familiar order of the everyday, so that we could be compelled to it on the ground of some requirements or even regulations. Nor does this questioning lie in the sphere of urgent concern and the satisfaction of dominant needs. The questioning itself is out-of-order. It is completely voluntary, fully and especially based on the mysterious ground of freedom, on what we have called the leap. The same Nietzsche says: “Philosophy . . . means living voluntarily amid ice and mountain ranges” (XV, 2).** Philosophizing, we can now say, is extra-ordinary questioning about the extra-ordinary.

In the age of the first and definitive unfolding of Western philosophy among the Greeks, when questioning about beings as such and as a whole received its true inception, beings were called *physis*. This fundamental Greek word for beings is usually translated as “nature.” We use the Latin translation *natura*, which really means “to be born,” “birth.” But with this Latin translation, the originary content of the Greek word *physis* is already thrust aside, the authentic philosophical naming force of the Greek word is destroyed. This is true not only of the Latin translation of *this* word but of all other translations of Greek philosophical language into Roman. This translation of

*[*Beyond Good and Evil*, §292. Heidegger’s references to Nietzsche cite the edition of his works published in Leipzig by C. G. Naumann, 1899–1905.]

**§ 3 of the preface to *Ecce Homo*.

Greek into Roman was not an arbitrary and innocuous process but was the first stage in the isolation and alienation of the originary essence of Greek philosophy. The Roman translation then became definitive for Christianity and the Christian Middle Ages. The Middle Ages translated themselves into modern philosophy, which moves within the conceptual world of the Middle Ages and then creates those familiar representations and conceptual terms that are used even today to understand the inception of Western philosophy. This inception is taken as something left behind long ago and supposedly overcome.

But now we leap over this whole process of deformation and decline, and we seek to win back intact the naming force of language and words; for words and language are not just shells into which things are packed for spoken and written intercourse. In the word, in language, things first come to be and are. For this reason, too, the misuse of language in mere idle talk, in slogans and phrases destroys our genuine relation to things. Now what does the word *phusis* say? It says what emerges from itself (for example, the emergence, the blossoming, of a rose), the unfolding that opens itself up, the coming-into-appearance in such unfolding, and holding itself and persisting in appearance—in short, the emerging-abiding sway. According to the dictionary, *phuein* means to grow to make grow.* But what does growing mean? Does it just mean to increase by acquiring bulk, to become more numerous and bigger?

Phusis as emergence can be experienced everywhere: for example, in celestial processes (the rising of the sun), in the surging of the sea, in the growth of plants, in the coming forth of animals and human beings from the womb. But *phusis*, the emerging sway, is not synonymous with these processes, which we still today count as part of “nature.” This emerging and standing-out-in-itself-from-itself may not be taken as just one process among others that we observe in beings. *Phusis* is Being itself, by virtue of which beings first become and remain observable.

It was not in natural processes that the Greeks first experienced what *phusis* is, but the other way around: on the basis of a fundamental experience of Being in poetry and thought, what they had to call *phusis* disclosed itself to them. Only on the basis of this disclosure could they then take a look at nature in the narrower sense. Thus *phusis* originally means both heaven and earth, both the stone and the plant, both the animal and the human, and human history as the work of humans and gods; and finally and first of all, it means the gods who themselves stand under destiny. *Phusis* means the emerging sway, and the enduring over which it thoroughly holds sway. This emerging, abiding sway includes both “becoming” as well as “Being” in the narrower sense of fixed continuity. *Phusis* is the event of *standing forth*, arising from the concealed and thus enabling the concealed to take its stand for the first time.**

But if one understands *phusis*, as one usually does, not in the originary sense of the emerging and abiding sway but in its later and present meaning, as nature, and if one also posits the motions of material things, of atoms and electrons—what modern physics investigates as *phusis*—as the fundamental manifestation of nature, then the inceptive philosophy of the Greeks turns into a philosophy of nature, a representation of all things according to which they are really of a material nature. Then the inception of Greek philosophy, in accordance with our everyday understanding of an inception, gives the impression of being, as we say once again in Latin, primitive. Thus the Greeks become in principle a better kind of Hottentot, in comparison to whom modern science

*The noun *phusis* corresponds to the verb *phuein*.

**[Heidegger is playing on the etymological connection between *Entstehen* (genesis, growth) and *Stand* (a stand, state, situation, condition).]

has progressed infinitely far. Disregarding all the particular absurdities involved in conceiving of the inception of Western philosophy as primitive, it must be said that this interpretation forgets that what is at issue is philosophy—one of the few great things of humanity. But whatever is great can only begin great. In fact, its inception is always what is greatest. Only the small begins small—the small, whose dubious greatness consists in diminishing everything; what is small is the inception of decline, which can then also become great in the sense of the enormity of total annihilation.

The great begins great, sustains itself only through the free recurrence of greatness, and if it is great, also comes to an end in greatness. So it is with the philosophy of the Greeks. It came to an end in greatness with Aristotle. Only the everyday understanding and the small man imagine that the great must endure forever, a duration which he then goes on to equate with the eternal.

What is, as such and as a whole, the Greeks call *phusis*. Let it be mentioned just in passing that already within Greek philosophy, a narrowing of the word set in right away, although its originary meaning did not disappear from the experience, the knowledge, and the attitude of Greek philosophy. An echo of knowledge about the originary meaning still survives in Aristotle, when he speaks of the grounds of beings as such (cf. *Metaphysics* Γ, I, 1003a27).*

But this narrowing of *phusis* in the direction of the “physical” did not happen in the way that we picture it today. We oppose to the physical the “psychical” the mind or soul, what is ensouled, what is alive. But all this, for the Greeks, continues even later to belong to *phusis*. As a counterphenomenon there arose what the Greeks call *thesis*, positing, ordinance, or *nomos*, law, rule in the sense of mores. But this is not what is moral but instead what concerns mores, that which rests on the commitment of freedom and the assignment of tradition; it is that which concerns a free comportment and attitude, the shaping of the historical Being of humanity, *ēthos*, which under the influence of morality was then degraded to the ethical.

Phusis gets narrowed down by contrast with *technē*—which means neither art nor technology but a kind of *knowledge*, the knowing disposal over the free planning and arranging and controlling of arrangements (cf. Plato’s *Phaedrus*).** *Technē* is generating, building, as a knowing producing. (It would require a special study to clarify what is essentially the same in *phusis* and *technē*.) But for all that, the counterconcept to the physical is the historical, a domain of beings that is also understood by the Greeks in the originally broader sense of *phusis*. This, however, does not have the least to do with a naturalistic interpretation of history. Beings, as such and as a whole, are *phusis*—that is, they have as their essence and character the emerging-abiding sway. This is then experienced, above all, in what tends to impose itself on us most immediately in a certain way, and which is later denoted by *phusis* in the narrower sense: *ta phusei onta*, *ta phusika*, what naturally is. When one asks about *phusis* in general, that is, what beings as such are, then it is above all *ta phusei onta* that provide the foothold, although in such a way that from the start, the questioning is not allowed to dwell on this or that domain of nature—inanimate bodies, plants, animals—but must go on beyond *ta phusika*.

In Greek, “away over something,” “over beyond,” is *meta*. Philosophical questioning about beings as such is *meta ta phusika*; it questions on beyond beings, it is metaphysics.

*[“Now since we are seeking the principles and the highest causes [or grounds], it is clear that these must belong to some *phusis* in virtue of itself. If, then, those who were seeking the elements of beings were also seeking these principles, these elements too must be elements of being, not accidentally, but as being. Accordingly, it is of being as being that we, too, must find the first causes”—*Metaphysics* Γ, I, 1003a26-32.]

***Phaedrus* 260d-274b is devoted to determining how rhetoric can become a proper *technē* and what is required in general of a proper *technē*.

At this point we do not need to trace the history of the genesis and meaning of this term in detail.

The question we have identified as first in rank—"Why are there beings at all instead of nothing?"—is thus the fundamental question of metaphysics. Metaphysics stands as the name for the center and core that determines all philosophy.

[For this introduction, we have intentionally presented all this in a cursory and thus basically ambiguous way. According to our explanation of *phusis*, this word means the Being of beings. If one is asking *peri phuseōs*, about the Being of beings, then the discussion of *phusis*, "physics" in the ancient sense, is in itself already beyond *ta phusika*, on beyond beings, and is concerned with Being. "Physics" determines the essence and the history of metaphysics from the inception onward. Even in the doctrine of Being as *actus purus* (Thomas Aquinas), as absolute concept (Hegel), as eternal recurrence of the same will to power (Nietzsche), metaphysics steadfastly remains "physics."

The question about Being as such, however, has a different essence and a different provenance.

To be sure, within the purview of metaphysics, and if one continues to think in its manner, one can regard the question about Being as such merely as a mechanical repetition of the question about beings as such. The question about Being as such is then just another transcendental question, albeit one of a higher order. This misconstrual of the question about Being as such, blocks the way to unfolding it in a manner befitting the matter.

However, this misconstrual is all too easy, especially because *Being and Time* spoke of a "transcendental horizon." But the "transcendental" meant there does not pertain to subjective consciousness; instead, it is determined by the existential-ecstatic temporality of Being-here. Nevertheless, the question about Being as such is misconstrued as coinciding with the question about beings as such; this misconstrual thrusts itself upon us above all because the essential provenance of the question about beings as such, and with it the essence of metaphysics, lies in obscurity. This drags into indeterminacy all questioning that concerns Being in any way.

The "introduction to metaphysics" attempted here keeps in view this confused condition of the "question of Being."

According to the usual interpretation, the "question of Being" means asking about beings as such (metaphysics). But if we think along the lines of *Being and Time*, the "question of Being" means asking about Being as such. This meaning of the expression is also appropriate both in terms of the matter at stake and in terms of language; for the "question of Being" in the sense of the metaphysical question about beings as such precisely does *not ask* thematically about Being. Being remains forgotten.

But this talk of the "oblivion of Being" is just as ambiguous as the expression "question of Being." One protests quite rightfully that metaphysics does indeed ask about the Being of beings, and that therefore it is manifest foolishness to charge metaphysics with an oblivion of Being.

But if we think the question of Being in the sense of the question about Being as such, then it becomes clear to everyone who accompanies us in thinking that it is precisely Being *as such* that remains concealed, remains in oblivion—and so decisively that the oblivion of Being, an oblivion that itself falls into oblivion, is the unrecognized yet enduring impulse for metaphysical questioning.

If one chooses the designation "metaphysics" for the treatment of the "question of Being" in an indefinite sense, then the title of this lecture course remains ambiguous. For at first it seems as though the questioning held itself within the purview of beings as such, whereas already with the first sentence it strives to depart this zone in order to

bring another domain into view with its questions. The title of the course is thus *deliberately* ambiguous.

The fundamental question of the lecture course is of a different kind than the guiding question of metaphysics. Taking *Being and Time* as its point of departure, the lecture course asks about the “*disclosedness of Being*” (*Being and Time*, pp. 21f. and 37f.). Disclosedness means: the openedness of what the oblivion of Being closes off and conceals. Through this questioning, too, fight first falls on the *essence* of metaphysics, which was also concealed up to now.]

“Introduction to metaphysics” accordingly means: leading into the asking of the fundamental question.* But questions, and above all fundamental questions, do not simply occur like stones and water. Questions are not given like shoes, clothes, or books. Questions *are* as they are actually asked, and this is the only way in which they are. Thus the leading into the asking of the fundamental question is not a passage over to something that lies or stands around somewhere; instead, this leading-to must first awaken and create the questioning. Leading is a questioning going-ahead, a questioning-ahead. This is a leadership that essentially has no following. Whenever one finds pretensions to a following, in a school of philosophy, for example, questioning is misunderstood. There can be such schools only in the sphere of scientific or professional labor. In such a sphere, everything has its distinct hierarchical order. Such labor also belongs, and even necessarily belongs, to philosophy and has today been lost. But the best professional ability will never replace the authentic strength of seeing and questioning and saying.

“Why are there beings at all instead of nothing?” That is the question. To pronounce the interrogative sentence, even in a questioning tone, is not yet to question. We can already see this in the fact that even if we repeat the interrogative sentence several times over and over, this does not necessarily make the questioning attitude any livelier; on the contrary, reciting the sentence repeatedly may well blunt the questioning.

Although the interrogative sentence thus is not the question and is not questioning, neither should it be taken as a mere linguistic form of communication, as if the sentence were only a statement “about” a question. If I say to you, “Why are there beings at all instead of nothing?” then the intent of my asking and saying is not to communicate to you that a process of questioning is now going on inside me. Certainly the spoken interrogative sentence can also be taken this way, but then one is precisely not hearing the questioning. The questioning does not result in any shared questioning and self-questioning. It awakens nothing in the way of a questioning attitude, or even a questioning disposition. For this consists in a *willing-to-know*. Willing this is not just wishing and trying. Whoever wishes to know also seems to question; but he does not get beyond saying the question, he stops short precisely where the question begins. Questioning is willing-to-know. Whoever wills, whoever lays his whole Dasein into a will, is resolute. Resoluteness delays nothing, does not shirk, but acts from the moment and without fail. Open resoluteness is no mere resolution to act; it is the decisive inception. of action that readies ahead of and through all action. To will is to be resolute. [The essence of willing is traced back here to open resoluteness. But the essence of open resoluteness <Ent-schlossenheit> lies in the de-concealment <Ent-borgenheit> of human Dasein for the clearing of Being and by no means in an accumulation of energy for “activity.” Cf. *Being and Time* §44 and §60. But the relation to Being is letting. That all

*[Throughout this passage, Heidegger plays on the connection between *Einführung*, “introduction,” and *führen*, “to lead.” Etymologically, *Einführung* means “leading into,” as do the Latin roots of the English “introduction.”]

willing should be grounded in letting strikes the understanding as strange. See the lecture "On the Essence of Truth," 1930.]

But to know means to be able to stand in the truth. Truth is the openness of beings. To know is accordingly to be able to stand in the openness of beings, to stand up to it. Merely to have information, however wide-ranging it may be, is not to know. Even if this information is focused on what is practically most important through courses of study and examination requirements, it is not knowledge. Even if this information, cut back to the most compelling needs, is "close to life," its possession is not knowledge. One who carries such information around with him and has added a few practical tricks to it will still be at a loss and will necessarily bungle in the face of real reality, which is always different from what the philistine understands by closeness to life and closeness to reality. Why? Because he has no knowledge, since to know means *to be able to learn*.

Of course, everyday understanding believes that one has knowledge when one needs to learn nothing more, because one has finished learning. No. The only one who knows is the one who understands that he must always learn again, and who above all, on the basis of this understanding, has brought himself to the point where he continually *can learn*. This is far harder than possessing information.

Being able to learn presupposes being able to question. Questioning is the willing-to-know that we discussed earlier: the open resoluteness to be able to stand in the openness of beings. Because we are concerned with asking the question that is first in rank, clearly the willing as well as the knowing are of a very special *kind*. All the less will the *interrogative sentence* exhaustively reproduce the question, even if it is genuinely said in a questioning way and heard in a partnership of questioning. The question that does indeed resonate in the interrogative sentence, but nevertheless remains closed off and enveloped there, must first be developed. In this way the questioning attitude must clarify and secure itself, establish itself through exercise.

Our next task consists in *unfolding* the question "Why are there beings at all instead of nothing?" In what direction can we unfold it? To begin with, the question is accessible in the interrogative sentence. The sentence takes a stab, as it were, at the question. Hence its linguistic formulation must be correspondingly broad and loose. Let us consider our interrogative sentence in this respect. "Why are there beings at all instead of nothing?" The sentence contains a break. "Why are there beings at all?" With this, the question really has been posed. The posing of the question includes: 1) the definite indication of what is put *into* question, what is *interrogated*; 2) the indication of that with regards to which what is interrogated is interrogated—what is asked about. For what is interrogated is indicated unequivocally: namely, beings. What is asked about, what is *asked*, is the Why—that is, the ground. What follows in the interrogative sentence—"instead of nothing?"—is an embellishing flourish; it is just an appendix that inserts itself, as if on its own, for the sake of an initially loose and introductory way of speaking, as an additional turn of phrase that says nothing more about what is interrogated and what is asked about. In fact, the question is far more unequivocal and decisive *without* the appended turn of phrase, which just comes from the superfluity of imprecise talk. "Why are there beings at all?" But the addition "instead of nothing?" is invalidated not just because we are striving for a precise formulation of the question, but even more because it says nothing at all. For what more are we supposed to ask about Nothing? Nothing is simply nothing. Questioning has nothing more to seek here. Above all, by bringing up Nothing we do not gain the slightest thing for the knowledge of beings.

Whoever talks about Nothing does not know what he is doing. In speaking about Nothing, he makes it into a something. By speaking this way, he speaks against what he means. He contradicts himself. But self-contradictory speech is an offense against the

fundamental rule of speech (*logos*), against “logic.” Talking about Nothing is illogical. Whoever talks and thinks illogically is an unscientific person. Now whoever goes so far as to talk about Nothing within philosophy, which after all is the home of logic, deserves all the more to be accused of offending against the fundamental rule of all thinking. Such talk about Nothing consists in utterly senseless propositions. Moreover, whoever takes Nothing seriously takes the side of nullity. He obviously promotes the spirit of negation and serves disintegration. Talking about Nothing is not only completely contrary to thought, but it undermines all culture and all faith. Whatever both disregards the fundamental law of thinking and also destroys faith and the will to construct is pure nihilism.

Given such considerations, we will do well to strike from our interrogative sentence the superfluous turn of phrase “instead of nothing?” and restrict the sentence to the simple and precise form: “Why are there beings at all?”

Nothing would stand in the way of this, if . . . if in the formulation of our question, if in the asking of this question altogether, we had as much license as it may have seemed up to now. But in asking the question we stand within a tradition. For philosophy has constantly and always asked about the ground of beings. With this question it had its inception, in this question it will find its end, provided that it comes to an end in greatness and not in a powerless decline. The question about what is not and about Nothing has gone side by side with the question of what is, since its inception. But it does not do so superficially, as an accompanying phenomenon; instead, the question about Nothing takes shape in accordance with the breadth, depth, and originality with which the question about beings is asked on each occasion, and conversely. The manner of asking about Nothing can serve as a gauge and a criterion for the manner of asking about beings.

If we think about this, then the interrogative sentence pronounced at the start, “Why are there beings at all *instead* of nothing?” appears far more suitable to express the question about beings than the abbreviated version after all. Our introduction of talk about Nothing here is not a careless and overly enthusiastic manner of speaking, nor our own invention, but merely strict respect for the originary tradition regarding the sense of the fundamental question.

Still, this talk of Nothing remains contrary to thought in general, and leads to disintegration in particular. But what if both the concern for the proper respect for the fundamental rules of thinking as well as the fear of nihilism, which would both like to advise against talk of Nothing, rested on a misunderstanding? This is in fact the case. Of course, the misunderstanding that is being played out here is not accidental. Its ground is a lack of understanding that has long ruled the question about beings. But this lack of understanding stems from an *oblivion of Being* that is getting increasingly rigid.

For it cannot be decided so readily whether logic and its fundamental rules can provide any measure for the question about beings as such. It could be the other way around, that the whole logic that we know and that we treat like a gift from heaven is grounded in a very definite answer to the question about beings, and that consequently any thinking that simply follows the laws of thought of established logic is intrinsically incapable of even beginning to understand the question about beings, much less of actually unfolding it and leading it toward an answer. In truth, it is only an illusion of rigor and scientificity when one appeals to the principle of contradiction, and to logic in general, in order to prove that all thinking and talk about Nothing is contradictory and therefore senseless. “Logic” is then taken as a tribunal, secure for all eternity, and it goes without saying that no rational human being will call into doubt its authority as the first and last court of appeal. Whoever speaks against logic is suspected, implicitly or

explicitly, of arbitrariness. This mere suspicion already counts as an argument and an objection, and one takes oneself to be exempted from further, authentic reflection.

One cannot, in fact, talk about and deal with Nothing as if it were a thing, such as the rain out there, or a mountain, or any object at all; Nothing remains in principle inaccessible to all science. Whoever truly wants to talk of Nothing must necessarily become unscientific. But this is a great misfortune only if one believes that scientific thinking alone is the authentic, rigorous thinking, that it alone can and must be made the measure even of philosophical thinking. But the reverse is the case. All scientific thinking is just a derivative and rigidified form of philosophical thinking. Philosophy never arises from or through science. Philosophy can never belong to the same order as the sciences. It belongs to a higher order, and not just “logically,” as it were, or in a table of the system of sciences. Philosophy stands in a completely different domain and rank of spiritual Dasein. Only poetry is of the same order as philosophical thinking, although thinking and poetry are not identical. Talking about Nothing remains forever an abomination and an absurdity for science. But aside from the philosopher, the poet can also talk about Nothing—and not because the procedure of poetry, in the opinion of everyday understanding, is less rigorous, but because, in comparison to all mere science, an essential superiority of the spirit holds sway in poetry (only genuine and great poetry is meant). Because of this superiority, the poet always speaks as if beings were expressed and addressed for the first time. In the poetry of the poet and in the thinking of the thinker, there is always so much worldspace to spare that each and every dung—a tree, a mountain, a house, the call of a bird—completely loses its indifference and familiarity.

True talk of Nothing always remains unfamiliar. It does not allow itself to be made common. It dissolves, to be sure, if one places it in the cheap acid of a merely logical cleverness. This is why we cannot begin to speak about Nothing immediately, as we can in describing a picture, for example. But the possibility of such speech about Nothing can be indicated. Consider a passage from one of the latest works of the poet Knut Hamsun, *The Road Leads On*, 1934 translation, p. 464. The work belongs together with *The Wayfarer* and *August*.^{*} *The Road Leads On* depicts the last years and the end of this man August, who embodies the uprooted, universal knowhow of today’s humanity; but in the form of a Dasein that cannot lose its ties to the unfamiliar, because in its despairing powerlessness it remains genuine and superior. In his last days, this August is alone in the high mountains. The poet says: “He sits here between his ears and hears true emptiness. Quite amusing, a fancy. On the ocean (earlier, August often went to sea) something stirred (at least), and there, there was a sound, something audible, a water chorus. Here—nothing meets nothing and is not there, there is not even a hole. One can only shake ones head in resignation.”

So there is, after all, something peculiar about Nothing. Thus we want to take up our interrogative sentence again and question through it, and see whether this “instead of nothing?” simply represents a turn of phrase that says nothing and is arbitrarily appended, or whether even in the preliminary expression of the question it has an essential sense.

To this end, let us stick at first to the abbreviated, apparently simpler and supposedly more rigorous question: “Why are there beings at all?” If we ask in this way, we start out from beings. They *are*. They are given to us, they are in front of us and can thus be found before us at any time, and are also known to us within certain domains. Now the beings given to us in this way are immediately interrogated as to their ground. The questioning advances directly toward a ground. Such a method just broadens and enlarges, as it were, a procedure that is practiced every day. Somewhere in the vineyard,

^{*}[Heidegger refers to these novels by the titles of their German translations.]

for example, an infestation turns up, something indisputably present at hand. One asks: where does this come from, where and what is its ground? Similarly, as a whole, beings are present at hand. One asks: where and what is the ground? This kind of questioning is represented in the simple formula: Why are there beings? Where and what is their ground? Tacitly one is asking after another, higher being. But here the question does not pertain at all to beings as a whole and as such.

But now if we ask the question in the form of our initial interrogative sentence—"Why are there beings at all instead of nothing?"—then the addition prevents us, in our questioning, from beginning directly with beings as unquestionably given, and having hardly began, already moving on to the ground we are seeking, which is also in being. Instead, these beings are held out in a questioning manner into the possibility of not-Being. In this way, the Why gains a completely different power and urgency of questioning. Why are beings torn from the possibility of not-Being? Why do they not fall back into it constantly with no further ado? Beings are now no longer what just happens to be present at hand; they begin to waver, regardless of whether we know beings with all certainty, regardless of whether we grasp them in their full scope or not. From now on, beings as such waver, insofar as we put them into question. The oscillation of this wavering reaches out into the most extreme and sharpest counterpossibility of beings, into not-Being and Nothing. The search for the Why now transforms itself accordingly. It does not just try to provide a present-at-hand ground for explaining what is present at hand—instead, we are now searching for a ground that is supposed to ground the dominance of beings as an overcoming of Nothing. The ground in question is now questioned as the ground of the decision for beings over against Nothing—more precisely, as the ground for the wavering of the beings that sustain us and unbind us, half in being, half not in being, which is also why we cannot wholly belong to any thing, not even to ourselves; yet Dasein is in each case mine.

[The qualification "in each case mine" signifies: Dasein is thrown to me so that my self may be Dasein. But Dasein means: care of the Being of beings as such that is ecstatically disclosed in care, not only of human Being. Dasein is "in each case mine"; this means neither that it is posited by me nor that it is confined to an isolated ego. Dasein is *itself* by virtue of its essential *relation* to Being in general. This is what the oft-repeated sentence in *Being and Time* means: the understanding of Being belongs to Dasein.]

Thus it is already becoming clearer that this "instead of nothing?" is no superfluous addition to the real question. Instead, this tam of phrase is an essential component of the whole interrogative sentence, which as a whole expresses a completely different question from what is meant by the question: Why are there beings? With our question we establish ourselves among beings in such a way that they forfeit their self-evidence as beings. Insofar as *beings* come to waver within the broadest and harshest possibility of oscillation—the "either beings—or nothing"—the questioning itself loses every secure foothold. Our Dasein, too, as it questions, comes into suspense, and nevertheless maintains itself, by itself, in this suspense.

But beings are not changed by our questioning. They remain what they are and as they are. After all, our questioning is just a psychospiritual process in us that, however it may play itself out, cannot concern beings themselves. Certainly, beings remain as they are revealed to us. And yet beings are not able to shrug off what is worthy of questioning: they, as what they are and how they are, could also *not* be. By no means do we experience this possibility as something that is just added on by our own thought, but beings themselves declare this possibility, they declare themselves as beings in this possibility. Our questioning just opens up the domain so that beings can break open in such questionworthiness.

What we know about how such questioning happens is all too little and all too crude. In this questioning, we seem to belong completely to ourselves. Yet it is *this* questioning that pushes us into the open, provided that it itself, as a questioning, transforms itself (as does every genuine questioning), and casts a new space over and through everything.

It is simply a matter of not being seduced by overhasty theories, but instead experiencing things as they are in whatever may be nearest. This piece of chalk here is an extended, relatively stable, definitely formed, grayish-white thing, and, furthermore, a thing for writing. As certainly as it belongs precisely to this thing to be here, the capacity not to be here and not to be so big also belongs to it. The possibility of being drawn along the blackboard and used up is not something that we merely add onto the dung with our thought. The chalk itself, as this being, is in this possibility; otherwise it would not be chalk as a writing implement. Every being, in turn, has this Possible in it, in a different way in each case. This Possible belongs to the chalk. It itself has in itself a definite appropriateness for a definite use. Of course, when we look for this Possible in the chalk, we are accustomed and inclined to say that we do not see it and do not grasp it. But that is a prejudice. The elimination of this prejudice is part of the unfolding of our question. For now, this question should just open up beings, in their wavering between not Being and Being Insofar as beings stand up against the extreme possibility of not Being, they themselves stand in Being, and yet they have never thereby overtaken and overcome the possibility of not-Being.

Suddenly we are speaking here about the not-Being and Being of beings, without saying how what we call Being is related to beings themselves. Are they the same? The being and its Being? The distinction! What, for example, is the being *<das Seiende>* in this piece of chalk? Already this question is ambiguous, because the word “being” can be understood in two ways, as can the Greek *to on*. On the one hand, being means what at any time is in being, in particular this grayish-white, light, breakable mass, formed in such and such a way. On the other hand, “being” means that which, as it were, “makes” this be a being instead of nonbeing *<nichtseiend>*, that which makes up the Being in the being, if it is a being. In accordance with this twofold meaning of the word “being,” the Greek *to on* often designates the second meaning, that is, not the being itself, *what* is in being, but rather “the in-being,” beingness, to be in being, Being. In contrast, the first meaning of “being” names the things themselves that are in being, either individually or as a whole, but always with reference to these things and not to their beingness, *ousia*.*

The first meaning of *to on* designates *ta onta* (*entia*), the second means *to einai* (*esse*). We have catalogued what the being is in the piece of chalk. We were able to find this out relatively easily. We could also easily see that the chalk can also not be, that this chalk ultimately need not be here and need not be at all. But then, as distinguished from that which can stand in Being or fall back into not-Being, as distinguished from the being—what is Being? Is it the same as the being? We ask this once again. But we did not include Being in our earlier catalogue of attributes—we listed only material mass, grayish-white, light, formed in such and such a manner, breakable. Now where is Being situated? It must after all belong to the chalk, for this chalk itself *is*.

*[The Greek noun *ousia* is formed from the present participle of the verb *einai* (to be). Normally meaning “goods, possessions,” it is developed by Plato and Aristotle into a central philosophical concept, and is usually translated as “essence” or “substance.” Heidegger’s *Seiendheit* (beingness) corresponds directly to the grammatical structure of *ousia*.]

We encounter beings everywhere; they surround us, carry and control us, enchant and fulfill us, elevate and disappoint us, but where in all this is the Being of beings, and what does it consist in? One could answer: this distinction between beings and their Being may at times have some linguistic importance, perhaps even some meaning; one can make this distinction in mere thought, that is, in re-presentation and opinion, without this distinction's corresponding to anything that is. But even this distinction made only in thought is questionable; for it remains *unclear* what we are supposed to think under the name "Being." Meanwhile, it is enough to be familiar with beings and to secure mastery over them. Distinguishing Being on top of this is artificial and leads to nothing.

We have already made some remarks about this popular question of what comes of such distinctions. Let us now simply reflect on our enterprise. We ask, "Why are there beings at all instead of nothing?" And in this question we apparently restrict ourselves only to beings and avoid empty brooding about Being. But what are we really asking? Why beings as such are. We are asking about the ground for the fact that beings *are*, and are what they *are*, and that there is not nothing instead. We are asking at bottom about Being. But how? We are asking about the Being of beings. We are interrogating beings in regards to their Being.

But if we persevere in the questioning, we are really already asking *ahead*, about Being in regard to its ground, even if this question does not develop and it remains undecided whether Being itself is not already in itself a ground and ground enough. If we pose this question about Being as the first question in rank, then should we do so without knowing how it stands with Being and how Being stands in its distinction from beings? How are we even supposed to inquire into the ground for the Being of beings, let alone be able to find it out, if we have not adequately conceived, understood and grasped Being itself? This enterprise would be just as hopeless as if someone wanted to explain the cause and ground of a fire and declared that he need not bother with the course of the fire or the investigation of its scene.

So it turns out that the question "Why are there beings at all instead of nothing?" forces us to the prior question: "*How does it stand with Being?*"

We are now asking about something that we hardly grasp, something that is now no more than the sound of a word for us and that puts us in danger of falling victim to the mere idolization of words in our further questioning. So it is all the more necessary for us to get clear from the outset about how it stands for us at present with Being and with our understanding of Being. Here it is important above all to impress on our experience again and again the fact that we are not able to lay hold of the *Being* of beings directly and expressly, neither by way of beings, nor in beings—nor anywhere else at all.

A few examples should help. Over there, on the other side of the street, stands the high school building. A being. We can scour every side of the building from the outside, roam through the inside from basement to attic, and note everything that can be found there: hallways, stairs, classrooms, and their furnishings. Everywhere we find beings, and in a very definite order. Where now is the Being of this high school? It *is*, after all. The building *is*. The Being of this being belongs to it if anything does, and nevertheless we do not find this Being within the being.

Moreover, Being does not consist in our observing beings. The building stands there even if we do not observe it. We can come across it only because it already is. In addition, the Being of this building does not at all seem to be identical for everybody. For us, as observers or passers-by, it is not what it is for the students who sit inside, not just because they see it only from the inside but because for them this building really is what it is and how it is. One can, as it were, smell the Being of such buildings, and often

after decades one still has the scent in one's nose. The scent provides the Being of this being much more directly and truly than it could be communicated by any description or inspection. On the other hand, the subsistence of the building does not depend on this scent that is hovering around somewhere.

How does it stand with Being? Can we see Being? We see beings—the chalk here. But do we see Being as we see color and light and dark? Or do we hear, smell, taste, or touch Being? We hear the motorcycle roaring along the street. We hear the grouse flying off through the mountain forest in its gliding flight. Yet really we are only hearing the noise of the motor's rattling, the noise that the grouse causes. Furthermore, it is hard and unusual for us to describe the pure noise, because it is precisely not what we generally hear. We always hear more [than the mere noise]. We hear the flying bird, although strictly speaking we have to say: a grouse is nothing we can hear, it is not a tone that could be registered on a scale. And so it is with the other senses. We touch velvet, silk; we see them without further ado as such and such a being, and the one is in being distinctly from the other. Where does Being lie and in what does it consist?

Yet we must look around us still more thoroughly and contemplate the narrower and wider sphere within which we dwell, daily and hourly, knowing and unknowing, a sphere that constantly shifts its boundaries and suddenly is broken through.

A heavy thunderstorm gathering in the mountains "is," or—it makes no difference here—"was" in the night. What does its Being consist in?

A distant mountain range under a vast sky—such a thing "is." What does its Being consist in? When and to whom does it reveal itself? To the hiker who enjoys the landscape, or to the peasant who makes his daily living from it and in it, or to the meteorologist who has to give a weather report? Who among them lays hold of Being? All and none. Or do these people only lay hold of particular aspects of the mountain range under the vast sky, not the mountain range itself as it "is," not what its real Being consists in? Who can lay hold of this? Or is it nonsensical, against the sense of Being in the first place, to ask about what is in itself, behind those aspects? Does Being lie in the aspects?

The portal of an early Romanesque church is a being. How and to whom does Being reveal itself? To the art historian who visits and photographs it on an excursion, or to the abbot who passes through the portal with his monks for a religious celebration, or to the children who play in its shadow on a summer's day? How does it stand with the Being of this being?

A state—it *is*. What does its Being consist in? In the fact that the state police arrest a suspect, or that in a ministry of the Reich so and so many typewriters clatter away and record the dictation of state secretaries and ministers? Or "is" the state in the discussion between the Führer and the English foreign minister? The state *is*. But where is Being situated? Is it located anywhere at all?

A painting by Van Gogh: a pair of sturdy peasant shoes, nothing else. The picture really represents nothing. Yet you are alone at once with what *is* there, as if you yourself were heading homeward from the field on a late autumn evening, tired, with your hoe, as the last potato fires smolder out. What is in being here? The canvas? The brushstrokes? The patches of color?

In everything we have mentioned, what is the Being of beings? Really, how is it that we can run around in the world and stand around with our stupid pretensions and our so-called cleverness?

Everything we have mentioned is, after all, and nevertheless—if we want to lay hold of Being it is always as if we were reaching into a void. The Being that we are

asking about is almost like Nothing, and yet we are always trying to arm and guard ourselves against the presumption of saying that all beings are *not*.

But Being remains undiscoverable, almost like Nothing, or in the end *entirely* so. The word "Being" is then finally just an empty word. It means nothing actual, tangible, real. Its meaning is an unreal vapor. So in the end Nietzsche is entirely right when he calls the "highest concepts" such as Being "the final wisp of evaporating reality" (*Twilight of the Idols* VIII, 78). Who would want to chase after such a vapor, the term for which is just the name for a huge error! "In fact, nothing up to now has been more naively persuasive than the error of Being . . ." (VIII, 80).

"Being"—a vapor and an error? What Nietzsche says here about Being is no casual remark, jotted down during the frenzy of labor in preparation for his authentic and never completed work. Instead, it is his guiding conception of Being since the earliest days of his philosophical labor. It supports and determines his philosophy from the ground up. But this philosophy remains, even now, well guarded against all the clumsy and trifling importunities of the horde of scribblers that is becoming ever more numerous around him today. It seems that his work hardly has the worst of this misuse behind it. In speaking of Nietzsche here, we want nothing to do with all this—nor with a blind hero worship. The task is much too decisive and, at the same time, too sober for such worship. It consists first and foremost in fully unfolding that which was realized through Nietzsche by means of a truly engaged attack on him. Being—a vapor, an error! If this is so, then the only possible conclusion is that we should also give up the question, "Why are there beings as such and as a whole instead of nothing?" For what is the point of the question anymore, if what it puts into question is just a vapor and an error?

Does Nietzsche speak the truth? Or is he himself only the final victim of a long-standing errancy and neglect, but *as* this victim the unrecognized witness to a new necessity?

Is it Being's fault that Being is so confused, and is it the fault of the word that it remains so empty, or is it our fault, because in all our bustling and chasing after beings, we have nevertheless fallen out of Being? What if the fault is not our own, we of today, nor that of our immediate or most distant forebears, but rather is based in a happening that runs through Western history from the inception onward, a happening that the eyes of all historians will never reach, but which nevertheless happens—formerly, today, and in the future? What if it were possible that human beings, that peoples in their greatest machinations and exploits, have a relation to beings but have long since fallen out of Being, without knowing it, and what if this were the innermost and most powerful ground of their decline? [Cf. *Being and Time*, §38, especially pp. 179f.]

These are not questions that we pose here casually, nor do we pose them on account of some predisposition or worldview. Instead, they are questions to which we are forced by that prior question, which springs necessarily from the main question: "How does it stand with Being?"—a sober question perhaps, but certainly a very useless question, too. And yet a *question, the question*: "Is 'Being' a mere word and its meaning a vapor, or is it the spiritual fate of the West?"

This Europe, in its unholy blindness always on the point of cutting its own throat, lies today in the great pincers between Russia on the one side and America on the other. Russia and America, seen metaphysically, are both the same: the same hopeless frenzy of unchained technology and of the rootless organization of the average man. When the farthest corner of the globe has been conquered technologically and can be exploited economically; when any incident you like, in any place you like, at any time you like, becomes accessible as fast as you like; when you can simultaneously "experience" an

assassination attempt against a king in France and a symphony concert in Tokyo; when time is nothing but speed, instantaneity, and simultaneity, and time as history has vanished from all Dasein of all peoples; when a boxer counts as the great man of a people; when the tallies of millions at mass meetings are a triumph; then, yes then, there still looms like a specter over all this uproar the question: what for?—where to?—and what then?

The spiritual decline of the earth has progressed so far that peoples are in danger of losing their last spiritual strength, the strength that makes it possible even to see the decline [which is meant in relation to the fate of “Being”] and to appraise it as such. This simple observation has nothing to do with cultural pessimism—nor with any optimism either, of course; for the darkening of the world, the flight of the gods, the destruction of the earth, the reduction of human beings to a mass, the hatred and mistrust of everything creative and free has already reached such proportions throughout the whole earth that such childish categories as pessimism and optimism have long become laughable.

We lie in the pincers. Our people, as standing in the center, suffers the most intense pressure—our people, the people richest in neighbors and hence the most endangered people, and for all that, the metaphysical people. We are sure of this vocation; but this people will gain a fate from its vocation only when it creates *in itself* a resonance, a possibility of resonance for this vocation, and grasps its tradition creatively. All this implies that this people, as a historical people, must transpose itself—and with it the history of the West—from the center of their future happening into the originary realm of the powers of Being. Precisely if the great decision regarding Europe is not to go down the path of annihilation—precisely then can this decision come about only through the development of new, historically *spiritual* forces from the center.

To ask: how does it stand with Being?—this means nothing less than to repeat and retrieve <*wiederholen*> the inception of our historical-spiritual Dasein, in order to transform it into the other inception. Such a thing is possible. It is in fact the definitive form of history, because it has its onset in a happening that grounds history. But an inception is not repeated when one shrinks back to it as something that once was, something that by now is familiar and is simply to be imitated, but rather when the inception is begun again *more originally*, and with all the strangeness, darkness, insecurity that a genuine inception brings with it. Repetition as we understand it is anything but the ameliorating continuation of what has been, by means of what has been.

The question “How does it stand with Being?” is included as a prior question in our guiding question: “Why are there beings at all instead of nothing?” If we now set out to pursue what stands in question in the prior question, namely Being, then Nietzsche’s saying at once proves to be completely true after all. For if we look closely, what more is “Being” to us than a mere locution, an indeterminate meaning, intangible as a vapor? Nietzsche’s judgment, of course, is meant in a purely dismissive sense. For him, “Being” is a deception that never should have happened. “Being”—indeterminate evanescent as a vapor? It is in fact so. But we don’t want to evade this fact. To the contrary, we must try to get clear about its factuality in order to survey its fall scope.

Through our questioning, we are entering a landscape; to be in this landscape is the fundamental prerequisite for restoring rootedness to historical Dasein. We will have to ask why this fact, the fact that “Being” remains a vaporous word for us, stands out precisely today; we will have to ask whether and why it has persisted for a long time. We should learn to know that this fact is not as innocuous as it seems at first sight. For

ultimately what matters is not that the word "Being" remains just a noise for us and its meaning just a vapor, but that we have fallen out of what this word is saying, and for now cannot find our way back; it is on *these* grounds and on no others that the word "Being" no longer applies to anything, that everything, if we merely want to take hold of it, dissolves like a shred of cloud in the sun. Because this is so, we ask about Being. And we ask because we know that truths have never yet fallen into a peoples lap. The fact that even now one still cannot understand this question, and does not want to understand it, even if it is asked in a still *more* originary way, takes from this question none of its inevitability.

Of course, one can show oneself to be very clever and superior, and once again trot out the well-known reflection: "Being" is simply the most universal concept. Its range extends to any and every thing, even to Nothing, which, as something thought and said, "is" also something. So there is, in the strict sense of the word, nothing above and beyond the range of this most universal concept "Being" in terms of which it could be further defined. One must be satisfied with this highest generality. The concept of Being is an ultimate. And it also corresponds to a law of logic that says: the more comprehensive a concept is in its scope—and what could be more comprehensive than the concept "Being"?—the more indeterminate and empty is its content.

For every normally thinking human being—and we all want to be normal—such trains of thought are immediately and entirely convincing. But now the question is whether the assessment of Being as the most universal concept reaches the essence of Being, or whether it so misinterprets Being from the start that questioning becomes hopeless. The question is whether Being can count only as the most universal concept that unavoidably presents itself in all particular concepts or whether Being has a completely different essence, and thus is anything but the object of an "ontology," if one takes this word in its established meaning.

The term "ontology" was first coined in the seventeenth century. It designates the development of the traditional doctrine of beings into a philosophical discipline and a branch of the philosophical system. But the traditional doctrine is the academic analysis and ordering of what for Plato and Aristotle, and again for Kant, was a question, though to be sure a question that was no longer originary. The word "ontology" is still used this way even today. Under this tide, philosophy busies itself with the composition and exposition of a branch within its system. But one can also take the word "ontology" "in the broadest sense," "without reference to ontological directions and tendencies" (cf. *Being and Time*, 1927, p. 11 top). In this case "ontology" means the effort to put Being into words, and to do so by passing through the question of how it stands with Being [not just with beings as such]. But because until now this question has found neither an accord nor even a resonance, but instead it is explicitly rejected by the various circles of academic philosophical scholarship, which pursues an "ontology" in the traditional sense, it may be good in the future to forgo the use of the terms "ontology" and "ontological." Two modes of questioning which, as is only now becoming clearer, are worlds apart should not bear the same name.

We *ask* the question—How does it stand with Being? What is the meaning of Being?—*not* in order to compose an ontology in the traditional style, much less to reckon up critically the mistakes of earlier attempts at ontology. We are concerned with something completely different. The point is to restore the historical Dasein of human beings—and this also always means our own most future Dasein, in the whole of the history that is allotted to us—back to the power of Being that is to be opened up originally; all this, to be sure, only within the limits of philosophy's capability.

From the fundamental question of metaphysics, “Why are there beings at all instead of nothing?” we have extracted the *prior question* <Vorfrage>: How does it stand with Being? The relation between these questions needs to be elucidated, for it is in a class of its own. Usually, a preliminary question <Vorfrage> is settled in advance and outside the main question, although with a view to it. But philosophical questions are in principle never settled as if some day one could set them aside. Here the preliminary question does not stand outside the fundamental question at all but is, as it were, the hearth-fire that glows in the asking of the fundamental question, the hearth at the heart of all questioning. That is to say: when we first ask the fundamental question, everything depends on our taking up the decisive fundamental position in asking its *prior question*, and winning and securing the bearing that is essential here. This is why we brought the question about Being into connection with the fate of Europe, where the fate of the earth is being decided, while for Europe itself our historical Dasein proves to be the center.

The question ran:

Is Being a mere word and its meaning a vapor, or does what is named with the word “Being” hold within it the spiritual fate of the West?

To many ears the question may sound forced and exaggerated. For if pressed, one could indeed imagine that discussing the question of Being might ultimately, at a very great remove and in a very indirect manner, have some relation to the decisive historical question of the earth, but by no means in such a way that from out of the history of the earth’s spirit, the fundamental position and bearing of our questioning could directly be determined. And yet there is such a connection. Because our aim is to get the asking of the prior question going, we now must show how, and to what extent, the asking of this prior question moves directly, and from the ground up, along with the decisive historical question. To demonstrate this, it is necessary at first to anticipate an essential insight in the form of an assertion.

We assert that the asking of this prior question, and thereby the asking of the fundamental question of metaphysics, is a historical questioning through and through. But does not metaphysics, and philosophy in general, thereby become a historical science? After all, historical science investigates the temporal, while philosophy, in contrast, investigates the supratemporal. Philosophy is historical only insofar as it, like every work of the spirit, realizes itself in the course of time. But in this sense, the designation of metaphysical questioning as historical cannot characterize metaphysics but can only propose something obvious. Thus either the assertion says nothing and is superfluous, or it is impossible, because it mixes up fundamentally different kinds of science: philosophy and the science of history.

In reply to this it must be said:

1. Metaphysics and philosophy are not science at all, and furthermore, the fact that their questioning is at bottom historical cannot make them so.

2. For its part, the science of history does not at all determine, as science, the originary relation to history; instead, it always already presupposes such a relation. This is why the science of history can either deform the relation to history—a relation that is itself always historical—misinterpret it and reduce it to mere antiquarian expertise, or else prepare essential domains of vision for the already grounded relation to history and let history be experienced in its bindingness. A historical relation of our historical Dasein to history can become an object of knowledge and a developed state of knowledge; but it need not. Besides, not all relations to history can be scientifically objectified and become scientific, and in fact it is precisely the essential relations that cannot. The

science of history can never institute the historical relation to history. It can only illuminate a relation once it is instituted, ground it informatively, which to be sure is an essential necessity for the historical Dasein of a knowing people, and thus neither merely an “advantage” nor a “disadvantage.”* It is only in philosophy—in *distinction from every science*—that essential relations to beings always take shape; and therefore this relation can, indeed must, be an originally historical one for us today.

But in order to understand our assertion that the “metaphysical” asking of the prior question is historical through and through, one must consider one thing above all: in this assertion, history is not equivalent to what is past; for this is precisely what is no longer happening.** But much less is history what is merely contemporary, which also never happens, but always just “passes” makes its entrance and goes by. History as happening is determined from the future, takes over what has been, and acts and endures its way through the *present*. It is precisely the present that vanishes in the happening.

Our asking of the fundamental metaphysical question is historical because it opens up the happening of human Dasein in its essential relations—that is, its relations to beings as such and as a whole—opens it up to possibilities not yet asked about, futures to come <Zukünften>, and thereby also binds it back to its inception that has been, and thus sharpens and burdens it in its present. In this questioning, our Dasein is summoned to its history in the full sense of the word and is called to make a decision in it—and this is not a derivative, useful application of this questioning in terms of morality and worldviews. Instead, the fundamental position and bearing of the questioning is in itself historical, stands and holds itself in the happening, and questions on the ground of this happening and for this happening.

But we still lack the essential insight into how far this asking of the question of Being, an asking which is in itself historical, intrinsically belongs to the world history of the earth. We said: on the earth, all over it, a darkening of the world is happening. The essential happenings in this darkening are: the flight of the gods, the destruction of the earth, the reduction of human beings to a mass, the preeminence of the mediocre.

What does “world” mean, when we speak of the darkening of the world? World is always *spiritual* world. The animal has no world <Welt>, nor any environment <Umwelt>. The darkening of the world contains within itself a *disempowering of the spirit*, its dissolution, diminution, suppression, and misinterpretation. We will try to elucidate this disempowering of the spirit in one respect, namely, the misinterpretation of the spirit. We said: Europe lies in the pincers between Russia and America, which are metaphysically the same, namely in regard to their world-character and their relation to the spirit. The situation of Europe is all the more dire because the disempowering of the spirit comes from Europe itself and—though prepared by earlier factors—is determined at last by its own spiritual situation in the first half of the nineteenth century. Among us at that time something happened that is all too readily and swiftly characterized as the “collapse of German idealism.” This formula is like a shield behind which the already dawning spiritlessness, the dissolution of spiritual powers, the deflection of all originary questioning about grounds and the bonding to such grounds, are hidden and obscured. For it was not German idealism that collapsed, but it was the age that was no

*[With the terms “antiquarian,” “advantage,” and “disadvantage” Heidegger alludes to Nietzsche’s “On the Advantage and Disadvantage of History for Life.” Cf. *Being and Time*, §76. In the winter semester of 1938–1939 Heidegger gave a lecture course on this essay by Nietzsche.]

**[Throughout this passage and elsewhere, Heidegger plays on *Geschichte* and *geschehen* (“history” and “happen”).]

longer strong enough to stand up to the greatness, breadth, and originality of that spiritual world—that is, truly to realize it, which always means something other than merely applying propositions and insights. Dasein began to slide into a world that lacked that depth from which the essential always comes and returns to human beings, thereby forcing them to superiority and allowing them to act on the basis of rank. AD things sank to the same level, to a surface resembling a blind mirror that no longer mirrors, that casts nothing back. The prevailing dimension became that of extension and number. *To be able*—this no longer means to spend and to lavish, thanks to lofty overabundance and the mastery of energies; instead, it means only practicing a routine in which anyone can be trained, always combined with a certain amount of sweat and display. In America and Russia, then, this all intensified until it turned into the measureless so-on-and-so-forth of the ever-identical and the indifferent, until finally this quantitative temper became a quality of its own. By now in those countries the predominance of a cross-section of the indifferent is no longer something inconsequential and merely barren but is the onslaught of that which aggressively destroys all rank and all that is world spiritual, and portrays these as a lie. This is the onslaught of what we call the demonic [in the sense of the destructively evil]. There are many omens of the arising of this demonism, in unison with the growing perplexity and uncertainty of Europe against it and within itself. One such omen is the disempowering of the spirit in the sense of its misinterpretation—a happening in the middle of which we still stand today. Let us briefly describe four aspects of this misinterpretation of the spirit.

1. One decisive aspect is the reinterpretation of the spirit as *intelligence*, and this as mere astuteness in the examination, calculation and observation of given things, their possible modification, and their additional elaboration. This astuteness is a matter of mere talent and practice and mass distribution. This astuteness is itself subject to the possibility of organization, none of which ever applies to the spirit. The whole phenomenon of literati and aesthetes is just a late consequence and mutation of the spirit falsified as intelligence. *Mere* ingenuity is the semblance of spirit and veils its absence.

2. Spirit, thus falsified as intelligence, is thereby reduced to the role of a tool in the service of something else, a tool whose handling can be taught and learned. Whether this service of intelligence now relates to the regulation and mastery of the material relations of production (as in Marxism) or in general to the clever ordering and clarification of everything that lies before us and is already posited (as in positivism), or whether it fulfills itself in organizing and directing the vital resources and race of a people—be this as it may, the spirit as intelligence becomes the powerless superstructure to something else, which, because it is spiritless or even hostile to spirit, counts as authentic reality. If one understands spirit as intelligence, as Marxism in its most extreme form has done, then it is completely correct to say in response that the spirit—that is, intelligence, in the ordering of the effective energies of human Dasein—must always be subordinated to healthy bodily fitness and to character. But this ordering becomes untrue as soon as one grasps the essence of spirit in its truth. For all true energy and beauty of the body, all sureness and boldness of the sword, but also all genuineness and ingenuity of the understanding, are grounded in the spirit, and they rise or fall only according to the current power or powerlessness of the spirit. Spirit is what sustains and rules, the first and the last, not a merely indispensable third element.

3. As soon as this instrumental misinterpretation of the spirit sets in, the powers of spiritual happening—poetry and fine arts, statescraft and religion—shift to a sphere where they can be *consciously* cultivated and planned. At the same time, they get

divided up into regions. The spiritual world becomes culture, and in the creation and conservation of culture the individual seeks to fulfill himself. These regions become fields of a free endeavor that sets its own standards for itself, according to the meaning of “standards” that it can still attain. These standards of validity for production and use are called values. Cultural values secure meaning for themselves in the whole of a culture only by restricting themselves to their self-validity: poetry for poetry’s sake, art for art’s sake, science for science’s sake.

In respect to science, which concerns us especially here in the university, the situation of the last few decades, a situation which remains unchanged today despite some cleansing, is easy to see. Although two seemingly different conceptions of science are now seemingly struggling against each other—science as technical and practical professional knowledge and science as a cultural value in itself—nevertheless *both* are moving along *the same* decadent path of a misinterpretation and disempowering of the spirit. They are distinct only in that the technical and practical conception of science as specialized science may still lay claim to the merit of open and clear consistency within today’s situation, whereas the reactionary interpretation of science as a cultural value, which is now again appearing, tries to hide the powerlessness of the spirit through an unconscious mendacity. The confusion of spiritlessness can even go so far that the practical, technical explanation of science confesses itself at the same time to be science as cultural value, so that both understand each other very well in the same dearth of spirit. One may wish to call the arrangement of the amalgam of the specialized sciences for purposes of teaching and research a university, but this is now just a name and no longer an originally unifying spiritual power that imposes duties. What I said here in my inaugural address in 1929 about the German university still applies today: “The regions of science have far asunder. Their ways of handling their subject matters are fundamentally different. This disintegrated multiplicity of disciplines is still meaningfully maintained today only through the technical organization of universities and faculties and through the practical aims of the disciplines. Yet the rootedness of the sciences in their essential ground has atrophied” (*What Is Metaphysics*, 1929, p. 8). In all its areas, science today is a technical, practical matter of gaining information and communicating it. No awakening of the spirit at all can proceed from it as science. Science itself needs such an awakening.

4. The last misinterpretation of the spirit rests on the formerly mentioned falsifications that represent the spirit as intelligence, this intelligence as a tool serviceable for goals, and this tool, together with what can be produced, as the realm of culture. The spirit as intelligence in the service of goals and the spirit as culture finally become showpieces and spectacles that one takes into account along with many others, that one publicly trots out and exhibits as proof that one does *not* want to deny culture in favor of barbarism. Russian Communism, after an initially purely negative attitude, went directly over to such propagandistic tactics.

Against these multiple misinterpretations of the spirit, we determine the essence of the spirit briefly in this way (I choose the formulation from my *Rectoral Address*, because there everything is succinctly brought together in accordance with the occasion): “Spirit is neither empty acuity, nor the noncommittal play of wit, nor the understanding’s boundless pursuit of analysis, nor even world reason, but rather spirit is originally attuned, knowing resolution to the essence of Being” (*Rectoral Address*, p. 13). Spirit is the empowering of the powers of beings as such and as a whole. Where spirit rules, beings as such always and in each case come more into being <wird . . . seinder>. Asking about beings as such and as a whole, asking the

question of Being, is then one of the essential fundamental conditions for awakening the spirit, and thus for an originary world of historical Dasein, and thus for subduing the danger of the darkening of the world, and thus for taking over the historical mission of our people, the people of the center of the West. Only in these broad strokes can we make plain here to what extent asking the question of Being is in itself historical through and through, and that accordingly our question, whether Being is to remain a mere vapor for us or whether it is to become the fate of the West, is anything but an exaggeration and a figure of speech.

But if our question about Being has this essential character of decision, then we must above all proceed in full seriousness with the *fact* that gives the question its immediate necessity: the fact that Being is in fact almost nothing more than a word now, and its meaning is an evanescent vapor. We do not just stand before this fact as something alien and other, which we may simply ascertain as an occurrence in its Being-present-at-hand. The fact is such that we stand within it. It is a state of our Dasein, though certainly not in the sense of a property that we could simply exhibit psychologically, "State" here means our whole constitution, the way in which we ourselves are constituted in relation to Being. This is not a matter of psychology; instead, it concerns our history in an essential respect. If we call it a "fact" that Being for us is a mere word and a vapor, this is a very provisional formulation. With it, we are for once simply establishing and coming to grips with something that has still not been thought through at all, something that we still have no place for, even if it seems as if it were an occurrence among us, we human beings, "in" us, as one likes to say.

One would like to treat the particular fact that Being for us is now just an empty word and an evanescent vapor as a case of the more general fact that many words—indeed, the essential words—are in the same situation, that language in general is used up and abused, that language is an indispensable but masterless, arbitrarily applicable means of communication, as indifferent as a means of public transportation, such as a streetcar, which everyone gets on and off. Thus everyone talks and writes unhindered and above all *unendangered* in language. That is certainly correct. Moreover, only a very few are still in a position to think through in its full scope this misrelation and unrelation of today's Dasein to language.

But the emptiness of the word "Being," the complete withering of its naming force, is not just a particular case of the general abuse of language—instead, the destroyed relation to Being as such is the real ground for our whole misrelation to language.

The organizations for the purification of language and for defense against its progressive mutilation deserve respect. Nevertheless, through such institutions one finally demonstrates only more clearly that one no longer knows what language is all about. Because the fate of language is grounded in the particular *relation* of a people to *Being*, the question about *Being* will be most intimately intertwined with the question about *language* for us. It is more than a superficial accident that now, as we make a start in laying out the above mentioned fact of the vaporization of Being in all its scope, we find ourselves forced to proceed from linguistic considerations.

LUDWIG WITTGENSTEIN

1889–1951

Ludwig Wittgenstein was born into one of Vienna's leading families. His father, Karl, was a wealthy steel industrialist and his mother, Leopoldine, a concert pianist. Johannes Brahms, Gustaf Mahler, and Pablo Casals were frequent house-guests of the Wittgensteins. Educated at home by tutors, Wittgenstein showed great promise in mathematics and engineering. According to one report, he built a working sewing machine from matchsticks at age 10.

Wittgenstein remained home until age 15, when he enrolled at the *Linz Realschule*, where he studied engineering for two years before transferring to Berlin. In 1908, Wittgenstein enrolled at the University of Manchester, England, for studies in aerodynamics. While designing a propeller, Wittgenstein developed an interest in mathematics, which led him to Cambridge. There, from 1912 to 1913, he studied with Bertrand Russell. Russell later recalled one of his first encounters with Wittgenstein:

At the end of his first term at Cambridge he came to me and said, "Will you please tell me whether I am a complete idiot or not?" I replied, "My dear fellow, I don't know. Why are you asking me?" He said, "Because if I am a complete idiot, I shall become an aeronaut; but, if not, I shall become a philosopher." I told him to write me something during the vacation on some philosophical subject and I would then tell him whether he was a complete idiot or not. At the beginning of the following term he brought me the fulfillment of this suggestion. After reading only one sentence, I said to him, "No, you must not become an aeronaut."*

*Bertrand Russell, *Portraits from Memory* (London: George Allen & Unwin, 1957), pp. 26–27.

Wittgenstein immersed himself in philosophical studies, filling notebooks with ideas. When World War I began in 1914, he enlisted as a machine-gunner in the Austrian army. While in the army, he continued his philosophical work, writing a short treatise in 1918 based on his notebooks. That same year, he was captured by the Italian army. In captivity, he managed to send a copy of this treatise to Russell, who considered it a work of genius and arranged for its publication as the *Tractatus Logico-Philosophicus* (1921). This was the only philosophical book Wittgenstein published during his lifetime.

Wittgenstein believed his *Tractatus* gave the definitive answer to all philosophical problems. Following the war, therefore, he left philosophy completely. After a course at a teacher's training college, he spent the next six years as a schoolteacher in remote Austrian villages. But teaching did not suit his temperament, and he was desperately unhappy. He resigned in 1926 and worked as a monastery gardener before moving back to Vienna to design a house for his sister. While in Vienna, Wittgenstein began talking philosophy again with Moritz Schlick, professor of philosophy at the University of Vienna, and with other professors who admired his *Tractatus*.

Philosophically revived, Wittgenstein returned to Cambridge in 1929, and, after submitting his now famous *Tractatus* as a doctoral dissertation, he became a research fellow of Trinity College. Again, Wittgenstein filled notebooks with philosophical reflections and prepared them for publication. But, with the exception of one paper, Wittgenstein never saw any of his new ideas in print; he always considered his newest thoughts incomplete or not yet adequately formulated.

For the rest of his life, Wittgenstein continued his association with Cambridge—though he never felt completely comfortable with academic life. On several occasions, he left the university, sometimes living in isolation in his hut in Norway. In 1939, he was appointed professor of philosophy at Cambridge, succeeding G.E. Moore. But before he could take the chair, World War II began, and he volunteered as a hospital orderly in London. He returned to Cambridge following the war, but he found his job so dreadful that he resigned after two years. Living alone in Ireland, he completed his second major work, *Philosophical Investigations*, though again he could not bring himself to publish it. (It appeared posthumously in 1953.)

During a visit to the United States in 1949, his health began to deteriorate. On his return to Cambridge, doctors discovered prostate cancer, and he died eighteen months later, in 1951. Since his death, his literary executors have published more than a dozen books of uncompleted manuscripts, notes, lectures, and letters.

* * *

Throughout his adult life, Wittgenstein was interested in philosophy as an activity rather than as a set of theories. He believed that the goal of philosophy is to remove or “dissolve” problems, and the primary means for doing this is analysis of language. According to Wittgenstein, most philosophical problems can be traced to a misuse of language. In one of his early notebooks he wrote:

Philosophy gives no pictures of reality and can neither confirm nor confute scientific investigations. Philosophy teaches us the logical form of propositions: that is its fundamental task.*

*Ludwig Wittgenstein, *Notebooks 1914–1916* (Oxford: John Wiley & Sons, 1981).

Thirty-five years later, he still maintained this philosophical position: “Philosophy is a battle against the bewitchment of our intelligence by means of language.”*

But despite this theme, Wittgenstein developed two different ways to understand language. The early Wittgenstein created a “picture theory of meaning” that held that language consists of statements or propositions that picture the world. Just as a picture has something in common with that which it pictures, so language has a logical form in common with the world it pictures. This logical form is usually obscured by ordinary language, so the philosopher’s job is to clear up ordinary language by crafting a language that more perfectly pictures the world. This perfected language will have to exclude many propositions (such as those in ethics, metaphysics, or religion), consigning them to silence. Our selection from the *Tractatus*, translated by D.F. Pears and B.F. McGuinness, presents this early theory.

Wittgenstein’s early theory was adopted and modified by Moritz Schlick and his “Vienna Circle.” This group developed a philosophy that came to be called “logical positivism.” Like Wittgenstein, they worked on an ideal language, free from the ambiguities of ordinary discourse, that would clearly exhibit its logical form. They also held that such a language would exclude the propositions of ethics, metaphysics, and religion.

The early Wittgenstein, and the logical positivism that adapted many of his ideas, profoundly impacted the philosophy of the mid-twentieth century. But Wittgenstein himself moved to a different understanding of language: a “language game” theory. This theory found the earlier picture theory too narrow; a perfected language is neither possible nor desirable. As he explains in our selection from the *Investigations*, given here in the G.E.M. Anscombe translation, there are many kinds of meaningful sentences that share certain characteristics, but not others. Just as there is no one characteristic common to all games, so there is no one theory to explain all language uses. The proper way to understand a sentence is not to break it down into its constituent parts and analyze its logical form. Instead, we should examine the “forms of life” out of which the sentence arises, to see what “game” it is playing. “The meaning of a word,” Wittgenstein wrote, “is its use in the language.”

The later Wittgenstein was not interested in creating a perfect language. He sought rather to expose the underlying assumptions of language and the forms of life out of which our sentences arise. By understanding language in terms of the social environment that gives it birth, the later Wittgenstein encouraged a socio-logical understanding of language. Accordingly, Wittgenstein argued against the idea of a private language—a language apart from communal interactions.

The influence of Wittgenstein’s early work peaked in the 1950s. But his later understanding of philosophy and his lifelong conception of philosophy as activity are still influential, particularly in the English-speaking world. For example, feminist philosophers have used Wittgenstein’s insights to show how patriarchal language both influences and is influenced by social structures, and theologians have tried to understand the language of sacred texts by exploring their historical contexts. Wittgenstein’s belief that the aim of philosophy is to dissolve problems—“To shew the fly the way out of the fly-bottle”—has continued to impress, or, as critics would say, to depress, philosophy.

*Ludwig Wittgenstein, *Philosophical Investigations* (New York: Macmillan, 1958), no. 109, p. 47.

Among the many general introductions to Wittgenstein's life and thought, Anthony Kenney, *Wittgenstein* (Cambridge, MA: Harvard University Press, 1973) still provides one of the best. Also helpful are George Pitcher, *The Philosophy of Wittgenstein* (Englewood Cliffs, NJ: Prentice Hall, 1964); David Pears, *Ludwig Wittgenstein* (New York: Viking Press, 1970); A.J. Ayer, *Wittgenstein* (Chicago: University of Chicago Press, 1985); P.M.S. Hacker, *Wittgenstein's Place in Twentieth-Century Analytic Philosophy* (Oxford: Basil Blackwell, 1996); P.M.S. Hacker, *Wittgenstein* (London: Routledge, 1999); and Mark Addis, *Wittgenstein: A Guide for the Perplexed* (London: Continuum, 2006). Norman Malcolm, *Ludwig Wittgenstein: A Memoir* (London: Oxford University Press, 1958); K.T. Fann, ed., *Wittgenstein: The Man and His Philosophy* (New York: Delta, 1967); and O.K. Bouwsma, *Wittgenstein: Conversations, 1949–1951* (Indianapolis, IN: Hackett, 1986) all provide personal memoirs, whereas Allan Janik and Stephen Toulmin, *Wittgenstein's Vienna* (New York: Simon & Schuster, 1973) and Ray Monk, *Ludwig Wittgenstein: The Duty of Genius* (New York: Penguin Books, 1992) give biographies. For guides to Wittgenstein's two major works, see G.E.M. Anscombe, *An Introduction to Wittgenstein's "Tractatus"* (London: Hillary House, 1959); H.O. Mounce, *Wittgenstein's "Tractatus"* (Chicago: University of Chicago Press, 1981); Eli Friedlander, *Signs of Sense: Reading Wittgenstein: Tractatus* (Cambridge, MA: Harvard University Press, 2000); Ian Proops, *Logic and Language in Wittgenstein's Tractatus* (New York: Garland, 2000); Alfred Nordmann, *Wittgenstein's Tractatus: An Introduction* (Cambridge: Cambridge University Press, 2005); Roger M. White, *Wittgenstein's Tractatus Logico-Philosophicus: A Reader's Guide* (London: Continuum, 2007); Garth Hallett, *A Companion to Wittgenstein's "Philosophical Investigations"* (Ithaca, NY: Cornell University Press, 1977); Marie McGinn, *Routledge Philosophy Guidebook to Wittgenstein and the Philosophical Investigations* (Oxford: Routledge, 1997); William H. Brenner, *Wittgenstein's Philosophical Investigations* (Albany, NY: SUNY Press, 1999); Andrew Lugg, *Wittgenstein's Investigations 1–132: A Guide and Interpretation* (London: Routledge, 2000); and David G. Stern, *Wittgenstein's Philosophical Investigations: An Introduction* (Cambridge: Cambridge University Press, 2004). Hans-Johann Glock, *A Wittgenstein Dictionary* (Oxford: Basil Blackwell, 1995) provides a useful reference work. Collections of essays include Irving Copi, ed., *Essays on Wittgenstein's "Tractatus"* (New York: Macmillan, 1966); George Pitcher, ed., *Wittgenstein's "Investigations"* (Garden City, NY: Anchor Doubleday, 1966); Peter A. French, Theodore E. Uehling, Jr., and Howard K. Wettstein, eds., *The Wittgenstein Legacy* (Notre Dame, IN: University of Notre Dame Press, 1992); Robert L. Arrington and Johann Glock, eds., *Wittgenstein and Quine* (Oxford: Routledge, 1996); Hans Sluga and David G. Stern, eds., *The Cambridge Companion to Wittgenstein* (Cambridge: Cambridge University Press, 1996); Alice Crary and Rupert Read, eds., *The New Wittgenstein* (London: Routledge, 2000); Robert L. Arrington and Mark Addis, eds., *Wittgenstein and Philosophy of Religion* (London: Routledge, 2001); Naomi Scheman and Peg O'Connor, eds., *Feminist Interpretations of Ludwig Wittgenstein Heidegger* (College Park, PA: Pennsylvania State University Press, 2002); and Meredith Williams, ed., *Wittgenstein's Philosophical Investigations: Critical Essays* (Lanham, MD: Rowman & Littlefield, 2006).

TRACTATUS LOGICO-PHILOSOPHICUS (in part)

PREFACE

Perhaps this book will be understood only by someone who has himself already had the thoughts that are expressed in it—or at least similar thoughts.—So it is not a textbook.—Its purpose would be achieved if it gave pleasure to one person who read and understood it.

The book deals with the problems of philosophy, and shows, I believe, that the reason why these problems are posed is that the logic of our language is misunderstood. The whole sense of the book might be summed up in the following words: what can be said at all can be said clearly, and what we cannot talk about we must consign to silence.

Thus the aim of the book is to set a limit to thought, or rather—not to thought, but to the expression of thoughts: for in order to be able to set a limit to thought, we should have to find both sides of the limit thinkable (i.e. we should have to be able to think what cannot be thought).

It will therefore only be in language that the limit can be set, and what lies on the other side of the limit will simply be nonsense.

I do not wish to judge how far my efforts coincide with those of other philosophers. Indeed, what I have written here makes no claim to novelty in detail, and the reason why I give no sources is that it is a matter of indifference to me whether the thoughts that I have had have been anticipated by someone else.

I will only mention that I am indebted to Frege's great works and to the writings of my friend Mr. Bertrand Russell for much of the stimulation of my thoughts.

If this work has any value, it consists in two things: the first is that thoughts are expressed in it, and on this score the better the thoughts are expressed—the more the nail has been hit on the head—the greater will be its value.—Here I am conscious of having fallen a long way short of what is possible. Simply because my powers are too slight for the accomplishment of the task.—May others come and do it better.

On the other hand the *truth* of the thoughts that are here set forth seems to me unassailable and definitive. I therefore believe myself to have found, on all essential points, the final solution of the problems. And if I am not mistaken in this belief, then the second thing in which the value of this work consists is that it shows how little is achieved when these problems are solved.

TRACTATUS LOGICO-PHILOSOPHICUS

- 1* The world is all that is the case.
- 1.1 The world is the totality of facts, not of things.

*[The decimal numbers assigned to the individual propositions indicate the logical importance of the propositions, the stress laid on them in my exposition. The propositions *n.1*, *n.2*, *n.3*, etc. are comments on proposition no. *n*; the propositions *n.m1*, *n.m2*, etc. are comments on proposition no. *n.m*; and so on.]

Ludwig Wittgenstein, *Tractatus Logico-Philosophicus*, Translated by D.F. Pears and B.F. McGuinness (London: Routledge & Kegan Paul PLC, 1972). Reprinted by permission of Routledge & Kegan Paul.

- 1.11 The world is determined by the facts, and by their being *all* the facts.
- 1.12 For the totality of facts determines what is the case, and also whatever is not the case.
- 1.13 The facts in logical space are the world.
- 1.2 The world divides into facts.
- 1.21 Each item can be the case or not the case while everything else remains the same.
- 2 What is the case—a fact—is the existence of states of affairs.
- 2.01 A state of affairs (a state of things) is a combination of objects (things).
- 2.011 It is essential to things that they should be possible constituents of states of affairs.
- 2.012 In logic nothing is accidental: if a thing *can* occur in a state of affairs, the possibility of the state of affairs must be written into the thing itself.
- 2.0121 It would seem to be a sort of accident, if it turned out that a situation would fit a thing that could already exist entirely on its own.
If things can occur in states of affairs, this possibility must be in them from the beginning.
(Nothing in the province of logic can be merely possible. Logic deals with every possibility and all possibilities are its facts.)
Just as we are quite unable to imagine spatial objects outside space or temporal objects outside time, so too there is *no* object that we can imagine excluded from the possibility of combining with others.
If I can imagine objects combined in states of affairs, I cannot imagine them excluded from the *possibility* of such combinations.
- 2.0122 Things are independent in so far as they can occur in all *possible* situations, but this form of independence is a form of connexion with states of affairs, a form of dependence. (It is impossible for words to appear in two different roles: by themselves, and in propositions.)
- 2.0123 If I know an object I also know all its possible occurrences in states of affairs. (Every one of these possibilities must be part of the nature of the object.)
A new possibility cannot be discovered later.
- 2.01231 If I am to know an object, though I need not know its external properties, I must know all its internal properties.
- 2.0124 If all objects are given, then at the same time all *possible* states of affairs are also given.
- 2.013 Each thing is, as it were, in a space of possible states of affairs. This space I can imagine empty, but I cannot imagine the thing without the space.
- 2.0131 A spatial object must be situated in infinite space. (A spatial point is an argument-place.)
A speck in the visual field, though it need not be red, must have some colour: it is, so to speak, surrounded by colour-space. Tones must have some pitch, objects of the sense of touch *some* degree of hardness, and so on.
- 2.014 Objects contain the possibility of all situations.
- 2.0141 The possibility of its occurring in states of affairs is the form of an object.
- 2.02 Objects are simple.
- 2.0201 Every statement about complexes can be resolved into a statement about their constituents and into the propositions that describe the complexes completely.
- 2.021 Objects make up the substance of the world. That is why they cannot be composite.

- 2.0211 If the world had no substance, then whether a proposition had sense would depend on whether another proposition was true.
- 2.0212 In that case we could not sketch out any picture of the world (true or false).
- 2.022 It is obvious that an imagined world, however different it may be from the real one, must have *something*—a form—in common with it.
- 2.023 Objects are just what constitute this unalterable form.
- 2.0231 The substance of the world *can* only determine a form, and not any material properties. For it is only by means of propositions that material properties are represented—only by the configuration of objects that they are produced.
- 2.0232 In a manner of speaking, objects are colourless.
- 2.0233 If two objects have the same logical form, the only distinction between them, apart from their external properties, is that they are different.
- 2.02331 Either a thing has properties that nothing else has, in which case we can immediately use a description to distinguish it from the others and refer to it; or, on the other hand, there are several things that have the whole set of their properties in common, in which case it is quite impossible to indicate one of them.
- For if there is nothing to distinguish a thing, I cannot distinguish it, since if I do it will be distinguished after all.
- 2.024 Substance is what subsists independently of what is the case.
- 2.025 It is form and content.
- 2.0251 Space, time, and colour (being coloured) are forms of objects.
- 2.026 There must be objects, if the world is to have an unalterable form.
- 2.027 Objects, the unalterable, and the subsistent are one and the same.
- 2.0271 Objects are what is unalterable and subsistent; their configuration is what is changing and unstable.
- 2.0272 The configuration of objects produces states of affairs.
- 2.03 In a state of affairs objects fit into one another like the links of a chain.
- 2.031 In a state of affairs objects stand in a determinate relation to one another.
- 2.032 The determinate way in which objects are connected in a state of affairs is the structure of the state of affairs.
- 2.033 Its form is the possibility of its structure.
- 2.034 The structure of a fact consists of the structures of states of affairs.
- 2.04 The totality of existing states of affairs is the world.
- 2.05 The totality of existing states of affairs also determines which states of affairs do not exist.
- 2.06 The existence and non-existence of states of affairs is reality.
(We also call the existence of states of affairs a positive fact, and their non-existence a negative fact.)
- 2.061 States of affairs are independent of one another.
- 2.062 From the existence or non-existence of one state of affairs it is impossible to infer the existence or non-existence of another.
- 2.063 The sum-total of reality is the world.
- 2.1 We picture facts to ourselves.
- 2.11 A picture presents a situation in logical space, the existence and non-existence of states of affairs.
- 2.12 A picture is a model of reality.
- 2.13 In a picture objects have the elements of the picture corresponding to them.
- 2.131 In a picture the elements of the picture are the representatives of objects.

Composition in Yellow, Red, Blue and Black, 1921, by Piet Mondrian (1872–1944). The painter/draftsman Mondrian constructed nonobjective paintings with mathematical precision. The clarity of form and structure, together with the lack of any ornamentation, provides a visual metaphor for the precision and austerity of Wittgenstein's *Tractatus*. (Giraudon/Art Resource, NY)

- 2.14 What constitutes a picture is that its elements are related to one another in a determinate way.
- 2.141 A picture is a fact.
- 2.15 The fact that the elements of a picture are related to one another in a determinate way represents that things are related to one another in the same way.
- Let us call this connexion of its elements the structure of the picture, and let us call the possibility of this structure the pictorial form of the picture.
- 2.151 Pictorial form is the possibility that things are related to one another in the same way as the elements of the picture.
- 2.1511 *That* is how a picture is attached to reality; it reaches right out to it.
- 2.1512 It is laid against reality like a ruler.
- 2.15121 Only the end-points of the graduating lines actually *touch* the object that is to be measured.
- 2.1513 So a picture, conceived in this way, also includes the pictorial relationship, which makes it into a picture.
- 2.1514 The pictorial relationship consists of the correlations of the picture's elements with things.
- 2.1515 These correlations are, as it were, the feelers of the picture's elements, with which the picture touches reality.
- 2.16 If a fact is to be a picture, it must have something in common with what it depicts.
- 2.161 There must be something identical in a picture and what it depicts, to enable the one to be a picture of the other at all.
- 2.17 What a picture must have in common with reality, in order to be able to depict it—correctly or incorrectly—in the way it does, is its pictorial form.
- 2.171 A picture can depict any reality whose form it has.
- A spatial picture can depict anything spatial, a coloured one anything coloured, etc.
- 2.172 A picture cannot, however, depict its pictorial form: it displays it.
- 2.173 A picture represents its subject from a position outside it. (Its standpoint is its representational form.) That is why a picture represents its subject correctly or incorrectly.
- 2.174 A picture cannot, however, place itself outside its representational form.
- 2.18 What any picture, of whatever form, must have in common with reality, in order to be able to depict it—correctly or incorrectly—in any way at all, is logical form, i.e. the form of reality.
- 2.181 A picture whose pictorial form is logical form is called a logical picture.
- 2.182 Every picture is *at the same time* a logical one. (On the other hand, not every picture is, for example, a spatial one.)
- 2.19 Logical pictures can depict the world.
- 2.2 A picture has logico-pictorial form in common with what it depicts.
- 2.201 A picture depicts reality by representing a possibility of existence and non-existence of states of affairs.
- 2.202 A picture represents a possible situation in logical space.
- 2.203 A picture contains the possibility of the situation that it represents.
- 2.21 A picture agrees with reality or fails to agree; it is correct or incorrect, true or false.

- 2.22 What a picture represents it represents independently of its truth or falsity, by means of its pictorial form.
- 2.221 What a picture represents is its sense.
- 2.222 The agreement or disagreement of its sense with reality constitutes its truth or falsity.
- 2.223 In order to tell whether a picture is true or false we must compare it with reality.
- 2.224 It is impossible to tell from the picture alone whether it is true or false.
- 2.225 There are no pictures that are true *a priori*.
- 3 A logical picture of facts is a thought.
- 3.001 “A state of affairs is thinkable”—this means that we can picture it to ourselves.
- 3.01 The totality of true thoughts is a picture of the world.
- 3.02 A thought contains the possibility of the situation of which it is the thought. What is thinkable is possible too.
- 3.03 Thought can never be of anything illogical, since, if it were, we should have to think illogically.
- 3.031 It used to be said that God could create anything except what would be contrary to the laws of logic.—The reason being that we could not say what an “illogical” world would look like.
- 3.032 It is as impossible to represent in language anything that “contradicts logic” as it is in geometry to represent by its co-ordinates a figure that contradicts the laws of space, or to give the co-ordinates of a point that does not exist.
- 3.0321 Though a state of affairs that would contravene the laws of physics can be represented by us spatially, one that would contravene the laws of geometry cannot.
- 3.04 If a thought were correct, it would be a thought whose possibility ensured its truth.
- 3.05 *A priori* knowledge that a thought was true would be possible only if its truth were recognizable from the thought itself (without anything to compare it with).
- 3.1 In a proposition a thought finds an expression that can be perceived by the senses.
- 3.11 We use the perceptible sign of a proposition (spoken or written, etc.) as a projection of a possible situation.
- The method of projection is to think out the sense of the proposition.
- 3.12 I call the sign with which we express a thought a propositional sign.—And a proposition is a propositional sign in its projective relation to the world.
- 3.13 A proposition includes all that the projection includes, but not what is projected.
- Therefore, though what is projected is not itself included, its possibility is.
- A proposition does not actually contain its sense, but does contain the possibility of expressing it.
- (“The content of a proposition” means the content of a proposition that has sense.)
- A proposition contains the form, but not the content, of its sense.
- 3.14 What constitutes a propositional sign is that in its elements (the words) stand in a determinate relation to one another.
- A propositional sign is a fact.

- 3.141 A proposition is not a medley of words.—(Just as a theme in music is not a medley of notes.)
A proposition is articulated.
- 3.142 Only facts can express a sense, a set of names cannot.
- 3.143 Although a propositional sign is a fact, this is obscured by the usual form of expression in writing or print.
For in a printed proposition, for example, no essential difference is apparent between a propositional sign and a word.
(That is what made it possible for Frege to call a proposition a composite name.)
- 3.1431 The essence of a propositional sign is very clearly seen if we imagine one composed of spatial objects (such as tables, chairs, and books) instead of written signs.
Then the spatial arrangement of these things will express the sense of the proposition.
- 4 A thought is a proposition with a sense.
- 4.06 A proposition can be true or false only in virtue of being a picture of reality.
- 4.1 Propositions represent the existence and non-existence of states of affairs.
- 5 A proposition is a truth-function of elementary propositions. (An elementary proposition is a truth-function of itself).
- 5.6 *The limits of my language* mean the limits of my world.
- 6.4 All propositions are of equal value.
- 6.41 The sense of the world must lie outside the world. In the world everything is as it is, and everything happens as it does happen: in it no value exists—and if it did, it would have no value.
If there is any value that does have value, it must lie outside the whole sphere of what happens and is the case. For all that happens and is the case is accidental.
What makes it non-accidental cannot lie *within* the world, since if it did it would itself be accidental.
It must lie outside the world.
- 6.42 And so it is impossible for there to be propositions of ethics.
Propositions can express nothing of what is higher.
- 6.421 It is clear that ethics cannot be put into words. Ethics is transcendental. (Ethics and aesthetics are one and the same.)
- 6.422 When an ethical law of the form, “Thou shalt . . .,” is laid down, one’s first thought is, “And what if I do not do it?” It is clear, however, that ethics has nothing to do with punishment and reward in the usual sense of the terms. So our question about the consequences of an action must be unimportant.—At least those consequences should not be events. For there must be something right about the question we posed. There must indeed be some kind of ethical reward and ethical punishment, but they must reside in the action itself.

(And it is also clear that the reward must be something pleasant and the punishment something unpleasant.)

- 6.423 It is impossible to speak about the will in so far as it is the subject of ethical attributes.

And the will as a phenomenon is of interest only to psychology.

- 6.43 If good or bad acts of will do alter the world, it can only be the limits of the world that they alter, not the facts, not what can be expressed by means of language.

In short their effect must be that it becomes an altogether different world. It must, so to speak, wax and wane as a whole.

The world of the happy man is a different one from that of the unhappy man.

- 6.431 So too at death the world does not alter, but comes to an end.

- 6.4311 Death is not an event in life: we do not live to experience death.

If we take eternity to mean not infinite temporal duration but timelessness, then eternal life belongs to those who live in the present.

Our life has no end in just the way in which our visual field has no limits.

- 6.4312 Not only is there no guarantee of the temporal immortality of the human soul, that is to say of its eternal survival after death; but, in any case, this assumption completely fails to accomplish the purpose for which it has always been intended. Or is some riddle solved by my surviving for ever? Is not this eternal life itself as much of a riddle as our present life? The solution of the riddle of life in space and time lies *outside* space and time.

(It is certainly not the solution of any problems of natural science that is required.)

- 6.432 *How* things are in the world is a matter of complete indifference for what is higher. God does not reveal himself *in* the world.

- 6.4321 The facts all contribute only to setting the problem, not to its solution.

- 6.44 It is not *how* things are in the world that is mystical, but *that* it exists.

- 6.45 To view the world *sub specie aeterni* is to view it as a whole—a limited whole.

Feeling the world as a limited whole—it is this that is mystical.

- 6.5 When the answer cannot be put into words, neither can the question be put into words.

The riddle does not exist.

If a question can be framed at all, it is also *possible* to answer it.

- 6.51 Scepticism is *not* irrefutable, but obviously nonsensical, when it tries to raise doubts where no questions can be asked.

For doubt can exist only where a question exists, a question only where an answer exists, and an answer only where something *can be said*.

- 6.52 We feel that even when *all possible* scientific questions have been answered, the problems of life remain completely untouched. Of course there are then no questions left, and this itself is the answer.

- 6.521 The solution of the problem of life is seen in the vanishing of the problem.
(Is not this the reason why those who have found after a long period of doubt that the sense of life became clear to them have then been unable to say what constituted that sense?)

- 6.522 There are, indeed, things that cannot be put into words. They *make themselves manifest*. They are what is mystical.

- 6.53 The correct method in philosophy would really be the following: to say nothing except what can be said, i.e. propositions of natural science—i.e. something that has nothing to do with philosophy—and then, whenever someone else wanted to say something metaphysical, to demonstrate to him that he had failed to give a meaning to certain signs in his propositions. Although it would not be satisfying to the other person—he would not have the feeling that we were teaching him philosophy—*this* method would be the only strictly correct one.
- 6.54 My propositions serve as elucidations in the following way: anyone who understands me eventually recognizes them as nonsensical, when he has used them—as steps—to climb up beyond them. (He must, so to speak, throw away the ladder after he has climbed up it.)
- He must transcend these propositions, and then he will see the world aright.
- 7 What we cannot speak about we must consign to silence.

PHILOSOPHICAL INVESTIGATIONS (in part)

1. “When they (my elders) named some object, and accordingly moved towards something, I saw this and I grasped that the thing was called by the sound they uttered when they meant to point it out. Their intention was shewn by their bodily movements, as it were the natural language of all peoples: the expression of the face, the play of the eyes, the movement of other parts of the body, and the tone of voice which expresses our state of mind in seeking, having, rejecting, or avoiding something. Thus, as I heard words repeatedly used in their proper places in various sentences, I gradually learnt to understand what objects they signified; and after I had trained my mouth to form these signs, I used them to express my own desires” (Augustine, *Confessions*, I. 8).

These words, it seems to me, give us a particular picture of the essence of human language. It is this: the individual words in language name objects—sentences are combinations of such names. In this picture of language we find the roots of the following idea: Every word has a meaning. This meaning is correlated with the word. It is the object for which the word stands.

Augustine does not speak of there being any difference between kinds of word. If you describe the learning of language in this way you are, I believe, thinking primarily of nouns like “table,” “chair,” “bread,” and of people’s names, and only secondarily of the names of certain actions and properties; and of the remaining kinds of word as something that will take care of itself.

Now think of the following use of language: I send someone shopping. I give him a slip marked “five red apples.” He takes the slip to the shopkeeper, who opens the drawer marked “apples”; then he looks up the word “red” in a table and finds a colour

sample opposite it; then he says the series of cardinal numbers—I assume that he knows them by heart—up to the word “five” and for each number he takes an apple of the same colour as the sample out of the drawer. It is in this and similar ways that one operates with words. “But how does he know where and how he is to look up the word ‘red’ and what he is to do with the word ‘five’?” Well, I assume that he acts as I have described. Explanations come to an end somewhere.—But what is the meaning of the word “five”?—No such thing was in question here, only how the word “five” is used.

2. That philosophical concept of meaning has its place in a primitive idea of the way language functions. But one can also say that it is the idea of a language more primitive than ours.

Let us imagine a language for which the description given by Augustine is right. The language is meant to serve for communication between a builder A and an assistant B. A is building with building-stones: there are blocks, pillars, slabs and beams. B has to pass the stones, and that in the order in which A needs them. For this purpose they use a language consisting of the words “block,” “pillar,” “slab,” “beam.” A calls them out;—B brings the stone which he has learnt to bring at such-and-such a call—Conceive this as a complete primitive language.

3. Augustine, we might say, does describe a system of communication; only not everything that we call language is this system. And one has to say this in many cases where the question arises “Is this an appropriate description or not?” The answer is: “Yes, it is appropriate, but only for this narrowly circumscribed region, not for the whole of what you were claiming to describe.”

It is as if someone were to say: “A game consists in moving objects about on a surface according to certain rules . . .”—and we replied: You seem to be thinking of board games, but there are others. You can make your definition correct by expressly restricting it to those games.

4. Imagine a script in which the letters were used to stand for sounds, and also as signs of emphasis and punctuation. (A script can be conceived as a language for describing sound-patterns.) Now imagine someone interpreting that script as if there were simply a correspondence of letters to sounds and as if the letters had not also completely different functions. Augustine’s conception of language is like such an oversimple conception of the script.

5. If we look at the example in ¶1, we may perhaps get an inkling how much this general notion of the meaning of a word surrounds the working of language with a haze which makes clear vision impossible. It disperses the fog to study the phenomena of language in primitive kinds of application in which one can command a clear view of the aim and functioning of the words.

A child uses such primitive forms of language when it learns to talk. Here the teaching of language is not explanation, but training.

6. We could imagine that the language of ¶2 was the *whole* language of A and B; even the whole language of a tribe. The children are brought up to perform *these* actions, to use these words as they do so, and to react in *this* way to the words of others.

An important part of the training will consist in the teacher’s pointing to the objects, directing the child’s attention to them, and at the same time uttering a word; for instance, the word “slab” as he points to that shape. (I do not want to call this “ostensive definition,” because the child cannot as yet ask what the name is. I will call it “ostensive teaching of words.” I say that it will form an important part of the training, because it is so with human beings; not because it could not be imagined otherwise.) This ostensive teaching of words can be said to establish an association between the word and the

thing. But what does this mean? Well, it may mean various things; but one very likely thinks first of all that a picture of the object comes before the child's mind when it hears the word. But now, if this does happen—is it the purpose of the word?—Yes, it *may* be the purpose.—I can imagine such a use of words (of series of sounds). (Uttering a word is like striking a note on the keyboard of the imagination.) But in the language of ¶2 it is *not* the purpose of the words to evoke images. (It may, of course, be discovered that that helps to attain the actual purpose.)

But if the ostensive teaching has this effect,—am I to say that it effects an understanding of the word? Don't you understand the call "Slab!" if you act upon it in such-and-such a way?—Doubtless the ostensive teaching helped to bring this about; but only together with a particular training. With different training the same ostensive teaching of these words would have effected a quite different understanding.

"I set the brake up by connecting up rod and lever."—Yes, given the whole of the rest of the mechanism. Only in conjunction with that is it a brake-lever, and separated from its support it is not even a lever; it may be anything, or nothing.

7. In the practice of the use of language (2) one party calls out the words, the other acts on them. In instruction in the language the following process will occur: the learner *names* the objects; that is, he utters the word when the teacher points to the stone.—And there will be this still simpler exercise: the pupil repeats the words after the teacher—both of these being processes resembling language.

We can also think of the whole process of using words in (2) as one of those games by means of which children learn their native language. I will call these games "language-games" and will sometimes speak of a primitive language as a language-game.

And the processes of naming the stones and of repeating words after someone might also be called language-games. Think of much of the use of words in games like ring-a-ring-a-roses.

I shall also call the whole, consisting of language and the actions into which it is woven, the "language-game."

8. Let us now look at an expansion of language (2). Besides the four words "block," "pillar," etc., let it contain a series of words used as the shopkeeper in (I) used the numerals (it can be the series of letters of the alphabet); further, let there be two words, which may as well be "there" and "this" (because this roughly indicates their purpose), that are used in connexion with a pointing gesture; and finally a number of colour samples. A gives an order like: "d—slab—there." At the same time he shews the assistant a colour sample, and when he says "there" he points to a place on the building site. From the stock of slabs B takes one for each letter of the alphabet up to "d," of the same colour as the sample, and brings them to the place indicated by A.—On other occasions A gives the order "this—there." At "this" he points to a building stone. And so on.

9. When a child learns this language, it has to learn the series of 'numerals' a, b, c, . . . by heart. And it has to learn their use.—Will this training include ostensive teaching of the words?—Well, people will, for example, point to slabs and count: "a, b, c slabs."—Something more like the ostensive teaching of the words "block," "pillar," etc. would be the ostensive teaching of numerals that serve not to count but to refer to groups of objects that can be taken in at a glance. Children do learn the use of the first five or six cardinal numerals in this way.

Are "there" and "this" also taught ostensively?—Imagine how one might perhaps teach their use. One will point to places and things—but in this case the pointing occurs in the *use* of the words too and not merely in learning the use.—

10. Now what do the words of this language *signify*?—What is supposed to shew what they signify, if not the kind of use they have? And we have already described that. So we are asking for the expression “This word signifies this” to be made a part of the description. In other words the description ought to take the form: “The word . . . signifies . . .”

Of course, one can reduce the description of the use of the word “slab” to the statement that this word signifies this object. This will be done when, for example, it is merely a matter of removing the mistaken idea that the word “slab” refers to the shape of building-stone that we in fact call a “block”—but the kind of ‘*referring*’ this is, that is to say the use of these words for the rest, is already known.

Equally one can say that the signs “a,” “b,” etc. signify numbers; when for example this removes the mistaken idea that “a,” “b,” “c,” play the part actually played in language by “block,” “slab,” “pillar.” And one can also say that “c” means this number and not that one; when for example this serves to explain that the letters are to be used in the order a, b, c, d, etc. and not in the order a, b, d, c.

But assimilating the descriptions of the uses of words in this way cannot make the uses themselves any more like one another. For, as we see, they are absolutely unlike.

11. Think of the tools in a toolbox: there is a hammer, pliers, a saw, a screw-driver, a rule, a glue-pot, glue, nails and screws.—The functions of words are as diverse as the functions of these objects. (And in both cases there are similarities.)

Of course, what confuses us is the uniform appearance of words when we hear them spoken or meet them in script and print. For their *application* is not presented to us so clearly. Especially when we are doing philosophy!

12. It is like looking into the cabin of a locomotive. We see handles all looking more or less alike. (Naturally, since they are all supposed to be handled.) But one is the handle of a crank which can be moved continuously (it regulates the opening of a valve); another is the handle of a switch, which has only two effective positions, it is either off or on; a third is the handle of a brake-lever, the harder one pulls on it, the harder it brakes; a fourth, the handle of a pump: it has an effect only so long as it is moved to and fro.

13. When we say: “Every word in language signifies something” we have so far said *nothing whatever*; unless we have explained exactly what distinction we wish to make. (It might be, of course, that we wanted to distinguish the words of language [8] from words ‘without meaning’ such as occur in Lewis Carroll’s poems, or words like “Lilliburlero” in songs.)

14. Imagine someone’s saying: “*All* tools serve to modify something. Thus the hammer modifies the position of the nail, the saw the shape of the board, and so on.”—And what is modified by the rule, the glue-pot, the nails?—“Our knowledge of a thing’s length, the temperature of the glue, and the solidity of the box.” Would anything be gained by this assimilation of expressions?—

15. The word “to signify” is perhaps used in the most straightforward way when the object signified is marked with the sign. Suppose that the tools A uses in building bear certain marks. When A shews his assistant such a mark, he brings the tool that has that mark on it.

It is in this and more or less similar ways that a name means and is given to a thing.—It will often prove useful in philosophy to say to ourselves: naming something is like attaching a label to a thing.

16. What about the colour samples that A shews to B: are they part of the *language*? Well, it is as you please. They do not belong among the words; yet when I say to someone: “Pronounce the word ‘the’,” you will count the second “the” as part

of the sentence. Yet it has a role just like that of a colour-sample in language-game (8); that is, it is a sample of what the other is meant to say.

It is most natural, and causes least confusion, to reckon the samples among the instruments of the language.

(Remark on the reflexive pronoun "*this* sentence.")

17. It will be possible to say: In language (8) we have different kinds *of word*. For the functions of the word "slab" and the word "block" are more alike than those of "slab" and "d." But how we group words into kinds will depend on the aim of the classification,—and on our own inclination.

Think of the different points of view from which one can classify tools or chessmen.

18. Do not be troubled by the fact that languages (2) and (8) consist only of orders. If you want to say that this shews them to be incomplete, ask yourself whether our language is complete;—whether it was so before the symbolism of chemistry and the notation of the infinitesimal calculus were incorporated in it; for these are, so to speak, suburbs of our language. (And how many houses or streets does it take before a town begins to be a town?) Our language can be seen as an ancient city: a maze of little streets and squares, of old and new houses, and of houses with additions from various periods; and this surrounded by a multitude of new boroughs with straight regular streets and uniform houses.

19. It is easy to imagine a language consisting only of orders and reports in battle.—Or a language consisting only of questions and expressions for answering yes and no. And innumerable others.—And to imagine a language means to imagine a form of life.

But what about this: is the call "Slab!" in example (2) a sentence or a word?—If a word, surely it has not the same meaning as the like-sounding word of our ordinary language, for in ¶2 it is a call. But if a sentence, it is surely not the elliptical sentence: "Slab!" of our language. As far as the first question goes you can call "Slab!" a word and also a sentence; perhaps it could be appropriately called a 'degenerate sentence' (as one speaks of a degenerate hyperbola); in fact it is our 'elliptical' sentence.—But that is surely only a shortened form of the sentence "Bring me a slab," and there is no such sentence in example (2).—But why should I not on the contrary have called the sentence "Bring me a slab" a *lengthening* of the sentence "Slab!"?—Because if you shout "Slab!" you really mean: "Bring me a slab."—But how do you do this: how do you mean that while you say "Slab!"? Do you say the unshortened sentence to yourself? And why should I translate the call "Slab!" into a different expression in order to say what someone means by it? And if they mean the same thing—why should I not say: "When he says 'Slab!' he means 'Slab!'"? Again, if you can mean "Bring me the slab," why should you not be able to mean "Slab!"? But when I call "Slab!" then what I want is, *that he should bring me a slab!*—Certainly, but does 'wanting this' consist in thinking in some form or other a different sentence from the one you utter?—

20. But now it looks as if when someone says "Bring me a slab" he could mean this expression as *one* long word corresponding to the single word "Slab!" Then can one mean it sometimes as one word and sometimes as four? And how does one usually mean it? I think we shall be inclined to say: we mean the sentence as four words when we use it in contrast with other sentences such as "*Hand* me a slab," "Bring *him* a slab," "Bring *two* slabs," etc.; that is, in contrast with sentences containing the separate words of our command in other combinations.—But what does using one sentence in contrast with others consist in? Do the others, perhaps, hover before one's mind? *All* of them? And *while* one is saying the one sentence, or before, or afterwards?—No. Even if such an explanation rather tempts us, we need only think for a moment of what actually happens in order to see that we are going astray here. We say that we use the command in

contrast with other sentences because *our language* contains the possibility of those other sentences. Someone who did not understand our language, a foreigner, who had fairly often heard someone giving the order: "Bring me a slab!" might believe that this whole series of sounds was one word corresponding perhaps to the word for "building-stone" in his language. If he himself had then given this order perhaps he would have pronounced it differently, and we should say: he pronounces it so oddly because he takes it for a *single* word.—But then, is there not also something different going on in him when he pronounces it,—something corresponding to the fact that he conceives the sentence as a single word?—Either the same thing may go on in him, or something different. For what goes on in you when you give such an order? Are you conscious of its consisting of four words *while* you are uttering it? Of course you have a mastery of this language—which contains those other sentences as well—but is this having a mastery something that *happens* while you are uttering the sentence?—And I have admitted that the foreigner will probably pronounce a sentence differently if he conceives it differently; but what we call his wrong conception *need* not lie in anything that accompanies the utterance of the command.

The sentence is 'elliptical,' not because it leaves out something that we think when we utter it, but because it is shortened—in comparison with a particular paradigm of our grammar.—Of course one might object here: "You grant that the shortened and the unshortened sentence have the same sense.—What is this sense, then? Isn't there a verbal expression for this sense?" But doesn't the fact that sentences have the same sense consist in their having the same *use*?—(In Russian one says "stone red" instead of "the stone is red"; do they feel the copula to be missing in the sense, or attach it in *thought*?)

21. Imagine a language-game in which A asks and B reports the number of slabs or blocks in a pile, or the colours and shapes of the building-stones that are stacked in such-and-such a place.—Such a report might run: "Five slabs." Now what is the difference between the report or statement "Five slabs" and the order "Five slabs!"?—Well, it is the part which uttering these words plays in the language-game. No doubt the tone of voice and the look with which they are uttered, and much else besides, will also be different. But we could also imagine the tone's being the same—for an order and a report can be spoken in a *variety* of tones of voice and with various expressions of face—the difference being only in the application. (Of course, we might use the words "statement" and "command" to stand for grammatical forms of sentence and intonations; we do in fact call "Isn't the weather glorious to-day?" a question, although it is used as a statement.) We could imagine a language in which *all* statements had the form and tone of rhetorical questions; or every command the form of the question "Would you like to . . .?" Perhaps it will then be said: "What he says has the form of a question but is really a command,"—that is, has the function of a command in the technique of using the language. (Similarly one says "You will do this" not as a prophecy but as a command. What makes it the one or the other?)

22. Frege's idea that every assertion contains an assumption, which is the thing that is asserted, really rests on the possibility found in our language of writing every statement in the form: "It is asserted that such-and-such is the case."—But "that such-and-such is the case" is not a sentence in our language—so far it is not a *move* in the language-game. And if I write, not "It is asserted that . . .," but "It is asserted: such-and-such is the case," the words "It is asserted" simply become superfluous.

We might very well also write every statement in the form of a question followed by a "Yes"; for instance: "Is it raining? Yes!" Would this shew that every statement contained a question?

Of course we have the right to use an assertion sign in contrast with a question-mark, for example, or if we want to distinguish an assertion from a fiction or a supposition. It is only a mistake if one thinks that the assertion consists of two actions, entertaining and asserting (assigning the truth-value, or something of the kind), and that in performing these actions we follow the propositional sign roughly as we sing from the musical score. Reading the written sentence loud or soft is indeed comparable with singing from a musical score, but ‘*meaning*’ (thinking) the sentence that is read is not.

Frege’s assertion sign marks the *beginning of the sentence*. Thus its function is like that of the full-stop. It distinguishes the whole period from a clause *within* the period. If I hear someone say “it’s raining” but do not know whether I have heard the beginning and end of the period, so far this sentence does not serve to tell me anything.

23. But how many kinds of sentences are there? Say assertion, question, and command?—There are *countless* kinds: countless different kinds of use of what we call “symbols,” “words,” “sentences.” And this multiplicity is not something fixed, given once for all; but new types of language, new language-games, as we may say, come into existence, and others become obsolete and get forgotten. (We can get a *rough picture* of this from the changes in mathematics.)

Here the term “language-game” is meant to bring into prominence the fact that the *speaking* of language is part of an activity, or of a form of life.

Review the multiplicity of language-games in the following examples, and in others:

- Giving orders, and obeying them—
- Describing the appearance of an object, or giving its measurements—
- Constructing an object from a description (a drawing)—
- Reporting an event—
- Speculating about an event—
- Forming and testing a hypothesis—
- Presenting the results of an experiment in tables and diagrams—
- Making up a story; and reading it—
- Play-acting—
- Singing catches—
- Guessing riddles—
- Making a joke; telling it—
- Solving a problem in practical arithmetic—
- Translating from one language into another—
- Asking, thanking, cursing, greeting, praying.

Imagine a picture representing a boxer in a particular stance. Now, this picture can be used to tell someone how he should stand, should hold himself; or how he should not hold himself; or how a particular man did stand in such-and-such a place; and so on. One might (using the language of chemistry) call this picture a proposition-radical. This will be how Frege thought of the “assumption.” [Note added by Wittgenstein.]

—It is interesting to compare the multiplicity of the tools in language and of the ways they are used, the multiplicity of kinds of word and sentence, with what logicians have said about the structure of language. (Including the author of the *Tractatus Logico-Philosophicus*.)

24. If you do not keep the multiplicity of language-games in view you will perhaps be inclined to ask questions like: “What is a question?”—Is it the statement that I do not know such-and-such, or the statement that I wish the other person would tell me . . .? Or is it the description of my mental state of uncertainty?—And is the cry “Help!” such a description?

Think how many different kinds of thing are called “description”: description of a body’s position by means of its co-ordinates; description of a facial expression; description of a sensation of touch; of a mood.

Of course it is possible to substitute the form of statement or description for the usual form of question: “I want to know whether . . .” or “I am in doubt whether . . .”—but this does not bring the different language-games any closer together.

The significance of such possibilities of transformation, for example of turning all statements into sentences beginning “I think” or “I believe” (and thus, as it were, into descriptions of my inner life) will become clearer in another place. (Solipsism.)

25. It is sometimes said that animals do not talk because they lack the mental capacity. And this means: “they do not think, and that is why they do not talk.” But—they simply do not talk. Or to put it better: they do not use language—if we except the most primitive forms of language.—Commanding, questioning, recounting, chatting, are as much a part of our natural history as walking, eating, drinking, playing.

26. One thinks that learning language consists in giving names to objects. Viz., to human beings, to shapes, to colours, to pains, to moods, to numbers, etc. To repeat—naming is something like attaching a label to a thing. One can say that this is preparatory to the use of a word. But *what* is it a preparation *for*?

27. “We name things and then we can talk about them: can refer to them in talk.”—As if what we did next were given with the mere act of naming. As if there were only one thing called “talking about a thing.” Whereas in fact we do the most various things with our sentences. Think of exclamations alone, with their completely different functions.

Water!

Away!

Ow!

Help!

Fine!

No!

Are you inclined still to call these words “names of objects”?

In languages (2) and (8) there was no such thing as asking something’s name. This, with its correlate, ostensive definition, is, we might say, a language-game on its own. That is really to say: we are brought up, trained, to ask: “What is that called?”—upon which the name is given. And there is also a language-game of inventing a name for something, and hence of saying, “This is . . .” and then using the new name. (Thus, for example, children give names to their dolls and then talk about them and to them. Think in this connexion how singular is the use of a person’s name to *call* him!)

28. Now one can ostensibly define a proper name, the name of a colour, the name of a material, a numeral, the name of a point of the compass and so on. The definition of the number two, “That is called ‘two’”—pointing to two nuts—is perfectly exact.—But how can two be defined like that? The person one gives the definition to doesn’t know what one wants to call “two”; he will suppose that “two” is the name given to *this* group

of nuts!—He *may* suppose this; but perhaps he does not. He might make the opposite mistake; when I want to assign a name to this group of nuts, he might understand it as a numeral. And he might equally well take the name of a person, of which I give an ostensive definition, as that of a colour, of a race, or even of a point of the compass. That is to say: an ostensive definition can be variously interpreted in *every* case.

29. Perhaps you say: two can only be ostensively defined in *this* way: “This *number* is called ‘two.’ ” For the word “number” here shews what place in language, in grammar, we assign to the word. But this means that the word “number” must be explained before the ostensive definition can be understood.—The word “number” in the definition does indeed shew this place; does shew the post at which we station the word. And we can prevent misunderstandings by saying: “This *colour* is called so-and-so,” “This *length* is called so-and-so,” and so on. That is to say: misunderstandings are sometimes averted in this way. But is there only *one* way of taking the word “colour” or “length”?—Well, they just need defining.—Defining, then, by means of other words! And what about the last definition in this chain? (Do not say: “There isn’t a ‘last’ definition.” That is just as if you chose to say: “There isn’t a last house in this road; one can always build an additional one.”)

Whether the word “number” is necessary in the ostensive definition depends on whether without it the other person takes the definition otherwise than I wish. And that will depend on the circumstances under which it is given, and on the person I give it to.

And how he ‘takes’ the definition is seen in the use that he makes of the word defined.

30. So one might say: the ostensive definition explains the use—the meaning—of the word when the overall role of the word in language is clear. Thus if I know that someone means to explain a colour-word to me the ostensive definition “That is called ‘sepia’ ” will help me to understand the word.—And you can say this, so long as you do not forget that all sorts of problems attach to the words “to know” or “to be clear.”

One has already to know (or be able to do) something in order to be capable of asking a thing’s name. But what does one have to know?

Could one define the word “red” by pointing to something that was *not red*? That would be as if one were supposed to explain the word “*modest*” to someone whose English was weak, and one pointed to an arrogant man and said “That man is *not* modest.” That is ambiguous is no argument against such a method of definition. Any definition can be misunderstood.

But it might well be asked: are we still to call this “definition”?—For, of course, even if it has the same practical consequences, the same *effect* on the learner, it plays a different part in the calculus from what we ordinarily call “ostensive definition” of the word “red.” [Note added by Wittgenstein.]

31. When one shews someone the king in chess and says: “This is the king,” this does not tell him the use of this piece—unless he already knows the rules of the game up to this last point: the shape of the king. You could imagine his having learnt the rules of the game without ever having been shewn an actual piece. The shape of the chessman corresponds here to the sound or shape of a word.

One can also imagine someone’s having learnt the game without ever learning or formulating rules. He might have learnt quite simple board-games first, by watching,

and have progressed to more and more complicated ones. He too might be given the explanation “This is the king,”—if, for instance, he were being shewn chessmen of a shape he was not used to. This explanation again only tells him the use of the piece because, as we might say, the place for it was already prepared. Or even: we shall only say that it tells him the use, if the place is already prepared. And in this case it is so, not because the person to whom we give the explanation already knows rules, but because in another sense he is already master of a game.

Consider this further case: I am explaining chess to someone; and I begin by pointing to a chessman and saying: “This is the king; it can move like this, . . . and so on.”—In this case we shall say: the words “This is the king” (or “This is called the ‘king’”) are a definition only if the learner already ‘knows what a piece in a game is.’ That is, if he has already played other games, or has watched other people playing ‘and understood’—*and similar things*. Further, only under these conditions will he be able to ask relevantly in the course of learning the game: “What do you call this?”—that is, this piece in a game.

We may say: only someone who already knows how to do something with it can significantly ask a name.

And we can imagine the person who is asked replying: “Settle the name yourself”—and now the one who asked would have to manage everything for himself.

32. Someone coming into a strange country will sometimes learn the language of the inhabitants from ostensive definitions that they give him; and he will often have to guess the meaning of these definitions; and will guess sometimes right, sometimes wrong.

And now, I think, we can say: Augustine describes the learning of human language as if the child came into a strange country and did not understand the language of the country; that is, as if it already had a language, only not this one. Or again: as if the child could already *think*, only not yet speak. And “think” would here mean something like “talk to itself.”

33. Suppose, however, someone were to object: “It is not true that you must already be master of a language in order to understand an ostensive definition: all you need—of course I—is to know or guess what the person giving the explanation is pointing to. That is, whether for example to the shape of the object, or to its colour, or to its number, and so on.” And what does ‘pointing to the shape,’ ‘pointing to the colour’ consist in? Point to a piece of paper.—And now point to its shape—now to its colour—now to its number (that sounds queer).—How did you do it?—You will say that you ‘meant’ a different thing each time you pointed. And if I ask how that is done, you will say you concentrated your attention on the colour, the shape, etc. But I ask again: how is *that* done?

Suppose someone points to a vase and says “Look at that marvelous blue—the shape isn’t the point.”—Or: “Look at the marvelous shape—the colour doesn’t matter.” Without doubt you will do something *different* when you act upon these two invitations. But do you always do the *same* thing when you direct your attention to the colour? Imagine various different cases. To indicate a few:

“Is this blue the same as the blue over there? Do you see any difference?”—

You are mixing paint and you say “It’s hard to get the blue of this sky.”

“It’s turning fine, you can already see blue sky again.”

“Look what different effects these two blues have.”

“Do you see the blue book over there? Bring it here.”

“This blue signal-light means. . . .”

“What’s this blue called?—Is it ‘indigo’?”

You sometimes attend to the colour by putting your hand up to keep the outline from view; or by not looking at the outline of the thing; sometimes by staring at the object and trying to remember where you saw that colour before.

You attend to the shape, sometimes by tracing it, sometimes by screwing up your eyes so as not to see the colour clearly, and in many other ways. I want to say: This is the sort of thing that happens while one 'directs one's attention to this or that.' But it isn't these things by themselves that make us say someone is attending to the shape, the colour, and so on. Just as a move in chess doesn't consist simply in moving a piece in such-and-such a way on the board—nor yet in one's thoughts and feelings as one makes the move: but in the circumstances that we call "playing a game of chess," "solving a chess problem," and so on.

34. But suppose someone said: "I always do the same thing when I attend to the shape: my eye follows the outline and I feel. . . ." And suppose this person to give someone else the ostensive definition "That is called a 'circle,'" pointing to a circular object and having all these experiences cannot his hearer still interpret the definition differently, even though he sees the other's eyes following the outline, and even though he feels what the other feels? That is to say: this 'interpretation' may also consist in how he now makes use of the word; in what he points to, for example, when told: "Point to a circle."—For neither the expression "to intend the definition in such-and-such a way" nor the expression "to interpret the definition in such-and-such a way" stands for a process which accompanies the giving and hearing of the definition.

35. There are, of course, what can be called "characteristic experiences" of pointing to (e.g.) the shape. For example, following the outline with one's finger or with one's eyes as one points.—But *this* does not happen in all cases in which I 'mean the shape,' and no more does any other one characteristic process occur in all these cases.—Besides, even if something of the sort did recur in all cases, it would still depend on the circumstances—that is, on what happened before and after the pointing—whether we should say "He pointed to the shape and not to the colour."

For the words "to point to the shape," "to mean the shape," and so on, are not used in the same way as *these*: "to point to this book (not to that one)," "to point to the chair, not to the table," and so on.—Only think how differently we *learn* the use of the words "to point to this thing," "to point to that thing," and on the other hand "to point to the colour, not the shape," "to mean the colour," and so on.

To repeat: in certain cases, especially when one points 'to the shape' or 'to the number' there are characteristic experiences and ways of pointing—'characteristic' because they recur often (not always) when shape or number are 'meant.' But do you also know of an experience characteristic of pointing to a piece in a game *as a piece in a game*? All the same one can say: "I mean that this *piece* is called the 'king,' not this particular bit of wood I am pointing to." (Recognizing, wishing, remembering, etc.)

36. And we do here what we do in a host of similar cases: because we cannot specify any *one* bodily action which we call pointing to the shape (as opposed, for example, to the colour), we say that a *spiritual* [mental, intellectual] activity corresponds to these words.

Where our language suggests a body and there is none: there, we should like to say, is a *spirit*.

37. What is the relation between name and thing named?—Well, what is it? Look at language-game (2) or at another one: there you can see the sort of thing this relation consists in. This relation may also consist, among many other things, in the fact that hearing the name calls before our mind the picture of what is named; and it also consists, among other things, in the name's being written on the thing named or being pronounced when that thing is pointed at.

38. But what, for example, is the word “this” the name of in language-game (8) or the word “that” in the ostensive definition “that is called. . . .”?—If you do not want to produce confusion you will do best not to call these words names at all.—Yet, strange to say, the word “this” has been called the only *genuine* name; so that anything else we call a name was one only in an inexact, approximate sense.

This queer conception springs from a tendency to sublime the logic of our language—as one might put it. The proper answer to it is: we call very different things “names”; the word “name” is used to characterize many different kinds of use of a word, related to one another in many different ways;—but the kind of use that “this” has is not among them.

What is it to mean the words “*That is blue*” at one time as a statement about the object one is pointing to—at another as an explanation of the word “blue”? Well, in the second case one really means “That is called ‘blue.’”—Then can one at one time mean the word “is” as “is called” and the word “blue” as “‘blue,’” and another time mean “is” really as “is”?

It is also possible for someone to get an explanation of the words out of what was intended as a piece of information. [Marginal note: Here lurks a crucial superstition.]

Can I say “bububu” and mean “If it doesn’t rain I shall go for a walk”?—It is only in a language that I can mean something by something. This shews clearly that the grammar of “to mean” is not like that of the expression “to imagine” and the like. [Note added by Wittgenstein.]

It is quite true that, in giving an ostensive definition for instance, we often point to the object named and say the name. And similarly, in giving an ostensive definition for instance, we say the word “this” while pointing to a thing. And also the word “this” and a name often occupy the same position in a sentence. But it is precisely characteristic of a name that it is defined by means of the demonstrative expression “That is N” (or “That is called ‘N’”). But do we also give the definitions: “That is called ‘this,’” or “This is called ‘this’”?

This is connected with the conception of naming as, so to speak, an occult process. Naming appears as a *queer* connexion of a word with an object.—And you really get such a queer connexion when the philosopher tries to bring out *the* relation between name and thing by staring at an object in front of him and repeating a name or even the word “this” innumerable times. For philosophical problems arise when language *goes on holiday*. And *here* we may indeed fancy naming to be some remarkable act of mind, as it were a baptism of an object. And we can also say the word “this” *to* the object, as it were *address* the object as “this”—a queer use of this word, which doubtless only occurs in doing philosophy.

39. But why does it occur to one to want to make precisely this word into a name, when it evidently is *not* a name?—That is just the reason. For one is tempted to make an objection against what is ordinarily called a name. It can be put like this: *a name ought really to signify a simple*. And for this one might perhaps give the following reasons: The word “Excalibur,” say, is a proper name in the ordinary sense. The sword Excalibur consists of parts combined in a particular way. If they are combined differently Excalibur does not exist. But it is clear that the sentence “Excalibur has a sharp blade” makes sense whether Excalibur is still whole or is broken up. But if “Excalibur” is the name of an object, this object no longer exists when Excalibur is broken in pieces; and as no object would then correspond to the name it would have no meaning. But then the

sentence “Excalibur has a sharp blade” would contain a word that had no meaning, and hence the sentence would be nonsense. But it does make sense; so there must always be something corresponding to the words of which it consists. So the word “Excalibur” must disappear when the sense is analysed and its place be taken by words which name simples. It will be reasonable to call these words the real names.

40. Let us first discuss *this* point of the argument: that a word has no meaning if nothing corresponds to it.—It is important to note that the word “meaning” is being used illicitly if it is used to signify the thing that ‘corresponds’ to the word. That is to confound the meaning of a name with the *bearer* of the name. When Mr. N. N. dies one says that the bearer of the name dies, not that the meaning dies. And it would be nonsensical to say that, for if the name ceased to have meaning it would make no sense to say “Mr. N. N. is dead.”

41. In §15 we introduced proper names into language (8). Now suppose that the tool with the name “N” is broken. Not knowing this, A gives B the sign “N.” Has this sign meaning now or not?—What is B to do when he is given it?—We have not settled anything about this. One might ask: what *will* he do? Well, perhaps he will stand there at a loss, or shew A the pieces. Here one *might* say: “N” has become meaningless; and this expression would mean that the sign “N” no longer had a use in our language-game (unless we gave it a new one). “N” might also become meaningless because, for whatever reason, the tool was given another name and the sign “N” no longer used in the language-game.—But we could also imagine a convention whereby B has to shake his head in reply if A gives him the sign belonging to a tool that is broken.—In this way the command “N” might be said to be given a place in the language-game even when the tool no longer exists, and the sign “N” to have meaning even when its bearer ceases to exist.

42. But has for instance a name which has *never* been used for a tool also got a meaning in that game? Let us assume that “X” is such a sign and that A gives this sign to B—well, even such signs could be given a place in the language-game, and B might have, say, to answer them too with a shake of the head. (One could imagine this as a sort of joke between them.)

43. For a *large* class of cases—though not for all—in which we employ the word “meaning” it can be defined thus: the meaning of a word is its use in the language.

And the *meaning* of a name is sometimes explained by pointing to its *bearer*.

44. We said that the sentence “Excalibur has a sharp blade” made sense even when Excalibur was broken in pieces. Now this is so because in this language-game a name is also used in the absence of its bearer. But we can imagine a language-game with names (that is, with signs which we should certainly include among names) in which they are used only in the presence of the bearer; and so could always be replaced by a demonstrative pronoun and the gesture of pointing.

45. The demonstrative “this” can never be without a bearer. It might be said: “so long as there is a *this*, the word ‘this’ has a meaning too, whether *this* is simple or complex.” But that does not make the word into a name. On the contrary: for a name is not used with, but only explained by means of, the gesture of pointing.

46. What lies behind the idea that names really signify simples?—

Socrates says in the *Theaetetus*: “If I make no mistake, I have heard some people say this: there is no definition of the primary elements—so to speak—out of which we and everything else are composed; for everything that exists in its own right can only be *named*, no other determination is possible, neither that it *is* nor that it *is not*. . . . But what exists in its own right has to be . . . named without any other determination. In consequence it is impossible to give an account of any primary element; for it, nothing is possible but the bare name; its name is all it has. But just as what consists of these primary

elements is itself complex, so the names of the elements become descriptive language by being compounded together. For the essence of speech is the composition of names."

Both Russell's 'individuals' and my 'objects' (*Tractatus Logico-Philosophicus*) were such primary elements.

47. But what are the simple constituent parts of which reality is composed?—What are the simple constituent parts of a chair?—The bits of wood of which it is made? Or the molecules, or the atoms?—"Simple" means: not composite. And here the point is: in what sense 'composite'? It makes no sense at all to speak absolutely of the 'simple parts of a chair.'

Again: Does my visual image of this tree, of this chair, consist of parts? And what are its simple component parts? Multi-colouredness is one kind of complexity; another is, for example, that of a broken outline composed of straight bits. And a curve can be said to be composed of an ascending and a descending segment.

If I tell someone without any further explanation: "What I see before me now is composite," he will have the right to ask: "What do you mean by 'composite'? For there are all sorts of things that that can mean!"—The question "Is what you see composite?" makes good sense if it is already established what kind of complexity—that is, which particular use of the word—is in question. If it had been laid down that the visual image of a tree was to be called "composite" if one saw not just a single trunk, but also branches, then the question "Is the visual image of this tree simple or composite?" and the question "What are its simple component parts?" would have a clear sense—a clear use. And of course the answer to the second question is not "The branches" (that would be an answer to the *grammatical* question: "What are here called 'simple component parts'?") but rather a description of the individual branches.

But isn't a chessboard, for instance, obviously, and absolutely, composite?—You are probably thinking of the composition out of thirty-two white and thirty-two black squares. But could we not also say, for instance, that it was composed of the colours black and white and the schema of squares? And if there are quite different ways of looking at it, do you still want to say that the chessboard is absolutely 'composite'?—Asking "Is this object composite?" *outside* a particular language-game is like what a boy once did, who had to say whether the verbs in certain sentences were in the active or passive voice, and who racked his brains over the question whether the verb "to sleep" meant something active or passive.

We use the word "composite" (and therefore the word "simple") in an enormous number of different and differently related ways. (Is the colour of a square on a chessboard simple, or does it consist of pure white and pure yellow? And is white simple, or does it consist of the colours of the rainbow?—Is this length of 2 cm. simple, or does it consist of two parts, each 1 cm. long? But why not of one bit 3 cm. long, and one bit 1 cm. long measured in the opposite direction?)

To the *philosophical* question: "Is the visual image of this tree composite, and what are its component parts?" the correct answer is: "That depends on what you understand by 'composite'." (And that is of course not an answer but a rejection of the question.)

* * *

65. Here we come up against the great question that lies behind all these considerations.—For someone might object against me: "You take the easy way out! You talk about all sorts of language-games, but have nowhere said what the essence of a language-game, and hence of language, is: what is common to all these activities, and

what makes them into language or parts of language. So you let yourself off the very part of the investigation that once gave you yourself most headache, the part about the *general form of propositions* and of language."

And this is true.—Instead of producing something common to all that we call language, I am saying that these phenomena have no one thing in common which makes us use the same word for all,—but that they are *related* to one another in many different ways. And it is because of this relationship, or these relationships, that we call them all "language." I will try to explain this.

66. Consider for example the proceedings that we call "games." I mean board-games, card-games, ball-games, Olympic games, and so on. What is common to them all?—Don't say: "There *must* be something common, or they would not be called 'games' "—but *look* and *see* whether there is anything common to all.—For if you look at them you will not see something that is common to *all*, but similarities, relationships, and a whole series of them at that. To repeat: don't think, but look!—Look for example at board-games, with their multifarious relationships. Now pass to card-games; here you find many correspondences with the first group, but many common features drop out, and others appear. When we pass next to ball-games, much that is common is retained, but much is lost.—Are they all 'amusing'? Compare chess with noughts and crosses. Or is there always winning and losing, or competition between players? Think of patience. In ball-games there is winning and losing; but when a child throws his ball at the wall and catches it again, this feature has disappeared. Look at the parts played by skill and luck; and at the difference between skill in chess and skill in tennis. Think now of games like ring-a-ring-a-roses; here is the element of amusement, but how many other characteristic features have disappeared! And we can go through the many, many other groups of games in the same way; can see how similarities crop up and disappear.

And the result of this examination is: we see a complicated network of similarities overlapping and criss-crossing: sometimes overall similarities, sometimes similarities of detail.

67. I can think of no better expression to characterize these similarities than "family resemblances"; for the various resemblances between members of a family: build, features, colour of eyes, gait, temperament, etc., etc. overlap and criss-cross in the same way.—And I shall say: "games" form a family.

And for instance the kinds of number form a family in the same way. Why do we call something a "number"? Well, perhaps because it has a—direct—relationship with several things that have hitherto been called number; and this can be said to give it an indirect relationship to other things we call the same name. And we extend our concept of number as in spinning a thread we twist fibre on fibre. And the strength of the thread does not reside in the fact that some one fibre runs through its whole length, but in the overlapping of many fibres.

But if someone wished to say: "There is something common to all these constructions—namely the disjunction of all their common properties"—I should reply: Now you are only playing with words. One might as well say: "Something runs through the whole thread—namely the continuous overlapping of those fibres."

68. "All right: the concept of number is defined for you as the logical sum of these individual interrelated concepts: cardinal numbers, rational numbers, real numbers, etc.; and in the same way the concept of a game as the logical sum of a corresponding set of sub-concepts."—It need not be so. For I *can* give the concept 'number' rigid limits in this way, that is, use the word "number" for a rigidly limited concept, but I can also use it so that the extension of the concept is *not* closed by a frontier. And this is how we do use the

word “game.” For how is the concept of a game bounded? What still counts as a game and what no longer does? Can you give the boundary? No. You can *draw* one; for none has so far been drawn. (But that never troubled you before when you used the word “game.”)

“But then the use of the word is unregulated, the ‘game’ we play with it is unregulated.”—It is not everywhere circumscribed by rules; but no more are there any rules for how high one throws the ball in tennis, or how hard; yet tennis is a game for all that and has rules too.

69. How should we explain to someone what a game is? I imagine that we should describe *games* to him, and we might add: “This *and similar things* are called ‘games’.” And do we know any more about it ourselves? Is it only other people whom we cannot tell exactly what a game is?—But this is not ignorance. We do not know the boundaries because none have been drawn. To repeat, we can draw a boundary—for a special purpose. Does it take that to make the concept usable? Not at all! (Except for that special purpose.) No more than it took the definition: 1 pace = 75 cm to make the measure of length ‘one pace’ usable. And if you want to say “But still, before that it wasn’t an exact measure,” then I reply: very well, it was an inexact one.—Though you still owe me a definition of exactness.

70. “But if the concept ‘game’ is uncircumscribed like that, you don’t really know what you mean by a ‘game’.”—When I give the description: “The ground was quite covered with plants”—do you want to say I don’t know what I am talking about until I can give a definition of a plant?

My meaning would be explained by, say, a drawing and the words “The ground looked roughly like this.” Perhaps I even say “it looked *exactly* like this.”—Then were just *this* grass and *these* leaves there, arranged just like this? No, that is not what it means. And I should not accept any picture as exact in *this* sense.

Someone says to me: “Shew the children a game.” I teach them gaming with dice, and the other says “I didn’t mean that sort of game.” Must the exclusion of the game with dice have come before his mind when he gave me the order? [Note added by Wittgenstein.]

71. One might say that the concept ‘game’ is a concept with blurred edges.—“But is a blurred concept a concept at all?”—Is an indistinct photograph a picture of a person at all? Is it even always an advantage to replace an indistinct picture by a sharp one? Isn’t the indistinct one often exactly what we need?

Frege compares a concept to an area and says that an area with vague boundaries cannot be called an area at all. This presumably means that we cannot do anything with it.—But is it senseless to say: “Stand roughly there”? Suppose that I were standing with someone in a city square and said that. As I say it I do not draw any kind of boundary, but perhaps point with my hand—as if I were indicating a particular *spot*. And this is just how one might explain to someone what a game is. One gives examples and intends them to be taken in a particular way.—I do not, however, mean by this that he is supposed to see in those examples that common thing which I—for some reason—was unable to express; but that he is now to *employ* those examples in a particular way. Here giving examples is not an *indirect* means of explaining—in default of a better. For any general definition can be misunderstood too. The point is that *this* is how we play the game. (I mean the language-game with the word “game.”)

241. “So you are saying that human agreement decides what is true and what is false?”—It is what human beings say that is true and false; and they agree in the *language* they use. That is not agreement in opinions but in form of life.

* * *

257. “What would it be like if human beings shewed no outward signs of pain (did not groan, grimace, etc.)? Then it would be impossible to teach a child the use of the word ‘tooth-ache’.”—Well, let’s assume the child is a genius and itself invents a name for the sensation!—But then, of course, he couldn’t make himself understood when he used the word.—So does he understand the name, without being able to explain its meaning to anyone?—But what does it mean to say that he has ‘named his pain’?—How has he done this naming of pain?! And whatever he did, what was its purpose?—When one says “He gave a name to his sensation” one forgets that a great deal of stage-setting in the language is presupposed if the mere act of naming is to make sense. And when we speak of someone’s having given a name to pain, what is presupposed is the existence of the grammar of the word “pain”; it shews the post where the new word is stationed.

258. Let us imagine the following case. I want to keep a diary about the recurrence of a certain sensation. To this end I associate it with the sign “S” and write this sign in a calendar for every day on which I have the sensation. I will remark first of all that a definition of the sign cannot be formulated.—But still I can give myself a kind of ostensive definition.—How? Can I point to the sensation? Not in the ordinary sense. But I speak, or write the sign down, and at the same time I concentrate my attention on the sensation—and so, as it were, point to it inwardly.—But what is this ceremony for? for that is all it seems to be! A definition surely serves to establish the meaning of a sign.—Well, that is done precisely by the concentrating of my attention; for in this way I impress on myself the connexion between the sign and the sensation.—But “I impress it on myself” can only mean: this process brings it about that I remember the connexion *right* in the future. But in the present case I have no criterion of correctness. One would like to say: whatever is going to seem right to me is right. And that only means that here we can’t talk about ‘right.’

* * *

305. “But you surely cannot deny that, for example, in remembering, an inner process takes place.”—What gives the impression that we want to deny anything? When one says “Still, an inner process does take place here”—one wants to go on: “After all, you *see* it.” And it is this inner process that one means by the word “remembering.”—The impression that we wanted to deny something arises from our setting our faces against the picture of the ‘inner process.’ What we deny is that the picture of the inner process gives us the correct idea of the use of the word “to remember.” We say that this picture with its ramifications stands in the way of our seeing the use of the word as it is.

* * *

309. What is your aim in philosophy?—To shew the fly the way out of the flybottle.

JEAN-PAUL SARTRE

1905–1980

In addition to being one of the leading philosophers of the twentieth century, Jean-Paul Sartre was also an essayist, novelist, playwright, and editor. His name has become synonymous with existentialism, a movement that exploded beyond the boundaries of the academy to enter virtually every area of Western culture. Sartre himself became as famous as the philosophy he taught, and at his death in 1980, almost 50,000 people accompanied his casket to Paris's Montparnasse Cemetery.

Jean-Paul-Charles-Aymard Sartre was born in Paris in 1905, the only child of naval officer Jean-Baptiste Sartre and his wife Anne-Marie Schweitzer Sartre. Barely a year after his birth, his father died. Jean-Paul and his mother moved in with her parents. Sartre's maternal grandfather, a German-language teacher, had a study filled with books; this room fascinated the young Sartre. He taught himself to read, and by the age of 8 he had read French classics such as *Madame Bovary*. While still a boy, his devotion to books overwhelmed all other devotions—including that to religion. From about the age of 12, Sartre said that he was a confirmed atheist. He did exceptionally well in his studies, exhibiting a clear independence of mind. One of his teachers noted on his report card: "Excellent student: mind already lively, good at discussing questions, but needs to depend a little less on himself."

In 1924, Sartre enrolled at the prestigious École Normale Supérieure. Over the next four years, he studied for the *agrégation* in philosophy (the highest degree except for the doctorate in the French system), but surprisingly he failed the written examination on his first attempt. He retook the examination a year later and placed first.

The person who took second in that 1929 examination was his study partner, Simone de Beauvoir. That same year, Sartre suggested to her that they take

Guernica, 1937, by Pablo Picasso (1881–1973). In 1937 the city of Guernica was destroyed by German bombers simply for the purpose of testing their new weapons. Sartre’s friend Picasso created this painting to memorialize the innocent sacrifice of the Spanish people. This representation of broken, fragmented pieces of humanity wrung by pain and anxiety capture well the reality of death and violence. Sartre insisted that to live fully one must squarely face such suffering. (© Succession Picasso/DACS, London 2015.)

“a two-year lease” on each other. Though neither believed in the bourgeois institution of marriage, and each had a variety of lovers, the two remained “companions” for life.

Over the next ten years, Sartre served briefly in the army, studied in Berlin, taught at a number of lycées, and began writing. Among his early publications were the philosophical novel *Nausea* (1938) and the collection of short stories *The Wall* (1939).

In 1939, Sartre was called up for active duty by the French army. Within the year, he was captured by the Germans. Released a few months later, he seemed to return to a quiet life of teaching and writing. But Sartre was secretly a member of the French resistance. He was never involved in the armed resistance but worked with the intellectual resistance group Socialism and Liberty. Even during the war, Sartre continued his writing, and in 1943 he published his most important philosophical text, *Being and Nothingness*. Three years later, *Existentialism Is a Humanism*, his most widely read philosophical work, was published.

After the war, Sartre retired from teaching and, with Maurice Merleau-Ponty and de Beauvoir, founded the influential journal *Les Temps modernes*. He was awarded the Nobel Prize for literature in 1964 but refused to accept it. Together with de Beauvoir, he spent the rest of his life writing and promoting revolutionary political causes. Frequently joining students or union workers in demonstrations, Sartre even served as president of the International War Crimes Tribunal, which condemned U.S. intervention in Vietnam. He was attracted to Marxist thought—though he frequently criticized the French Communist Party for its inadequacies. The discrepancies between the determinism of Marxist theory and Sartre’s existentialist emphasis on radical freedom have been the subject of many books. (See the suggested readings.)

Throughout his life, Sartre preferred the pleasures of the café over the joys of the hearth. For years, he and de Beauvoir were fixtures at La Coupole, a restaurant on the Left Bank of Paris frequented by artists. But eventually his health deteriorated, exacerbated by his frequent use of amphetamines, and he was forced to retire to his apartment. After an agonizingly slow decline, Sartre died in 1980.

* * *

Like Heidegger before him, Sartre was fascinated with “being.” According to Sartre, there are two categories of being: “being-in-itself” (*être en-soi*) and “being-for-itself” (*être pour-soi*). *Being-in-itself* is complete in itself, “solid,” fixed, and totally given: “Uncreated, without reason for being, without connection with any other being, being-in-itself is superfluous for all eternity.” Like Parmenides’ One, being-in-itself simply is. This is the being of rocks and trees. This being-in-itself has no sufficient reason for being, no purpose or meaning—it is “absurd.”

Being-for-itself, on the other hand, is incomplete and fluid and without a determined structure. Being-for-itself is the being of human consciousness that at every moment is freely choosing its future. This consciousness arises by virtue of its power of negation, based on freedom: “[Consciousness] constitutes itself in its own flesh as the nihilation of a possibility which another human reality projects as its possibility. For that reason it must arise in the world as a Not.” Individual consciousness constitutes itself by freely rejecting all roles that others try to force upon it. It is precisely in the act of saying “No” to all attempts to make me into a being-in-itself that I create myself as a being-for-itself.

In creating myself, I do not choose what I will become on the basis of pre-existing values. There are no eternal values, no givens for me to use. Dostoevsky’s character Ivan Karamazov had claimed, “If there is no God, all things are lawful.” Sartre agreed and added that since there was no God, all things are, indeed, lawful. In fact, there is no possible justification for any choice I might make, since justification implies an appeal to given values. I am free to choose my values without any external justification.

Although this freedom is complete, it is not absolute. In the first place, as a free being, I encounter other free beings. My world is interrupted when the “other” gives me “the look.” By looking at me, the other objectifies me, makes me a part of his or her world, part of his or her freedom: “Thus being-seen constitutes me as a being without defenses for a freedom which is not my freedom.” But I can regain my freedom by looking back and by an act of will transforming the other into an object for me. (This world of people-objects led Sartre to exclaim, “Hell is other people.”)

Second, I must acknowledge the “facticity” found in existence. I cannot change the fact that this tree is in front of me or that I cannot walk through it. But even here my freedom still prevails. I freely create the *meaning* of this tree as an object to climb or as a source of lumber or as a thing to be preserved or as a biological specimen. In creating these meanings, I create the world in which I live.

In *Existentialism Is a Humanism*, translated here by Bernard Frechtman, Sartre expands on this freedom while defending the basic ideas of existentialism. He begins by discussing human artifacts, such as a book or a paper-cutter. An object such as a paper-cutter begins as an essence, that is, as an “ensemble of both the production routines and the properties which enable it to be both produced and

defined.” One conceives of a paper-cutter (essentially) and how to make it and only then does one construct it. The essence of a paper-cutter precedes its existence. According to Sartre, theists believe that God does the same with human beings. First God conceives of humans and then creates them. But Sartre says that there is no God, and hence no preexisting human essence: “There is no human nature, since there is no God to conceive it.” Instead, “Man is nothing else but what he makes of himself.” For humans, existence precedes essence.

When one realizes the implications of this atheism and the primacy of freedom, one is brought to anguish and forlornness. But Sartre strongly denied that this state necessarily led to despair. Even though all my actions are indeed ultimately futile because of my eventual death, and existence is in fact absurd, I can still choose my actions and so give my life meaning. As Sartre concluded, “In this sense existentialism is optimistic, a doctrine of action.”

* * *

There are many studies of existentialism; see especially Gabriel Marcel, *The Philosophy of Existentialism*, translated by Manya Harari (New York: Citadel Press, 1956); Hazel E. Barnes, *An Existentialist Ethic* (Chicago: University of Chicago Press, 1967); and William Barrett’s two books, *Irrational Man* (Garden City, NY: Doubleday, 1962) and *What Is Existentialism?* (New York: Grove Press, 1964); and Steven Earnshaw, *Existentialism: A Guide for the Perplexed* (London: Continuum, 2007). For primary source materials, see Walter Kaufmann, ed., *Existentialism from Dostoevsky to Sartre* (New York: Viking Press, 1956) and Charles Guignon and Derk Pereboom, *Existentialism: Basic Texts* (Indianapolis, IN: Hackett, 1994).

For biographies of Sartre, see Annie Cohen-Solal, *Sartre: A Life*, translated by Anna Cancogni (New York: Pantheon Books, 1987); John Gerassi, *Jean-Paul Sartre: Hated Conscience of His Century* (Chicago: University of Chicago Press, 1989); and Simone de Beauvoir’s recounting of Sartre’s final days, *Adieux: A Farewell to Sartre* (New York: Pantheon, 1984). For general introductions to Sartre’s thought, see Mary Warnock, *The Philosophy of Sartre* (London: Hutchinson, 1965); Anthony Manser, *Sartre: A Philosophic Study* (London: Athlone Press, 1966); Arthur C. Danto, *Jean-Paul Sartre* (New York: Viking Press, 1975); Peter Caws, *Sartre* (London: Routledge & Kegan Paul, 1979); and Gary Cox, *Sartre: A Guide for the Perplexed* (London: Continuum, 2006). Iris Murdoch, *Sartre: Romantic Rationalist* (New Haven, CT: Yale University Press, 1959) explores the philosophical ideas in Sartre’s novels. For collections of essays, see Edith Kern, ed., *Sartre: A Collection of Critical Essays* (Englewood Cliffs, NJ: Prentice Hall, 1962); Mary Warnock, ed., *Sartre* (Garden City, NY: Anchor Doubleday, 1971); Hugh J. Silverman and Frederick A. Elliston, eds., *Jean-Paul Sartre: Contemporary Approaches to His Philosophy* (Pittsburgh, PA: Duquesne University Press, 1980); Paul A. Schilpp, ed., *The Philosophy of Jean-Paul Sartre* (La Salle, IL: Open Court, 1981); Christina Howells, ed., *The Cambridge Companion to Sartre* (Cambridge: Cambridge University Press, 1992); and the multi-volume William L. McBride, *Sartre and Existentialism* (Hamden, CT: Garland, 1997).

EXISTENTIALISM IS A HUMANISM

I should like on this occasion to defend existentialism against some charges which have been brought against it.

First, it has been charged with inviting people to remain in a kind of desperate quietism because, since no solutions are possible, we should have to consider action in this world as quite impossible. We should then end up in a philosophy of contemplation; and since contemplation is a luxury, we come in the end to a bourgeois philosophy. The communists in particular have made these charges.

On the other hand, we have been charged with dwelling on human degradation, with pointing up everywhere the sordid, shady, and slimy, and neglecting the gracious and beautiful, the bright side of human nature; for example, according to Mlle. Mercier, a Catholic critic, with forgetting the smile of the child. Both sides charge us with having ignored human solidarity, with considering man as an isolated being. The communists say that the main reason for this is that we take pure subjectivity, *the Cartesian I think*, as our starting point; in other words, the moment in which man becomes fully aware of what it means to him to be an isolated being; as a result, we are unable to return to a state of solidarity with the men who are not ourselves, a state which we can never reach in the *cogito*.

From the Christian standpoint, we are charged with denying the reality and seriousness of human undertakings, since, if we reject God's commandments and the eternal verities, there no longer remains anything but pure caprice, with everyone permitted to do as he pleases and incapable, from his own point of view, of condemning the points of view and acts of others.

I shall try today to answer these different charges. Many people are going to be surprised at what is said here about humanism. We shall try to see in what sense it is to be understood. In any case, what can be said from the very beginning is that by existentialism we mean a doctrine which makes human life possible and, in addition, declares that every truth and every action implies a human setting and a human subjectivity.

As is generally known, the basic charge against us is that we put the emphasis on the dark side of human life. Someone recently told me of a lady who, when she let slip a vulgar word in a moment of irritation, excused herself by saying, "I guess I'm becoming an existentialist." Consequently, existentialism is regarded as something ugly; that is why we are said to be naturalists; and if we are, it is rather surprising that in this day and age we cause so much more alarm and scandal than does naturalism, properly so called. The kind of person who can take in his stride such a novel as Zola's *The Earth* is disgusted as soon as he starts reading an existentialist novel; the kind of person who is resigned to the wisdom of the ages—which is pretty sad—finds us even sadder. Yet, what can be more disillusioning than saying "true charity begins at home" or "a scoundrel will always return evil for good"?

We know the commonplace remarks made when this subject comes up, remarks which always add up to the same thing: we shouldn't struggle against the powers-that-be; we shouldn't resist authority; we shouldn't try to rise above our station; any action which doesn't conform to authority is romantic; any effort not based on past experience is doomed to failure; experience shows that man's bent is always toward trouble, that there

must be a strong hand to hold him in check, if not, there will be anarchy. There are still people who go on mumbling these melancholy old saws, the people who say, "It's only human!" whenever a more or less repugnant act is pointed out to them, the people who glut themselves on *chansons réalistes*; these are the people who accuse existentialism of being too gloomy, and to such an extent that I wonder whether they are complaining about it, not for its pessimism, but much rather its optimism. Can it be that what really scares them in the doctrine I shall try to present here is that it leaves to man a possibility of choice? To answer this question, we must re-examine it on a strictly philosophical plane. What is meant by the term *existentialism*?

Most people who use the word would be rather embarrassed if they had to explain it, since, now that the word is all the rage, even the work of a musician or painter is being called existentialist. A gossip columnist in *Clartés* signs himself *The Existentialist*, so that by this time the word has been so stretched and has taken on so broad a meaning, that it no longer means anything at all. It seems that for want of an avant-garde doctrine analogous to surrealism, the kind of people who are eager for scandal and flurry turn to this philosophy which in other respects does not at all serve their purposes in this sphere.

Actually, it is the least scandalous, the most austere of doctrines. It is intended strictly for specialists and philosophers. Yet it can be defined easily. What complicates matters is that there are two kinds of existentialist; first, those who are Christian, among whom I would include Jaspers and Gabriel Marcel, both Catholic; and on the other hand the atheistic existentialists, among whom I class Heidegger, and then the French existentialists and myself. What they have in common is that they think that existence precedes essence, or, if you prefer, that subjectivity must be the starting point.

Just what does that mean? Let us consider some object that is manufactured, for example, a book or a paper-cutter: here is an object which has been made by an artisan whose inspiration came from a concept. He referred to the concept of what a paper-cutter is and likewise to a known method of production, which is part of the concept, something which is, by and large, a routine. Thus, the paper-cutter is at once an object produced in a certain way and, on the other hand, one having a specific use; and one cannot postulate a man who produces a paper-cutter but does not know what it is used for. Therefore, let us say that, for the paper-cutter, essence—that is, the ensemble of both the production routines and the properties which enable it to be both produced and defined—precedes existence. Thus, the presence of the paper-cutter or book in front of me is determined. Therefore, we have here a technical view of the world whereby it can be said that production precedes existence.

When we conceive God as the Creator, He is generally thought of as a superior sort of artisan. Whatever doctrine we may be considering, whether one like that of Descartes or that of Leibnitz, we always grant that will more or less follows understanding or, at the very least, accompanies it, and that when God creates He knows exactly what He is creating. Thus, the concept of man in the mind of God is comparable to the concept of paper-cutter in the mind of the manufacturer, and, following certain techniques and a conception, God produces man, just as the artisan, following a definition and a technique, makes a paper-cutter. Thus, the individual man is the realization of a certain concept in the divine intelligence.

In the eighteenth century, the atheism of the *philosophes* discarded the idea of God, but not so much for the notion that essence precedes existence. To a certain extent, this idea is found everywhere; we find it in Diderot, in Voltaire, and even in Kant. Man has a human nature; this human nature, which is the concept of the human, is found in all men, which means that each man is a particular example of a universal concept, man. In

Kant, the result of this universality is that the wild-man, the natural man, as well as the bourgeois, are circumscribed by the same definition and have the same basic qualities. Thus, here too the essence of man precedes the historical existence that we find in nature.

Atheistic existentialism, which I represent, is more coherent. It states that if God does not exist, there is at least one being in whom existence precedes essence, a being who exists before he can be defined by any concept, and that this being is man, or, as Heidegger says, human reality. What is meant here by saying that existence precedes essence? It means that, first of all, man exists, turns up, appears on the scene, and, only afterwards, defines himself. If man, as the existentialist conceives him, is indefinable, it is because at first he is nothing. Only afterward will he be something, and he himself will have made what he will be. Thus, there is no human nature, since there is no God to conceive it. Not only is man what he conceives himself to be, but he is also only what he wills himself to be after this thrust toward existence.

Man is nothing else but what he makes of himself. Such is the first principle of existentialism. It is also what is called subjectivity, the name we are labeled with when charges are brought against us. But what do we mean by this, if not that man has a greater dignity than a stone or table? For we mean that man first exists, that is, that man first of all is the being who hurls himself toward a future and who is conscious of imagining himself as being in the future. Man is at the start a plan which is aware of itself, rather than a patch of moss, a piece of garbage, or a cauliflower; nothing exists prior to this plan; there is nothing in heaven; man will be what he will have planned to be. Not what he will want to be. Because by the word "will" we generally mean a conscious decision, which is subsequent to what we have already made of ourselves. I may want to belong to a political party, write a book, get married; but all that is only a manifestation of an earlier, more spontaneous choice that is called "will." But if existence really does precede essence, man is responsible for what he is. Thus, existentialism's first move is to make every man aware of what he is and to make the full responsibility of his existence rest on him. And when we say that a man is responsible for himself, we do not only mean that he is responsible for his own individuality, but that he is responsible for all men.

The word subjectivism has two meanings, and our opponents play on the two. Subjectivism means, on the one hand, that an individual chooses and makes himself; and, on the other, that it is impossible for man to transcend human subjectivity. The second of these is the essential meaning of existentialism. When we say that man chooses his own self, we mean that every one of us does likewise; but we also mean by that that in making this choice he also chooses all men. In fact, in creating the man that we want to be, there is not a single one of our acts which does not at the same time create an image of man as we think he ought to be. To choose to be this or that is to affirm at the same time the value of what we choose, because we can never choose evil. We always choose the good, and nothing can be good for us without being good for all.

If, on the other hand, existence precedes essence, and if we grant that we exist and fashion our image at one and the same time, the image is valid for everybody and for our whole age. Thus, our responsibility is much greater than we might have supposed, because it involves all mankind. If I am a workingman and choose to join a Christian trade-union rather than be a communist, and if by being a member I want to show that the best thing for man is resignation, that the kingdom of man is not of this world, I am not only involving my own case—I want to be resigned for everyone. As a result, my action has involved all humanity. To take a more individual matter, if I want to marry, to have children; even if this marriage depends solely on my own circumstances or passion or wish, I am involving all humanity in monogamy and not merely myself. Therefore,

I am responsible for myself and for everyone else. I am creating a certain image of man of my own choosing. In choosing myself, I choose man.

This helps us understand what the actual content is of such rather grandiloquent words as anguish, forlornness, despair. As you will see, it's all quite simple.

First, what is meant by anguish? The existentialists say at once that man is in anguish. What that means is this: the man who involves himself and who realizes that he is not only the person he chooses to be, but also a law-maker who is, at the same time, choosing all mankind as well as himself, can not help escape the feeling of his total and deep responsibility. Of course, there are many people who are not anxious; but we claim that they are hiding their anxiety, that they are fleeing from it. Certainly, many people believe that when they do something, they themselves are the only ones involved, and when someone says to them, "What if everyone acted that way?" they shrug their shoulders and answer, "Everyone doesn't act that way." But really, one should always ask himself, "What would happen if everybody looked at things that way?" There is no escaping this disturbing thought except by a kind of double-dealing. A man who lies and makes excuses for himself by saying "not everybody does that," is someone with an uneasy conscience, because the act of lying implies that a universal value is conferred upon the lie.

Anguish is evident even when it conceals itself. This is the anguish that Kierkegaard called the anguish of Abraham. You know the story: an angel has ordered Abraham to sacrifice his son; if it really were an angel who has come and said, "You are Abraham, you shall sacrifice your son," everything would be all right. But everyone might first wonder, "Is it really an angel, and am I really Abraham? What proof do I have?"

There was a mad woman who had hallucinations; someone used to speak to her on the telephone and give her orders. Her doctor asked her, "Who is it who talks to you?" She answered, "He says it's God." What proof did she really have that it was God? If an angel comes to me, what proof is there that it's an angel? And if I hear voices, what proof is there that they come from heaven and not from hell, or from the subconscious, or a pathological condition? What proves that they are addressed to me? What proof is there that I have been appointed to impose my choice and my conception of man on humanity? I'll never find any proof or sign to convince me of that. If a voice addresses me, it is always for me to decide that this is the angel's voice; if I consider that such an act is a good one, it is I who will choose to say that it is good rather than bad.

Now, I'm not being singled out as an Abraham, and yet at every moment I'm obliged to perform exemplary acts. For every man, everything happens as if all mankind had its eyes fixed on him and were guiding itself by what he does. And every man ought to say to himself, "Am I really the kind of man who has the right to act in such a way that humanity might guide itself by my actions?" And if he does not say that to himself, he is masking his anguish.

There is no question here of the kind of anguish which would lead to quietism, to inaction. It is a matter of a simple sort of anguish that anybody who has had responsibilities is familiar with. For example, when a military officer takes the responsibility for an attack and sends a number of men to death, he chooses to do so, and in the main he alone makes the choice. Doubtless, orders come from above, but they are too broad; he interprets them, and on this interpretation depend the lives of ten or fourteen or twenty men. In making a decision he can not help having a certain anguish. All leaders know this anguish. That doesn't keep them from acting; on the contrary, it is the very condition of their action. For it implies that they envisage a number of possibilities, and when they choose one, they realize that it has value only because it is chosen. We shall see that this kind of anguish, which is the kind that existentialism describes, is explained, in

addition, by a direct responsibility to the other men whom it involves. It is not a curtain separating us from action, but is part of action itself.

When we speak of forlornness, a term Heidegger was fond of, we mean only that God does not exist and that we have to face all the consequences of this. The existentialist is strongly opposed to a certain kind of secular ethics which would like to abolish God with the least possible expense. About 1880, some French teachers tried to set up a secular ethic which went something like this: God is a useless and costly hypothesis; we are discarding it; but, meanwhile, in order for there to be an ethics, a society, a civilization, it is essential that certain values be taken seriously and that they be considered as having an *a priori* existence. It must be obligatory, *a priori*, to be honest, not to lie, not to beat your wife, to have children, etc., etc. So we're going to try a little device which will make it possible to show that values exist all the same, inscribed in a heaven of ideas, though otherwise God does not exist. In other words—and this, I believe, is the tendency of everything called reformism in France—nothing will be changed if God does not exist. We shall find ourselves with the same norms of honesty, progress, and humanism, and we shall have made of God an outdated hypothesis which will peacefully die off by itself.

The existentialist, on the contrary, thinks it very distressing that God does not exist, because all possibility of finding values in a heaven of ideas disappears along with Him; there can no longer be an *a priori* Good, since there is no infinite and perfect consciousness to think it. Nowhere is it written that the Good exists, that we must be honest, that we must not lie; because the fact is we are on a plane where there are only men. Dostoevski said, "If God didn't exist, everything would be possible." That is the very starting point of existentialism. Indeed, everything is permissible if God does not exist, and as a result man is forlorn, because neither within him nor without does he find anything to cling to. He can't start making excuses for himself.

If existence really does precede essence, there is no explaining things away by reference to a fixed and given human nature. In other words, there is not determinism, man is free, man is freedom. On the other hand, if God does not exist, we find no values or commands to turn to which legitimize our conduct. So, in the bright realm of values, we have no excuse behind us, nor justification before us. We are alone, with no excuses.

That is the idea I shall try to convey when I say that man is condemned to be free. Condemned, because he did not create himself, yet, in other respects is free; because, once thrown into the world, he is responsible for everything he does. The existentialist does not believe in the power of passion. He will never agree that a sweeping passion is a ravaging torrent which fatally leads a man to certain acts and is therefore an excuse. He thinks that man is responsible for his passion.

The existentialist does not think man is going to help himself by finding in the world some omen by which to orient himself. Because he thinks that man will interpret the omen to suit himself. Therefore, he thinks that man, with no support and no aid, is condemned every moment to invent man. Ponge, in a very fine article, has said, "Man is the future of man." That's exactly it. But if it is taken to mean that this future is recorded in heaven, that God sees it, then it is false, because it would really no longer be a future. If it is taken to mean that, whatever a man may be, there is a future to be forged, a virgin future before him, then this remark is sound. But then we are forlorn.

To give you an example which will enable you to understand forlornness better, I shall cite the case of one of my students who came to see me under the following circumstances: his father was on bad terms with his mother, and, moreover, was inclined to be a collaborationist; his older brother had been killed in the German offensive of

1940, and the young man, with somewhat immature but generous feelings, wanted to avenge him. His mother lived alone with him, very much upset by the half-treason of her husband and the death of her older son; the boy was her only consolation.

The boy was faced with the choice of leaving for England and joining the Free French Forces—that is, leaving his mother behind—or remaining with his mother and helping her to carry on. He was fully aware that the woman lived only for him and that his going-off—and perhaps his death—would plunge her into despair. He was also aware that every act that he did for his mother's sake was a sure thing, in the sense that it was helping her to carry on, whereas every effort he made toward going off and fighting was an uncertain move which might run aground and prove completely useless; for example, on his way to England he might, while passing through Spain, be detained indefinitely in a Spanish camp; he might reach England or Elgers and be stuck in an office at a desk job. As a result, he was faced with two very different kinds of action: one, concrete, immediate, but concerning only one individual; the other concerned an incomparably vaster group, a national collectivity, but for that very reason was dubious, and might be interrupted en route. And, at the same time, he was wavering between two kinds of ethics. On the one hand, an ethics of sympathy, of personal devotion; on the other, a broader ethics, but one whose efficacy was more dubious. He had to choose between the two.

Who could help him choose? Christian doctrine? No. Christian doctrine says, "Be charitable, love your neighbor, take the more rugged path, etc., etc." But which is the more rugged path? Whom should he love as a brother? The fighting man or his mother? Which does the greater good, the vague act of fighting in a group, or the concrete one of helping a particular human being to go on living? Who can decide *a priori*? Nobody. No book of ethics can tell him. The Kantian ethics says, "Never treat any person as a means, but as an end." Very well, if I stay with my mother, I'll treat her as an end and not as a means; but by virtue of this very fact, I'm running the risk of treating the people around me who are fighting, as means; and, conversely, if I go to join those who are fighting, I'll be treating them as an end, and, by doing that, I run the risk of treating my mother as a means.

If values are vague, and if they are always too broad for the concrete and specific case that we are considering, the only thing left for us is to trust our instincts. That's what this young man tried to do; and when I saw him, he said, "In the end, feeling is what counts. I ought to choose whichever pushes me in one direction. If I feel that I love my mother enough to sacrifice everything else for her—my desire for vengeance, for action, for adventure—then I'll stay with her. If, on the contrary, I feel that my love for my mother isn't enough, I'll leave."

But how is the value of a feeling determined? What gives his feeling for his mother value? Precisely the fact that he remained with her. I may say that I like so-and-so well enough to sacrifice a certain amount of money for him, but I may say so only if I've done it. I may say "I love my mother well enough to remain with her" if I have remained with her. The only way to determine the value of this affection is, precisely, to perform an act which confirms and defines it. But, since I require this affection to justify my act, I find myself caught in a vicious circle.

On the other hand, Gide has well said that a mock feeling and a true feeling are almost indistinguishable; to decide that I love my mother and will remain with her, or to remain with her by putting on an act, amount somewhat to the same thing. In other words, the feeling is formed by the acts one performs; so, I can not refer to it in order to act upon it. Which means that I can neither seek within myself the true condition which will impel me to act, nor apply to a system of ethics for concepts which will permit me to act. You will say, "At least, he did go to a teacher for advice." But if you seek advice

from a priest, for example, you have chosen this priest; you already knew, more or less, just about what advice he was going to give you. In other words, choosing your adviser is involving yourself. The proof of this is that if you are a Christian, you will say, "Consult a priest." But some priests are collaborating, some are just marking time, some are resisting. Which to choose? If the young man chooses a priest who is resisting or collaborating, he has already decided on the kind of advice he's going to get. Therefore, in coming to see me he knew the answer I was going to give him, and I had only one answer to give: "You're free, choose, that is, invent." No general ethics can show you what is to be done; there are no omens in the world. The Catholics will reply, "But there are." Granted—but, in any case, I myself choose the meaning they have.

When I was a prisoner, I knew a rather remarkable young man who was a Jesuit. He had entered the Jesuit order in the following way: he had a number of very bad breaks; in childhood, his father died, leaving him in poverty, and he was a scholarship student at a religious institution where he was constantly made to feel that he was being kept out of charity; then, he failed to get any of the honors and distinctions that children like; later on, at about eighteen, he bungled a love affair; finally, at twenty-two, he failed in military training, a childish enough matter, but it was the last straw.

This young fellow might well have felt that he had botched everything. It was a sign of something, but of what? He might have taken refuge in bitterness or despair. But he very wisely looked upon all this as a sign that he was not made for secular triumphs, and that only the triumphs of religion, holiness, and faith were open to him. He saw the hand of God in all this, and so he entered the order. Who can help seeing that he alone decided what the sign meant?

Some other interpretation might have been drawn from this series of setbacks; for example, that he might have done better to turn carpenter or revolutionist. Therefore, he is fully responsible for the interpretation. Forlornness implies that we ourselves choose our being. Forlornness and anguish go together.

As for despair, the term has a very simple meaning. It means that we shall confine ourselves to reckoning only with what depends upon our will, or on the ensemble of probabilities which make our action possible. When we want something, we always have to reckon with probabilities. I may be counting on the arrival of a friend. The friend is coming by rail or street-car; this supposes that the train will arrive on schedule, or that the street-car will not jump the track. I am left in the realm of possibility; but possibilities are to be reckoned with only to the point where my action comports with the ensemble of these possibilities, and no further. The moment the possibilities I am considering are not rigorously involved by my action, I ought to disengage myself from them, because no God, no scheme, can adapt the world and its possibilities to my will. When Descartes said, "Conquer yourself rather than the world," he meant essentially the same thing.

The Marxists to whom I have spoken reply, "You can rely on the support of others in your action, which obviously has certain limits because you're not going to live forever. That means: rely on both what others are doing elsewhere to help you, in China, in Russia, and what they will do later on, after your death, to carry on the action and lead it to its fulfillment, which will be the revolution. You even *have* to rely upon that, otherwise you're immoral." I reply at once that I will always rely on fellow-fighters insofar as these comrades are involved with me in a common struggle, in the unity of a party or a group in which I can more or less make my weight felt; that is, one whose ranks I am in as a fighter and whose movements I am aware of at every moment. In such a situation, relying on the unity and will of the party is exactly like counting on the fact that the train will arrive on time, or that the car won't jump the track. But, given that

man is free and that there is no human nature for me to depend on, I can not count on men whom I do not know by relying on human goodness or man's concern for the good of society. I don't know what will become of the Russian revolution; I may make an example of it to the extent that at the present time it is apparent that the proletariat plays a part in Russia that it plays in no other nation. But I can't swear that this will inevitably lead to a triumph of the proletariat. I've got to limit myself to what I see.

Given that men are free and that tomorrow they will freely decide what man will be, I can not be sure that, after my death, fellow-fighters will carry on my work to bring it to its maximum perfection. Tomorrow, after my death, some men may decide to set up Fascism, and the others may be cowardly and muddled enough to let them do it. Fascism will then be the human reality, so much the worse for us.

Actually, things will be as man will have decided they are to be. Does that mean that I should abandon myself to quietism? No. First, I should involve myself; then, act on the old saw, "Nothing ventured, nothing gained." Nor does it mean that I shouldn't belong to a party, but rather that I shall have no illusions and shall do what I can. For example, suppose I ask myself, "Will socialization, as such, ever come about?" I know nothing about it. All I know is that I'm going to do everything in my power to bring it about. Beyond that, I can't count on anything. Quietism is the attitude of people who say, "Let others do what I can't do." The doctrine I am presenting is the very opposite of quietism, since it declares, "There is no reality except in action." Moreover, it goes further, since it adds, "Man is nothing else than his plan; he exists only to the extent that he fulfills himself; he is therefore nothing else than the ensemble of his acts, nothing else than his life."

According to this, we can understand why our doctrine horrifies certain people. Because often the only way they can bear their wretchedness is to think, "Circumstances have been against me. What I've been and done doesn't show my true worth. To be sure, I've had no great love, no great friendship, but that's because I haven't met a man or woman who was worthy. The books I've written haven't been very good because I haven't had the proper leisure. I haven't had children to devote myself to because I didn't find a man with whom I could have spent my life. So there remains within me, unused and quite viable, a host of propensities, inclinations, possibilities, that one wouldn't guess from the mere series of things I've done."

Now, for the existentialist there is really no love other than one which manifests itself in a person's being in love. There is no genius other than one which is expressed in works of art; the genius of Proust is the sum of Proust's works; the genius of Racine is his series of tragedies. Outside of that, there is nothing. Why say that Racine could have written another tragedy, when he didn't write it? A man is involved in life, leaves his impress on it, and outside of that there is nothing. To be sure, this may seem a harsh thought to someone whose life hasn't been a success. But, on the other hand, it prompts people to understand that reality alone is what counts, that dreams, expectations, and hopes warrant no more than to define a man as a disappointed dream, as miscarried hopes, as vain expectations. In other words, to define him negatively and not positively. However, when we say, "You are nothing else than your life," that does not imply that the artist will be judged solely on the basis of his works of art; a thousand other things will contribute toward summing him up. What we mean is that a man is nothing else than a series of undertakings, that he is the sum, the organization, the ensemble of the relationships which make up these undertakings.

When all is said and done, what we are accused of, at bottom, is not our pessimism, but an optimistic toughness. If people throw up to us our works of fiction in which we write about people who are soft, weak, cowardly, and sometimes even downright bad,

it's not because these people are soft, weak, cowardly, or bad; because if we were to say, as Zola did, that they are that way because of heredity, the workings of environment, society, because of biological or psychological determinism, people would be reassured. They would say, "Well, that's what we're like, no one can do anything about it." But when the existentialist writes about a coward, he says that this coward is responsible for his cowardice. He's not like that because he has a cowardly heart or lung or brain; he's not like that on account of his physiological makeup; but he's like that because he has made himself a coward by his acts. There's no such thing as a cowardly constitution; there are nervous constitutions; there is poor blood, as the common people say, or strong constitutions. But the man whose blood is poor is not a coward on that account, for what makes cowardice is the act of renouncing or yielding. A constitution is not an act; the coward is defined on the basis of the acts he performs. People feel, in a vague sort of way, that this coward we're talking about is guilty of being a coward, and the thought frightens them. What people would like is that a coward or a hero be born that way.

One of the complaints most frequently made about *The Ways of Freedom** can be summed up as follows: "After all, these people are so spineless, how are you going to make heroes out of them?" This objection almost makes me laugh, for it assumes that people are born heroes. That's what people really want to think. If you're born cowardly, you may set your mind perfectly at rest; there's nothing you can do about it; you'll be cowardly all your life, whatever you may do. If you're born a hero, you may set your mind just as much at rest; you'll be a hero all your life; you'll drink like a hero and eat like a hero. What the existentialist says is that the coward makes himself cowardly, that the hero makes himself heroic. There's always a possibility for the coward not to be cowardly any more and for the hero to stop being heroic. What counts is total involvement; some one particular action or set of circumstances is not total involvement.

Thus, I think we have answered a number of the charges concerning existentialism. You see that it can not be taken for a philosophy of quietism, since it defines man in terms of action; nor for a pessimistic description of man—there is no doctrine more optimistic, since man's destiny is within himself; nor for an attempt to discourage man from acting, since it tells him that the only hope is in his acting and that action is the only thing that enables a man to live. Consequently, we are dealing here with an ethic of action and involvement.

Nevertheless, on the basis of a few notions like these, we are still charged with immuring man in his private subjectivity. There again we're very much misunderstood. Subjectivity of the individual is indeed our point of departure, and this for strictly philosophic reasons. Not because we are bourgeois, but because we want a doctrine based on truth and not a lot of fine theories, full of hope but with no real basis. There can be no other truth to take off from than this: *I think; therefore I exist*. There we have the absolute truth of consciousness becoming aware of itself. Every theory which takes man out of the moment in which he becomes aware of himself is, at its very beginning, a theory which confounds truth, for outside the Cartesian *cogito*, all views are only probable, and a doctrine of probability which is not bound to a truth dissolves into thin air. In order to describe the probable, you must have a firm hold on the true. Therefore, before there can be any truth whatsoever, there must be an absolute truth; and this one is simple and easily arrived at; it's on everyone's doorstep; it's a matter of grasping it directly.

*[*Les Chennus de la Liberté*, A trilogy of novels of which two—*L'Age de Raison* (*The Age of Reason*) and *Le Sursis* (*The Reprieve*)—had been published at the time of this article.]

Secondly, this theory is the only one which gives man dignity, the only one which does not reduce him to an object. The effect of all materialism is to treat all men, including the one philosophizing, as objects, that is, as an ensemble of determined reactions in no way distinguished from the ensemble of qualities and phenomena which constitute a table or a chair or a stone. We definitely wish to establish the human realm as an ensemble of values distinct from the material realm. But the subjectivity that we have thus arrived at, and which we have claimed to be truth, is not a strictly individual subjectivity, for we have demonstrated that one discovers in the *cogito* not only himself, but others as well.

The philosophies of Descartes and Kant to the contrary, through the *I think* we reach our own self in the presence of others, and the others are just as real to us as our own self. Thus, the man who becomes aware of himself through the *cogito* also perceives all others, and he perceives them as the condition of his own existence. He realizes that he can not be anything (in the sense that we say that someone is witty or nasty or jealous) unless others recognize it as such. In order to get any truth about myself, I must have contact with another person. The other is indispensable to my own existence, as well as to my knowledge about myself. This being so, in discovering my inner being I discover the other person at the same time, like a freedom placed in front of me which thinks and wills only for or against me. Hence, let us at once announce the discovery of a world which we shall call intersubjectivity; this is the world in which man decides what he is and what others are.

Besides, if it is impossible to find in every man some universal essence which would be human nature, yet there does exist a universal human condition. It's not by chance that today's thinkers speak more readily of man's condition than of his nature. By condition they mean, more or less definitely, the *a priori* limits which outline man's fundamental situation in the universe. Historical situations vary; a man may be born a slave in a pagan society or a feudal lord or a proletarian. What does not vary is the necessity for him to exist in the world, to be at work there, to be there in the midst of other people, and to be mortal there. The limits are neither subjective nor objective, or, rather, they have an objective and a subjective side. Objective because they are to be found everywhere and are recognizable everywhere; subjective because they are lived and are nothing if man does not live them, that is, freely determine his existence with reference to them. And though the configurations may differ, at least none of them are completely strange to me, because they all appear as attempts either to pass beyond these limits or recede from them or deny them or adapt to them. Consequently, every configuration, however individual it may be, has a universal value.

Every configuration, even the Chinese, the Indian, or the Negro, can be understood by a Westerner. "Can be understood" means that by virtue of a situation that he can imagine, a European of 1945 can, in like manner, push himself to his limits and reconstitute within himself the configuration of the Chinese, the Indian, or the African. Every configuration has universality in the sense that every configuration can be understood by every man. This does not at all mean that this configuration defines man forever, but that it can be met with again. There is always a way to understand the idiot, the child, the savage, the foreigner, provided one has the necessary information.

In this sense we may say that there is a universality of man; but it is not given, it is perpetually being made. I build the universal in choosing myself; I build it in understanding the configuration of every other man, whatever age he might have lived in. This absoluteness of choice does not do away with the relativeness of each epoch. At heart, what existentialism shows is the connection between the absolute character of

free involvement, by virtue of which every man realizes himself in realizing a type of mankind, an involvement always comprehensible in any age whatsoever and by any person whatsoever, and the relativeness of the cultural ensemble which may result from such a choice; it must be stressed that the relativity of Cartesianism and the absolute character of Cartesian involvement go together. In this sense, you may, if you like, say that each of us performs an absolute act in breathing, eating, sleeping, or behaving in any way whatever. There is no difference between being free, like a configuration, like an existence which chooses its essence, and being absolute. There is no difference between being an absolute temporarily localized, that is, localized in history, and being universally comprehensible.

This does not entirely settle the objection to subjectivism. In fact, the objection still takes several forms. First, there is the following: we are told, "So you're able to do anything, no matter what!" This is expressed in various ways. First we are accused of anarchy; then they say, "You're unable to pass judgment on others, because there's no reason to prefer one configuration to another"; finally they tell us, "Everything is arbitrary in this choosing of yours. You take something from one pocket and pretend you're putting it into the other."

These three objections aren't very serious. Take the first objection. "You're able to do anything, no matter what" is not to the point. In one sense choice is possible, but what is not possible is not to choose. I can always choose, but I ought to know that if I do not choose, I am still choosing. Though this may seem purely formal, it is highly important for keeping fantasy and caprice within bounds. If it is true that in facing a situation, for example, one in which, as a person capable of having sexual relations, of having children, I am obliged to choose an attitude, and if I in any way assume responsibility for a choice which, in involving myself, also involves all mankind, this has nothing to do with caprice, even if no *a priori* value determines my choice.

If anybody thinks that he recognizes here Gide's theory of the arbitrary act, he fails to see the enormous difference between this doctrine and Gide's. Gide does not know what a situation is. He acts out of pure caprice. For us, on the contrary, man is in an organized situation in which he himself is involved. Through his choice, he involves all mankind, and he can not avoid making a choice: either he will remain chaste, or he will marry without having children, or he will marry and have children; anyhow, whatever he may do, it is impossible for him not to take full responsibility for the way he handles this problem. Doubtless, he chooses without referring to preestablished values, but it is unfair to accuse him of caprice. Instead, let us say that moral choice is to be compared to the making of a work of art. And before going any further, let it be said at once that we are not dealing here with an aesthetic ethics, because our opponents are so dishonest that they even accuse us of that. The example I've chosen is a comparison only.

Having said that, may I ask whether anyone has ever accused an artist who has painted a picture of not having drawn his inspiration from rules set up *a priori*? Has anyone ever asked, "What painting ought he to make?" It is clearly understood that there is no definite painting to be made, that the artist is engaged in the making of his painting, and that the painting to be made is precisely the painting he will have made. It is clearly understood that there are no *a priori* aesthetic values, but that there are values which appear subsequently in the coherence of the painting, in the correspondence between what the artist intended and the result. Nobody can tell what the painting of tomorrow will be like. Painting can be judged only after it has once been made. What connection does that have with ethics? We are in the same creative situation. We never say that a work of art is arbitrary. When we speak of a canvas of Picasso, we

never say that it is arbitrary; we understand quite well that he was making himself what he is at the very time he was painting, that the ensemble of his work is embodied in his life.

The same holds on the ethical plane. What art and ethics have in common is that we have creation and invention in both cases. We can not decide *a priori* what there is to be done. I think that I pointed that out quite sufficiently when I mentioned the case of the student who came to see me, and who might have applied to all the ethical systems, Kantian or otherwise, without getting any sort of guidance. He was obliged to devise his law himself. Never let it be said by us that this man—who, taking affection, individual action, and kindheartedness toward a specific person as his ethical first principle, chooses to remain with his mother, or who, preferring to make a sacrifice, chooses to go to England—has made an arbitrary choice. Man makes himself. He isn't ready made at the start. In choosing his ethics, he makes himself, and force of circumstances is such that he can not abstain from choosing one. We define man only in relationship to involvement. It is therefore absurd to charge us with arbitrariness of choice.

In the second place, it is said that we are unable to pass judgment on others. In a way this is true, and in another way, false. It is true in this sense, that, whenever a man sanely and sincerely involves himself and chooses his configuration, it is impossible for him to prefer another configuration, regardless of what his own may be in other respects. It is true in this sense, that we do not believe in progress. Progress is betterment. Man is always the same. The situation confronting him varies. Choice always remains a choice in a situation. The problem has not changed since the time one could choose between those for and those against slavery, for example, at the time of the Civil War, and the present time, when one can side with the Maquis Resistance Party, or with the Communists.

But, nevertheless, one can still pass judgment, for, as I have said, one makes a choice in relationship to others. First, one can judge (and this is perhaps not a judgment of value, but a logical judgment) that certain choices are based on error and others on truth. If we have defined man's situation as a free choice, with no excuses and no recourse, every man who takes refuge behind the excuse of his passions, every man who sets up a determinism, is a dishonest man.

The objection may be raised, "But why mayn't he choose himself dishonestly?" I reply that I am not obliged to pass moral judgment on him, but that I do define his dishonesty as an error. One can not help considering the truth of the matter. Dishonesty is obviously a falsehood because it belies the complete freedom of involvement. On the same grounds, I maintain that there is also dishonesty if I choose to state that certain values exist prior to me; it is self-contradictory for me to want them and at the same state that they are imposed on me. Suppose someone says to me, "What if I want to be dishonest?" I'll answer, "There's no reason for you not to be, but I'm saying that that's what you are, and that the strictly coherent attitude is that of honesty."

Besides, I can bring moral judgment to bear. When I declare that freedom in every concrete circumstance can have no other aim than to want itself, if man has once become aware that in his forlornness he imposes values, he can no longer want but one thing, and that is freedom, as the basis of all values. That doesn't mean that he wants it in the abstract. It means simply that the ultimate meaning of the acts of honest men is the quest for freedom as such. A man who belongs to a communist or revolutionary union wants concrete goals; these goals imply an abstract desire for freedom; but this freedom is wanted in something concrete. We want freedom for freedom's sake and in every particular circumstance. And in wanting freedom we discover that it depends

entirely on the freedom of others, and that the freedom of others depends on ours. Of course, freedom as the definition of man does not depend on others, but as soon as there is involvement, I am obliged to want others to have freedom at the same time that I want my own freedom. I can take freedom as my goal only if I take that of others as a goal as well. Consequently, when, in all honesty, I've recognized that man is a being in whom existence precedes essence, that he is a free being who, in various circumstances, can want only his freedom, I have at the same time recognized that I can want only the freedom of others.

Therefore, in the name of this will for freedom, which freedom itself implies, I may pass judgment on those who seek to hide from themselves the complete arbitrariness and the complete freedom of their existence. Those who hide their complete freedom from themselves out of a spirit of seriousness or by means of deterministic excuses, I shall call cowards; those who try to show that their existence was necessary, when it is the very contingency of man's appearance on earth, I shall call stinkers. But cowards or stinkers can be judged only from a strictly unbiased point of view.

Therefore though the content of ethics is variable, a certain form of it is universal. Kant says that freedom desires both itself and the freedom of others. Granted. But he believes that the formal and the universal are enough to constitute an ethics. We, on the other hand, think that principles which are too abstract run aground in trying to decide action. Once again, take the case of the student. In the name of what, in the name of what great moral maxim do you think he could have decided, in perfect peace of mind, to abandon his mother or to stay with her? There is no way of judging. The content is always concrete and thereby unforeseeable; there is always the element of invention. The one thing that counts is knowing whether the inventing that has been done has been done in the name of freedom.

For example, let us look at the following two cases. You will see to what extent they correspond, yet differ. Take *The Mill on the Floss*. We find a certain young girl, Maggie Tulliver, who is an embodiment of the value of passion and who is aware of it. She is in love with a young man, Stephen, who is engaged to an insignificant young girl. This Maggie Tulliver, instead of heedlessly preferring her own happiness, chooses, in the name of human solidarity, to sacrifice herself and give up the man she loves. On the other hand, Sanseverina, in *The Charterhouse of Parma*, believing that passion is man's true value, would say that a great love deserves sacrifices; that it is to be preferred to the banality of the conjugal love that would tie Stephen to the young ninny he had to marry. She would choose to sacrifice the girl and fulfill her happiness; and, as Stendhal shows, she is even ready to sacrifice herself for the sake of passion, if this life demands it. Here we are in the presence of two strictly opposed moralities. I claim that they are much the same thing; in both cases what has been set up as the goal is freedom.

You can imagine two highly similar attitudes: one girl prefers to renounce her love out of resignation; another prefers to disregard the prior attachment of the man she loves out of sexual desire. On the surface these two actions resemble those we've just described. However, they are completely different. Sanseverina's attitude is much nearer that of Maggie Tulliver, one of heedless rapacity.

Thus, you see that the second charge is true and, at the same time, false. One may choose anything if it is on the grounds of free involvement.

The third objection is the following: "You take something from one pocket and put it into the other. That is, fundamentally, values aren't serious, since you choose them." My answer to this is that I'm quite vexed that that's the way it is; but if I've discarded God the Father, there has to be someone to invent values. You've got to take

things as they are. Moreover, to say that we invent values means nothing else but this: life has no meaning *a priori*. Before you come alive, life is nothing; it's up to you to give it a meaning, and value is nothing else but the meaning that you choose. In that way, you see, there is a possibility of creating a human community.

I've been reproached for asking whether existentialism is humanistic. It's been said, "But you said in *Nausea* that the humanists were all wrong. You made fun of a certain kind of humanist. Why come back to it now?" Actually, the word humanism has two very different meanings. By humanism one can mean a theory which takes man as an end and as a higher value. Humanism in this sense can be found in Cocteau's tale *Around the World in Eighty Hours* when a character, because he is flying over some mountains in an airplane, declares, "Man is simply amazing." That means that I, who did not build the airplanes, shall personally benefit from these particular inventions, and that I, as man, shall personally consider myself responsible for, and honored by, acts of a few particular men. This would imply that we ascribe a value to man on the basis of the highest deeds of certain men. This humanism is absurd, because only the dog or the horse would be able to make such an overall judgment about man, which they are careful not to do, at least to my knowledge.

But it can not be granted that a man may make a judgment about man. Existentialism spares him from any such judgment. The existentialist will never consider man as an end because he is always in the making. Nor should we believe that there is a mankind to which we might set up a cult in the manner of Auguste Comte. The cult of mankind ends in the self-enclosed humanism of Comte, and, let it be said, of fascism. This kind of humanism we can do without.

But there is another meaning of humanism. Fundamentally it is this: man is constantly outside of himself; in projecting himself, in losing himself outside of himself, he makes for man's existing; and, on the other hand, it is by pursuing transcendent goals that he is able to exist; man, being this state of passing-beyond, and seizing upon things only as they bear upon this passing-beyond, is at the heart, at the center of this passing-beyond. There is no universe other than a human universe, the universe of human subjectivity. This connection between transcendency, as a constituent element of man—not in the sense that God is transcendent, but in the sense of passing beyond—and subjectivity, in the sense that man is not closed in on himself but is always present in a human universe, is what we call existentialism humanism. Humanism, because we remind man that there is no law-maker other than himself, and that in his forlornness he will decide by himself; because we point out that man will fulfill himself as man, not in turning toward himself, but in seeking outside of himself a goal which is just this liberation, just this particular fulfillment.

From these few reflections it is evident that nothing is more unjust than the objections that have been raised against us. Existentialism is nothing else than an attempt to draw all the consequences of a coherent atheistic position. It isn't trying to plunge man into despair at all. But if one calls every attitude of unbelief despair, like the Christians, then the word is not being used in its original sense. Existentialism isn't so atheistic that it wears itself out showing that God doesn't exist. Rather, it declares that even if God did exist, that would change nothing. There you've got our point of view. Not that we believe that God exists, but we think that the problem of His existence is not the issue. In this sense existentialism is optimistic, a doctrine of action, and it is plain dishonesty for Christians to make no distinction between their own despair and ours and then to call us despairing.

SIMONE DE BEAUVOIR

1908–1986

Simone Lucie Ernestine Marie Bertrand de Beauvoir was the elder of two daughters born to attorney Georges Bertrand de Beauvoir and Françoise Brasseur de Beauvoir. The noble-sounding “de” in their name indicated some family prestige, but they were only comfortable, not wealthy. Apart from a five-year period during adulthood, de Beauvoir spent her entire life in the Montparnasse district of Paris. Her mother was a devout Catholic, and as a young girl de Beauvoir regularly attended church and went to confession. She studied in a Catholic school and considered God her personal companion. However, by adolescence she had given up her faith. She later recounted that this loss of belief was both freeing and terrifying: “Alone: for the first time I understood the terrible significance of that word. Alone: without a witness, without anyone to speak to, without refuge.”

After the World War I, de Beauvoir’s father suffered financial setbacks. He was forced to tell his daughters he could not provide them a dowry and concluded, “My dears, you’ll never marry; you’ll have to work for your livings.” De Beauvoir decided to pursue a career as a philosophy teacher. She was drawn to philosophy because

It went straight to essentials. . . . I had always wanted to know *everything*; philosophy would allow me to satisfy this desire, for it aimed at total reality.*

She enrolled at the Institut Sainte-Marie in 1925 and studied there for the next four years, simultaneously hearing lectures at the Institut Catholique and the Sorbonne.

*Simone de Beauvoir, *Memoirs of a Dutiful Daughter* (New York: Harper & Row, 1959), p. 158.

In 1929, de Beauvoir met Jean-Paul Sartre and studied with him for the *agrégation* in philosophy (which he had failed the previous year). After both passed the examination with high honors, she agreed to a “two-year lease” relationship with Sartre. During this period, she was an assistant at a lycée in Paris. In 1931, de Beauvoir accepted a full-time position at a lycée in Marseille and a year later moved to nearby Rouen. Though Sartre took a similar position at a lycée in Le Havre, on the opposite side of the country, their relationship continued. In fact, their “two-year lease” became a lifelong companionship, though they never married and were free to have “contingent” relationships.

By 1936, de Beauvoir was back in her beloved Montparnasse, Paris. For the next eight years, she taught at various lycées in Paris until the involvement of a student in her unusual lifestyle led to charges of corrupting a minor, and she was suspended. Though reinstated, she resigned in 1944 and supported herself for the rest of her life by her writings. Her first novel, *She Came to Stay*, was published that year to critical acclaim and financial success. She was heralded (with Albert Camus and Sartre) as one of the leaders of the new existentialist movement. The following year, with Maurice Merleau-Ponty and Sartre, she founded the influential journal *Les Temps modernes* and served as an editor and contributor to the magazine.

In her later years, de Beauvoir became increasingly involved in political issues. With Sartre, she visited Cuba, attended the International War Crimes Tribunal on U.S. War Crimes in Vietnam, and joined the student demonstrations at the Sorbonne. On her own, she worked vigorously for feminist issues such as legalized abortion and care for unmarried mothers. While leading the involved life of a left-wing political activist, de Beauvoir published a total of five novels, two collections of stories, and a play. She also published five volumes of memoirs, giving a picture of France in the twentieth century and of her relationship to Sartre. But de Beauvoir is best known for her philosophical works, especially the groundbreaking feminist text *The Second Sex* (1949).

* * *

The Second Sex is actually two separate volumes united around the question, “What is woman?” The first section, entitled “Facts and Myths,” explores biology, psychology, sociology, history, myth, and literature to explain the answers given to this basic question. The second section, “Woman’s Life Today,” focuses on women’s various roles and explores ways to move beyond these roles.

In the introduction to the work, reprinted here in the H.M. Parshley translation, de Beauvoir presents the basic categories that will guide her exploration of what it means to be woman. According to de Beauvoir, woman is the “second sex” because she is defined by man. Borrowing terminology from Sartre, she claims, “He is the Subject, he is the Absolute—she is the Other.” Man sets himself up as the standard, the “One”—the definition of what it is to be human—so that immediately woman becomes the “Other.” As the “Other,” woman is relegated to existence as “*en-soi*”: a being-in-itself, an object. Woman is not able to exist as “*pour-soi*,” a being-for-itself. She cannot choose her existence because her role is already defined for her as the “Other.”

De Beauvoir goes on to ask why women allow this to happen: “Why is it that women do not dispute male sovereignty?” After all, throughout history other

groups have been treated as the “Other” and have redefined themselves. Why not women? Later in the book, de Beauvoir speculates that a woman’s identity as the “Other” derives in part from her body—especially her reproductive capacity. But in our selection, she points out that women have always (with rare exceptions) been subordinated to men, “and hence their dependency is not the result of a historical event or a social change—it was not something that *occurred*.” Women have accepted their role as the “Other” because otherness “lacks the contingent or incidental nature of historical facts.” Women have no past, no history of their own. They are not grouped together as women, they have no solidarity of employment since as a rule they work dispersed among men. In short, they do not have the “concrete means for organizing themselves into a unit which can stand face to face with the correlative unit.”

The goal of *The Second Sex* is to move beyond analysis to a “concrete means” for organizing women. According to de Beauvoir, there must be two changes in order to accomplish this goal: (1) Women need to act as authentic subjects choosing their own histories and (2) society must be changed to make this possible. The first of these needed changes reflects de Beauvoir’s existentialism, the second her Marxism.

Whereas traditionalists condemned the entire work, feminist critics raised questions about some of de Beauvoir’s specific analyses. Many contemporary feminists claim that she did not go to the roots of patriarchy and its pervasive infection of even our language. Other feminists question her existentialist or Marxist assumptions (and her apparent hostility to the female body). But most feminists salute de Beauvoir for calling attention to feminist issues. As one writer put it, *The Second Sex* is for feminists “the base-line from which other works either explicitly . . . or implicitly . . . take off.”

* * *

There are several biographies of de Beauvoir, including Axel Madsen, *Hearts and Minds: The Common Journey of Simone de Beauvoir and Jean-Paul Sartre* (New York: Morrow, 1977); the thorough Deirdre Bair, *Simone de Beauvoir: A Biography* (New York: Summit Books, 1990); Ursula Tidd, *Simone de Beauvoir: Gender and Testimony* (Cambridge: Cambridge University Press, 1999); Hazel Rowley, *Tête-à-Tête: Simone de Beauvoir and Jean-Paul Sartre* (New York: HarperCollins, 2005); and her own autobiography, *Simone De Beauvoir, Memoirs of a Dutiful Daughter*, translated by James Kirkup (New York: HarperCollins, 2005). General studies of her writings include Terry Keefe, *Simone de Beauvoir: A Study of Her Writings* (Totowa, NJ: Barnes & Noble, 1983); Judith Okely, *Simone de Beauvoir: A Re-reading* (London: Virago Press, 1986); Renee Winegarten, *Simone de Beauvoir: A Critical View* (New York: St. Martin’s Press, 1988); Catharine Savage Brosman, *Simone de Beauvoir Revisited* (Boston: Twayne, 1991); Margaret Crosland, *Simone de Beauvoir: The Woman and Her Work* (London: Heinemann, 1992); and Clandia Card, ed., *The Cambridge Companion to Simone de Beauvoir* (Cambridge: Cambridge University Press, 2003). For material on her feminist theories specifically, see Jean Leighton, *Simone de Beauvoir on Woman* (Rutherford, NJ: Fairleigh Dickinson University Press, 1975); Mary Evans, *Simone de Beauvoir: A Feminist Mandarin* (London: Tavistock, 1985); Rosemarie Tong, *Feminist Thought: A Comprehensive*

Introduction (Boulder, CO: Westview Press, 1989); Toril Moi, *Feminist Theory & Simone de Beauvoir* (Oxford: Blackwell, 1990); Margaret A. Simons, ed., *Feminist Interpretations of Simone de Beauvoir* (College Park, PA: Pennsylvania State University Press, 1995); Debra B. Bergoffen, *The Philosophy of Simone de Beauvoir: Gendered Phenomenologies, Erotic Generosities* (Albany, NY: SUNY Press, 1996); Margaret A. Simons, *Beauvoir and The Second Sex: Feminism, Race, and the Origins of Existentialism* (Lanham, MD: Rowman and Littlefield, 2000); and Penelope Deutscher, *The Philosophy of Simone de Beauvoir: Ambiguity, Conversion, Resistance* (Cambridge: Cambridge University Press, 2008). Alice Schwarzer, *After "The Second Sex": Conversations with Simone de Beauvoir* (New York: Pantheon Books, 1984), gives de Beauvoir's reflections on her classic, whereas Donald L. Hatcher, *Understanding "The Second Sex"* (New York: Peter Lang, 1984) and Nancy Bauer, *Simone de Beauvoir, Philosophy, and Feminism* (NY: Columbia University Press, 2001) provide philosophical appraisals of that work.

THE SECOND SEX (in part)

INTRODUCTION

For a long time I have hesitated to write a book on woman. The subject is irritating, especially to women; and it is not new. Enough ink has been spilled in the quarreling over feminism, now practically over, and perhaps we should say no more about it. It is still talked about, however, for the voluminous nonsense uttered during the last century seems to have done little to illuminate the problem. After all, is there a problem? And if so, what is it? Are there women, really? Most assuredly the theory of the eternal feminine still has its adherents who will whisper in your ear: "Even in Russia women still are *women*"; and other erudite persons—sometimes the very same—say with a sigh: "Woman is losing her way, woman is lost." One wonders if women still exist, if they will always exist, whether or not it is desirable that they should, what place they occupy in this world, what their place should be. "What has become of women?" was asked recently in an ephemeral magazine.

But first we must ask: what is a woman? "*Tota mulier in utero*," says one, "woman is a womb." But in speaking of certain women, connoisseurs declare that they are not women, although they are equipped with a uterus like the rest. All agree in recognizing the fact that females exist in the human species; today as always they make up about one half of humanity. And yet we are told that femininity is in danger; we are exhorted to be women, remain women, become women. It would appear, then, that every female human being is not necessarily a woman; to be so considered she must

share in that mysterious and threatened reality known as femininity. Is this attribute something secreted by the ovaries? Or is it a Platonic essence, a product of the philosophic imagination? Is a rustling petticoat enough to bring it down to earth? Although some women try zealously to incarnate this essence, it is hardly patentable. It is frequently described in vague and dazzling terms that seem to have been borrowed from the vocabulary of the seers, and indeed in the times of St. Thomas it was considered an essence as certainly defined as the somniferous virtue of the poppy.

But conceptualism has lost ground. The biological and social sciences no longer admit the existence of unchangeably fixed entities that determine given characteristics, such as those ascribed to woman, the Jew, or the Negro. Science regards any characteristic as a reaction dependent in part upon a *situation*. If today femininity no longer exists, then it never existed. But does the word *woman*, then, have no specific content? This is stoutly affirmed by those who hold to the philosophy of the enlightenment, of rationalism, of nominalism; women, to them, are merely the human beings arbitrarily designated by the word woman. Many American women particularly are prepared to think that there is no longer any place for woman as such; if a backward individual still takes herself for a woman, her friends advise her to be psychoanalyzed and thus get rid of this obsession. In regard to a work, *Modern Woman: The Lost Sex*, which in other respects has its irritating features, Dorothy Parker has written: "I cannot be just to books which treat of woman as woman. . . . My idea is that all of us, men as well as women, should be regarded as human beings." But nominalism is a rather inadequate doctrine, and the antifeminists have had no trouble in showing that women simply *are not* men. Surely woman is, like man, a human being; but such a declaration is abstract. The fact is that every concrete human being is always a singular, separate individual. To decline to accept such notions as the eternal feminine, the black soul, the Jewish character, is not to deny that Jews, Negroes, women exist today—this denial does not represent a liberation for those concerned, but rather a flight from reality. Some years ago a well-known woman writer refused to permit her portrait to appear in a series of photographs especially devoted to women writers; she wished to be counted among the men. But in order to gain this privilege she made use of her husband's influence! Women who assert that they are men lay claim none the less to masculine consideration and respect. I recall also a young Trotskyite standing on a platform at a boisterous meeting and getting ready to use her fists, in spite of her evident fragility. She was denying her feminine weakness; but it was for love of a militant male whose equal she wished to be. The attitude of defiance of many American women proves that they are haunted by a sense of their femininity. In truth, to go for a walk with one's eyes open is enough to demonstrate that humanity is divided into two classes of individuals whose clothes, faces, bodies, smiles, gaits, interests, and occupations are manifestly different. Perhaps these differences are superficial, perhaps they are destined to disappear. What is certain is that right now they do most obviously exist.

If her functioning as a female is not enough to define woman, if we decline also to explain her through "the eternal feminine," and if nevertheless we admit, provisionally, that women do exist, then we must face the question: what is a woman?

To state the question is, to me, to suggest, at once, a preliminary answer. The fact that I ask it is in itself significant. A man would never get the notion of writing a book on the peculiar situation of the human male. But if I wish to define myself, I must first of all say: "I am a woman"; on this truth must be based all further discussion. A man never begins by presenting himself as an individual of a certain sex; it goes without saying that he is a man. The terms *masculine* and *feminine* are used symmetrically only as a matter of form, as on legal papers. In actuality the relation of the two sexes is not

quite like that of two electrical poles, for man represents both the positive and the neutral, as is indicated by the common use of man to designate human beings in general; whereas woman represents only the negative, defined by limiting criteria, without reciprocity. In the midst of an abstract discussion it is vexing to hear a man say: "You think thus and so because you are a woman"; but I know that my only defense is to reply: "I think thus and so because it is true," thereby removing my subjective self from the argument. It would be out of the question to reply: "And you think the contrary because you are a man," for it is understood that the fact of being a man is no peculiarity. A man is in the right in being a man; it is the woman who is in the wrong. It amounts to this: just as for the ancients there was an absolute vertical with reference to which the oblique was defined, so there is an absolute human type, the masculine. Woman has ovaries, a uterus; these peculiarities imprison her in her subjectivity, circumscribe her within the limits of her own nature. It is often said that she thinks with her glands. Man superbly ignores the fact that his anatomy also includes glands, such as the testicles, and that they secrete hormones. He thinks of his body as a direct and normal connection with the world, which he believes he apprehends objectively, whereas he regards the body of woman as a hindrance, a prison, weighed down by everything peculiar to it. "The female is a female by virtue of a certain *lack* of qualities," said Aristotle; "we should regard the female nature as afflicted with a natural defectiveness." And St. Thomas for his part pronounced woman to be an "imperfect man," an "incidental" being. This is symbolized in Genesis where Eve is depicted as made from what Bossuet called "a supernumerary bone" of Adam.

Thus humanity is male and man defines woman not in herself but as relative to him; she is not regarded as an autonomous being. Michelet writes: "Woman, the relative being. . . ." And Benda is most positive in his *Rapport d'Uriel*: "*The body of man makes sense in itself quite apart from that of woman, whereas the latter seems wanting in significance by itself. . . . Man can think of himself without woman. She cannot think of herself without man.*" And she is simply what man decrees; thus she is called "the sex," by which is meant that she appears essentially to the male as a sexual being. For him she is sex—absolute sex, no less. She is defined and differentiated with reference to man and not he with reference to her; she is the incidental, the inessential as opposed to the essential. He is the Subject, he is the Absolute—she is the Other.*

The category of the Other is as primordial as consciousness itself. In the most primitive societies, in the most ancient mythologies, one finds the expression of a duality—that of the Self and the Other. This duality was not originally attached to the division of the sexes; it was not dependent upon any empirical facts. It is revealed in such works as that of Granet on Chinese thought and those of Dumezil on the East Indies and Rome. The feminine element was at first no more involved in such pairs as

*L. Lévinas expresses this idea most explicitly in his essay *Temps et l'Autre*. "Is there not a case in which otherness, alterity [*altérité*], unquestionably marks the nature of a being, as its essence, an instance of otherness not consisting purely and simply in the opposition of two species of the same genus? I think that the feminine represents the contrary in its absolute sense, this contrariness being in no wise affected by any relation between it and its correlative and thus remaining absolutely other. Sex is not a certain specific difference . . . no more is the sexual difference a mere contradiction. . . . Nor does this difference lie in the duality of two complementary terms, for two complementary terms imply a pre-existing whole. . . . Otherness reaches its full flowering in the feminine, a term of the same rank as consciousness but of opposite meaning."

I suppose that Lévinas does not forget that woman, too, is aware of her own consciousness, or ego. But it is striking that he deliberately takes a man's point of view, disregarding the reciprocity of subject and object. When he writes that woman is mystery, he implies that she is mystery for man. Thus his description, which is intended to be objective, is in fact an assertion of masculine privilege.

Varuna-Mitra, Uranus-Zeus, Sun-Moon, and Day-Night than it was in the contrasts between Good and Evil, lucky and unlucky auspices, right and left, God and Lucifer. Otherness is a fundamental category of human thought.

Thus it is that no group ever sets itself up as the One without at once setting up the Other over against itself. If three travelers chance to occupy the same compartment, that is enough to make vaguely hostile "others" out of all the rest of the passengers on the train. In small-town eyes all persons not belonging to the village are "strangers" and suspect; to the native of a country all who inhabit other countries are "foreigners"; Jews are "different" for the anti-Semite, Negroes are "inferior" for American racists, aborigines are "natives" for colonists, proletarians are the "lower class" for the privileged.

Lévi-Strauss, at the end of a profound work on the various forms of primitive societies, reaches the following conclusion: "Passage from the state of Nature to the state of Culture is marked by man's ability to view biological relations as a series of contrasts; duality, alternation, opposition, and symmetry, whether under definite or vague forms, constitute not so much phenomena to be explained as fundamental and immediately given data of social reality." These phenomena would be incomprehensible if in fact human society were simply a *Mitsein* or fellowship based on solidarity and friendliness. Things become clear, on the contrary, if, following Hegel, we find in consciousness itself a fundamental hostility toward every other consciousness; the subject can be posed only in being opposed—he sets himself up as the essential, as opposed to the other, the inessential, the object.

But the other consciousness, the other ego, sets up a reciprocal claim. The native traveling abroad is shocked to find himself in turn regarded as a "stranger" by the natives of neighboring countries. As a matter of fact, wars, festivals, trading, treaties, and contests among tribes, nations, and classes tend to deprive the concept *Other* of its absolute sense and to make manifest its relativity; willy-nilly, individuals and groups are forced to realize the reciprocity of their relations. How is it, then, that this reciprocity has not been recognized between the sexes, that one of the contrasting terms is set up as the sole essential, denying any relativity in regard to its correlative and defining the latter as pure otherness? Why is it that women do not dispute male sovereignty? No subject will readily volunteer to become the object, the inessential; it is not the Other who, in defining himself as the Other, establishes the One. The Other is posed as such by the One in defining himself as the One. But if the Other is not to regain the status of being the One, he must be submissive enough to accept this alien point of view. Whence comes this submission in the case of woman?

There are, to be sure, other cases in which a certain category has been able to dominate another completely for a time. Very often this privilege depends upon inequality of numbers—the majority imposes its rule upon the minority or persecutes it. But women are not a minority, like the American Negroes or the Jews; there are as many women as men on earth. Again, the two groups concerned have often been originally independent; they may have been formerly unaware of each other's existence, or perhaps they recognized each other's autonomy. But a historical event has resulted in the subjugation of the weaker by the stronger. The scattering of the Jews, the introduction of slavery into America, the conquests of imperialism are examples in point. In these cases the oppressed retained at least the memory of former days; they possessed in common a past, a tradition, sometimes a religion or a culture.

The parallel drawn by Bebel between women and the proletariat is valid in that neither ever formed a minority or a separate collective unit of mankind. And instead of a single historical event it is in both cases a historical development that explains their status as a class and accounts for the membership of *particular individuals* in that class.

But proletarians have not always existed, whereas there have always been women. They are women in virtue of their anatomy and physiology. Throughout history they have always been subordinated to men, and hence their dependency is not the result of a historical event or a social change—it was not something that *occurred*. The reason why otherness in this case seems to be an absolute is in part that it lacks the contingent or incidental nature of historical facts. A condition brought about at a certain time can be abolished at some other time, as the Negroes of Haiti and others have proved; but it might seem that a natural condition is beyond the possibility of change. In truth, however, the nature of things is no more immutably given, once for all, than is historical reality. If woman seems to be the inessential which never becomes the essential, it is because she herself fails to bring about this change. Proletarians say “We”; Negroes also. Regarding themselves as subjects, they transform the bourgeois, the whites, into “others.” But women do not say “We,” except at some congress of feminists or similar formal demonstration; men say “women,” and women use the same word in referring to themselves. They do not authentically assume a subjective attitude. The proletarians have accomplished the revolution in Russia, the Negroes in Haiti, the Indo-Chinese are battling for it in Indo-China; but the women’s effort has never been anything more than a symbolic agitation. They have gained only what men have been willing to grant; they have taken nothing, they have only received.

The reason for this is that women lack concrete means for organizing themselves into a unit which can stand face to face with the correlative unit. They have no past, no history, no religion of their own; and they have no such solidarity of work and interest as that of the proletariat. They are not even promiscuously herded together in the way that creates community feeling among the American Negroes, the ghetto Jews, the workers of Saint-Denis, or the factory hands of Renault. They live dispersed among the males, attached through residence, housework, economic condition, and social standing to certain men—fathers or husbands—more firmly than they are to other women. If they belong to the bourgeoisie, they feel solidarity with men of that class, not with proletarian women; if they are white, their allegiance is to white men, not to Negro women. The proletariat can propose to massacre the ruling class, and a sufficiently fanatical Jew or Negro might dream of getting sole possession of the atomic bomb and making humanity wholly Jewish or black; but woman cannot even dream of exterminating the males. The bond that unites her to her oppressors is not comparable to any other. The division of the sexes is a biological fact, not an event in human history. Male and female stand opposed within a primordial *Mitsein*, and woman has not broken it. The couple is a fundamental unity with its two halves riveted together, and the cleavage of society along the line of sex is impossible. Here is to be found the basic trait of woman: she is the Other in a totality of which the two components are necessary to one another.

One could suppose that this reciprocity might have facilitated the liberation of woman. When Hercules sat at the feet of Omphale and helped with her spinning, his desire for her held him captive; but why did she fail to gain a lasting power? To revenge herself on Jason, Medea killed their children; and this grim legend would seem to suggest that she might have obtained a formidable influence over him through his love for his offspring. In *Lysistrata* Aristophanes gaily depicts a band of women who joined forces to gain social ends through the sexual needs of their men; but this is only a play. In the legend of the Sabine women, the latter soon abandoned their plan of remaining sterile to punish their ravishers. In truth woman has not been socially emancipated through man’s need—sexual desire and the desire for offspring—which makes the male dependent for satisfaction upon the female.

Migrant Mother, 1936, by Dorothea Lange (1895–1965). This powerful photograph of a migrant mother in central California reveals both anxiety and strength. (Copyright The Dorothea Lange Collection, The Oakland Museum of California, City of Oakland. Gift of Paul S. Taylor.)

Master and slave, also, are united by a reciprocal need, in this case economic, which does not liberate the slave. In the relation of master to slave the master does not make a point of the need that he has for the other; he has in his grasp the power of satisfying this need through his own action; whereas the slave, in his dependent condition, his

hope and fear, is quite conscious of the need he has for his master. Even if the need is at bottom equally urgent for both, it always works in favor of the oppressor and against the oppressed. That is why the liberation of the working class, for example, has been slow.

Now, woman has always been man's dependent, if not his slave; the two sexes have never shared the world in equality. And even today woman is heavily handicapped, though her situation is beginning to change. Almost nowhere is her legal status the same as man's, and frequently it is much to her disadvantage. Even when her rights are legally recognized in the abstract, long-standing custom prevents their full expression in the mores. In the economic sphere men and women can almost be said to make up two castes; other things being equal, the former hold the better jobs, get higher wages, and have more opportunity for success than their new competitors. In industry and politics men have a great many more positions and they monopolize the most important posts. In addition to all this, they enjoy a traditional prestige that the education of children tends in every way to support, for the present enshrines the past—and in the past all history has been made by men. At the present time, when women are beginning to take part in the affairs of the world, it is still a world that belongs to men—they have no doubt of it at all and women have scarcely any. To decline to be the *Other*, to refuse to be a party to the deal—this would be for women to renounce all the advantages conferred upon them by their alliance with the superior caste. Man-the-sovereign will provide woman-the-liege with material protection and will undertake the moral justification of her existence; thus she can evade at once both economic risk and the metaphysical risk of a liberty in which ends and aims must be contrived without assistance. Indeed, along with the ethical urge of each individual to affirm his subjective existence, there is also the temptation to forgo liberty and become a thing. This is an inauspicious road, for he who takes it—passive, lost, ruined—becomes henceforth the creature of another's will, frustrated in his transcendence and deprived of every value. But it is an easy road; on it one avoids the strain involved in undertaking an authentic existence. When man makes of woman the *Other*, he may, then, expect her to manifest deep-seated tendencies toward complicity. Thus, woman may fail to lay claim to the status of subject because she lacks definite resources, because she feels the necessary bond that ties her to man regardless of reciprocity, and because she is often very well pleased with her role as the *Other*.

But it will be asked at once: how did all this begin? It is easy to see that the duality of the sexes, like any duality, gives rise to conflict. And doubtless the winner will assume the status of absolute. But why should man have won from the start? It seems possible that women could have won the victory; or that the outcome of the conflict might never have been decided. How is it that this world has always belonged to the men and that things have begun to change only recently? Is this change a good thing? Will it bring about an equal sharing of the world between men and women?

These questions are not new, and they have often been answered. But the very fact that woman *is the Other* tends to cast suspicion upon all the justifications that men have ever been able to provide for it. These have all too evidently been dictated by men's interest. A little-known feminist of the seventeenth century, Poulain de la Barre, put it this way: "All that has been written about women by men should be suspect, for the men are at once judge and party to the lawsuit." Everywhere, at all times, the males have displayed their satisfaction in feeling that they are the lords of creation. "Blessed be God . . . that He did not make me a woman," say the Jews in their morning prayers, while their wives pray on a note of resignation: "Blessed be the Lord, who created me according to His will." The first among the blessings for which Plato thanked the gods was that he had been created

free, not enslaved; the second, a man, not a woman. But the males could not enjoy this privilege fully unless they believed it to be founded on the absolute and the eternal; they sought to make the fact of their supremacy into a right. "Being men, those who have made and compiled the laws have favored their own sex, and jurists have elevated these laws into principles," to quote Poulain de la Barre once more.

Legislators, priests, philosophers, writers, and scientists have striven to show that the subordinate position of woman is willed in heaven and advantageous on earth. The religions invented by men reflect this wish for domination. In the legends of Eve and Pandora men have taken up arms against women. They have made use of philosophy and theology, as the quotations from Aristotle and St. Thomas have shown. Since ancient times satirists and moralists have delighted in showing up the weaknesses of women. We are familiar with the savage indictments hurled against women throughout French literature. Montherlant, for example, follows the tradition of Jean de Meung, though with less gusto. This hostility may at times be well founded, often it is gratuitous; but in truth it more or less successfully conceals a desire for self-justification. As Montaigne says, "It is easier to accuse one sex than to excuse the other." Sometimes what is going on is clear enough. For instance, the Roman law limiting the rights of woman cited "the imbecility, the instability of the sex" just when the weakening of family ties seemed to threaten the interests of male heirs. And in the effort to keep the married woman under guardianship, appeal was made in the sixteenth century to the authority of St. Augustine, who declared that "woman is a creature neither decisive nor constant," at a time when the single woman was thought capable of managing her property. Montaigne understood clearly how arbitrary and unjust was woman's appointed lot: "Women are not in the wrong when they decline to accept the rules laid down for them, since the men make these rules without consulting them. No wonder intrigue and strife abound." But he did not go so far as to champion their cause.

It was only later, in the eighteenth century, that genuinely democratic men began to view the matter objectively. Diderot, among others, strove to show that woman is, like man, a human being. Later John Stuart Mill came fervently to her defense. But these philosophers displayed unusual impartiality. In the nineteenth century the feminist quarrel became again a quarrel of partisans. One of the consequences of the industrial revolution was the entrance of women into productive labor, and it was just here that the claims of the feminists emerged from the realm of theory and acquired an economic basis, while their opponents became the more aggressive. Although landed property lost power to some extent, the bourgeoisie clung to the old morality that found the guarantee of private property in the solidity of the family. Woman was ordered back into the home the more harshly as her emancipation became a real menace. Even within the working class the men endeavored to restrain woman's liberation, because they began to see the women as dangerous competitors—the more so because they were accustomed to work for lower wages.

In proving woman's inferiority, the antifeminists then began to draw not only upon religion, philosophy, and theology, as before, but also upon science—biology, experimental psychology, etc. At most they were willing to grant "equality in difference" to the *other* sex. That profitable formula is most significant; it is precisely like the "equal but separate" formula of the Jim Crow laws aimed at the North American Negroes. As is well known, this so-called equalitarian segregation has resulted only in the most extreme discrimination. The similarity just noted is in no way due to chance, for whether it is a race, a caste, a class, or a sex that is reduced to a position of inferiority, the methods of justification are the same. "The eternal feminine" corresponds to "the black soul" and to

"the Jewish character." True, the Jewish problem is on the whole very different from the other two—to the anti-Semite the Jew is not so much an inferior as he is an enemy for whom there is to be granted no place on earth, for whom annihilation is the fate desired. But there are deep similarities between the situation of woman and that of the Negro. Both are being emancipated today from a like paternalism, and the former master class wishes to "keep them in their place"—that is, the place chosen for them. In both cases the former masters lavish more or less sincere eulogies, either on the virtues of "the good Negro" with his dormant, childish, merry soul—the submissive Negro—or on the merits of the woman who is "truly feminine"—that is, frivolous, infantile, irresponsible—the submissive woman. In both cases the dominant class bases its argument on a state of affairs that it has itself created. As George Bernard Shaw puts it, in substance, "The American white relegates the black to the rank of shoeshine boy; and he concludes from this that the black is good for nothing but shining shoes." This vicious circle is met with in all analogous circumstances; when an individual (or a group of individuals) is kept in a situation of inferiority, the fact is that he is inferior. But the significance of the verb *to be* must be rightly understood here; it is in bad faith to give it a static value when it really has the dynamic Hegelian sense of "to have become." Yes, women on the whole *are* today inferior to men; that is, their situation affords them fewer possibilities. The question is: should that state of affairs continue?

Many men hope that it will continue; not all have given up the battle. The conservative bourgeoisie still see in the emancipation of women a menace to their morality and their interests. Some men dread feminine competition. Recently a male student wrote in the *Hebdo-Latin*: "Every woman student who goes into medicine or law robs us of a job." He never questioned his rights in this world. And economic interests are not the only ones concerned. One of the benefits that oppression confers upon the oppressors is that the most humble among them is made to *feel* superior; thus, a "poor white" in the South can console himself with the thought that he is not a "dirty nigger"—and the more prosperous whites cleverly exploit this pride.

Similarly, the most mediocre of males feels himself a demigod as compared with women. It was much easier for M. de Montherlant to think himself a hero when he faced women (and women chosen for his purpose) than when he was obliged to act the man among men—something many women have done better than he, for that matter. And in September 1948, in one of his articles in the *Figaro littéraire*, Claude Mauriac—whose great originality is admired by all—could write regarding woman: "We listen on a tone [*sic!*] of polite indifference . . . to the most brilliant among them, well knowing that her wit reflects more or less luminously ideas that come from *us*." Evidently the speaker referred to is not reflecting the ideas of Mauriac himself, for no one knows of his having any. It may be that she reflects ideas originating with men, but then, even among men there are those who have been known to appropriate ideas not their own; and one can well ask whether Claude Mauriac might not find more interesting a conversation reflecting Descartes, Marx, or Gide rather than himself. What is really remarkable is that by using the questionable *we* he identifies himself with St. Paul, Hegel, Lenin, and Nietzsche, and from the lofty eminence of their grandeur looks down disdainfully upon the bevy of women who make bold to converse with him on a footing of equality. In truth, I know of more than one woman who would refuse to suffer with patience Mauriac's "tone of polite indifference."

I have lingered on this example because the masculine attitude is here displayed with disarming ingenuousness. But men profit in many more subtle ways from the otherness, the alterity of woman. Here is miraculous balm for those afflicted with an

inferiority complex, and indeed no one is more arrogant toward women, more aggressive or scornful, than the man who is anxious about his virility. Those who are not farridden in the presence of their fellow men are much more disposed to recognize a fellow creature in woman; but even to these the myth of Woman, the Other, is precious for many reasons.* They cannot be blamed for not cheerfully relinquishing all the benefits they derive from the myth, for they realize what they would lose in relinquishing woman as they fancy her to be, while they fail to realize what they have to gain from the woman of tomorrow. Refusal to pose oneself as the Subject, unique and absolute, requires great self-denial. Furthermore, the vast majority of men make no such claim explicitly. They do not *postulate* woman as inferior, for today they are too thoroughly imbued with the ideal of democracy not to recognize all human beings as equals.

In the bosom of the family, woman seems in the eyes of childhood and youth to be clothed in the same social dignity as the adult males. Later on, the young man, desiring and loving, experiences the resistance, the independence of the woman desired and loved; in marriage, he respects woman as wife and mother, and in the concrete events of conjugal life she stands there before him as a free being. He can therefore feel that social subordination as between the sexes no longer exists and that on the whole, in spite of differences, woman is an equal. As, however, he observes some points of inferiority—the most important being unfitness for the professions—he attributes these to natural causes. When he is in a co-operative and benevolent relation with woman, his theme is the principle of abstract equality, and he does not base his attitude upon such inequality as may exist. But when he is in conflict with her, the situation is reversed: his theme will be the existing inequality, and he will even take it as justification for denying abstract equality.**

So it is that many men will affirm as if in good faith that women *are* the equals of man and that they have nothing to clamor for, while *at the same* time they will say that women can never be the equals of man and that their demands are in vain. It is, in point of fact, a difficult matter for man to realize the extreme importance of social discriminations which seem outwardly insignificant but which produce in woman moral and intellectual effects so profound that they appear to spring from her original nature. The most sympathetic of men never fully comprehend woman's concrete situation. And there is no reason to put much trust in the men when they rush to the defense of privileges whose full extent they can hardly measure. We shall not, then, permit ourselves to be intimidated by the number and violence of the attacks launched against women, nor to be entrapped by the self-seeking eulogies bestowed on the "true woman," nor to profit by the enthusiasm for woman's destiny manifested by men who would not for the world have any part of it.

We should consider the arguments of the feminists with no less suspicion, however, for very often their controversial aim deprives them of all real value. If the "woman question" seems trivial, it is because masculine arrogance has made of it a

*A significant article on this theme by Michel Carrouges appeared in No. 292 of the *Cahiers du Sud*. He writes indignantly: "Would that there were no woman-myth at all but only a cohort of cooks, matrons, prostitutes, and bluestockings serving functions of pleasure or usefulness!" That is to say, in his view woman has no existence in and for herself; he thinks only of her *function* in the male world. Her reason for existence lies in man. But then, in fact, her poetic "function" as a myth might be more valued than any other. The real problem is precisely to find out why woman should be defined with relation to man.

**For example, a man will say that he considers his wife in no wise degraded because she has no gainful occupation. The profession of housewife is just as lofty, and so on. But when the first quarrel comes, he will exclaim: "Why, you couldn't make your living without me!"

“quarrel”; and when quarreling one no longer reasons well. People have tirelessly sought to prove that woman is superior, inferior, or equal to man. Some say that, having been created after Adam, she is evidently a secondary being; others say on the contrary that Adam was only a rough draft and that God succeeded in producing the human being in perfection when He created Eve. Woman’s brain is smaller; yes, but it is relatively larger. Christ was made a man; yes, but perhaps for his greater humility. Each argument at once suggests its opposite, and both are often fallacious. If we are to gain understanding, we must get out of these ruts; we must discard the vague notions of superiority, inferiority, equality which have hitherto corrupted every discussion of the subject and start afresh.

Very well, but just how shall we pose the question? And, to begin with, who are we to propound it at all? Man is at once judge and party to the case; but so is woman. What we need is an angel—neither man nor woman—but where shall we find one? Still, the angel would be poorly qualified to speak, for an angel is ignorant of all the basic facts involved in the problem. With a hermaphrodite we should be no better off, for here the situation is most peculiar; the hermaphrodite is not really the combination of a whole man and a whole woman, but consists of parts of each and thus is neither. It looks to me as if there are, after all, certain women who are best qualified to elucidate the situation of woman. Let us not be misled by the sophism that because Epimenides was a Cretan he was necessarily a liar; it is not a mysterious essence that compels men and women to act in good or in bad faith; it is their situation that inclines them more or less toward the search for truth. Many of today’s women, fortunate in the restoration of all the privileges pertaining to the estate of the human being, can afford the luxury of impartiality—we even recognize its necessity. We are no longer like our partisan elders; by and large we have won the game. In recent debates on the status of women the United Nations has persistently maintained that the equality of the sexes is now becoming a reality, and already some of us have never had to sense in our femininity an inconvenience or an obstacle. Many problems appear to us to be more pressing than those which concern us in particular, and this detachment even allows us to hope that our attitude will be objective. Still, we know the feminine world more intimately than do the men because we have our roots in it, we grasp more immediately than do men what it means to a human being to be feminine; and we are more concerned with such knowledge. I have said that there are more pressing problems, but this does not prevent us from seeing some importance in asking how the fact of being women will affect our lives. What opportunities precisely have been given us and what withheld? What fate awaits our younger sisters, and what directions should they take? It is significant that books by women on women are in general animated in our day less by a wish to demand our rights than by an effort toward clarity and understanding. As we emerge from an era of excessive controversy, this book is offered as one attempt among others to confirm that statement.

But it is doubtless impossible to approach any human problem with a mind free from bias. The way in which questions are put, the points of view assumed, presuppose a relativity of interest; all characteristics imply values, and every objective description, so called, implies an ethical background. Rather than attempt to conceal principles more or less definitely implied, it is better to state them openly at the beginning. This will make it unnecessary to specify on every page in just what sense one uses such words as *superior*, *inferior*, *better*, *worse*, *progress*, *reaction*, and the like. If we survey some of the works on woman, we note that one of the points of view most frequently adopted is that of the public good, the general interest; and one always means by this the

benefit of society as one wishes it to be maintained or established. For our part, we hold that the only public good is that which assures the private good of the citizens; we shall pass judgment on institutions according to their effectiveness in giving concrete opportunities to individuals. But we do not confuse the idea of private interest with that of happiness, although that is another common point of view. Are not women of the harem more happy than women voters? Is not the housekeeper happier than the working-woman? It is not too clear just what the word *happy* really means and still less what true values it may mask. There is no possibility of measuring the happiness of others, and it is always easy to describe as happy the situation in which one wishes to place them.

In particular those who are condemned to stagnation are often pronounced happy on the pretext that happiness consists in being at rest. This notion we reject, for our perspective is that of existentialist ethics. Every subject plays his part as such specifically through exploits or projects that serve as a mode of transcendence; he achieves liberty only through a continual reaching out toward other liberties. There is no justification for present existence other than its expansion into an indefinitely open future. Every time transcendence falls back into immanence, stagnation, there is a degradation of existence into the "*en-soi*"—the brutish life of subjection to given conditions—and of liberty into constraint and contingency. This downfall represents a moral fault if the subject consents to it; if it is inflicted upon him, it spells frustration and oppression. In both cases it is an absolute evil. Every individual concerned to justify his existence feels that his existence involves an undefined need to transcend himself, to engage in freely chosen projects.

Now, what peculiarly signalizes the situation of woman is that she—a free and autonomous being like all human creatures—nevertheless finds herself living in a world where men compel her to assume the status of the Other. They propose to stabilize her as object and to doom her to immanence since her transcendence is to be overshadowed and forever transcended by another ego (*conscience*) which is essential and sovereign. The drama of woman lies in this conflict between the fundamental aspirations of every subject (ego)—who always regards the self as the essential—and the compulsions of a situation in which she is the inessential. How can a human being in woman's situation attain fulfillment? What roads are open to her? Which are blocked? How can independence be recovered in a state of dependency? What circumstances limit woman's liberty and how can they be overcome? These are the fundamental questions on which I would fain throw some light. This means that I am interested in the fortunes of the individual as defined not in terms of happiness but in terms of liberty.

Quite evidently this problem would be without significance if we were to believe that woman's destiny is inevitably determined by physiological, psychological, or economic forces. Hence I shall discuss first of all the light in which woman is viewed by biology, psychoanalysis, and historical materialism. Next I shall try to show exactly how the concept of the "truly feminine" has been fashioned—why woman has been defined as the Other—and what have been the consequences from man's point of view. Then from woman's point of view I shall describe the world in which women must live; and thus we shall be able to envisage the difficulties in their way as, endeavoring to make their escape from the sphere hitherto assigned them, they aspire to full membership in the human race.

WILLARD VAN ORMAN QUINE 1908–2000

Willard Van Orman Quine was the youngest of the sons born to Robert Quine and Harriet Van Orman Quine of Akron, Ohio. His mother was a schoolteacher and his father a worker in heavy industry. As a child, Quine developed a lifelong fascination with travel and maps. On summer vacations, he would draw careful maps of nearby lakes and sell copies to local cabin owners. The young Quine also excelled in mathematics and languages. In 1926, he enrolled at Oberlin College, where he majored in mathematics and studied philosophy. His research led him to mathematical philosophy, logic, and the philosophy of Bertrand Russell. In Russell, he found a kindred spirit—they shared a logical approach to philosophical problems and a religious skepticism.

Quine went to Harvard University for graduate studies in 1930. He married his college sweetheart, buried himself in studies with such noted philosophers as C.I. Lewis and Alfred North Whitehead, finished his course work, passed preliminary examinations, and received his master's degree—all in a year. The following year, he completed a 290-page dissertation on logic and received his Ph.D. degree at age 23. *A System of Logistic* (1934), a revision of this dissertation, became the first of his fifteen published books.

The year Quine received his doctorate, he was also awarded Harvard's Sheldon Traveling Fellowship. He took the title of the fellowship seriously, and in one year he and his wife visited twenty-seven countries. Quine met several members of the Vienna Circle and studied logic in Warsaw with the great Polish logicians Alfred Tarski, Stanisław Leśniewski, and Jan Łukasiewicz. At the end of the year, he was elected into Harvard's Society of Fellows, which gave him, among other emoluments, three years' pay and no duties. Among his five colleagues as junior fellows was the promising young psychologist B.F. Skinner.

Quine taught at Harvard until 1942. During World War II, his skill in languages and his gift for logic were put to use translating and analyzing decoded messages from German submarines. In 1946, Quine returned to Harvard and teaching. Except for sabbaticals and visiting professorships (and traveling in more than 100 countries), Quine remained a professor at Harvard until his retirement in 1978. He spent the next twenty-two years writing and travelling until his death in 2000.

* * *

In his autobiography, Quine explains that he has always despised conceptual constraints and has “been at pains to blur the boundaries between natural science, mathematics, and philosophy.” Nowhere is this impatience with divisions more apparent than in Quine’s critique of the analytic-synthetic distinction.

Ever since Hume first distinguished between “relations of ideas” and “matters of fact,” philosophers have divided all propositions into two categories: analytic and synthetic. Yet in his famous paper “Two Dogmas of Empiricism,” reprinted here (complete), Quine argues on the basis of various tests of meaning, synonymy, definition, and semantics that such a division has never been clearly made and that there is no compelling reason for believing such a separation can be made.

For example, the foundational propositions of logic and mathematics have been held to be true by convention independent of any matters of fact. Thus, the proposition (1) “No unmarried man is married” is true regardless of the various interpretations of “man” and “married.” But there are also semantic propositions, such as (2) “No bachelor is married,” which are claimed to be equally analytic. As Quine points out, it is common to believe that this latter (supposed) analytic proposition can be made into a truth of logic by “putting synonyms for synonyms; thus (2) can be turned into (1) by putting ‘unmarried man’ for its synonym ‘bachelor’.” But what is our criterion of synonymy and how is it any more clear than our criterion of “analyticity”? We could say that propositions (1) and (2) are synonymous if the term “bachelor” in (2) is *defined* as “unmarried man.” But what is the basis for such a definition? Does analyticity depend on the empirical observations of a lexicographer or the authority of a dictionary? We could say that these propositions are synonymous if proposition (2) is “necessarily true.” However, this would be begging the question; to say a proposition is “necessary” is to say it is analytic. Quine concludes that analyticity as a clearly distinguished notion is “an unempirical dogma of empiricists, a metaphysical article of faith.”

Having critiqued the analytic-synthetic distinction, Quine next turns his attention to another empirical dogma: the verification theory of meaning and the reductionism that it presupposes. According to this theory of meaning, the meaning of any statement is the “method of empirically confirming or inferring it.” But such a theory implies that each meaningful statement can be reduced to an equivalent statement that contains only references to immediate experience. Logical positivists such as A.J. Ayer sought to develop such a reductionistic language. But according to Quine, Ayer and the others are relying on the nonexistent analytic-synthetic distinction to separate the “linguistic components” from the “factual components” in any individual statement. Furthermore, *no* statement, taken by itself, could be confirmed or discredited by sensory experience because there could always be a further experience that would overturn the original statement.

Quine concludes:

The totality of our so-called knowledge or beliefs, from the most casual matters of geography and history to the profoundest laws of atomic physics or even of pure mathematics and logic, is a man-made fabric which impinges on experience only along the edges.

Individual experiences “along the edges” may be dismissed as errors or hallucinations if they disturb more central beliefs. But even our core beliefs of mathematics and logic are subject to possible revision. There is no final truth nor even a clear distinction between the truths of logic and the truths of experience, that is, between analytic and synthetic.

Alex Orenstein, *Willard Van Orman Quine* (Boston: Twayne, 1977); Gary Kemp, *Quine: A Guide for the Perplexed* (London: Continuum, 2006); and Peter Hylton, *Quine* (Abingdon, UK: Routledge, 2007) provide good places to begin further study, whereas Roger F. Gibson, *The Philosophy of W.V. Quine: An Expository Essay* (Tampa: University Presses of Florida, 1982); George D. Romanas, *Quine and Analytic Philosophy* (Cambridge: MIT Press, 1983); Ilham Dilman, *Quine on Ontology, Necessity, and Experience: A Philosophical Critique* (Albany, NY: SUNY Press, 1984); and Christopher Hookway, *Quine: Language, Experience, and Reality* (Stanford, CA: Stanford University Press, 1988) have written critical investigations. For information on Quine’s life, see his autobiography, *The Time of My Life: An Autobiography* (Cambridge: MIT Press, 1985). For collections of essays, see Donald Davidson and Jaakko Hintikka, eds., *Words and Objections: Essays on the Work of W.V. Quine* (Dordrecht, The Netherlands: D. Reidel, 1969); Robert W. Shahan and Chris Swoyer, eds., *Essays on the Philosophy of W.V. Quine* (Norman: University of Oklahoma Press, 1979); Robert Barrett and Roger Gibson, eds., *Perspectives on Quine* (Oxford: Basil Blackwell, 1993); Paolo Leonardi and Marlo Santambrogio, eds., *On Quine: New Essays* (Cambridge: Cambridge University Press, 1994); Robert L. Arrington and Johann Glock, eds., *Wittgenstein and Quine* (Oxford: Routledge, 1996); Lynn Hankinson Nelson and Jack Nelson, eds., *Feminist Interpretations of W.V. Quine* (College Park, PA: Pennsylvania State University Press, 2003); Roger F. Gibson, Jr., ed., *The Cambridge Companion to Quine* (Cambridge: Cambridge University Press, 2004); and, especially, Lewis Edwin Hahn and Paul Arthur Schilpp, eds., *The Philosophy of W.V. Quine* (La Salle, IL: Open Court, 1986), another volume in the Library of Living Philosophers Series, which includes Quine’s responses to critics and a short version of his autobiography.

TWO DOGMAS OF EMPIRICISM

Modern empiricism has been conditioned in large part by two dogmas. One is a belief in some fundamental cleavage between truths which are *analytic*, or grounded in meanings independently of matters of fact, and truths which are *synthetic*, or grounded in fact. The other dogma is *reductionism*: the belief that each meaningful statement is equivalent to some logical construct upon terms which refer to immediate experience. Both dogmas, I shall argue, are ill-founded. One effect of abandoning them is, as we shall see, a blurring of the supposed boundary between speculative metaphysics and natural science. Another effect is a shift toward pragmatism.

I. BACKGROUND FOR ANALYTICITY

Kant's cleavage between analytic and synthetic truths was foreshadowed in Hume's distinction between relations of ideas and matters of fact, and in Leibniz's distinction between truths of reason and truths of fact. Leibniz spoke of the truths of reason as true in all possible worlds. Picturesqueness aside, this is to say that the truths of reason are those which could not possibly be false. In the same vein we hear analytic statements defined as statements whose denials are self-contradictory. But this definition has small explanatory value; for the notion of self-contradictoriness, in the quite broad sense needed for this definition of analyticity, stands in exactly the same need of clarification as does the notion of analyticity itself. The two notions are the two sides of a single dubious coin.

Kant conceived of an analytic statement as one that attributes to its subject no more than is already conceptually contained in the subject. This formulation has two shortcomings: it limits itself to statements of subject-predicate form, and it appeals to a notion of containment which is left at a metaphorical level. But Kant's intent, evident more from the use he makes of the notion of analyticity than from his definition of it, can be restated thus: a statement is analytic when it is true by virtue of meanings and independently of fact. Pursuing this line, let us examine the concept of *meaning* which is presupposed.

Meaning, let us remember, is not to be identified with naming. Frege's example of 'Evening Star' and 'Morning Star,' and Russell's of 'Scott' and 'the author of *Waverley*,' illustrate that terms can name the same thing but differ in meaning. The distinction between meaning and naming is no less important at the level of abstract terms. The terms '9' and 'the number of the planets' name one and the same abstract entity but presumably must be regarded as unlike in meaning; for astronomical observation was needed, and not mere reflection on meanings, to determine the sameness of the entity in question.

The above examples consist of singular terms, concrete and abstract. With general terms, or predicates, the situation is somewhat different but parallel. Whereas a singular term purports to name an entity, abstract or concrete, a general term does not; but a general term is *true of* an entity, or of each of many, or of none. The class of all entities of which a general term is true is called the *extension* of the term. Now paralleling the contrast between the meaning of a singular term and the entity named, we must distinguish equally between the meaning of a general term and its extension. The general terms 'creature with a heart' and 'creature with kidneys,' for example, are perhaps alike in extension but unlike in meaning.

Confusion of meaning with extension, in the case of general terms, is less common than confusion of meaning with naming in the case of singular terms. It is indeed a commonplace in philosophy to oppose intension (or meaning) to extension, or, in a variant vocabulary, connotation to denotation.

The Aristotelian notion of essence was the forerunner, no doubt, of the modern notion of intension or meaning. For Aristotle it was essential in men to be rational, accidental to be two-legged. But there is an important difference between this attitude and the doctrine of meaning. From the latter point of view it may indeed be conceded (if only for the sake of argument) that rationality is involved in the meaning of the word 'man' while two-leggedness is not; but two-leggedness may at the same time be viewed as involved in the meaning of 'biped' while rationality is not. Thus from the point of view of the doctrine of meaning it makes no sense to say of the actual individual, who is at once a man and a biped, that his rationality is essential and his two-leggedness accidental or vice versa. Things had essences for Aristotle, but only linguistic forms have meanings. Meaning is what essence becomes when it is divorced from the object of reference and wedded to the word.

For the theory of meaning a conspicuous question is the nature of its objects: what sort of things are meanings? A felt need for meant entities may derive from an earlier failure to appreciate that meaning and reference are distinct. Once the theory of meaning is sharply separated from the theory of reference, it is a short step to recognizing as the primary business of the theory of meaning simply the synonymy of linguistic forms and the analyticity of statements; meanings themselves, as obscure intermediary entities, may well be abandoned.

The problem of analyticity then confronts us anew. Statements which are analytic by general philosophical acclaim are not, indeed, far to seek. They fall into two classes. Those of the first class, which may be called *logically true*, are typified by:

- (1) No unmarried man is married.

The relevant feature of this example is that it not merely is true as it stands, but remains true under any and all reinterpretations of 'man' and 'married.' If we suppose a prior inventory of *logical* particles, comprising 'no,' 'un-,' 'not,' 'if,' 'then,' 'and,' etc., then in general a logical truth is a statement which is true and remains true under all reinterpretations of its components other than the logical particles.

But there is also a second class of analytic statements, typified by:

- (2) No bachelor is married.

The characteristic of such a statement is that it can be turned into a logical truth by putting synonyms for synonyms; thus (2) can be turned into (1) by putting 'unmarried man' for its synonym 'bachelor.' We still lack a proper characterization of this second

class of analytic statements, and therewith of analyticity generally, inasmuch as we have had in the above description to lean on a notion of “synonymy” which is no less in need of clarification than analyticity itself.

In recent years Carnap has tended to explain analyticity by appeal to what he calls state-descriptions. A state-description is any exhaustive assignment of truth values to the atomic, or noncompound, statements of the language. All other statements of the language are, Carnap assumes, built up of their component clauses by means of the familiar logical devices, in such a way that the truth value of any complex statement is fixed for each state-description by specifiable logical laws. A statement is then explained as analytic when it comes out true under every state description. This account is an adaptation of Leibniz’s “true in all possible worlds.” But note that this version of analyticity serves its purpose only if the atomic statements of the language are, unlike ‘John is a bachelor’ and ‘John is married,’ mutually independent. Otherwise there would be a state-description which assigned truth to ‘John is a bachelor’ and to ‘John is married,’ and consequently ‘No bachelors are married’ would turn out synthetic rather than analytic under the proposed criterion. Thus the criterion of analyticity in terms of state-descriptions serves only for languages devoid of extralogical synonym-pairs, such as ‘bachelor’ and ‘unmarried man’—synonym-pairs of the type which give rise to the “second class” of analytic statements. The criterion in terms of state-descriptions is a reconstruction at best of logical truth, not of analyticity.

I do not mean to suggest that Carnap is under any illusions on this point. His simplified model language with its state-descriptions is aimed primarily not at the general problem of analyticity but at another purpose, the clarification of probability and induction. Our problem, however, is analyticity; and here the major difficulty lies not in the first class of analytic statements, the logical truths, but rather in the second class, which depends on the notion of synonymy.

2. DEFINITION

There are those who find it soothing to say that the analytic statements of the second class reduce to those of the first class, the logical truths, by *definition*; ‘bachelor,’ for example, is *defined* as ‘unmarried man.’ But how do we find that ‘bachelor’ is defined as ‘unmarried man’? Who defined it thus, and when? Are we to appeal to the nearest dictionary, and accept the lexicographer’s formulation as law? Clearly this would be to put the cart before the horse. The lexicographer is an empirical scientist, whose business is the recording of antecedent facts; and if he glosses ‘bachelor’ as ‘unmarried man’ it is because of his belief that there is a relation of synonymy between those forms, implicit in general or preferred usage prior to his own work. The notion of synonymy presupposed here has still to be clarified, presumably in terms relating to linguistic behavior. Certainly the “definition” which is the lexicographer’s report of an observed synonymy cannot be taken as the ground of the synonymy.

Definition is not, indeed, an activity exclusively of philologists. Philosophers and scientists frequently have occasion to “define” a recondite term by paraphrasing it into terms of a more familiar vocabulary. But ordinarily such a definition, like the philologist’s, is pure lexicography, affirming a relation of synonymy antecedent to the exposition in hand.

Just what it means to affirm synonymy, just what the interconnections may be which are necessary and sufficient in order that two linguistic forms be properly describable as synonymous, is far from clear; but, whatever these interconnections may be, ordinarily they are grounded in usage. Definitions reporting selected instances of synonymy come then as reports upon usage.

There is also, however, a variant type of definitional activity which does not limit itself to the reporting of preexisting synonymies. I have in mind what Carnap calls *explication*—an activity to which philosophers are given, and scientists also in their more philosophical moments. In explication the purpose is not merely to paraphrase the definiendum into an outright synonym, but actually to improve upon the definiendum by refining or supplementing its meaning. But even explication, though not merely reporting a preexisting synonymy between definiendum and definiens, does rest nevertheless on *other* preexisting synonymies. The matter may be viewed as follows. Any word worth explicating has some contexts which, as wholes, are clear and precise enough to be useful; and the purpose of explication is to preserve the usage of these favored contexts while sharpening the usage of other contexts. In order that a given definition be suitable for purposes of explication, therefore, what is required is not that the definiendum in its antecedent usage be synonymous with the definiens, but just that each of these favored contexts of the definiendum, taken as a whole in its antecedent usage, be synonymous with the corresponding context of the definiens.

Two alternative definitientia may be equally appropriate for the purposes of a given task of explication and yet not be synonymous with each other; for they may serve interchangeably within the favored contexts but diverge elsewhere. By cleaving to one of these definitientia rather than the other, a definition of explicative kind generates, by fiat, a relation of synonymy between definiendum and definiens which did not hold before. But such a definition still owes its explicative function, as seen, to preexisting synonymies.

There does, however, remain still an extreme sort of definition which does not hark back to prior synonymies at all: namely, the explicitly conventional introduction of novel notations for purposes of sheer abbreviation. Here the definiendum becomes synonymous with the definiens simply because it has been created expressly for the purpose of being synonymous with the definiens. Here we have a really transparent case of synonymy created by definition; would that all species of synonymy were as intelligible. For the rest, definition rests on synonymy rather than explaining it.

The word 'definition' has come to have a dangerously reassuring sound, owing no doubt to its frequent occurrence in logical and mathematical writings. We shall do well to digress now into a brief appraisal of the role of definition in formal work.

In logical and mathematical systems either of two mutually antagonistic types of economy may be striven for, and each has its peculiar practical utility. On the one hand we may seek economy of practical expression—ease and brevity in the statement of multifarious relations. This sort of economy calls usually for distinctive concise notations for a wealth of concepts. Second, however, and oppositely, we may seek economy in grammar and vocabulary; we may try to find a minimum of basic concepts such that, once a distinctive notation has been appropriated to each of them, it becomes possible to express any desired further concept by mere combination and iteration of our basic notations. This second sort of economy is impractical in one way, since a poverty in basic idioms tends to a necessary lengthening of discourse. But it is practical in another way: it greatly simplifies theoretical discourse *about* the language, through minimizing the terms and the forms of construction wherein the language consists.

Both sorts of economy, though *prima facie* incompatible, are valuable in their separate ways. The custom has consequently arisen of combining both sorts of economy by forging in effect two languages, the one a part of the other. The inclusive language, though redundant in grammar and vocabulary, is economical in message lengths, while the part, called primitive notation, is economical in grammar and vocabulary. Whole and part are correlated by rules of translation whereby each idiom not in primitive notation is equated to some complex built up of primitive notation. These rules of translation are the so-called *definitions* which appear in formalized systems. They are best viewed not as adjuncts to one language but as correlations between two languages, the one a part of the other.

But these correlations are not arbitrary. They are supposed to show how the primitive notations can accomplish all purposes, save brevity and convenience, of the redundant language. Hence the definiendum and its definiens may be expected, in each case, to be related in one or another of the three ways lately noted. The definiens may be a faithful paraphrase of the definiendum into the narrower notation, preserving a direct synonymy* as of antecedent usage; or the definiens may, in the spirit of explication, improve upon the antecedent usage of the definiendum; or finally, the definiendum may be a newly created notation, newly endowed with meaning here and now.

In formal and informal work alike, thus, we find that definition—except in the extreme case of the explicitly conventional introduction of new notations—hinges on prior relations of synonymy. Recognizing then that the notion of definition does not hold the key to synonymy and analyticity, let us look further into synonymy and say no more of definition.

3. INTERCHANGEABILITY

A natural suggestion, deserving close examination, is that the synonymy of two linguistic forms consists simply in their interchangeability in all contexts without change of truth value—interchangeability, in Leibniz's phrase, *salva veritate*. Note that synonyms so conceived need not even be free from vagueness, as long as the vaguenesses match.

But it is not quite true that the synonyms 'bachelor' and 'unmarried man' are everywhere interchangeable *salva veritate*. Truths which become false under substitution of 'unmarried man' for 'bachelor' are easily constructed with the help of 'bachelor of arts' or 'bachelor's buttons'; also with the help of quotation, thus:

'Bachelor' has less than ten letters.

Such counterinstances can, however, perhaps be set aside by treating the phrases 'bachelor of arts' and 'bachelor's buttons' and the quotation "bachelor" each as a single indivisible word and then stipulating that the interchangeability *salva veritate* which is to be the touchstone of synonymy is not supposed to apply to fragmentary occurrences inside of a word. This account of synonymy, supposing it acceptable on other counts, has indeed the drawback of appealing to a prior conception of "word" which can be counted

*According to an important variant sense of 'definition,' the relation preserved may be the weaker relation of mere agreement in reference. . . . But definition in this sense is better ignored in the present connection, being irrelevant to the question of synonymy.

on to present difficulties of formulation in its turn. Nevertheless some progress might be claimed in having reduced the problem of synonymy to a problem of wordhood. Let us pursue this line a bit, taking "word" for granted.

The question remains whether interchangeability *salva veritate* (apart from occurrences within words) is a strong enough condition for synonymy, or whether, on the contrary, some heteronymous expressions might be thus interchangeable. Now let us be clear that we are not concerned here with synonymy in the sense of complete identity in psychological associations or poetic quality; indeed no two expressions are synonymous in such a sense. We are concerned only with what may be called *cognitive* synonymy. Just what this is cannot be said without successfully finishing the present study; but we know something about it from the need which arose for it in connection with analyticity in ¶1. The sort of synonymy needed there was merely such that any analytic statement could be turned into a logical truth by putting synonyms for synonyms. Turning the tables and assuming analyticity, indeed, we could explain cognitive synonymy of terms as follows (keeping to the familiar example): to say that 'bachelor' and 'unmarried man' are cognitively synonymous is to say no more nor less than that the statement:

(3) All and only bachelors are unmarried men \$\$\$ is analytic.*

What we need is an account of cognitive synonymy not presupposing analyticity—if we are to explain analyticity conversely with help of cognitive synonymy as undertaken in ¶1. And indeed such an independent account of cognitive synonymy is at present up for consideration, namely, interchangeability *salva veritate* everywhere except within words. The question before us, to resume the thread at last, is whether such interchangeability is a sufficient condition for cognitive synonymy. We can quickly assure ourselves that it is, by examples of the following sort. The statement:

(4) Necessarily all and only bachelors are bachelors

is evidently true, even supposing 'necessarily' so narrowly construed as to be truly applicable only to analytic statements. Then, if 'bachelor' and 'unmarried man' are interchangeable *salva veritate*, the result:

(5) Necessarily all and only bachelors are unmarried men

of putting 'unmarried man' for an occurrence of 'bachelor' in (4) must, like (4), be true. But to say that (5) is true is to say that (3) is analytic, and hence that 'bachelor' and 'unmarried man' are cognitively synonymous.

Let us see what there is about the above argument that gives it its air of hocus-pocus. The condition of interchangeability *salva veritate* varies in its force with variations in the richness of the language at hand. The above argument supposes we are working with a language rich enough to contain the adverb 'necessarily,' this adverb being so construed as to yield truth when and only when applied to an analytic statement. But can we condone a language which contains such an adverb? Does the adverb

*This is cognitive synonymy in a primary, broad sense. Carnap and Lewis have suggested how, once this notion is at hand, a narrower sense of cognitive synonymy which is preferable for some purposes can in turn be derived. But this special ramification of concept-building lies aside from the present purposes and must not be confused with the broad sort of cognitive synonymy here concerned.

really make sense? To suppose that it does is to suppose that we have already made satisfactory sense of 'analytic.' Then what are we so hard at work on right now?

Our argument is not flatly circular, but something like it. It has the form, figuratively speaking, of a closed curve in space.

Interchangeability *salva veritate* is meaningless until relativized to a language whose extent is specified in relevant respects. Suppose now we consider a language containing just the following materials. There is an indefinitely large stock of one-place predicates (for example, '*F*' where '*Fx*' means that *x* is a man) and many-place predicates (for example, '*G*' where '*Gxy*' means that *x* loves *y*), mostly having to do with extralogical subject matter. The rest of the language is logical. The atomic sentences consist each of a predicate followed by one or more variables '*x*,' '*y*,' etc.; and the complex sentences are built up of the atomic ones by truth functions ('not,' 'and,' 'or,' etc.) and quantification. In effect such a language enjoys the benefits also of descriptions and indeed singular terms generally, these being contextually definable in known ways. Even abstract singular terms naming classes, classes of classes, etc., are contextually definable in case the assumed stock of predicates includes the two-place predicate of class membership. Such a language can be adequate to classical mathematics and indeed to scientific discourse generally, except in so far as the latter involves debatable devices such as contrary-to-fact conditionals or modal adverbs like 'necessarily.' Now a language of this type is extensional, in this sense: any two predicates which agree extensionally (that is, are true of the same objects) are interchangeable *salva veritate*.

In an extensional language, therefore, interchangeability *salva veritate* is no assurance of cognitive synonymy of the desired type. That 'bachelor' and 'unmarried man' are interchangeable *salva veritate* in an extensional language assures us of no more than that (3) is true. There is no assurance here that the extensional agreement of 'bachelor' and 'unmarried man' rests on meaning rather than merely on accidental matters of fact, as does the extensional agreement of 'creature with a heart' and 'creature with kidneys.'

For most purposes extensional agreement is the nearest approximation to synonymy we need care about. But the fact remains that extensional agreement falls far short of cognitive synonymy of the type required for explaining analyticity in the manner of ¶1. The type of cognitive synonymy required there is such as to equate the synonymy of 'bachelor' and 'unmarried man' with the analyticity of (3), not merely with the truth of (3).

So we must recognize that interchangeability *salva veritate*, if construed in relation to an extensional language, is not a sufficient condition of cognitive synonymy in the sense needed for deriving analyticity in the manner of ¶1. If a language contains an intensional adverb 'necessarily' in the sense lately noted, or other particles to the same effect, then interchangeability *salva veritate* in such a language does afford a sufficient condition of cognitive synonymy; but such a language is intelligible only in so far as the notion of analyticity is already understood in advance.

The effort to explain cognitive synonymy first, for the sake of deriving analyticity from it afterward as in ¶1, is perhaps the wrong approach. Instead we might try explaining analyticity somehow without appeal to cognitive synonymy. Afterward we could doubtless derive cognitive synonymy from analyticity satisfactorily enough if desired. We have seen that cognitive synonymy of 'bachelor' and 'unmarried man' can be explained as analyticity of (3). The same explanation works for any pair of one-place predicates, of course, and it can be extended in obvious fashion to many-place predicates. Other syntactical categories can also be accommodated in fairly parallel fashion. Singular terms may be said to

be cognitively synonymous when the statement of identity formed by putting '=' between them is analytic. Statements may be said simply to be cognitively synonymous when their biconditional (the result of joining them by 'if and only if') is analytic.* If we care to lump all categories into a single formulation, at the expense of assuming again the notion of "word" which was appealed to early in this section, we can describe any two linguistic forms as cognitively synonymous when the two forms are interchangeable (apart from occurrences within "words") *salva* (no longer *veritate* but) *analyticitate*. Certain technical questions arise, indeed, over cases of ambiguity or homonymy; let us not pause for them, however, for we are already digressing. Let us rather turn our backs on the problem of synonymy and address ourselves anew to that of analyticity.

4. SEMANTICAL RULES

Analyticity at first seemed most naturally definable by appeal to a realm of meanings. On refinement, the appeal to meanings gave way to an appeal to synonymy or definition. But definition turned out to be a will-o'-the-wisp, and synonymy turned out to be best understood only by dint of a prior appeal to analyticity itself. So we are back at the problem of analyticity.

I do not know whether the statement 'Everything green is extended' is analytic. Now does my indecision over this example really betray an incomplete understanding, an incomplete grasp of the "meanings," of 'green' and 'extended'? I think not. The trouble is not with 'green' or 'extended,' but with 'analytic.'

It is often hinted that the difficulty in separating analytic statements from synthetic ones in ordinary language is due to the vagueness of ordinary language and that the distinction is clear when we have a precise artificial language with explicit "semantical rules." This, however, as I shall now attempt to show, is a confusion.

The notion of analyticity about which we are worrying is a purported relation between statements and languages: a statement *S* is said to be *analytic* for a language *L*, and the problem is to make sense of this relation generally, that is, for variable '*S*' and '*L*.' The gravity of this problem is not perceptibly less for artificial languages than for natural ones. The problem of making sense of the idiom '*S* is analytic for *L*,' with variable '*S*' and '*L*,' retains its stubbornness even if we limit the range of the variable '*L*' to artificial languages. Let me now try to make this point evident.

For artificial languages and semantical rules we look naturally to the writings of Carnap. His semantical rules take various forms, and to make my point I shall have to distinguish certain of the forms. Let us suppose, to begin with, an artificial language L_0 whose semantical rules have the form explicitly of a specification, by recursion or otherwise, of all the analytic statements of L_0 . The rules tell us that such and such statements, and only those, are the analytic statements of L_0 . Now here the difficulty is simply that the rules contain the word 'analytic,' which we do not understand! We understand what expressions the rules attribute analyticity to, but we do not understand what the rules attribute to those expressions. In short, before we can understand a rule which begins 'A statement *S* is analytic for language L_0 if and only if . . .,' we must understand the general relative term 'analytic for'; we must understand '*S* is analytic for *L*' where '*S*' and '*L*' are variables.

*The 'if and only if' itself is intended in the true functional sense.

Alternatively we may, indeed, view the so-called rule as a conventional definition of a new simple symbol 'analytic-for- L_0 ,' which might better be written untendentiously as ' K ' so as not to seem to throw light on the interesting word 'analytic.' Obviously any number of classes K , M , N , etc. of statements of L_0 can be specified for various purposes or for no purpose; what does it mean to say that K , as against M , N , etc., is the class of the "analytic" statements of L_0 ?

By saying what statements are analytic for L_0 we explain 'analytic-for- L_0 ' but not 'analytic,' not 'analytic for.' We do not begin to explain the idiom ' S is analytic for L ' with variable ' S ' and ' L ,' even if we are content to limit the range of ' L ' to the realm of artificial languages.

Actually we do know enough about the intended significance of 'analytic' to know that analytic statements are supposed to be true. Let us then turn to a second form of semantical rule, which says not that such and such statements are analytic but simply that such and such statements are included among the truths. Such a rule is not subject to the criticism of containing the un-understood word 'analytic'; and we may grant for the sake of argument that there is no difficulty over the broader term 'true.' A semantical rule of this second type, a rule of truth, is not supposed to specify all the truths of the language; it merely stipulates, recursively or otherwise, a certain multitude of statements which, along with others unspecified, are to count as true. Such a rule may be conceded to be quite clear. Derivatively, afterward, analyticity can be demarcated thus: a statement is analytic if it is (not merely true but) true according to the semantical rule.

Still there is really no progress. Instead of appealing to an unexplained word 'analytic,' we are now appealing to an unexplained phrase 'semantical rule.' Not every true statement which says that the statements of some class are true can count as a semantical rule—otherwise *all* truths would be "analytic" in the sense of being true according to semantical rules. Semantical rules are distinguishable, apparently, only by the fact of appearing on a page under the heading 'Semantical Rules'; and this heading is itself then meaningless.

We can say indeed that a statement is *analytic-for- L_0* if and only if it is true according to such and such specifically appended "semantical rules," but then we find ourselves back at essentially the same case which was originally discussed: ' S is *analytic-for- L_0* if and only if' Once we seek to explain ' S is analytic for L ' generally for variable ' L ' (even allowing limitation of ' L ' to artificial languages), the explanation 'true according to the semantical rules of L ' is unavailing; for the relative term 'semantical rule of' is as much in need of clarification, at least, as 'analytic for.'

It may be instructive to compare the notion of semantical rule with that of postulate. Relative to a given set of postulates, it is easy to say what a postulate is: it is a member of the set. Relative to a given set of semantical rules, it is equally easy to say what a semantical rule is. But given simply a notation, mathematical or otherwise, and indeed as thoroughly understood a notation as you please in point of the translations or truth conditions of its statements, who can say which of its true statements rank as postulates? Obviously the question is meaningless—as meaningless as asking which points in Ohio are starting points. Any finite (or effectively specifiable infinite) selection of statements (preferably true ones, perhaps) is as much a set of postulates as any other. The word 'postulate' is significant only relative to an act of inquiry; we apply the word to a set of statements just in so far as we happen, for the year or the moment, to be thinking of those statements in relation to the statements which can be reached from them by some set of transformations to which we have seen fit to direct our attention. Now the notion of semantical rule is as sensible and meaningful as that of postulate, if conceived in a similarly relative spirit—relative, this

time, to one or another particular enterprise of schooling unacquainted persons in sufficient conditions for truth of statements of some natural or artificial language *L*. But from this point of view no one signalization of a subclass of the truths of *L* is intrinsically more a semantical rule than another; and, if 'analytic' means 'true by semantical rules,' no one truth of *L* is analytic to the exclusion of another.

It might conceivably be protested that an artificial language *L* (unlike a natural one) is a language in the ordinary sense *plus* a set of explicit semantical rules—the whole constituting, let us say, an ordered pair; and that the semantical rules of *L* then are specifiable simply as the second component of the pair *L*. But, by the same token and more simply, we might construe an artificial language *L* outright as an ordered pair whose second component is the class of its analytic statements; and then the analytic statements of *L* become specifiable simply as the statements in the second component of *L*. Or better still, we might just stop tugging at our bootstraps altogether.

Not all the explanations of analyticity known to Carnap and his readers have been covered explicitly in the above considerations, but the extension to other forms is not hard to see. Just one additional factor should be mentioned which sometimes enters: sometimes the semantical rules are in effect rules of translation into ordinary language, in which case the analytic statements of the artificial language are in effect recognized as such from the analyticity of their specified translations in ordinary language. Here certainly there can be no thought of an illumination of the problem of analyticity from the side of the artificial language.

From the point of view of the problem of analyticity the notion of an artificial language with semantical rules is a *feu follet par excellence*. Semantical rules determining the analytic statements of an artificial language are of interest only in so far as we already understand the notion of analyticity; they are of no help in gaining this understanding.

Appeal to hypothetical languages of an artificially simple kind could conceivably be useful in clarifying analyticity, if the mental or behavioral or cultural factors relevant to analyticity—whatever they may be—were somehow sketched into the simplified model. But a model which takes analyticity merely as an irreducible character is unlikely to throw light on the problem of explicating analyticity.

It is obvious that truth in general depends on both language and extralinguistic fact. The statement 'Brutus killed Caesar' would be false if the world had been different in certain ways, but it would also be false if the word 'killed' happened rather to have the sense of 'begat.' Thus one is tempted to suppose in general that the truth of a statement is somehow analyzable into a linguistic component and a factual component. Given this supposition, it next seems reasonable that in some statements the factual component should be null; and these are the analytic statements. But, for all its *a priori* reasonableness, a boundary between analytic and synthetic statements simply has not been drawn. That there is such a distinction to be drawn at all is an unempirical dogma of empiricists, a metaphysical article of faith.

5. THE VERIFICATION THEORY AND REDUCTIONISM

In the course of these somber reflections we have taken a dim view first of the notion of meaning, then of the notion of cognitive synonymy, and finally of the notion of analyticity. But what, it may be asked, of the verification theory of meaning? This phrase

has established itself so firmly as a catchword of empiricism that we should be very unscientific indeed not to look beneath it for a possible key to the problem of meaning and the associated problems.

The verification theory of meaning, which has been conspicuous in the literature from Peirce onward, is that the meaning of a statement is the method of empirically confirming or infirming it. An analytic statement is that limiting case which is confirmed no matter what.

As urged in ¶1, we can as well pass over the question of meanings as entities and move straight to sameness of meaning, or synonymy. Then what the verification theory says is that statements are synonymous if and only if they are alike in point of method of empirical confirmation or infirmation.

This is an account of cognitive synonymy not of linguistic forms generally, but of statements.* However, from the concept of synonymy of statements we could derive the concept of synonymy for other linguistic forms, by considerations somewhat similar to those at the end of ¶3. Assuming the notion of "word," indeed, we could explain any two forms as synonymous when the putting of the one form for an occurrence of the other in any statement (apart from occurrences within "words") yields a synonymous statement. Finally, given the concept of synonymy thus for linguistic forms generally, we could define analyticity in terms of synonymy and logical truth as in ¶1. For that matter, we could define analyticity more simply in terms of just synonymy of statements together with logical truth; it is not necessary to appeal to synonymy of linguistic forms other than statements. For a statement may be described as analytic simply when it is synonymous with a logically true statement.

So, if the verification theory can be accepted as an adequate account of statement synonymy, the notion of analyticity is saved after all. However, let us reflect. Statement synonymy is said to be likeness of method of empirical confirmation or infirmation. Just what are these methods which are to be compared for likeness? What, in other words, is the nature of the relation between a statement and the experiences which contribute to or detract from its confirmation?

The most naive view of the relation is that it is one of direct report. This is *radical reductionism*. Every meaningful statement is held to be translatable into a statement (true or false) about immediate experience. Radical reductionism, in one form or another, well antedates the verification theory of meaning explicitly so called. Thus Locke and Hume held that every idea must either originate directly in sense experience or else be compounded of ideas thus originating; and taking a hint from Tooke we might rephrase this doctrine in semantical jargon by saying that a term, to be significant at all, must be either a name of a sense datum or a compound of such names or an abbreviation of such a compound. So stated, the doctrine remains ambiguous as between sense data as sensory events and sense data as sensory qualities; and it remains vague as to the admissible ways of compounding. Moreover, the doctrine is unnecessarily and intolerably restrictive in the term-by-term critique which it imposes. More reasonably, and without yet exceeding the limits of what I have called radical reductionism, we may take full statements as our significant units—thus demanding that our statements as wholes be translatable into sense-datum language, but not that they be translatable term by term.

This emendation would unquestionably have been welcome to Locke and Hume and Tooke, but historically it had to await an important reorientation in semantics—the

*The doctrine can indeed be formulated with terms rather than statements as the units. Thus Lewis describes the meaning of a term as "*a criterion in mind*, by reference to which one is able to apply or refuse to apply the expression in question in the case of presented, or imagined, things or situations."

reorientation whereby the primary vehicle of meaning came to be seen no longer in the term but in the statement. This reorientation, seen in Bentham and Frege, underlies Russell's concept of incomplete symbols defined in use; also it is implicit in the verification theory of meaning, since the objects of verification are statements.

Radical reductionism, conceived now with statements as units, set itself the task of specifying a sense-datum language and showing how to translate the rest of significant discourse, statement by statement, into it. Carnap embarked on this project in the *Aufbau*.

The language which Carnap adopted as his starting point was not a sense-datum language in the narrowest conceivable sense, for it included also the notations of logic, up through higher set theory. In effect it included the whole language of pure mathematics. The ontology implicit in it (that is, the range of values of its variables) embraced not only sensory events but classes, classes of classes, and so on. Empiricists there are who would boggle at such prodigality. Carnap's starting point is very parsimonious, however, in its extralogical or sensory part. In a series of constructions in which he exploits the resources of modern logic with much ingenuity, Carnap succeeds in defining a wide array of important additional sensory concepts which, but for his constructions, one would not have dreamed were definable on so slender a basis. He was the first empiricist who, not content with asserting the reducibility of science to terms of immediate experience, took serious steps toward carrying out the reduction.

If Carnap's starting point is satisfactory, still his constructions were, as he himself stressed, only a fragment of the full program. The construction of even the simplest statements about the physical world was left in a sketchy state. Carnap's suggestions on this subject were, despite their sketchiness, very suggestive. He explained spatio-temporal point-instants as quadruples of real numbers and envisaged assignment of sense qualities to point-instants according to certain canons. Roughly summarized, the plan was that qualities should be assigned to point-instants in such a way as to achieve the laziest world compatible with our experience. The principle of least action was to be our guide in constructing a world from experience.

Carnap did not seem to recognize, however, that his treatment of physical objects fell short of reduction not merely through sketchiness, but in principle. Statements of the form 'Quality q is at point-instant $x;y;z;t$ ' were, according to his canons, to be apportioned truth values in such a way as to maximize and minimize certain over-all features, and with growth of experience the truth values were to be progressively revised in the same spirit. I think this is a good schematization (deliberately oversimplified, to be sure) of what science really does; but it provides no indication, not even the sketchiest, of how a statement of the form 'Quality q is at $x;y;z;t$ ' could ever be translated into Carnap's initial language of sense data and logic. The connective 'is at' remains an added undefined connective; the canons counsel us in its use but not in its elimination.

Carnap seems to have appreciated this point afterward; for in his later writings he abandoned all notion of the translatability of statements about the physical world into statements about immediate experience. Reductionism in its radical form has long since ceased to figure in Carnap's philosophy.

But the dogma of reductionism has, in a subtler and more tenuous form, continued to influence the thought of empiricists. The notion lingers that to each statement, or each synthetic statement, there is associated a unique range of possible sensory events such that the occurrence of any of them would add to the likelihood of truth of the statement, and that there is associated also another unique range of possible sensory events whose occurrence would detract from that likelihood. This notion is of course implicit in the verification theory of meaning.

The dogma of reductionism survives in the supposition that each statement, taken in isolation from its fellows, can admit of confirmation or infirmation at all. My counter-suggestion, issuing essentially from Carnap's doctrine of the physical world in the *Aufbau*, is that our statements about the external world face the tribunal of sense experience not individually but only as a corporate body.

The dogma of reductionism, even in its attenuated form, is intimately connected with the other dogma—that there is a cleavage between the analytic and the synthetic. We have found ourselves led, indeed, from the latter problem to the former through the verification theory of meaning. More directly, the one dogma clearly supports the other in this way: as long as it is taken to be significant in general to speak of the confirmation and infirmation of a statement, it seems significant to speak also of a limiting kind of statement which is vacuously confirmed, *ipso facto*, come what may; and such a statement is analytic.

The two dogmas are, indeed, at root identical. We lately reflected that in general the truth of statements does obviously depend both upon language and upon extralinguistic fact; and we noted that this obvious circumstance carries in its train, not logically but all too naturally, a feeling that the truth of a statement is somehow analyzable into a linguistic component and a factual component. The factual component must, if we are empiricists, boil down to a range of confirmatory experiences. In the extreme case where the linguistic component is all that matters, a true statement is analytic. But I hope we are now impressed with how stubbornly the distinction between analytic and synthetic has resisted any straightforward drawing. I am impressed also, apart from pre-fabricated examples of black and white balls in an urn, with how baffling the problem has always been of arriving at any explicit theory of the empirical confirmation of a synthetic statement. My present suggestion is that it is nonsense, and the root of much nonsense, to speak of a linguistic component and a factual component in the truth of any individual statement. Taken collectively, science has its double dependence upon language and experience; but this duality is not significantly traceable into the statements of science taken one by one.

The idea of defining a symbol in use was, as remarked, an advance over the impossible term-by-term empiricism of Locke and Hume. The statement, rather than the term, came with Bentham to be recognized as the unit accountable to an empiricist critique. But what I am now urging is that even in taking the statement as unit we have drawn our grid too finely. The unit of empirical significance is the whole of science.

6. EMPIRICISM WITHOUT THE DOGMAS

The totality of our so-called knowledge or beliefs, from the most casual matters of geography and history to the profoundest laws of atomic physics or even of pure mathematics and logic, is a man-made fabric which impinges on experience only along the edges. Or, to change the figure, total science is like a field of force whose boundary conditions are experience. A conflict with experience at the periphery occasions readjustments in the interior of the field. Truth values have to be redistributed over some of our statements. Reevaluation of some statements entails reevaluation of others, because of their logical interconnections—the logical laws being in turn simply certain further statements of the system, certain further elements of the field. Having reevaluated one statement we must reevaluate some others, which may be statements logically connected with the first or

may be the statements of logical connections themselves. But the total field is so underdetermined by its boundary conditions, experience, that there is much latitude of choice as to what statements to reevaluate in the light of any single contrary experience. No particular experiences are linked with any particular statements in the interior of the field, except indirectly through considerations of equilibrium affecting the field as a whole.

If this view is right, it is misleading to speak of the empirical content of an individual statement—especially if it is a statement at all remote from the experiential periphery of the field. Furthermore it becomes folly to seek a boundary between synthetic statements, which hold contingently on experience, and analytic statements, which hold come what may. Any statement can be held true come what may, if we make drastic enough adjustments elsewhere in the system. Even a statement very close to the periphery can be held true in the face of recalcitrant experience by pleading hallucination or by amending certain statements of the kind called logical laws. Conversely, by the same token, no statement is immune to revision. Revision even of the logical law of the excluded middle has been proposed as a means of simplifying quantum mechanics; and what difference is there in principle between such a shift and the shift whereby Kepler superseded Ptolemy, or Einstein Newton, or Darwin Aristotle?

For vividness I have been speaking in terms of varying distances from a sensory periphery. Let me try now to clarify this notion without metaphor. Certain statements, though *about* physical objects and not sense experience, seem peculiarly germane to sense experience—and in a selective way: some statements to some experiences, others to others. Such statements, especially germane to particular experiences, I picture as near the periphery. But in this relation of “germaneness” I envisage nothing more than a loose association reflecting the relative likelihood, in practice, of our choosing one statement rather than another for revision in the event of recalcitrant experience. For example, we can imagine recalcitrant experiences to which we would surely be inclined to accommodate our system by reevaluating just the statement that there are brick houses on Elm Street, together with related statements on the same topic. We can imagine other recalcitrant experiences to which we would be inclined to accommodate our system by reevaluating just the statement that there are no centaurs, along with kindred statements. A recalcitrant experience can, I have urged, be accommodated by any of various alternative reevaluations in various alternative quarters of the total system; but, in the cases which we are now imagining, our natural tendency to disturb the total system as little as possible would lead us to focus our revisions upon these specific statements concerning brick houses or centaurs. These statements are felt, therefore, to have a sharper empirical reference than highly theoretical statements of physics or logic or ontology. The latter statements may be thought of as relatively centrally located within the total network, meaning merely that little preferential connection with any particular sense data obtrudes itself.

As an empiricist I continue to think of the conceptual scheme of science as a tool, ultimately, for predicting future experience in the light of past experience. Physical objects are conceptually imported into the situation as convenient intermediaries—not by definition in terms of experience, but simply as irreducible posits comparable, epistemologically, to the gods of Homer. For my part I do, *qua* lay physicist, believe in physical objects and not in Homer’s gods; and I consider it a scientific error to believe otherwise. But in point of epistemological footing the physical objects and the gods differ only in degree and not in kind. Both sorts of entities enter our conception only as cultural posits. The myth of physical objects is epistemologically superior to most in that it has proved more efficacious than other myths as a device for working a manageable structure into the flux of experience.

Positing does not stop with macroscopic physical objects. Objects at the atomic level are posited to make the laws of macroscopic objects, and ultimately the laws of experience, simpler and more manageable; and we need not expect or demand full definition of atomic and subatomic entities in terms of macroscopic ones, any more than definition of macroscopic things in terms of sense data. Science is a continuation of common sense, and it continues the common-sense expedient of swelling ontology to simplify theory.

Physical objects, small and large, are not the only posits. Forces are another example; and indeed we are told nowadays that the boundary between energy and matter is obsolete. Moreover, the abstract entities which are the substance of mathematics—ultimately classes and classes of classes and so on up—are another posit in the same spirit. Epistemologically these are myths on the same footing with physical objects and gods, neither better nor worse except for differences in the degree to which they expedite our dealings with sense experiences.

The over-all algebra of rational and irrational numbers is underdetermined by the algebra of rational numbers, but is smoother and more convenient; and it includes the algebra of rational numbers as a jagged or gerrymandered part. Total science, mathematical and natural and human, is similarly but more extremely underdetermined by experience. The edge of the system must be kept squared with experience; the rest, with all its elaborate myths or fictions, has as its objective the simplicity of laws.

Ontological questions, under this view, are on a par with questions of natural science. Consider the question whether to countenance classes as entities. This, as I have argued elsewhere, is the question whether to quantify with respect to variables which take classes as values. Now Carnap has maintained that this is a question not of matters of fact but of choosing a convenient language form, a convenient conceptual scheme or framework for science. With this I agree, but only on the proviso that the same be conceded regarding scientific hypotheses generally. Carnap has recognized that he is able to preserve a double standard for ontological questions and scientific hypotheses only by assuming an absolute distinction between the analytic and the synthetic; and I need not say again that this is a distinction which I reject.

The issue over there being classes seems more a question of convenient conceptual scheme; the issue over there being centaurs, or brick houses on Elm Street, seems more a question of fact. But I have been urging that this difference is only one of degree, and that it turns upon our vaguely pragmatic inclination to adjust one strand of the fabric of science rather than another in accommodating some particular recalcitrant experience. Conservatism figures in such choices, and so does the quest for simplicity.

Carnap, Lewis, and others take a pragmatic stand on the question of choosing between language forms, scientific frameworks; but their pragmatism leaves off at the imagined boundary between the analytic and the synthetic. In repudiating such a boundary I espouse a more thorough pragmatism. Each man is given a scientific heritage plus a continuing barrage of sensory stimulation; and the considerations which guide him in warping his scientific heritage to fit his continuing sensory promptings are, where rational, pragmatic.

JACQUES DERRIDA

1930–2004

In the spirit of his celebrated dictum that “there is nothing outside the text,” Jacques Derrida long resisted the publication of information about his life. For seventeen years (1962–1979), he even refused to have a personal photograph accompany his texts. However, his fame as the founder of what came to be called “deconstruction” led him to provide biographical “scraps.”

Born in 1930 near Algiers, Jacques Derrida as a Jew was forced to leave school in 1942 until the Free French repealed Vichy racial laws. At 19, he moved to Paris to prepare for the École Normale Supérieure, where he subsequently studied and taught philosophy. Though his first published work (1962)—about Husserl’s essay on geometry—won a philosophical prize, Derrida was not widely known until 1966. At a conference on France’s new structuralism at Johns Hopkins University, Derrida gave a paper—“Structure, Sign, and Play in the Discourse of the Human Sciences”—that daringly exposed contradictions in the thought of structuralism’s leading figure, Lévi-Strauss. Derrida’s critique became one of the important building blocks in what came to be called “poststructuralism.”

The following year, Derrida continued his critique, publishing no less than three books showing how structuralist positions refuted their own theses. The books—*Of Grammatology*, *Writing and Difference*, and *Speech and Phenomena* (as the titles were translated)—created a storm of philosophical debate in France. In these works, Derrida showed how his critique went beyond structuralism and attacked the enterprise of philosophy itself. “Deconstruction,” as Derrida’s approach in these works was now called, claimed that the very nature of a written text—of every traditional text and not just the structuralist’s—undermines itself. To “deconstruct” a text, then, is to dismantle inherent hierarchical systems of thought, to seek out unregarded details, to find the “margins” of the text, where there are new possibilities of interpretation.

In 1972, Derrida published three additional works, translated as *Dissemination*, *Margins of Philosophy*, and *Positions*, which continued to influence poststructuralism in the 1970s. As Derrida's fame grew, he accepted a visiting professorship first at Yale University, and then at the University of California in Irvine. In the 1980s, Derrida gave himself to political causes such as the abolition of apartheid. He also became actively interested in architecture, which he regarded as the last bastion of metaphysics. He helped architect Peter Eisenman design a garden in Paris that explores the relationship between center and periphery. Born on the periphery of colonial France, on the margin of Algiers, as a marginalized Jew, Derrida constantly examined the philosophical relation between margin and center (and often employed language that is only marginally understandable). All for a purpose.

* * *

Derrida believes that Western philosophy is built upon a "Metaphysics of Presence": upon, that is to say, the idea that there is an origin of knowledge from which "truth" can be made present. Philosophy has always seen itself as the arbiter of reason, the discipline that adjudicates what is and is not. Forms of writing other than philosophical discourse, such as poetic or literary writing, have been judged inferior, and removed from the truth. In *Of Grammatology*, Derrida calls this positing of a center that can situate certainty *logocentrism*. Philosophy thinks it can talk about "meaning" through a language unsullied by the imprecision of metaphors. *Au Contraire!* As Derrida argues in our selection, translated by Gayatri Chakravorty Spivak, philosophical discourse is not privileged in any way, and any attempt to explain what "meaning" *means* will self-destruct. Put more precisely, the signifiers of language systems cannot refer to a transcendental *signified* originating in the mind of the speaker because the "signified" is itself created by the conventional, and hence arbitrary, signifiers of language. Signifiers therefore merely refer to other signifiers (e.g., words refer only to other words). The "meaning" is always deferred and Presence is never actually present. Signifiers attain significance only in their differences from each other (the signifier "cat" is neither "cap" nor "car") or in what they define themselves against ("to be asleep" is understood in contrast to "to be awake").

To highlight the ambiguities of language, Derrida coined the word *différance*. In French, this word sounds no different from the French word *différence*, which comes from the verb *différer*, meaning both "to differ" and "to defer." Whereas the definition of *différence* reminds us that signifiers defer meaning as they differ both from their referents and from each other, the written word *différance* calls attention in a striking way to the limitations of the spoken word. The spoken word can establish no aural distinction between *différence* and *différance*. Derrida thus questions the traditional privileging of speech over writing, which goes back at least as far as Plato. For example, in the *Phaedrus*, Plato had placed writing as one step further removed than speaking from Ideal Form. Derrida shows, however, that even as Plato sought to place speech closer to the source of meaning, he could not keep writing out of his system. At one point in the *Phaedrus*, Plato states that speech "is *written* in the soul of the listener" (emphasis added).

This is just one example of how Derrida repeatedly exposes the repressed figures of speech in even the most systematic of thinkers. According to Derrida,

all systems of thought contain “traces” of that which they define themselves against. Thus, whereas many philosophers have thought literature merely sugar-coated philosophy, Derrida has reversed this hierarchy to say that the discourse of philosophy is merely literary medicine—an assumption that is hard for many to swallow. For Derrida, all writing is reduced (or elevated) to the same level, with no privileging of one genre as more “meaning-ful” than another. This may explain why deconstruction—with its close reading of texts to unearth language working against itself—made its greatest impact in literature, rather than in philosophy.

But what about Derrida’s writings themselves—do they not represent a conceptual order, an attempt to communicate “meaning”? Derrida goes to great pains to avoid the systemization of his own thought, constantly inventing new terms to destabilize his readers’ sense that they understand his “philosophy.” In the meantime, although he works to expose the failures of language to make present meaning, he acknowledges that, since language is all we have, he must situate himself inside a system even as he is breaking it apart. He signals this paradox, or *aporia*, of language by borrowing a technique from Heidegger, who simultaneously included and deleted the word Being in his works by placing an X over it: ~~Being~~. Derrida crosses out certain metaphysically loaded words, putting them “under erasure.” He asserts the inadequacy of a signifier like ~~nature~~ to have a definitive meaning, while also acknowledging that thought cannot operate without the term. Derrida demonstrates that his own writing—like everyone else’s—is not innocent, that it cannot become a coherent theoretical system corresponding to reality. Derrida has therefore been called a nihilist. His defenders, however, call this accusation inaccurate. Derrida never denies the existence of an Absolute; he only asserts the impossibility of putting the Absolute into words.

(London: Continuum, 2006) are more recent specialized studies. Gary A. Olson and Irene Gale, eds., *(Inter)view: Cross-Disciplinary Perspectives on Rhetoric and Literacy* (Carbondale: Southern Illinois University Press, 1991); Jacques Derrida, *Points. . . : Interview 1974–1994*, edited by Elisabeth Weber (Stanford, CA: Stanford University Press, 1995); John Caputo, ed., *Deconstruction in a Nutshell: A Conversation with Jacques Derrida* (New York: Fordham University Press, 1997); and Jacques Derrida, *Positions: Revised Edition*, translated and annotated by Alan Bass (London: Continuum, 2004) include discussions with Derrida. For a feminist reading of Derrida, see Ellen K. Feder, Mary C. Rawlinson, and Emily Zakin, eds., *Derrida and Feminism* (Oxford: Routledge, 1997). General collections of critical essays include John Sallis, ed., *Deconstruction and Philosophy: The Texts of Jacques Derrida* (Chicago: University of Chicago Press, 1987); David Wood, ed., *Derrida: A Critical Reader* (Oxford: Basil Blackwell, 1992); Harold Coward and Toby Foshay, eds., *Derrida and Negative Theology* (Albany, NY: SUNY Press, 1992); Gary B. Madison, ed., *Working through Derrida* (Evanston, IL: Northwestern University Press, 1993); and Jack Reynolds and Jon Roffe, eds., *Understanding Derrida* (London: Continuum, 2004). Finally, in Geoffrey Bennington and Jacques Derrida, *Jacques Derrida* (Chicago: University of Chicago Press, 1993), the top two-thirds of each page give Bennington's comment on Derrida's thought, whereas Derrida himself writes "in the margin" along the bottom of each page.

OF GRAMMATOLOGY (in part)

CHAPTER 1: THE WRITTEN BEING/THE BEING WRITTEN

The reassuring evidence within which Western tradition had to organize itself and must continue to live would therefore be as follows: the order of the signified is never contemporary, is at best the subtly discrepant inverse or parallel—discrepant by the time of a breath—from the order of the signifier. And the sign must be the unity of a heterogeneity, since the signified (sense or thing, noeme or reality) is not in itself a signifier, a *trace*: in any case is not constituted in its sense by its relationship with a possible trace. The formal essence of the signified is *presence*, and the privilege of its proximity to the logos as *phonè* is the privilege of presence. This is the inevitable response as soon as one asks: "what is the sign?," that is to say, when one submits the sign to the question of essence, to the "ti esti." The "formal essence" of the sign can only be determined in terms of presence. One cannot get around that response, except by challenging the very form of the question and beginning to think that the sign ~~is~~ that ill-named thing, the only one, that escapes the instituting question of philosophy: "what is . . . ?"

*I attempt to develop this theme elsewhere (*Speech and Phenomena*).

Open Warfare, 1991, by Jeremy Gilbert-Rolfe. Derrida holds that the limits or frame of a given piece defines an inside and an outside but also “permits, and even encourages, a complicated movement or passage across it both from inside-out and outside-in” (from David Carroll, *Paraesthetics: Foucault, Lyotard, Derrida* (New York: Methuen, 1987), p. 136). Gilbert-Rolfe’s painting exemplifies this deferral of meaning as its pattern suggests a continuation beyond itself. (95 x 95 oil on linen, Jeremy Gilbert-Rolfe)

Radicalizing the concepts of *interpretation, perspective, evaluation, difference*, and all the “empiricist” or nonphilosophical motifs that have constantly tormented philosophy throughout the history of the West, and besides, have had nothing but the inevitable weakness of being produced in the field of philosophy, Nietzsche, far from remaining simply (with Hegel and as Heidegger wished) *within* metaphysics, contributed a great deal to the liberation of the signifier from its dependence or derivation with respect to the logos and the related concept of truth or the primary signified in whatever sense that is understood. Reading, and therefore writing, the text were for Nietzsche

“originary”* operations (I put that word within quotation marks for reasons to appear later) with regard to a sense that they do not first have to transcribe or discover, which would not therefore be a truth signified in the original element and presence of the logos, as *topos noetos*, divine understanding, or the structure of a priori necessity. To save Nietzsche from a reading of the Heideggerian type, it seems that we must above all not attempt to restore or make explicit a less naive “ontology,” composed of profound ontological intuitions acceding to some originary truth, an entire fundamentality hidden under the appearance of an empiricist or metaphysical text. The virulence of Nietzschean thought could not be more completely misunderstood. On the contrary, one must *accentuate* the “naïveté” of a breakthrough which cannot attempt a step outside of metaphysics, which cannot *criticize* metaphysics radically without still utilizing in a certain way, in a certain type or a certain style of *text*, propositions that, read within the philosophic corpus, that is to say according to Nietzsche ill-read or unread, have always been and will always be “naïvetés,” incoherent signs of an absolute appurtenance. Therefore, rather than protect Nietzsche from the Heideggerian reading, we should perhaps offer him up to it completely, underwriting that interpretation without reserve; in a *certain way* and up to the point where, the content of the Nietzschean discourse being almost lost for the question of being, its form regains its absolute strangeness, where his text finally invokes a different type of reading, more faithful to his type of writing: Nietzsche has *written what* he has written. He has written that writing—and first of all his own—is not originarily subordinate to the logos and to truth. And that this subordination has *come into being* during an epoch whose meaning we must deconstruct. Now in this direction (but only in this direction, for read otherwise, the Nietzschean demolition remains dogmatic and, like all reversals, a captive of that metaphysical edifice which it professes to overthrow. On that point and in that *order of reading*, the conclusions of Heidegger and Fink are irrefutable), Heideggerian thought would reinstate rather than destroy the instance of the logos and of the truth of being as *primum signatum*: the “transcendental” signified (“transcendental” in a certain sense, as in the Middle Ages the transcendental—*ens, unum, verum, bonum***—was said to be the “*primum cognitum*”) implied by all categories or all determined significations, by all lexicons and all syntax, and therefore by all linguistic signifiers, though not to be identified simply with any one of those signifiers, allowing itself to be precomprehended through each of them, remaining irreducible to all the epochal determinations that it nonetheless makes possible, thus opening the history of the logos, yet itself being only through the logos; that is, *being nothing* before the logos and outside of it. The logos *of* being, “Thought obeying the Voice of Being,”*** is the first and the last resource of the sign, of the difference between *signans* and *signatum*. There has to be a transcendental signified for the difference between signifier and

*This does not, by simple inversion, mean that the signifier is fundamental or primary. The “primacy” or “priority” of the signifier would be an expression untenable and absurd to formulate illogically within the very logic that it would legitimately destroy. The signifier will never by rights precede the signified, in which case it would no longer be a signifier and the “signifying” signifier would no longer have a possible signified. The thought that is announced in this impossible formula without being successfully contained therein should therefore be stated in another way; it will clearly be impossible to do so without putting the very idea of the sign into suspicion, the “sign-of” which will always remain attached to what is here put in question. At the limit therefore, that thought would destroy the entire conceptuality organized around the concept of the sign (signifier and signified, expression and content, and so on).

**[In Latin, respectively: being, unity, truth, goodness.]

***Postface to *Was ist Metaphysik?* (Frankfurt am Main, 1960), p. 46. [*What is Metaphysics?*, trans. David Krell in *Basic Writings* (New York: Harper & Row, 1977).] The insistence of the voice also dominates the analysis of *Gewissen* [conscience] in *Sein und Zeit* (pp. 267 f.).

signified to be somewhere absolute and irreducible. It is not by chance that the thought of being, as the thought of this transcendental signified, is manifested above all in the voice: in a language of words. The voice is *heard* (understood)—that undoubtedly is what is called conscience—closest to the self as the absolute effacement of the signifier: pure auto-affectation that necessarily has the form of time and which does not borrow from outside of itself, in the world or in “reality,” any accessory signifier, any substance of expression foreign to its own spontaneity. It is the unique experience of the signified producing itself spontaneously, from within the self, and nevertheless, as signified concept, in the element of ideality or universality. The unworldly character of this substance of expression is constitutive of this ideality. This experience of the effacement of the signifier in the voice is not merely one illusion among many—since it is the condition of the very idea of truth—but I shall elsewhere show in what it does delude itself. This illusion is the history of truth and it cannot be dissipated so quickly. Within the closure of this experience, the word [*mot*] is lived as the elementary and undecomposable unity of the signified and the voice, of the concept and a transparent substance of expression. This experience is considered in its greatest purity—and at the same time in the condition of its possibility—as the experience of “being.” The word “being,” or at any rate the words designating the sense of being in different languages, is, with some others, an “originary word” (“*Urwort*”),* the transcendental word assuring the possibility of being-word to all other words. As such, it is precomprehended in all language and—this is the opening of *Being and Time*—only this precomprehension would permit the opening of the question of the sense of being in general, beyond all regional ontologies and all metaphysics: a question that broaches philosophy (for example, in the *Sophist***) and lets itself be taken over by philosophy, a question that Heidegger repeats by submitting the history of metaphysics to it. Heidegger reminds us constantly that the sense of being is neither the word “being” nor the concept of being. But as that sense is nothing outside of language and the language of words, it is tied, if not to a particular word or to a particular system of language (concesso non dato), at least to the possibility of the word in general. And to the possibility of its irreducible simplicity. One could thus think that it remains only to choose between two possibilities. (1) Does a modern linguistics, a science of signification breaking the unity of the word and breaking with its alleged irreducibility, still have anything to do with “language?” Heidegger would probably doubt it. (2) Conversely, is not all that is profoundly meditated as the thought or the question of being enclosed within an old linguistics of the word which one practices here unknowingly? Unknowingly because such a linguistics, whether spontaneous or systematic, has always had to share the presuppositions of metaphysics. The two operate on the same grounds.

It goes without saying that the alternatives cannot be so simple.

On the one hand, if modern linguistics remains completely enclosed within a classical conceptuality, if especially it naively uses the word *being* and all that it presupposes, that which, within this linguistics, deconstructs the unity of the word in general can no longer, according to the model of the Heideggerian question, as it functions powerfully from the very opening of *Being and Time*, be circumscribed as ontic science or regional ontology. In as much as the question of being unites indissolubly with the precomprehension of the word *being*, without being reduced to it, the linguistics that works for the deconstruction of the constituted unity of that word has only, in

*Cf. *Das Wesen der Sprache*, and *Das Wort*, in *Unterwegs zur Sprache* (Pfullingen, 1959). [“The Nature of Language” and “words” in *On the Way to Language*, trans. Peter Hertz (New York: Harper & Row, 1971).]

**[A dialogue of Plato’s.]

fact or in principle, to have the question of being posed in order to define its field and the order of its dependence.

Not only is its field no longer simply ontic, but the limits of ontology that correspond to it no longer have anything regional about them. And can what I say here of linguistics, or at least of a certain work that may be undertaken within it and thanks to it, not be said of all research *in as much as and to the strict extent that* it would finally deconstitute the founding concept-words of ontology, of being in its privilege? Outside of linguistics, it is in psychoanalytic research that this breakthrough seems at present to have the greatest likelihood of being expanded.

Within the strictly limited space of this breakthrough, these “sciences” are no longer *dominated* by the questions of a transcendental phenomenology or a fundamental ontology. One may perhaps say, following the order of questions inaugurated by *Being and Time* and radicalizing the questions of Husserlian phenomenology, that this breakthrough does not belong to science itself, that what thus seems to be produced within an ontic field or within a regional ontology, does not belong to them by rights and leads back to the question of being itself.

Because it is indeed the *question* of being that Heidegger asks metaphysics. And with it the question of truth, of sense, of the logos. The incessant meditation upon that question does not restore confidence. On the contrary, it dislodges the confidence at its own depth, which, being a matter of the meaning of being, is more difficult than is often believed. In examining the state just before all determinations of being, destroying the securities of onto-theology, such a meditation contributes, quite as much as the most contemporary linguistics, to the dislocation of the unity of the sense of being, that is, in the last instance, the unity of the word.

It is thus that, after evoking the “voice of being,” Heidegger recalls that it is silent, mute, insonorous, wordless, originarily *a-phonic* (*die Gewähr der lautlosen Stimme verborgener Quellen . . .*).^{*} The voice of the sources is not heard. A rupture between the originary meaning of being and the word, between meaning and the voice, between “the voice of being” and the “*phonè*,” between “the call of being,” and articulated sound; such a rupture, which at once confirms a fundamental metaphor, and renders it suspect by accentuating its metaphoric discrepancy, translates the ambiguity of the Heideggerian situation with respect to the metaphysics of presence and logocentrism. It is at once contained within it and transgresses it. But it is impossible to separate the two. The very movement of transgression sometimes holds it back short of the limit. In opposition to what we suggested above, it must be remembered that, for Heidegger, the sense of being is never simply and rigorously a “signified.” It is not by chance that that word is not used; that means that being escapes the movement of the sign, a proposition that can equally well be understood as a repetition of the classical tradition and as a caution with respect to a technical or metaphysical theory of signification. On the other hand, the sense of being is literally neither “primary,” nor “fundamental,” nor “transcendental,” whether understood in the scholastic, Kantian, or Husserlian sense. The restoration of being as “transcending” the categories of the entity, the opening of the fundamental ontology, are nothing but necessary yet provisional moments. From *The Introduction to Metaphysics* onward, Heidegger renounces the project of and the word ontology.^{**} The necessary, originary, and irreducible dissimulation of the meaning of being, its occultation within the very blossoming forth of presence, that

^{*}[The testimony of the soundless voice of hidden origins. . . .]

^{**}[Martin Heidegger, *Einführung in die Metaphysik* (Tübingen, 1953) translated as *An Introduction to Metaphysics*. See above in this volume.]

retreat without which there would be no history of being which was completely *history* and history of *being*, Heidegger's insistence on noting that being is produced as history only through the logos, and is nothing outside of it, the difference between being and the entity—all this clearly indicates that fundamentally nothing escapes the movement of the signifier and that, in the last instance, the difference between signified and signifier is *nothing*. This proposition of transgression, not yet integrated into a careful discourse, runs the risk of formulating regression itself. One must therefore *go by way of* the question of being as it is directed by Heidegger and by him alone, at and beyond onto-theology, in order to reach the rigorous thought of that strange nondifference and in order to determine it correctly. Heidegger occasionally reminds us that "being," as it is fixed in its general syntactic and lexicological forms within linguistics and Western philosophy, is not a primary and absolutely irreducible signified, that it is still rooted in a system of languages and an historically determined "significance," although strangely privileged as the virtue of disclosure and dissimulation; particularly when he invites us to meditate on the "privilege" of the "third person singular of the present indicative" and the "infinitive." Western metaphysics, as the limitation of the sense of being within the field of presence, is produced as the domination of a linguistic form.* To question the origin of that domination does not amount to hypostatizing a transcendental signified, but to a questioning of what constitutes our history and what produced transcendentality itself. Heidegger brings it up also when in *Zur Seinsfrage*, for the same reason, he lets the word "being" be read only if it is crossed out (*kreuzweise Durchstreichung*). That mark of deletion is not, however, a "merely negative symbol" (p. 31). That deletion is the final writing of an epoch. Under its strokes the presence of a transcendental signified is effaced while still remaining legible. Is effaced while still remaining legible, is destroyed while making visible the very idea of the sign. In as much as it de-limits onto-theology, the metaphysics of presence and logocentrism, this last writing is also the first writing.

To come to recognize, not within but on the horizon of the Heideggerian paths, and yet in them, that the sense of being is not a transcendental or trans-epochal signified (even if it was always dissimulated within the epoch) but already, in a truly *unheard of* sense, a determined signifying trace, is to affirm that within the decisive concept of ontico-ontological difference, *all is not to be thought at one go*; entity and being, ontic and ontological, "ontico-ontological," are, in an original style, *derivative* with regard to difference; and with respect to what I shall later call *differance*, an economic concept designating the production of differing/deferring. The ontico-ontological difference and its ground (*Grund*) in the "transcendence of Dasein" (*Vomn Wesen des Grundes*, p. 16) are not absolutely originary. Difference by itself would be more "originary," but one would no longer be able to call it

**Introduction a la metaphysique*, tr. fr. p. 103 [*Introduction* p. 92]. "All this points in the direction of what we encountered when we characterized the Greek experience and interpretation of being. If we retain the usual interpretation of being, the word 'being' takes its meaning from the unity and determinateness of the horizon which guided our understanding. In short: we understand the verbal substantive 'Sein' through the infinitive, which in turn is related to the 'is' and its diversity that we have described. The definite and particular verb form 'is,' the *third person singular of the present indicative*, has here a pre-eminent rank. We understand 'being' not in regard to the 'thou art,' 'you are,' 'I am,' or 'they would be,' though all of these, just as much as 'is,' represent verbal inflections of 'to be.' . . . And involuntarily, almost as though nothing else were possible, we explain the infinitive 'to be' to ourselves through the 'is.'

"Accordingly, 'being' has the meaning indicated above, recalling the Greek view of the essence of being, hence a determinateness which has not just dropped on us accidentally from somewhere but has dominated our historical being-there since antiquity. At one stroke our search for the definition of the meaning of the word 'being' becomes explicitly what it is, namely a reflection on the source of our hidden history." I should, of course, cite the entire analysis that concludes with these words.

“origin” or “ground,” those notions belonging essentially to the history of onto-theology, to the system functioning as the effacing of difference. It can, however, be thought of in the closest proximity to itself only on one condition: that one begins by determining it as the ontico-ontological difference before erasing that determination. The necessity of passing through that erased determination, the necessity of that *trick of writing* is irreducible. An unemphatic and difficult thought that, through much unperceived meditation, must carry the entire burden of our question, a question that I shall provisionally call *historical*. It is with its help that I shall later be able to attempt to relate difference and writing.

The hesitation of these thoughts (here Nietzsche’s and Heidegger’s) is not an “incoherence”: it is a trembling proper to all post-Hegelian attempts and to this passage between two epochs. The movements of deconstruction do not destroy structures from the outside. They are not possible and effective, nor can they take accurate aim, except by inhabiting those structures. Inhabiting them *in a certain way*, because one always inhabits, and all the more when one does not suspect it. Operating necessarily from the inside, borrowing all the strategic and economic resources of subversion from the old structure, borrowing them structurally, that is to say without being able to isolate their elements and atoms, the enterprise of deconstruction always in a certain way falls prey to its own work. This is what the person who has begun the same work in another area of the same habitation does not fail to point out with zeal. No exercise is more widespread today and one should be able to formalize its rules.

Hegel was already caught up in this game. *On the one hand*, he undoubtedly *summed up* the entire philosophy of the logos. He determined ontology as absolute logic; he assembled all the delimitations of philosophy as presence; he assigned to presence the eschatology of parousia, of the self-proximity of infinite subjectivity. And for the same reason he had to debase or subordinate writing. When he criticizes the Leibnizian characteristic, the formalism of the understanding, and mathematical symbolism, he makes the same gesture: denouncing the being-outside-of-itself of the logos in the sensible or the intellectual abstraction. Writing is that forgetting of the self, that exteriorization, the contrary of the interiorizing memory, of the *Erinnerung* [remembering] that opens the history of the spirit. It is this that the *Phaedrus* said: writing is at once mnemotechnique and the power of forgetting. Naturally, the Hegelian critique of writing stops at the alphabet. As phonetic writing, the alphabet is at the same time more servile, more contemptible, more secondary (“alphabetic writing expresses *sounds* which are themselves signs. It consists therefore of the signs of signs”) but it is also the best writing, the mind’s writing; its effacement before the voice, that in it which respects the ideal interiority of phonic signifiers, all that by which it sublimates space and sight, all that makes of it the writing of history, the writing, that is, of the infinite spirit relating to itself in its discourse and its culture:

It follows that to learn to read and write an alphabetic writing should be regarded as a means to infinite culture (*unendliches Bildungsmittel*) that is not enough appreciated; because thus the mind, distancing itself from the concrete sense-perceptible, directs its attention on the more formal moment, the sonorous word and its abstract elements, and contributes essentially to the founding and purifying of the ground of interiority within the subject.

In that sense it is the *Aufhebung* of other writings, particularly of hieroglyphic script and of the Leibnizian characteristic that had been criticized previously through one and the same gesture. (*Aufhebung* is, more or less implicitly, the dominant concept of nearly all histories of writing, even today. It is *the* concept of history and of teleology.) In fact, Hegel continues: “Acquired habit later also suppresses the specificity of alphabetic writing, which

consists in seeming to be, in the interest of sight, a detour through hearing to arrive at representations, and makes it into a hieroglyphic script for us, such that in using it, we do not need to have present to our consciousness the mediation of sounds.”

It is on this condition that Hegel subscribes to the Leibnizian praise of nonphonetic writing. It can be produced by deaf mutes, Leibniz had said. Hegel:

Beside the fact that, by the practice which transforms this alphabetic script into hieroglyphics, the aptitude for abstraction acquired through such an exercise *is conserved*, the reading of hieroglyphs is for itself a deaf reading and a mute writing (*ein taubes Lesen und ein stummes Schreiben*). What is audible or temporal, visible or spatial, has each its proper basis and in the first place they are of equal value; but in alphabetic script there is only one basis and that following a specific relation, namely, that the visible language is related only as a sign to the audible language; intelligence expresses itself immediately and unconditionally through speech. (ibid.)

What writing itself, in its nonphonetic moment, betrays, is life. It menaces at once the breath, the spirit, and history as the spirit’s relationship with itself. It is their end, their finitude, their paralysis. Cutting breath short, sterilizing or immobilizing spiritual creation in the repetition of the letter, in the commentary or the *exegesis*, confined in a narrow space, reserved for a minority, it is the principle of death and of difference in the becoming of being. It is to speech what China is to Europe: “It is only to the exegeticism* of Chinese spiritual culture that their hieroglyphic writing is suited. This type of writing is, besides, the part reserved for a very small section of a people, the section that possesses the exclusive domain of spiritual culture. . . . A hieroglyphic script would require a philosophy as exegetical as Chinese culture generally is” (ibid.).

If the nonphonetic moment menaces the history and the life of the spirit as self-presence in the breath, it is because it menaces substantiality, that other metaphysical name of presence and of *ousia*.** First in the form of the substantive. Nonphonetic writing breaks the noun apart. It describes relations and not appellations. The noun and the word, those unities of breath and concept, are effaced within pure writing. In that regard, Leibniz is as disturbing as the Chinese in Europe: “This situation, the analytic notation of representations in hieroglyphic script, which seduced Leibniz to the point of wrongly preferring this script to the alphabetic, rather contradicts the fundamental exigency of language in general, namely the noun. . . . All difference in analysis would produce another formation of the written substantive.”

The horizon of absolute knowledge is the effacement of writing in the logos, the retrieval of the trace in parousia, the reappropriation of difference, the accomplishment of what I have elsewhere called* the *metaphysics of the proper****

Yet, all that Hegel thought within this horizon, all, that is, except eschatology, may be reread as a meditation on writing. Hegel is *also* the thinker of irreducible difference. He rehabilitated thought as the *memory productive* of signs. And he reintroduced, as I shall try to show elsewhere, the essential necessity of the written trace in a philosophical—that is to say Socratic—discourse that had always believed it possible to do without it; the last philosopher of the book and the first thinker of writing.

**dem Statarischen*, an old German word that one has hitherto been tempted to translate as “immobile” or “static” (see [Jean] Gibelin, [tr. *Leçons sur la philosophie de la religion* (Paris, 1959)], pp. 255-7.

***Ousia* is “being” in Greek.

****La parole soufflée*, “*L’écriture et la différence*.” [Writing and Difference, trans. Alan Bass (Chicago: University of Chicago, 1978).]

ἀνάγκη δὲ στῆναι.
One must stop somewhere.
