Preface

There is no better introduction to philosophy than to read some of the great philosophers. But few books are more difficult to read than Aristotle's *Metaphysics* or Spinoza's *Ethics*. Even works that are less puzzling are sometimes like snippets of a conversation that you overhear on entering a room: What is said is clear, only you cannot be sure you have got the point because you do not know just what has gone before. A slight point may be crucial to refute some earlier suggestion, and a seemingly pointless remark may contain a barbed allusion. As a result of this difficulty, some students of philosophy cry out for a simple summary of the "central doctrines" of the great philosophers. Yet carving up great books to excerpt essential doctrines is one of the greatest sins against the spirit of philosophy. If the reading of a whole Platonic dialogue leaves one more doubtful and less sure of oneself than the perusal of a brief summary, so much the better. It is part of the point of philosophy to make us a little less sure about things. After all, Socrates himself insisted that what distinguished him from other persons was not that he knew all, or even most, answers but rather that he realized his ignorance.

Still, one need not despair of joining this ongoing conversation. In the first place, you can get in near the beginning of this conversation by starting with Plato and moving on from there. Given that they are over two thousand years old, his early dialogues are surprisingly easy to follow. The later Platonic dialogues, Aristotle, and much which follows will be more difficult, but by that point you will have some idea of what the conversation is about.

Secondly, the structure of this book is designed to make this conversation accessible. There are section introductions and introductions to the individual philosophers. These latter introductions are divided into three sections: (1) biographical (a glimpse of

the life), (2) philosophical (a resume of the philosopher's thought), and (3) bibliographical (suggestions for further reading). To give a sense of the development of ideas, there are short representative passages from some of the less important, but transitional, thinkers. To make all the works more readable, most footnotes treating textual matters (variant readings, etc.) have been omitted and all Greek words have been transliterated and put in angle brackets. My goal throughout this volume is to be unobtrusive and allow you to hear, and perhaps join in, the ongoing conversation that is Western philosophy.

WHAT'S NEW IN THIS EDITION?

- New translations of Plato's *Republic*, Aristotle's *Physics*, *Metaphysics*, and *On the Soul* by Joe Sachs.
- New translation of Spinoza's *Ethics* by Samuel Shirley.
- New section on Pyrrho using a reading from Sextus Empiricus, *Outlines of Pyrrhonism*.
- New section on Charles Sanders Peirce with the reading "The Fixation of Belief."
- New section on William James with the reading "What Pragmatism Means" from *Pragmatism*.
- New section on W.E.B. Du Bois with the reading "Of Our Spiritual Strivings" from *The Souls of Black Folks*.
- Jean-Paul Sartre's *Existentialism is a Humanism* is now given complete.
- New reading by Jacques Derrida, "The Written Being/The Being Written" from *Of Grammatology*.
- Updated bibliographies reflecting the most recent scholarship on each thinker and philosophical school.

Throughout the editing of this edition, I have tried to follow the editorial principles established by Walter Kaufmann in his 2 volume *Philosophic Classics* (1961) on which this current series is based: (1) to use complete works or, where more appropriate, complete sections of works (2) in clear translations (3) of texts central to the thinker's philosophy or widely accepted as part of the "canon." While little remains of Professor Kaufmann's introductions or editing—and the series has now grown to 7 volumes—his spirit of inclusion and respect for ideas continues. Those who use this volume in a one-term introduction to philosophy, history of philosophy, or history of intellectual thought course will find more material here than can easily fit a normal semester. But this embarrassment of riches gives teachers some choice and, for those who offer the same course year after year, an opportunity to change the menu.

* * *

I would like to thank the many people who assisted me in this volume, including the library staff of Whitworth College, especially Hans Bynagle, Gail Fielding, and Jeanette Langston; my colleagues, F. Dale Bruner, who made helpful suggestions on all the introductions, Barbara Filo, who helped make selections for the artwork, and

Corliss Slack and John Yoder, who provided historical context; Stephen Davis, Claremont McKenna College; Jerry H. Gill, The College of St. Rose; Rex Hollowell, Spokane Falls Community College; Arthur F. Holmes, Wheaton College; Stanley Obitts, Westmont College; Wayne Pomerleau, Gonzaga University; Timothy A. Robinson, The College of St. Benedict; Glenn Ross, Franklin & Marshall College; and Charles Young, The Claremont Graduate School, who each read some of the introductions and gave helpful advice; Edward Beach, University of Wisconsin, Eau Claire, and John Justice, Randolph-Macon Women's College who graciously called my attention to errors in previous editions; my former secretary, Michelle Seefried; my production editor, Shiny Rajesh of Integra, my project managers, Sarah Holle and Cheryl Keenan of Prentice Hall; and my former acquisitions editors, Mical Moser, Ross Miller, Karita France, Angela Stone and Ted Bolen. I would also like to acknowledge the following reviewers who made helpful suggestions: Marianina Alcott, San Jose State University; James W. Allard, Montana State University; David Apolloni, Augsburg College; Robert C. Bennett, El Centro College; Sarah Borden, Wheaton College; Herbert L. Carson, Ferris State University; Mary T. Clark, Manhattanville College; Stuart Dalton, Monmouth College; Sandra S. Edwards, University of Arkansas; Steven M. Emmanuel, Virginia Wesleyan College; David Griesedieck, University of Missouri, Saint Louis; John Hurley, Central Connecticut State University; Stephen E. Lahey, LaMoyné College; Helen S. Lang, Trinity College; R. James Long, Fairfield University; Scott MacDonald, University of Iowa; Angel Medina, Georgia State University; Nick More, Westminster College; Paul Newberry, California State University–Bakersfield; Eric Palmer, Allegheny College; David F. T. Rodier, American University; Katherine Rogers, University of Delaware; Gregory Schultz, Wisconsin Lutheran College; Stephen Scott, Eastern Washington University; Daniel C. Shartin, Worcester State College; Walter G. Scott, Oklahoma State University; Howard N. Tuttle, University of New Mexico; Richard J. Van Iten, Iowa State University; Donald Phillip Verene, Emory University; Tamara Welsh, University of Tennessee–Chattanooga; Sarah Worth, Allegheny College; and Wilhelm S. Wurzer, Duquesne University.

I am especially thankful to my wife, Joy Lynn Fulton Baird, and to our children, Whitney, Sydney, and Soren, who have supported me throughout this enterprise.

ANCIENT GREEK PHILOSOPHY

Something unusual happened in Greece and in the Greek colonies of the Aegean Sea some twenty-five hundred years ago. Whereas the previous great cultures of the Mediterranean had used mythological stories of the gods to explain the operations of the world and of the self, some of the Greeks began to discover new ways of explaining these phenomena. Instead of reading their ideas into, or out of, ancient scriptures or poems, they began to use reason, contemplation, and sensory observation to make sense of reality.

The story as we know it began with the Greeks living on the coast of Asia Minor (present-day Turkey). Colonists there, such as Thales, tried to find the one common element in the diversity of nature. Subsequent thinkers, such as Anaximenes, sought not only to find this one common element, but also to find the process by which one form changes into another. Other thinkers, such as Pythagoras, turned to the nature of form itself rather than the basic stuff that takes on a particular form.

With Socrates, the pursuit of knowledge turned inward as he sought not to understand the world, but himself. His call to “know thyself,” together with his uncompromising search for truth, inspired generations of thinkers. With the writings of Plato and Aristotle, ancient Greek thought reached its zenith. These giants of human thought developed all-embracing systems that explained both the nature of the universe and the humans who inhabit it.

All these lovers of wisdom, or *philosophers*, came to different conclusions and often spoke disrespectfully of one another. Some held the universe to be one single entity, whereas others insisted that it must be made of many parts. Some

believed that human knowledge was capable of understanding virtually everything about the world and the self, whereas others thought that it was not possible to have any knowledge at all. But despite all their differences, there is a thread of continuity, a continuing focus among them: the *human* attempt to understand the world and the self, using *human* reason. This fact distinguishes these philosophers from the great minds that preceded them.

The philosophers of ancient Greece have fascinated thinking persons for centuries, and their writings have been one of the key influences on the development of Western civilization. The works of Plato and Aristotle, especially, have defined the questions and suggested many of the answers for subsequent generations. As the great Greek statesman Pericles sagely predicted, “Future ages will wonder at us, as the present age wonders at us now.”

* * *

For a comprehensive, yet readable, work on Greek philosophy, see W.K.C. Guthrie’s authoritative *The History of Greek Philosophy*, six volumes. (Cambridge: Cambridge University Press, 1962–1981). W.T. Jones, *The Classical Mind* (New York: Harcourt, Brace & World, 1969); Frederick Copleston, *A History of Philosophy: Volume I, Greece & Rome* (Garden City, NY: Doubleday, 1962); Friedo Ricken, *Philosophy of the Ancients*, translated by Eric Watkins (Notre Dame, IN: University of Notre Dame Press, 1991); J.V. Luce, *An Introduction to Greek Philosophy* (New York: Thames and Hudson, 1992); C.C.W. Taylor, ed., *Routledge History of Philosophy, Volume 1: From the Beginning to Plato* (London: Routledge, 1997); David Furley, ed., *Routledge History of Philosophy, Volume 2: Aristotle to Augustine* (London: Routledge, 1997); Julia Annas, *Ancient Philosophy: A Very Short Introduction* (Oxford: Oxford University Press, 2000); James A. Arieti, *Philosophy in the Ancient World* (Lanham, MD: Rowman & Littlefield, 2005); Anthony Kenny, *Ancient Philosophy: A New History of Western Philosophy* (Oxford University Press, 2004); and Stephanie Lynn Budin, *The Ancient Greeks: An Introduction* (Oxford: Oxford University Press, 2009) provide basic introductions. Julie K. Ward, ed., *Feminism and Ancient Philosophy* (London: Routledge, 1996) provides a feminist critique while Robert S. Brumbaugh, *The Philosophers of Greece* (Albany, NY: SUNY Press, 1981) is an accessible introduction with pictures, charts, and maps.

SOCRATES

470–399 B.C.

PLATO

428/7–348/7 B.C.

Socrates has fascinated and inspired men and women for over two thousand years. All five of the major “schools” of ancient Greece (Academics, Peripatetics, Epicureans, Stoics, and Cynics) were influenced by his thought. Some of the early Christian thinkers, such as Justin Martyr, considered him a “proto-Christian,” while others, such as St. Augustine (who rejected this view) still expressed deep admiration for Socrates’ ethical life. More recently, existentialists have found in Socrates’ admonition “know thyself” an encapsulation of their thought, and opponents of unjust laws have seen in Socrates’ trial a blueprint for civil disobedience. In short, Socrates is one of the most admired men who ever lived.

The Athens into which Socrates was born in 470 B.C. was a city still living in the flush of its epic victory over the Persians, and it was bursting with new ideas. The playwrights Euripides and Sophocles were young boys, and Pericles, the great Athenian democrat, was still a young man. The Parthenon’s foundation was laid when Socrates was twenty-two, and its construction was completed fifteen years later.

Socrates was the son of Sophroniscus, a sculptor, and of Phaenarete, a midwife. As a boy, Socrates received a classical Greek education in music, gymnastics, and grammar (or the study of language), and he decided early on to become a sculptor like his father. Tradition says he was a gifted artist who fashioned impressively simple statues of the Graces. He married a woman named Xanthippe, and together they had three children. He took an early interest in the developing science of the Milesians, and then he served for a time in the army.

When he was a middle-aged man, Socrates’ friend, Chaerephon, asked the oracle at Delphi “if there was anyone who was wiser than Socrates.” For once the mysterious oracle gave an unambiguous answer: “No one.” When Socrates heard

of the incident, he was confused. He knew that he was not a wise man. So he set out to find a wiser man to prove the answer wrong. Socrates later described the method and results of his mission:

So I examined the man—I need not tell you his name, he was a politician—but this was the result. Athenians. When I conversed with him I came to see that, though a great many persons, and most of all he himself, thought that he was wise, yet he was not wise. Then I tried to prove to him that he was not wise, though he fancied that he was. By so doing I made him indignant, and many of the bystanders. So when I went away, I thought to myself, “I am wiser than this man: neither of us knows anything that is really worth knowing, but he thinks that he has knowledge when he has not, while I, having no knowledge, do not think that I have. I seem, at any rate, to be a little wiser than he is on this point: I do not think that I know what I do not know.” Next I went to another man who was reputed to be still wiser than the last, with exactly the same result. And there again I made him, and many other men, indignant. (*Apology* 21c)

As Socrates continued his mission by interviewing the politicians, poets, and artisans of Athens, young men followed along. They enjoyed seeing the authority figures humiliated by Socrates’ intense questioning. Those in authority, however, were not amused. Athens was no longer the powerful, self-confident city of 470 B.C., the year of Socrates’ birth. An exhausting succession of wars with Sparta (the Peloponnesian Wars) and an enervating series of political debacles had left the city narrow in vision and suspicious of new ideas and of dissent. In 399 B.C., Meletus and Anytus brought an indictment of impiety and corrupting the youth against Socrates. As recorded in the *Apology*, the Athenian assembly found him guilty by a vote of 281 to 220 and sentenced him to death. His noble death is described incomparably in the closing pages of the *Phaedo* by Plato.

Socrates wrote nothing, and our knowledge of his thought comes exclusively from the report of others. The playwright Aristophanes (455–375 B.C.) satirized Socrates in his comedy *The Clouds*. His caricature of Socrates as a cheat and charlatan was apparently so damaging that Socrates felt compelled to offer a rebuttal before the Athenian assembly (see the *Apology*, following). The military general Xenophon (ca. 430–350 B.C.) honored his friend Socrates in his *Apology of Socrates*, his *Symposium*, and, later, in his *Memorabilia* (“Recollections of Socrates”). In an effort to defend his dead friend’s memory, Xenophon’s writings illumine Socrates’ life and character. Though born fifteen years after the death of Socrates, Aristotle (384–322 B.C.) left many fascinating allusions to Socrates in his philosophic works, as did several later Greek philosophers. But the primary source of our knowledge of Socrates comes from one of those young men who followed him: Plato.

* * *

Plato was probably born in 428/7 B.C. He had two older brothers, Adeimantus and Glaucon, who appear in Plato’s *Republic*, and a sister, Potone. Though he may have known Socrates since childhood, Plato was probably nearer twenty when he came under the intellectual spell of Socrates. The death of Socrates made an enormous impression on Plato and contributed to his call to bear witness to posterity of “the best, . . . the wisest and most just” person that he knew (*Phaedo*, 118). Though Plato was from a distinguished family and might have followed his relatives into politics, he chose philosophy.

Following Socrates' execution, the twenty-eight-year-old Plato left Athens and traveled for a time. He is reported to have visited Egypt and Cyrene—though some scholars doubt this. During this time he wrote his early dialogues on Socrates' life and teachings. He also visited Italy and Sicily, where he became the friend of Dion, a relative of Dionysius, the tyrant of Syracuse, Sicily.

On returning to Athens from Sicily, Plato founded a school, which came to be called the Academy. One might say it was the world's first university, and it endured as a center of higher learning for nearly one thousand years, until the Roman emperor Justinian closed it in A.D. 529. Except for two later trips to Sicily, where he unsuccessfully sought to institute his political theories, Plato spent the rest of his life at the Athenian Academy. Among his students was Aristotle. Plato died at eighty in 348/7 B.C.

Plato's influence was best described by the twentieth-century philosopher Alfred North Whitehead when he said, "The safest general characterization of the European philosophical tradition is that it consists of a series of footnotes to Plato."

* * *

It is difficult to separate the ideas of Plato from those of his teacher, Socrates. In virtually all of Plato's dialogues, Socrates is the main character, and it is possible that in the early dialogues Plato is recording his teacher's actual words. But in the later dialogues, "Socrates" gives Plato's views—views that, in some cases, in fact, the historical Socrates denied.

The first four dialogues presented in this text describe the trial and death of Socrates and are arranged in narrative order. The first, the *Euthyphro*, takes place as Socrates has just learned of the indictment against him. He strikes up a conversation with a "theologian" so sure of his piety that he is prosecuting his own father for murder. The dialogue moves on, unsuccessfully, to define piety. Along the way, Socrates asks a question that has vexed philosophers and theologians for centuries: Is something good because the gods say it is, or do the gods say it is good because it is?

The next dialogue, the *Apology*, is generally regarded as one of Plato's first, and as eminently faithful to what Socrates said at his trial on charges of impiety and corruption of youth. The speech was delivered in public and heard by a large audience; Plato has Socrates mention that Plato was present; and there is no need to doubt the historical veracity of the speech, at least in essentials. There are two breaks in the narrative: one after Socrates' defense (during which the Athenians vote "guilty") and one after Socrates proposes an alternative to the death penalty (during which the Athenians decide on death). This dialogue includes Socrates' famous characterization of his mission and purpose in life.

In the *Crito*, Plato has Crito visit Socrates in prison to assure him that his escape from Athens has been well prepared and to persuade him to consent to leave. Socrates argues that one has an obligation to obey the state even when it orders one to suffer wrong. That Socrates, in fact, refused to leave is certain; that he used the arguments Plato ascribes to him is less certain. In any case, anyone who has read the *Apology* will agree that after his speech Socrates could not well escape.

The moving account of Socrates' death is given at the end of the *Phaedo*, the last of our group of dialogues. There is common agreement that this dialogue was written much later than the other three and that the earlier part of the dialogue, with its Platonic doctrine of Forms and immortality, uses "Socrates" as a vehicle for Plato's own ideas. These first four dialogues are given in the F.J. Church translation.

There are few books in Western civilization that have had the impact of Plato's *Republic*—aside from the Bible, perhaps none. Like the Bible, there are also few books whose interpretation and evaluation have differed so widely. Apparently it is a description of Plato's ideal society: a utopian vision of the just state, possible only if philosophers were kings. But some (see the following suggested readings) claim that its purpose is not to give a model of the ideal state, but to show the impossibility of such a state and to convince aspiring philosophers to shun politics. Evaluations of the *Republic* have also varied widely: from the criticisms of Karl Popper, who denounced the *Republic* as totalitarian, to the admiration of more traditional interpreters, such as Francis MacDonald Cornford and Gregory Vlastos.

Given the importance of this work and the diversity of opinions concerning its point and value, it was extremely difficult to decide which sections of the *Republic* to include in this series. I chose to include the discussion of justice from Books I and II, the descriptions of the guardians and of the “noble lie” from Book III, the discussions of the virtues and the soul in Book IV, the presentations of the guardians' qualities and lifestyles in Book V, and the key sections on knowledge (including the analogy of the line and the myth of the cave) from the end of Book VI and the beginning of Book VII. I admit that space constraints have forced me to exclude important sections. Ideally, the selections chosen will whet the student's appetite to read the rest of this classic. I am pleased to offer the *Republic* in the outstanding new translation by Joe Sachs.

The marginal page numbers are those of all scholarly editions, Greek, English, German, or French.

For studies of Socrates, see the classic A.E. Taylor, *Socrates: The Man and His Thought* (London: Methuen, 1933); the second half of Volume III of W.K.C. Guthrie, *The History of Greek Philosophy* (Cambridge: Cambridge University Press, 1969); Hugh H. Benson, *Essays on the Philosophy of Socrates* (Oxford: Oxford University Press, 1992); Anthony Gottlieb, *Socrates* (London: Routledge, 1999); Christopher Taylor's pair of introductions, *Socrates* and *Socrates: A Very Short Introduction* (both Oxford: Oxford University Press, 1999 and 2000); Nalin Ranasingle, *The Soul of Socrates* (Ithaca, NY: Cornell University Press, 2000); Thomas C. Brickhouse and Nicholas D. Smith, *The Philosophy of Socrates* (Boulder, CO: Westview, 2000); and James Colaizzo, *Socrates Against Athens* (London: Routledge, 2001). For collections of essays, see Gregory Vlastos, ed., *The Philosophy of Socrates* (Garden City, NY: Doubleday, 1971); Hugh H. Benson, ed., *Essays on the Philosophy of Socrates* (Oxford: Oxford University Press, 1992); Terence Irwin, ed., *Socrates and His Contemporaries* (Hamden, CT: Garland Publishing, 1995); and the multivolume William J. Prior, ed., *Socrates* (Oxford: Routledge, 1996); and Lindsay Judson and Vassilis Karasmanis, eds., *Remembering Socrates: Philosophical Essays* (Oxford: Oxford University Press, 2006). For discussions of the similarities and differences between the historical Socrates and the “Socrates” of the Platonic dialogues, see Gregory Vlastos, *Socrates: Ironist and Moral Philosopher* (Ithaca, NY: Cornell University Press, 1991), especially Chapters 2 and 3.

Books about Plato are legion. Once again the work of W.K.C. Guthrie is sensible, comprehensive, yet readable. See Volumes IV and V of his *The History of Greek Philosophy* (Cambridge: Cambridge University Press, 1975 and 1978). Paul Shorey, *What Plato Said* (Chicago: Chicago University Press, 1933); and G.M.A. Grube, *Plato's Thought* (London: Methuen, 1935) are classic treatments of Plato, while Robert

Brumbaugh, *Plato for a Modern Age* (New York: Macmillan, 1964); I.M. Crombie, *An Examination of Plato's Doctrines*, two volumes (New York: Humanities Press, 1963–1969), R.M. Hare, *Plato* (Oxford: Oxford University Press, 1982); David J. Melling, *Understanding Plato* (Oxford: Oxford University Press, 1987); Bernard Williams, *Plato* (London: Routledge, 1999); Julius Moravcsik, *Plato and Platonism* (Oxford: Basil Blackwell, 2000); and Gail Fine, *The Oxford Handbook of Plato* (Oxford: Oxford University Press, 2008) are more recent studies. For collections of essays, see Gregory Vlastos, ed., *Plato: A Collection of Critical Essays*, two volumes (Garden City, NY: Doubleday, 1971); Richard Kraut, ed., *The Cambridge Companion to Plato* (Cambridge: Cambridge University Press, 1991); Nancy Tuana, ed., *Feminist Interpretations of Plato* (College Park, PA: Pennsylvania State University Press, 1994); Terence Irwin, ed., *Plato's Ethics* and *Plato's Metaphysics and Epistemology* (both Hamden, CT: Garland Publishing, 1995); Gregory Vlastos, ed., *Studies in Greek Philosophy, Volume II: Socrates, Plato, and Their Tradition* (Princeton, NJ: Princeton University Press, 1995); Nicholas D. Smith, ed., *Plato: Critical Assessments* (London: Routledge, 1998); Gail Fine, ed., *Plato* (Oxford: Oxford University Press, 2000); and Gerald A. Press, ed., *Who Speaks for Plato?* (Lanham, MD: Rowman and Littlefield, 2000). C.D.C. Reeve, *Socrates in the Apology* (Indianapolis, IN: Hackett, 1989) provides insights on this key dialogue. For further reading on the *Republic*, see Nicholas P. White, *A Companion to Plato's Republic* (Indianapolis, IN: Hackett, 1979); Julia Annas, *An Introduction to Plato's Republic* (Oxford: Clarendon Press, 1981); Nickolas Pappas, *Routledge Guidebook to Plato and the Republic* (Oxford: Routledge, 1995); Daryl Rice, *A Guide to Plato's Republic* (Oxford: Oxford University Press, 1997); Richard Kraut, ed., *Plato's Republic: Critical Essays* (Lanham, MD: Rowan & Littlefield, 1997); Sean Sayers, *Plato's Republic: An Introduction* (Edinburgh: Edinburgh University Press, 1999); Stanley Rosen, *Plato's Republic* (New Haven, CT: Yale University Press, 2005); Luke Purshouse, *Plato's Republic: A Reader's Guide* (London: Continuum, 2006); and C.R.F. Ferrari, ed., *The Cambridge Companion to Plato's Republic* (Cambridge: Cambridge University Press, 2007). Terence Irwin, *Plato's Ethics* (Oxford: Oxford University Press, 1995) and Gabriela Roxanna Carone, *Plato's Cosmology and Its Ethical Dimensions* (Cambridge: Cambridge University Press, 2005) examine several dialogues while thoroughly exploring Plato's ethical thought. Finally, for unusual interpretations of Plato and his work, see Werner Jaeger, *Paideia*, Vols. II and III, translated by Gilbert Highet (New York: Oxford University Press, 1939–1943); Karl R. Popper, *The Open Society and Its Enemies; Volume I: The Spell of Plato* (Princeton, NJ: Princeton University Press, 1962); and Allan Bloom's interpretive essay in Plato, *Republic*, translated by Allan Bloom (New York: Basic Books, 1968).

EUTHYPHRO

Characters

Socrates

Euthyphro

Scene—The Hall of the King*

- 2 EUTHYPHRO: What in the world are you doing here in the king's hall, Socrates? Why have you left your haunts in the Lyceum? You surely cannot have a suit before him, as I have.

SOCRATES: The Athenians, Euthyphro, call it an indictment, not a suit.

- b EUTHYPHRO: What? Do you mean that someone is prosecuting you? I cannot believe that you are prosecuting anyone yourself.

SOCRATES: Certainly I am not.

EUTHYPHRO: Then is someone prosecuting you?

SOCRATES: Yes.

EUTHYPHRO: Who is he?

SOCRATES: I scarcely know him myself, Euthyphro; I think he must be some unknown young man. His name, however, is Meletus, and his district Pitthis, if you can call to mind any Meletus of that district—a hook-nosed man with lanky hair and rather a scanty beard.

EUTHYPHRO: I don't know him, Socrates. But tell me, what is he prosecuting you for?

- c SOCRATES: What for? Not on trivial grounds, I think. It is no small thing for so young a man to have formed an opinion on such an important matter. For he, he says, knows how the young are corrupted, and who are their corrupters. He must be a wise
d man who, observing my ignorance, is going to accuse me to the state, as his mother, of corrupting his friends. I think that he is the only one who begins at the right point in his political reforms; for his first care is to make the young men as good as possible, just as a good farmer will take care of his young plants first, and, after he has done that, of the
3 others. And so Meletus, I suppose, is first clearing us away who, as he says, corrupt the young men growing up; and then, when he has done that, of course he will turn his attention to the older men, and so become a very great public benefactor. Indeed, that is only what you would expect when he goes to work in this way.

EUTHYPHRO: I hope it may be so, Socrates, but I fear the opposite. It seems to me that in trying to injure you, he is really setting to work by striking a blow at the foundation of the state. But how, tell me, does he say that you corrupt the youth?

- b SOCRATES: In a way which sounds absurd at first, my friend. He says that I am a maker of gods; and so he is prosecuting me, he says, for inventing new gods and for not believing in the old ones.

EUTHYPHRO: I understand, Socrates. It is because you say that you always have a divine guide. So he is prosecuting you for introducing religious reforms; and he is going into court to arouse prejudice against you, knowing that the multitude are easily prejudiced

*The anachronistic title "king" was retained by the magistrate who had jurisdiction over crimes affecting the state religion.

The Acropolis and the Parthenon

a. The *Parthenon*, Athens, built 477–438 B.C. The Parthenon, dedicated to Athena, patron deity of Athens, was at one period rededicated to the Christian Virgin Mary and then later became a Turkish mosque. In 1687 a gunpowder explosion created the ruin we see today. The Doric shell remains as a monument to ancient architectural engineering expertise and to a sense of classical beauty and order. (©James Davis/Eye Ubiquitous/Corbis)

b. Restored plan of the Acropolis, 400 B.C. The history of the Acropolis is as varied as the style and size of the temples and buildings constructed atop the ancient site. (Public Domain)

c. This model of the Acropolis of Athens recreates the complexity of fifth century B.C. public space, which included centers for worship, public forum, and entertainment. (With permission of the Royal Ontario Museum © ROM)

d. Doric, Ionic, and Corinthian columns with their characteristic capitals. (©AS400 DB/Corbis)

about such matters. Why, they laugh even at me, as if I were out of my mind, when I talk about divine things in the assembly and tell them what is going to happen; and yet I have never foretold anything which has not come true. But they are resentful of all people like us. We must not worry about them; we must meet them boldly. c

SOCRATES: My dear Euthyphro, their ridicule is not a very serious matter. The Athenians, it seems to me, may think a man to be clever without paying him much attention, so long as they do not think that he teaches his wisdom to others. But as soon as they think that he makes other people clever, they get angry, whether it be from resentment, as you say, or for some other reason. d

EUTHYPHRO: I am not very anxious to test their attitude toward me in this matter.

SOCRATES: No, perhaps they think that you are reserved, and that you are not anxious to teach your wisdom to others. But I fear that they may think that I am; for my love of men makes me talk to everyone whom I meet quite freely and unreservedly, and

without payment. Indeed, if I could I would gladly pay people myself to listen to me. If then, as I said just now, they were only going to laugh at me, as you say they do at you, it would not be at all an unpleasant way of spending the day—to spend it in court, joking and laughing. But if they are going to be in earnest, then only prophets like you can tell where the matter will end.

EUTHYPHRO: Well, Socrates, I dare say that nothing will come of it. Very likely you will be successful in your trial, and I think that I shall be in mine.

SOCRATES: And what is this suit of yours, Euthyphro? Are you suing, or being sued?

EUTHYPHRO: I am suing.

SOCRATES: Whom?

4 EUTHYPHRO: A man whom people think I must be mad to prosecute.

SOCRATES: What? Has he wings to fly away with?

EUTHYPHRO: He is far enough from flying; he is a very old man.

SOCRATES: Who is he?

EUTHYPHRO: He is my father.

SOCRATES: Your father, my good man?

EUTHYPHRO: He is indeed.

SOCRATES: What are you prosecuting him for? What is the accusation?

EUTHYPHRO: Murder, Socrates.

b SOCRATES: Good heavens, Euthyphro! Surely the multitude are ignorant of what is right. I take it that it is not everyone who could rightly do what you are doing; only a man who was already well advanced in wisdom.

EUTHYPHRO: That is quite true, Socrates.

SOCRATES: Was the man whom your father killed a relative of yours? But, of course, he was. You would never have prosecuted your father for the murder of a stranger?

EUTHYPHRO: You amuse me, Socrates. What difference does it make whether the murdered man were a relative or a stranger? The only question that you have to ask is, did the murderer kill justly or not? If justly, you must let him alone; if unjustly, c you must indict him for murder, even though he share your hearth and sit at your table. The pollution is the same if you associate with such a man, knowing what he has done, without purifying yourself, and him too, by bringing him to justice. In the present case the murdered man was a poor laborer of mine, who worked for us on our farm in Naxos. While drunk he got angry with one of our slaves and killed him. My father therefore bound the man hand and foot and threw him into a ditch, while he sent to Athens to ask the priest what he should do. While the messenger was gone, he entirely neglected the man, thinking that he was a murderer, and that it would be no d great matter, even if he were to die. And that was exactly what happened; hunger and cold and his bonds killed him before the messenger returned. And now my father and the rest of my family are indignant with me because I am prosecuting my father for the murder of this murderer. They assert that he did not kill the man at all; and they say that, even if he had killed him over and over again, the man himself was a murderer, and that I ought not to concern myself about such a person because it is impi- e ous for a son to prosecute his father for murder. So little, Socrates, do they know the divine law of piety and impiety.

SOCRATES: And do you mean to say, Euthyphro, that you think that you understand divine things and piety and impiety so accurately that, in such a case as you have stated, you can bring your father to justice without fear that you yourself may be doing something impious?

EUTHYPHRO: If I did not understand all these matters accurately, Socrates, I should not be worth much—Euthyphro would not be any better than other men. 5

SOCRATES: Then, my dear Euthyphro, I cannot do better than become your pupil and challenge Meletus on this very point before the trial begins. I should say that I had always thought it very important to have knowledge about divine things; and that now, when he says that I offend by speaking carelessly about them, and by introducing reforms, I have become your pupil. And I should say, “Meletus, if you acknowledge Euthyphro to be wise in these matters and to hold the correct belief, then think the same of me and do not put me on trial; but if you do not, then bring a suit, not against me, but against my master, for corrupting his elders—namely, myself whom he corrupts by his teaching, and his own father whom he corrupts by admonishing and punishing him.” And if I did not succeed in persuading him to release me from the suit or to indict you in my place, then I could repeat my challenge in court. b

EUTHYPHRO: Yes, by Zeus! Socrates, I think I should find out his weak points if he were to try to indict me. I should have a good deal to say about him in court long before I spoke about myself. c

SOCRATES: Yes, my dear friend, and knowing this I am anxious to become your pupil. I see that Meletus here, and others too, seem not to notice you at all, but he sees through me without difficulty and at once prosecutes me for impiety. Now, therefore, please explain to me what you were so confident just now that you knew. Tell me what are righteousness and sacrilege with respect to murder and everything else. I suppose that piety is the same in all actions, and that impiety is always the opposite of piety, and retains its identity, and that, as impiety, it always has the same character, which will be found in whatever is impious. d

EUTHYPHRO: Certainly, Socrates, I suppose so.

SOCRATES: Tell me, then, what is piety and what is impiety?

EUTHYPHRO: Well, then, I say that piety means prosecuting the unjust individual who has committed murder or sacrilege, or any other such crime, as I am doing now, whether he is your father or your mother or whoever he is; and I say that impiety means not prosecuting him. And observe, Socrates, I will give you a clear proof, which I have already given to others, that it is so, and that doing right means not letting off unpunished the sacrilegious man, whosoever he may be. Men hold Zeus to be the best and the most just of the gods; and they admit that Zeus bound his own father, Cronos, for wrongfully devouring his children; and that Cronos, in his turn, castrated his father for similar reasons. And yet these same men are incensed with me because I proceed against my father for doing wrong. So, you see, they say one thing in the case of the gods and quite another in mine. e

SOCRATES: Is not that why I am being prosecuted, Euthyphro? I mean, because I find it hard to accept such stories people tell about the gods? I expect that I shall be found at fault because I doubt those stories. Now if you who understand all these matters so well agree in holding all those tales true, then I suppose that I must yield to your authority. What could I say when I admit myself that I know nothing about them? But tell me, in the name of friendship, do you really believe that these things have actually happened? b

EUTHYPHRO: Yes, and more amazing things, too, Socrates, which the multitude do not know of. c

SOCRATES: Then you really believe that there is war among the gods, and bitter hatreds, and battles, such as the poets tell of, and which the great painters have depicted in our temples, notably in the pictures which cover the robe that is carried up to the

Acropolis at the great Panathenaic festival? Are we to say that these things are true, Euthyphro?

EUTHYPHRO: Yes, Socrates, and more besides. As I was saying, I will report to you many other stories about divine matters, if you like, which I am sure will astonish you when you hear them.

SOCRATES: I dare say. You shall report them to me at your leisure another time. At present please try to give a more definite answer to the question which I asked you just now. What I asked you, my friend, was, What is piety? and you have not explained it to me to my satisfaction. You only tell me that what you are doing now, namely, prosecuting your father for murder, is a pious act.

EUTHYPHRO: Well, that is true, Socrates.

SOCRATES: Very likely. But many other actions are pious, are they not, Euthyphro?

EUTHYPHRO: Certainly.

SOCRATES: Remember, then, I did not ask you to tell me one or two of all the many pious actions that there are; I want to know what is characteristic of piety which makes all pious actions pious. You said, I think, that there is one characteristic which makes all pious actions pious, and another characteristic which makes all impious actions impious. Do you not remember?

EUTHYPHRO: I do.

SOCRATES: Well, then, explain to me what is this characteristic, that I may have it to turn to, and to use as a standard whereby to judge your actions and those of other men, and be able to say that whatever action resembles it is pious, and whatever does not, is not pious.

EUTHYPHRO: Yes, I will tell you that if you wish, Socrates.

SOCRATES: Certainly I do.

EUTHYPHRO: Well, then, what is pleasing to the gods is pious, and what is not pleasing to them is impious.

SOCRATES: Fine, Euthyphro. Now you have given me the answer that I wanted. Whether what you say is true, I do not know yet. But, of course, you will go on to prove that it is true.

EUTHYPHRO: Certainly.

SOCRATES: Come, then, let us examine our statement. The things and the men that are pleasing to the gods are pious, and the things and the men that are displeasing to the gods are impious. But piety and impiety are not the same; they are as opposite as possible—was not that what we said?

EUTHYPHRO: Certainly.

SOCRATES: And it seems the appropriate statement?

EUTHYPHRO: Yes, Socrates, certainly.

SOCRATES: Have we not also said, Euthyphro, that there are quarrels and disagreements and hatreds among the gods?

EUTHYPHRO: We have.

SOCRATES: But what kind of disagreement, my friend, causes hatred and anger? Let us look at the matter thus. If you and I were to disagree as to whether one number were more than another, would that make us angry and enemies? Should we not settle such a dispute at once by counting?

EUTHYPHRO: Of course.

SOCRATES: And if we were to disagree as to the relative size of two things, we should measure them and put an end to the disagreement at once, should we not?

EUTHYPHRO: Yes.

SOCRATES: And should we not settle a question about the relative weight of two things by weighing them?

EUTHYPHRO: Of course.

SOCRATES: Then what is the question which would make us angry and enemies if we disagreed about it, and could not come to a settlement? Perhaps you have not an answer ready; but listen to mine. Is it not the question of the just and unjust, of the honorable and the dishonorable, of the good and the bad? Is it not questions about these matters which make you and me and everyone else quarrel, when we do quarrel, if we differ about them and can reach no satisfactory agreement?

EUTHYPHRO: Yes, Socrates, it is disagreements about these matters.

SOCRATES: Well, Euthyphro, the gods will quarrel over these things if they quarrel at all, will they not?

EUTHYPHRO: Necessarily.

SOCRATES: Then, my good Euthyphro, you say that some of the gods think one thing just, the others another; and that what some of them hold to be honorable or good, others hold to be dishonorable or evil. For there would not have been quarrels among them if they had not disagreed on these points, would there?

EUTHYPHRO: You are right.

SOCRATES: And each of them loves what he thinks honorable, and good, and just; and hates the opposite, does he not?

EUTHYPHRO: Certainly.

SOCRATES: But you say that the same action is held by some of them to be just, and by others to be unjust; and that then they dispute about it, and so quarrel and fight among themselves. Is it not so?

EUTHYPHRO: Yes.

SOCRATES: Then the same thing is hated by the gods and loved by them; and the same thing will be displeasing and pleasing to them.

EUTHYPHRO: Apparently.

SOCRATES: Then, according to your account, the same thing will be pious and impious.

EUTHYPHRO: So it seems.

SOCRATES: Then, my good friend, you have not answered my question. I did not ask you to tell me what action is both pious and impious; but it seems that whatever is pleasing to the gods is also displeasing to them. And so, Euthyphro, I should not be surprised if what you are doing now in punishing your father is an action well pleasing to Zeus, but hateful to Cronos and Uranus, and acceptable to Hephaestus, but hateful to Hera; and if any of the other gods disagree about it, pleasing to some of them and displeasing to others.

EUTHYPHRO: But on this point, Socrates, I think that there is no difference of opinion among the gods: they all hold that if one man kills another unjustly, he must be punished.

SOCRATES: What, Euthyphro? Among mankind, have you never heard disputes whether a man ought to be punished for killing another man unjustly, or for doing some other unjust deed?

EUTHYPHRO: Indeed, they never cease from these disputes, especially in courts of justice. They do all manner of unjust things; and then there is nothing which they will not do and say to avoid punishment.

SOCRATES: Do they admit that they have done something unjust, and at the same time deny that they ought to be punished, Euthyphro?

EUTHYPHRO: No, indeed, that they do not.

SOCRATES: Then it is not the case that there is nothing which they will not do and say. I take it, they do not dare to say or argue that they must not be punished if they have done something unjust. What they say is that they have not done anything unjust, is it not so?

EUTHYPHRO: That is true.

SOCRATES: Then they do not disagree over the question that the unjust individual must be punished. They disagree over the question, who is unjust, and what was done and when, do they not?

EUTHYPHRO: That is true.

SOCRATES: Well, is not exactly the same thing true of the gods if they quarrel about justice and injustice, as you say they do? Do not some of them say that the others are doing something unjust, while the others deny it? No one, I suppose, my dear friend, whether god or man, dares to say that a person who has done something unjust must not be punished.

EUTHYPHRO: No, Socrates, that is true, by and large.

SOCRATES: I take it, Euthyphro, that the disputants, whether men or gods, if the gods do disagree, disagree over each separate act. When they quarrel about any act, some of them say that it was just, and others that it was unjust. Is it not so?

EUTHYPHRO: Yes.

SOCRATES: Come, then, my dear Euthyphro, please enlighten me on this point. What proof have you that all the gods think that a laborer who has been imprisoned for murder by the master of the man whom he has murdered, and who dies from his imprisonment before the master has had time to learn from the religious authorities what he should do, dies unjustly? How do you know that it is just for a son to indict his father and to prosecute him for the murder of such a man? Come, see if you can make it clear to me that the gods necessarily agree in thinking that this action of yours is just; and if you satisfy me, I will never cease singing your praises for wisdom.

EUTHYPHRO: I could make that clear enough to you, Socrates; but I am afraid that it would be a long business.

SOCRATES: I see you think that I am duller than the judges. To them, of course, you will make it clear that your father has committed an unjust action, and that all the gods agree in hating such actions.

EUTHYPHRO: I will indeed, Socrates, if they will only listen to me.

SOCRATES: They will listen if they think that you are a good speaker. But while you were talking, it occurred to me to ask myself this question: suppose that Euthyphro were to prove to me as clearly as possible that all the gods think such a death unjust, how has he brought me any nearer to understanding what piety and impiety are? This particular act, perhaps, may be displeasing to the gods, but then we have just seen that piety and impiety cannot be defined in that way; for we have seen that what is displeasing to the gods is also pleasing to them. So I will let you off on this point, Euthyphro; and all the gods shall agree in thinking your father's action wrong and in hating it, if you like. But shall we correct our definition and say that whatever all the gods hate is impious, and whatever they all love is pious; while whatever some of them love, and others hate, is either both or neither? Do you wish us now to define piety and impiety in this manner?

EUTHYPHRO: Why not, Socrates?

SOCRATES: There is no reason why I should not, Euthyphro. It is for you to consider whether that definition will help you to teach me what you promised.

EUTHYPHRO: Well, I should say that piety is what all the gods love, and that impiety is what they all hate. e

SOCRATES: Are we to examine this definition, Euthyphro, and see if it is a good one? Or are we to be content to accept the bare statements of other men or of ourselves without asking any questions? Or must we examine the statements?

EUTHYPHRO: We must examine them. But for my part I think that the definition is right this time.

SOCRATES: We shall know that better in a little while, my good friend. Now consider this question. Do the gods love piety because it is pious, or is it pious because they love it? 10

EUTHYPHRO: I do not understand you, Socrates.

SOCRATES: I will try to explain myself: we speak of a thing being carried and carrying, and being led and leading, and being seen and seeing; and you understand that all such expressions mean different things, and what the difference is.

EUTHYPHRO: Yes, I think I understand.

SOCRATES: And we talk of a thing being loved, of a thing loving, and the two are different?

EUTHYPHRO: Of course.

SOCRATES: Now tell me, is a thing which is being carried in a state of being carried because it is carried, or for some other reason? b

EUTHYPHRO: No, because it is carried.

SOCRATES: And a thing is in a state of being led because it is led, and of being seen because it is seen?

EUTHYPHRO: Certainly.

SOCRATES: Then a thing is not seen because it is in a state of being seen: it is in a state of being seen because it is seen; and a thing is not led because it is in a state of being led: it is in a state of being led because it is led; and a thing is not carried because it is in a state of being carried: it is in a state of being carried because it is carried. Is my meaning clear now, Euthyphro? I mean this: if anything becomes or is affected, it does not become because it is in a state of becoming: it is in a state of becoming because it becomes; and it is not affected because it is in a state of being affected: it is in a state of being affected because it is affected. Do you not agree? c

EUTHYPHRO: I do.

SOCRATES: Is not that which is being loved in a state either of becoming or of being affected in some way by something?

EUTHYPHRO: Certainly.

SOCRATES: Then the same is true here as in the former cases. A thing is not loved by those who love it because it is in a state of being loved; it is in a state of being loved because they love it.

EUTHYPHRO: Necessarily.

SOCRATES: Well, then, Euthyphro, what do we say about piety? Is it not loved by all the gods, according to your definition? d

EUTHYPHRO: Yes.

SOCRATES: Because it is pious, or for some other reason?

EUTHYPHRO: No, because it is pious.

SOCRATES: Then it is loved by the gods because it is pious; it is not pious because it is loved by them?

EUTHYPHRO: It seems so.

SOCRATES: But, then, what is pleasing to the gods is pleasing to them, and is in a state of being loved by them, because they love it?

EUTHYPHRO: Of course.

SOCRATES: Then piety is not what is pleasing to the gods, and what is pleasing to the gods is not pious, as you say, Euthyphro. They are different things.

e EUTHYPHRO: And why, Socrates?

SOCRATES: Because we are agreed that the gods love piety because it is pious, and that it is not pious because they love it. Is not this so?

EUTHYPHRO: Yes.

SOCRATES: And that what is pleasing to the gods because they love it, is pleasing to them by reason of this same love, and that they do not love it because it is pleasing to them.

EUTHYPHRO: True.

11 SOCRATES: Then, my dear Euthyphro, piety and what is pleasing to the gods are different things. If the gods had loved piety because it is pious, they would also have loved what is pleasing to them because it is pleasing to them; but if what is pleasing to them had been pleasing to them because they loved it, then piety, too, would have been piety because they loved it. But now you see that they are opposite things, and wholly different from each other. For the one is of a sort to be loved because it is loved, while the other is loved because it is of a sort to be loved. My question, Euthyphro, was, What is piety? But it turns out that you have not explained to me the essential character of piety; you have been content to mention an effect which belongs to it—namely, that all
b the gods love it. You have not yet told me what its essential character is. Do not, if you please, keep from me what piety is; begin again and tell me that. Never mind whether the gods love it, or whether it has other effects: we shall not differ on that point. Do your best to make clear to me what is piety and what is impiety.

EUTHYPHRO: But, Socrates, I really don't know how to explain to you what is in my mind. Whatever statement we put forward always somehow moves round in a circle, and will not stay where we put it.

c SOCRATES: I think that your statements, Euthyphro, are worthy of my ancestor Daedalus.* If they had been mine and I had set them down, I dare say you would have made fun of me, and said that it was the consequence of my descent from Daedalus that the statements which I construct run away, as his statues used to, and will not stay where they are put. But, as it is, the statements are yours, and the joke would have no point. You yourself see that they will not stay still.

d EUTHYPHRO: Nay, Socrates, I think that the joke is very much in point. It is not my fault that the statement moves round in a circle and will not stay still. But you are the Daedalus, I think; as far as I am concerned, my statements would have stayed put.

e SOCRATES: Then, my friend, I must be a more skillful artist than Daedalus; he only used to make his own works move, while I, you see, can make other people's works move, too. And the beauty of it is that I am wise against my will. I would rather that our statements had remained firm and immovable than have all the wisdom of Daedalus and all the riches of Tantalus to boot. But enough of this. I will do my best to help you to explain to me what piety is, for I think that you are lazy. Don't give in yet. Tell me, do you not think that all piety must be just?

EUTHYPHRO: I do.

12 SOCRATES: Well, then, is all justice pious, too? Or, while all piety is just, is a part only of justice pious, and the rest of it something else?

EUTHYPHRO: I do not follow you, Socrates.

*Daedalus' statues were reputed to have been so lifelike that they came alive.

SOCRATES: Yet you have the advantage over me in your youth no less than your wisdom. But, as I say, the wealth of your wisdom makes you complacent. Exert yourself, my good friend: I am not asking you a difficult question. I mean the opposite of what the poet [Stasinus] said, when he wrote:

“You shall not name Zeus the creator, who made all things: for where there is fear there also is reverence.” b

Now I disagree with the poet. Shall I tell you why?

EUTHYPHRO: Yes.

SOCRATES: I do not think it true to say that where there is fear, there also is reverence. Many people who fear sickness and poverty and other such evils seem to me to have fear, but no reverence for what they fear. Do you not think so?

EUTHYPHRO: I do.

SOCRATES: But I think that where there is reverence there also is fear. Does any man feel reverence and a sense of shame about anything, without at the same time dreading and fearing the reputation of wickedness? c

EUTHYPHRO: No, certainly not.

SOCRATES: Then, though there is fear wherever there is reverence, it is not correct to say that where there is fear there also is reverence. Reverence does not always accompany fear; for fear, I take it, is wider than reverence. It is a part of fear, just as the odd is a part of number, so that where you have the odd you must also have number, though where you have number you do not necessarily have the odd. Now I think you follow me?

EUTHYPHRO: I do.

SOCRATES: Well, then, this is what I meant by the question which I asked you. Is there always piety where there is justice? Or, though there is always justice where there is piety, yet there is not always piety where there is justice, because piety is only a part d of justice? Shall we say this, or do you differ?

EUTHYPHRO: No, I agree. I think that you are right.

SOCRATES: Now observe the next point. If piety is a part of justice, we must find out, I suppose, what part of justice it is? Now, if you had asked me just now, for instance, what part of number is the odd, and what number is an odd number, I should have said that whatever number is not even is an odd number. Is it not so?

EUTHYPHRO: Yes.

SOCRATES: Then see if you can explain to me what part of justice is piety, that I e may tell Meletus that now that I have been adequately instructed by you as to what actions are righteous and pious, and what are not, he must give up prosecuting me unjustly for impiety.

EUTHYPHRO: Well, then, Socrates, I should say that righteousness and piety are that part of justice which has to do with the careful attention which ought to be paid to the gods; and that what has to do with the careful attention which ought to be paid to men is the remaining part of justice.

SOCRATES: And I think that your answer is a good one, Euthyphro. But there is one little point about which I still want to hear more. I do not yet understand what the careful attention is to which you refer. I suppose you do not mean that the attention which we pay to the gods is like the attention which we pay to other things. We say, for instance, do we not, that not everyone knows how to take care of horses, but only the trainer of horses? 13

EUTHYPHRO: Certainly.

SOCRATES: For I suppose that the skill that is concerned with horses is the art of taking care of horses.

EUTHYPHRO: Yes.

SOCRATES: And not everyone understands the care of dogs, but only the huntsman.

EUTHYPHRO: True.

b SOCRATES: For I suppose that the huntsman's skill is the art of taking care of dogs.

EUTHYPHRO: Yes.

SOCRATES: And the herdsman's skill is the art of taking care of cattle.

EUTHYPHRO: Certainly.

SOCRATES: And you say that piety and righteousness are taking care of the gods, Euthyphro?

EUTHYPHRO: I do.

SOCRATES: Well, then, has not all care the same object? Is it not for the good and benefit of that on which it is bestowed? For instance, you see that horses are benefited and improved when they are cared for by the art which is concerned with them. Is it not so?

EUTHYPHRO: Yes, I think so.

c SOCRATES: And dogs are benefited and improved by the huntsman's art, and cattle by the herdsman's, are they not? And the same is always true. Or do you think care is ever meant to harm that which is cared for?

EUTHYPHRO: No, indeed; certainly not.

SOCRATES: But to benefit it?

EUTHYPHRO: Of course.

SOCRATES: Then is piety, which is our care for the gods, intended to benefit the gods, or to improve them? Should you allow that you make any of the gods better when you do a pious action?

EUTHYPHRO: No indeed; certainly not.

d SOCRATES: No, I am quite sure that that is not your meaning, Euthyphro. It was for that reason that I asked you what you meant by the careful attention which ought to be paid to the gods. I thought that you did not mean that.

EUTHYPHRO: You were right, Socrates. I do not mean that.

SOCRATES: Good. Then what sort of attention to the gods will piety be?

EUTHYPHRO: The sort of attention, Socrates, slaves pay to their masters.

SOCRATES: I understand; then it is a kind of service to the gods?

EUTHYPHRO: Certainly.

SOCRATES: Can you tell me what result the art which serves a doctor serves to produce? Is it not health?

EUTHYPHRO: Yes.

e SOCRATES: And what result does the art which serves a ship-wright serve to produce?

EUTHYPHRO: A ship, of course, Socrates.

SOCRATES: The result of the art which serves a builder is a house, is it not?

EUTHYPHRO: Yes.

SOCRATES: Then tell me, my good friend: What result will the art which serves the gods serve to produce? You must know, seeing that you say that you know more about divine things than any other man.

EUTHYPHRO: Well, that is true, Socrates.

SOCRATES: Then tell me, I beg you, what is that grand result which the gods use our services to produce?

EUTHYPHRO: There are many notable results, Socrates.

SOCRATES: So are those, my friend, which a general produces. Yet it is easy to see that the crowning result of them all is victory in war, is it not? 14

EUTHYPHRO: Of course.

SOCRATES: And, I take it, the farmer produces many notable results; yet the principal result of them all is that he makes the earth produce food.

EUTHYPHRO: Certainly.

SOCRATES: Well, then, what is the principal result of the many notable results which the gods produce?

EUTHYPHRO: I told you just now, Socrates, that accurate knowledge of all these matters is not easily obtained. However, broadly I say this: if any man knows that his words and actions in prayer and sacrifice are acceptable to the gods, that is what is pious; and it preserves the state, as it does private families. But the opposite of what is acceptable to the gods is sacrilegious, and this it is that undermines and destroys everything. b

SOCRATES: Certainly, Euthyphro, if you had wished, you could have answered my main question in far fewer words. But you are evidently not anxious to teach me. Just now, when you were on the very point of telling me what I want to know, you stopped short. If you had gone on then, I should have learned from you clearly enough by this time what piety is. But now I am asking you questions, and must follow wherever you lead me; so tell me, what is it that you mean by piety and impiety? Do you not mean a science of prayer and sacrifice? c

EUTHYPHRO: I do.

SOCRATES: To sacrifice is to give to the gods, and to pray is to ask of them, is it not?

EUTHYPHRO: It is, Socrates.

SOCRATES: Then you say that piety is the science of asking of the gods and giving to them? d

EUTHYPHRO: You understand my meaning exactly, Socrates.

SOCRATES: Yes, for I am eager to share your wisdom, Euthyphro, and so I am all attention; nothing that you say will fall to the ground. But tell me, what is this service of the gods? You say it is to ask of them, and to give to them?

EUTHYPHRO: I do.

SOCRATES: Then, to ask rightly will be to ask of them what we stand in need of from them, will it not? e

EUTHYPHRO: Naturally.

SOCRATES: And to give rightly will be to give back to them what they stand in need of from us? It would not be very skillful to make a present to a man of something that he has no need of.

EUTHYPHRO: True, Socrates.

SOCRATES: Then piety, Euthyphro, will be the art of carrying on business between gods and men?

EUTHYPHRO: Yes, if you like to call it so.

SOCRATES: But I like nothing except what is true. But tell me, how are the gods benefited by the gifts which they receive from us? What they give is plain enough. Every good thing that we have is their gift. But how are they benefited by what we give them? Have we the advantage over them in these business transactions to such an extent that we receive from them all the good things we possess, and give them nothing in return? 15

EUTHYPHRO: But do you suppose, Socrates, that the gods are benefited by the gifts which they receive from us?

SOCRATES: But what *are* these gifts, Euthyphro, that we give the gods?

EUTHYPHRO: What do you think but honor and praise, and, as I have said, what is acceptable to them.

b SOCRATES: Then piety, Euthyphro, is acceptable to the gods, but it is not profitable to them nor loved by them?

EUTHYPHRO: I think that nothing is more loved by them.

SOCRATES: Then I see that piety means that which is loved by the gods.

EUTHYPHRO: Most certainly.

c SOCRATES: After that, shall you be surprised to find that your statements move about instead of staying where you put them? Shall you accuse me of being the Daedalus that makes them move, when you yourself are far more skillful than Daedalus was, and make them go round in a circle? Do you not see that our statement has come round to where it was before? Surely you remember that we have already seen that piety and what is pleasing to the gods are quite different things. Do you not remember?

EUTHYPHRO: I do.

SOCRATES: And now do you not see that you say that what the gods love is pious? But does not what the gods love come to the same thing as what is pleasing to the gods?

EUTHYPHRO: Certainly.

SOCRATES: Then either our former conclusion was wrong or, if it was right, we are wrong now.

EUTHYPHRO: So it seems.

d SOCRATES: Then we must begin again and inquire what piety is. I do not mean to give in until I have found out. Do not regard me as unworthy; give your whole mind to the question, and this time tell me the truth. For if anyone knows it, it is you; and you are a Proteus whom I must not let go until you have told me. It cannot be that you would ever have undertaken to prosecute your aged father for the murder of a laboring man unless you had known exactly what piety and impiety are. You would have feared to risk the anger of the gods, in case you should be doing wrong, and you would have been
e afraid of what men would say. But now I am sure that you think that you know exactly what is pious and what is not; so tell me, my good Euthyphro, and do not conceal from me what you think.

EUTHYPHRO: Another time, then, Socrates. I am in a hurry now, and it is time for me to be off.

16 SOCRATES: What are you doing, my friend! Will you go away and destroy all my hopes of learning from you what is pious and what is not, and so of escaping Meletus? I meant to explain to him that now Euthyphro has made me wise about divine things, and that I no longer in my ignorance speak carelessly about them or introduce reforms. And then I was going to promise him to live a better life for the future.

Scene—The Court of Justice

SOCRATES: I do not know what impression my accusers have made upon you, Athenians. But I do know that they nearly made me forget who I was, so persuasive were they. And yet they have scarcely spoken one single word of truth. Of all their many falsehoods, the one which astonished me most was their saying that I was a clever speaker, and that you must be careful not to let me deceive you. I thought that it was most shameful of them not to be ashamed to talk in that way. For as soon as I open my mouth they will be refuted, and I shall prove that I am not a clever speaker in any way at all—unless, indeed, by a clever speaker they mean someone who speaks the truth. If that is their meaning, I agree with them that I am an orator not to be compared with them. My accusers, I repeat, have said little or nothing that is true, but from me you shall hear the whole truth. Certainly you will not hear a speech, Athenians, dressed up, like theirs, with fancy words and phrases. I will say to you what I have to say, without artifice, and I shall use the first words which come to mind, for I believe that what I have to say is just; so let none of you expect anything else. Indeed, my friends, it would hardly be right for me, at my age, to come before you like a schoolboy with his concocted phrases. But there is one thing, Athenians, which I do most earnestly beg and entreat of you. Do not be surprised and do not interrupt with shouts if in my defense I speak in the same way that I am accustomed to speak in the market place, at the tables of the money-changers, where many of you have heard me, and elsewhere. The truth is this: I am more than seventy, and this is the first time that I have ever come before a law court; thus your manner of speech here is quite strange to me. If I had really been a stranger, you would have forgiven me for speaking in the language and the manner of my native country. And so now I ask you to grant me what I think I have a right to claim. Never mind the manner of my speech—it may be superior or it may be inferior to the usual manner. Give your whole attention to the question, whether what I say is just or not? That is what is required of a good judge, as speaking the truth is required of a good orator.

I have to defend myself, Athenians, first against the older false accusations of my old accusers, and then against the more recent ones of my present accusers. For many men have been accusing me to you, and for very many years, who have not spoken a word of truth; and I fear them more than I fear Anytus* and his associates, formidable as they are. But, my friends, the others are still more formidable, since they got hold of most of you when you were children and have been more persistent in accusing me untruthfully, persuading you that there is a certain Socrates, a wise man, who speculates about the heavens, who investigates things that are beneath the earth, and who can make the worse argument appear the stronger. These men, Athenians, who spread abroad this report are

*Anytus is singled out as politically the most influential member of the prosecution. He had played a prominent part in the restoration of the democratic regime at Athens.

the accusers whom I fear; for their hearers think that persons who pursue such inquiries never believe in the gods. Besides they are many, their attacks have been going on for a long time, and they spoke to you when you were most ready to believe them, since you were all young, and some of you were children. And there was no one to answer them when they attacked me. The most preposterous thing of all is that I do not even know their names: I cannot tell you who they are except when one happens to be a comic poet. But all the rest who have persuaded you, from motives of resentment and prejudice, and sometimes, it may be, from conviction, are hardest to cope with. For I cannot call any one of them forward in court to cross-examine him. I have, as it were, simply to spar with shadows in my defense, and to put questions which there is no one to answer. I ask you, therefore, to believe that, as I say, I have been attacked by two kinds of accusers—first, by Meletus* and his associates, and, then, by those older ones of whom I have spoken. And, with your leave, I will defend myself first against my old accusers, since you heard their accusations first, and they were much more compelling than my present accusers are.

19 Well, I must make my defense, Athenians, and try in the short time allowed me to remove the prejudice which you have been so long a time acquiring. I hope that I may manage to do this, if it be best for you and for me, and that my defense may be successful; but I am quite aware of the nature of my task, and I know that it is a difficult one. Be the outcome, however, as is pleasing to god, I must obey the law and make my defense.

Let us begin from the beginning, then, and ask what is the accusation that has given rise to the prejudice against me, on which Meletus relied when he brought his indictment. What is the prejudice which my enemies have been spreading about me? I must assume that they are formally accusing me, and read their indictment. It would run somewhat in this fashion: “Socrates is guilty of engaging in inquiries into things beneath the earth and in the heavens, of making the weaker argument appear the stronger, and of teaching others these same things.” That is what they say. And in the comedy of Aristophanes** you yourselves saw a man called Socrates swinging around in a basket and saying that he walked on air, and sputtering a great deal of nonsense about matters of which I understand nothing at all. I do not mean to disparage that kind of knowledge if there is anyone who is wise about these matters. I trust Meletus may never be able to prosecute me for that. But the truth is, Athenians, I have nothing to do with these matters, and almost all of you are yourselves my witnesses of this. I beg all of you who have ever heard me discussing, and they are many, to inform your neighbors and tell them if any of you have ever heard me discussing such matters at all. That will show you that the other common statements about me are as false as this one.

20 But the fact is that not one of these is true. And if you have heard that I undertake to educate men, and make money by so doing, that is not true either, though I think that it would be a fine thing to be able to educate men, as Gorgias of Leontini, and Prodicus of Ceos, and Hippias of Elis do. For each of them, my friends, can go into any city, and persuade the young men to leave the society of their fellow citizens, with any of whom they might associate for nothing, and to be only too glad to be allowed to pay money for the privilege of associating with themselves. And I believe that there is another wise man from Paros residing in Athens at this moment. I happened to meet Callias, the son

*Apparently, in order to obscure the political implications of the trial, the role of chief prosecutor was assigned to Meletus, a minor poet with fervent religious convictions. Anytus was evidently ready to make political use of Meletus' convictions without entirely sharing his fervor, for in the same year as this trial Meletus also prosecuted Andocides for impiety, but Anytus came to Andocides' defense.

***The Clouds*. The basket was satirically assumed to facilitate Socrates' inquiries into things in the heavens.

of Hipponicus, a man who has spent more money on sophists than everyone else put together. So I said to him (he has two sons), “Callias, if your two sons had been foals or calves, we could have hired a trainer for them who would have trained them to excel in doing what they are naturally capable of. He would have been either a groom or a farmer. But whom do you intend to take to train them, seeing that they are men? Who understands the excellence which a man and citizen is capable of attaining? I suppose that you must have thought of this, because you have sons. Is there such a person or not?” “Certainly there is,” he replied. “Who is he,” said I, “and where does he come from, and what is his fee?” “Evenus, Socrates,” he replied, “from Paros, five minae.” Then I thought that Evenus was a fortunate person if he really understood this art and could teach so cleverly. If I had possessed knowledge of that kind, I should have been conceited and disdainful. But, Athenians, the truth is that I do not possess it.

Perhaps some of you may reply: “But, Socrates, what is the trouble with you? What has given rise to these prejudices against you? You must have been doing something out of the ordinary. All these rumors and reports of you would never have arisen if you had not been doing something different from other men. So tell us what it is, that we may not give our verdict arbitrarily.” I think that that is a fair question, and I will try to explain to you what it is that has raised these prejudices against me and given me this reputation. Listen, then. Some of you, perhaps, will think that I am joking, but I assure you that I will tell you the whole truth. I have gained this reputation, Athenians, simply

The *Thólos* at Delphi with the *Sanctuary of Apollo* in the background. Socrates' friend, Chaerophon, went to the famous oracle at Delphi to ask if there was anyone wiser than Socrates. The oracle, who usually gave very cryptic answers, responded with a simple “no.” This led Socrates on a quest to find someone wiser than himself—a quest which resulted in Socrates making a number of influential enemies. (Forrest E. Baird)

- by reason of a certain wisdom. But by what kind of wisdom? It is by Just that wisdom which is perhaps human wisdom. In that, it may be, I am really wise. But the men of whom I was speaking just now must be wise in a wisdom which is greater than human wisdom, or else I cannot describe it, for certainly I know nothing of it myself, and if any man says that I do, he lies and speaks to arouse prejudice against me. Do not interrupt me with shouts, Athenians, even if you think that I am boasting. What I am going to say is not my own statement. I will tell you who says it, and he is worthy of your respect. I will bring the god of Delphi to be the witness of my wisdom, if it is wisdom at all, and of its nature. You remember Chaerephon. From youth upwards he was my comrade; and also a partisan of your democracy, sharing your recent exile* and returning with you. You remember, too, Chaerephon's character—how impulsive he was in carrying through whatever he took in hand. Once he went to Delphi and ventured to put this question to the oracle—I entreat you again, my friends, not to interrupt me with your shouts—he asked if there was anyone who was wiser than I. The priestess answered that there was no one. Chaerephon himself is dead, but his brother here will witness to what I say.
- Now see why I tell you this. I am going to explain to you how the prejudice against me has arisen. When I heard of the oracle I began to reflect: What can the god mean by this riddle? I know very well that I am not wise, even in the smallest degree. Then what can he mean by saying that I am the wisest of men? It cannot be that he is speaking falsely, for he is a god and cannot lie. For a long time I was at a loss to understand his meaning. Then, very reluctantly, I turned to investigate it in this manner: I went to a man who was reputed to be wise, thinking that there, if anywhere, I should prove the answer wrong, and meaning to point out to the oracle its mistake, and to say, "You said that I was the wisest of men, but this man is wiser than I am." So I examined the man—I need not tell you his name, he was a politician—but this was the result, Athenians. When I conversed with him I came to see that, though a great many persons, and most of all he himself, thought that he was wise, yet he was not wise. Then I tried to prove to him that he was not wise, though he fancied that he was. By so doing I made him indignant, and many of the bystanders. So when I went away, I thought to myself, "I am wiser than this man: neither of us knows anything that is really worth knowing, but he thinks that he has knowledge when he has not, while I, having no knowledge, do not think that I have. I seem, at any rate, to be a little wiser than he is on this point: I do not think that I know what I do not know." Next I went to another man who was reputed to be still wiser than the last, with exactly the same result. And there again I made him, and many other men, indignant.
- Then I went on to one man after another, realizing that I was arousing indignation every day, which caused me much pain and anxiety. Still I thought that I must set the god's command above everything. So I had to go to every man who seemed to possess any knowledge, and investigate the meaning of the oracle. Athenians, I must tell you the truth; I swear, this was the result of the investigation which I made at the god's command: I found that the men whose reputation for wisdom stood highest were nearly the most lacking in it, while others who were looked down on as common people were much more intelligent. Now I must describe to you the wanderings which I undertook, like Herculean labors, to prove the oracle irrefutable. After the politicians, I went to the poets, tragic, dithyrambic, and others, thinking that there I should find myself manifestly more ignorant than they. So I took up the poems on which I thought that they had spent most pains, and asked them what they meant, hoping at the same time to learn something from them. I am ashamed to

*During the totalitarian regime of The Thirty, which remained in power for eight months (404 B.C.), five years before the trial.

tell you the truth, my friends, but I must say it. Almost any one of the bystanders could have talked about the works of these poets better than the poets themselves. So I soon found that it is not by wisdom that the poets create their works, but by a certain instinctive inspiration, like soothsayers and prophets, who say many fine things, but understand nothing of what they say. The poets seemed to me to be in a similar situation. And at the same time I perceived that, because of their poetry, they thought that they were the wisest of men in other matters too, which they were not. So I went away again, thinking that I had the same advantage over the poets that I had over the politicians.

Finally, I went to the artisans, for I knew very well that I possessed no knowledge at all worth speaking of, and I was sure that I should find that they knew many fine things. And in that I was not mistaken. They knew what I did not know, and so far they were wiser than I. But, Athenians, it seemed to me that the skilled artisans had the same failing as the poets. Each of them believed himself to be extremely wise in matters of the greatest importance because he was skillful in his own art: and this presumption of theirs obscured their real wisdom. So I asked myself, on behalf of the oracle, whether I would choose to remain as I was, without either their wisdom or their ignorance, or to possess both, as they did. And I answered to myself and to the oracle that it was better for me to remain as I was.

From this examination, Athenians, has arisen much fierce and bitter indignation, and as a result a great many prejudices about me. People say that I am "a wise man." For the bystanders always think that I am wise myself in any matter wherein I refute another. But, gentlemen, I believe that the god is really wise, and that by this oracle he meant that human wisdom is worth little or nothing. I do not think that he meant that Socrates was wise. He only made use of my name, and took me as an example, as though he would say to men, "He among you is the wisest who, like Socrates, knows that his wisdom is really worth nothing at all." Therefore I still go about testing and examining every man whom I think wise, whether he be a citizen or a stranger, as the god has commanded me. Whenever I find that he is not wise, I point out to him, on the god's behalf, that he is not wise. I am so busy in this pursuit that I have never had leisure to take any part worth mentioning in public matters or to look after my private affairs. I am in great poverty as the result of my service to the god.

Besides this, the young men who follow me about, who are the sons of wealthy persons and have the most leisure, take pleasure in hearing men cross-examined. They often imitate me among themselves; then they try their hands at cross-examining other people. And, I imagine, they find plenty of men who think that they know a great deal when in fact they know little or nothing. Then the persons who are cross-examined get angry with me instead of with themselves, and say that Socrates is an abomination and corrupts the young. When they are asked, "Why, what does he do? What does he teach?" they do not know what to say. Not to seem at a loss, they repeat the stock charges against all philosophers, and allege that he investigates things in the air and under the earth, and that he teaches people to disbelieve in the gods, and to make the worse argument appear the stronger. For, I suppose, they would not like to confess the truth, which is that they are shown up as ignorant pretenders to knowledge that they do not possess. So they have been filling your ears with their bitter prejudices for a long time, for they are ambitious, energetic, and numerous; and they speak vigorously and persuasively against me. Relying on this, Meletus, Anytus, and Lycon have attacked me. Meletus is indignant with me on behalf of the poets, Anytus on behalf of the artisans and politicians, and Lycon on behalf of the orators. And so, as I said at the beginning, I shall be surprised if I am able, in the short time allowed me for my defense, to remove from your minds this prejudice which has grown so strong. What I have told you, Athenians, is the truth: I neither conceal nor do

I suppress anything, trivial or important. Yet I know that it is just this outspokenness which rouses indignation. But that is only a proof that my words are true, and that the prejudice
 b against me, and the causes of it, are what I have said. And whether you investigate them now or hereafter, you will find that they are so.

What I have said must suffice as my defense against the charges of my first accusers. I will try next to defend myself against Meletus, that “good patriot,” as he calls himself, and my later accusers. Let us assume that they are a new set of accusers, and read their indictment, as we did in the case of the others. It runs thus: Socrates is guilty of corrupting the youth, and of believing not in the gods whom the state believes
 c in, but in other new divinities. Such is the accusation. Let us examine each point in it separately. Meletus says that I am guilty of corrupting the youth. But I say, Athenians, that he is guilty of playing a solemn joke by casually bringing men to trial, and pretending to have a solemn interest in matters to which he has never given a moment’s thought. Now I will try to prove to you that this is so.

d Come here, Meletus. Is it not a fact that you think it very important that the young should be as good as possible?

MELETUS: It is.

SOCRATES: Come, then, tell the judges who improves them. You care so much,* you must know. You are accusing me, and bringing me to trial, because, as you say, you have discovered that I am the corrupter of the youth. Come now, reveal to the gentlemen who improves them. You see, Meletus, you have nothing to say; you are silent. But don’t you think that this is shameful? Is not your silence a conclusive proof of what I say—that you have never cared? Come, tell us, my good man, who makes the young better?

MELETUS: The laws.

e SOCRATES: That, my friend, is not my question. What man improves the young, who begins by knowing the laws?

MELETUS: The judges here, Socrates.

SOCRATES: What do you mean, Meletus? Can they educate the young and improve them?

MELETUS: Certainly.

SOCRATES: All of them? Or only some of them?

MELETUS: All of them.

SOCRATES: By Hera, that is good news! Such a large supply of benefactors! And
 25 do the members of the audience here improve them, or not?

MELETUS: They do.

SOCRATES: And do the councilors?

MELETUS: Yes.

SOCRATES: Well, then, Meletus, do the members of the assembly corrupt the young or do they again all improve them?

MELETUS: They, too, improve them.

SOCRATES: Then all the Athenians, apparently, make the young into good men except me, and I alone corrupt them. Is that your meaning?

MELETUS: Certainly, that is my meaning.

SOCRATES: You have discovered me to be most unfortunate. Now tell me: do you think that the same holds good in the case of horses? Does one man do them
 b harm and everyone else improve them? On the contrary, is it not one man only, or a

*Throughout the following passage, Socrates plays on the etymology of the name “Meletus” as meaning “the man who cares.”

very few—namely, those who are skilled with horses—who can improve them, while the majority of men harm them if they use them and have anything to do with them? Is it not so, Meletus, both with horses and with every other animal? Of course it is, whether you and Anytus say yes or no. The young would certainly be very fortunate if only one man corrupted them, and everyone else did them good. The truth is, Meletus, you prove conclusively that you have never thought about the young in your life. You exhibit your carelessness in not caring for the very matters about which you are prosecuting me. c

Now be so good as to tell us, Meletus, is it better to live among good citizens or bad ones? Answer, my friend. I am not asking you at all a difficult question. Do not the bad harm their associates and the good do them good?

MELETUS: Yes.

SOCRATES: Is there anyone who would rather be injured than benefitted by his companions? Answer, my good man; you are obliged by the law to answer. Does anyone like to be injured? d

MELETUS: Certainly not.

SOCRATES: Well, then, are you prosecuting me for corrupting the young and making them worse, voluntarily or involuntarily?

MELETUS: For doing it voluntarily.

SOCRATES: What, Meletus? Do you mean to say that you, who are so much younger than I, are yet so much wiser than I that you know that bad citizens always do evil, and that good citizens do good, to those with whom they come in contact, while I am so extraordinarily ignorant as not to know that, if I make any of my companions evil, he will probably injure me in some way? And you allege that I do this voluntarily? You will not make me believe that, nor anyone else either, I should think. Either I do not corrupt the young at all or, if I do, I do so involuntarily, so that you are lying in either case. And if I corrupt them involuntarily, the law does not call upon you to prosecute me for an error which is involuntary, but to take me aside privately and reprove and educate me. For, of course, I shall cease from doing wrong involuntarily, as soon as I know that I have been doing wrong. But you avoided associating with me and educating me; instead you bring me up before the court, where the law sends persons, not for education, but for punishment. e 26

The truth is, Athenians, as I said, it is quite clear that Meletus has never cared at all about these matters. However, now tell us, Meletus, how do you say that I corrupt the young? Clearly, according to your indictment, by teaching them not to believe in the gods the state believes in, but other new divinities instead. You mean that I corrupt the young by that teaching, do you not? b

MELETUS: Yes, most certainly I mean that.

SOCRATES: Then in the name of these gods of whom we are speaking, explain yourself a little more clearly to me and to these gentlemen here. I cannot understand what you mean. Do you mean that I teach the young to believe in some gods, but not in the gods of the state? Do you accuse me of teaching them to believe in strange gods? If that is your meaning, I myself believe in some gods, and my crime is not that of complete atheism. Or do you mean that I do not believe in the gods at all myself, and that I teach other people not to believe in them either? c

MELETUS: I mean that you do not believe in the gods in any way whatever.

SOCRATES: You amaze me, Meletus! Why do you say that? Do you mean that I believe neither the sun nor the moon to be gods, like other men? d

MELETUS: I swear he does not, judges. He says that the sun is a stone, and the moon earth.

SOCRATES: My dear Meletus, do you think that you are prosecuting Anaxagoras? You must have a very poor opinion of these men, and think them illiterate, if you imagine that they do not know that the works of Anaxagoras of Clazomenae are full of these doctrines. And so young men learn these things from me, when they can often buy them
 e in the theater for a drachma at most, and laugh at Socrates were he to pretend that these doctrines, which are very peculiar doctrines, too, were his own. But please tell me, do you really think that I do not believe in the gods at all?

MELETUS: Most certainly I do. You are a complete atheist.

SOCRATES: No one believes that, Meletus, not even you yourself. It seems to me, Athenians, that Meletus is very insolent and reckless, and that he is prosecuting me simply out of insolence, recklessness, and youthful bravado. For he seems to be testing me, by asking
 27 me a riddle that has no answer. "Will this wise Socrates," he says to himself, "see that I am joking and contradicting myself? Or shall I deceive him and everyone else who hears me?" Meletus seems to me to contradict himself in his indictment: it is as if he were to say, "Socrates is guilty of not believing in the gods, but believes in the gods." This is joking.

Now, my friends, let us see why I think that this is his meaning. You must answer
 b me, Meletus, and you, Athenians, must remember the request which I made to you at the start, and not interrupt me with shouts if I talk in my usual manner.

Is there any man, Meletus, who believes in the existence of things pertaining to men and not in the existence of men? Make him answer the question, gentlemen, without these interruptions. Is there any man who believes in the existence of horsemanship and not in the existence of horses? Or in flute playing, and not in flute players? There is not, my friend. If you will not answer, I will tell both you and the judges. But you must
 c answer my next question. Is there any man who believes in the existence of divine things and not in the existence of divinities?

MELETUS: There is not.

SOCRATES: I am very glad that these gentlemen have managed to extract an answer from you. Well then, you say that I believe in divine things, whether they be old or new, and that I teach others to believe in them. At any rate, according to your statement, I believe in divine things. That you have sworn in your indictment. But if I believe in divine things, I suppose it follows necessarily that I believe in divinities. Is it not so? It is. I assume that you grant that, as you do not answer. But do we not believe that
 d divinities are either gods themselves or the children of the gods? Do you admit that?

MELETUS: I do.

SOCRATES: Then you admit that I believe in divinities. Now, if these divinities are gods, then, as I say, you are joking and asking a riddle, and asserting that I do not believe in the gods, and at the same time that I do, since I believe in divinities. But if these divinities are the illegitimate children of the gods, either by the nymphs or by other mothers, as they are said to be, then, I ask, what man could believe in the existence of the children of the gods, and not in the existence of the gods? That would be as absurd as believing in the existence of the offspring of horses and asses, and not in the existence of horses and asses. You must have indicted me in this manner, Meletus, either to test me or because you could not
 e find any act of injustice that you could accuse me of with truth. But you will never contrive to persuade any man with any sense at all that a belief in divine things and things of the gods does not necessarily involve a belief in divinities, and in the gods.

But in truth, Athenians, I do not think that I need say very much to prove that I have not committed the act of injustice for which Meletus is prosecuting me. What I have said is enough to prove that. But be assured it is certainly true, as I have already told you, that I have aroused much indignation. That is what will cause my condemnation if I am

condemned; not Meletus nor Anytus either, but that prejudice and resentment of the multitude which have been the destruction of many good men before me, and I think will be so again. There is no prospect that I shall be the last victim. b

Perhaps someone will say: "Are you not ashamed, Socrates, of leading a life which is very likely now to cause your death?" I should answer him with justice, and say: "My friend, if you think that a man of any worth at all ought to reckon the chances of life and death when he acts, or that he ought to think of anything but whether he is acting justly or unjustly, and as a good or a bad man would act, you are mistaken. According to you, the demigods who died at Troy would be foolish, and among them c Achilles, who thought nothing of danger when the alternative was disgrace. For when his mother—and she was a goddess—addressed him, when he was resolved to slay Hector, in this fashion, 'My son, if you avenge the death of your comrade Patroclus and slay Hector, you will die yourself, for fate awaits you next after Hector.' When he heard this, he scorned danger and death; he feared much more to live a coward and not to davenge his friend. 'Let me punish the evildoer and afterwards die,' he said, 'that I may not remain here by the beaked ships jeered at, encumbering the earth.'"^{*} Do you suppose that he thought of danger or of death? For this, Athenians, I believe to be the truth. Wherever a man's station is, whether he has chosen it of his own will, or whether he has been placed at it by his commander, there it is his duty to remain and face the danger without thinking of death or of any other thing except disgrace.

When the generals whom you chose to command me, Athenians, assigned me my station during the battles of Potidaea, Amphipolis, and Delium, I remained where they stationed me and ran the risk of death, like other men. It would be very strange conduct on my part if I were to desert my station now from fear of death or of any other thing when the god has commanded me—as I am persuaded that he has done—to spend my life in searching for wisdom, and in examining myself and others. That would indeed be a very strange e thing. Then certainly I might with justice be brought to trial for not believing in the gods, for I should be disobeying the oracle, and fearing death and thinking myself wise when I was not wise. For to fear death, my friends, is only to think ourselves wise without really being wise, for it is to think that we know what we do not know. For no one knows whether death may not be the greatest good that can happen to man. But men fear it as if they knew quite well that it was the greatest of evils. And what is this but that shameful ignorance of b thinking that we know what we do not know? In this matter, too, my friends, perhaps I am different from the multitude. And if I were to claim to be at all wiser than others, it would be because, not knowing very much about the other world, I do not think I know. But I do know very well that it is evil and disgraceful to do an unjust act, and to disobey my superior, whether man or god. I will never do what I know to be evil, and shrink in fear from what I do not know to be good or evil. Even if you acquit me now, and do not listen to c Anytus' argument that, if I am to be acquitted, I ought never to have been brought to trial at all, and that, as it is, you are bound to put me to death because, as he said, if I escape, all your sons will be utterly corrupted by practicing what Socrates teaches. If you were therefore to say to me, "Socrates, this time we will not listen to Anytus. We will let you go, but on the condition that you give up this investigation of yours, and philosophy. If you are found following these pursuits again, you shall die." I say, if you offered to let me go, on these terms, I should reply: "Athenians, I hold you in the highest regard and affection, but d I will be persuaded by the god rather than you. As long as I have breath and strength I will not give up philosophy and exhorting you and declaring the truth to every one of you whom

^{*}Homer, *Iliad*, xviii, 96, 98.

I meet, saying, as I am accustomed, 'My good friend, you are a citizen of Athens, a city which is very great and very famous for its wisdom and power—are you not ashamed of caring so much for the making of money and for fame and prestige, when you neither think nor care about wisdom and truth and the improvement of your soul?' " If he disputes my words and says that he does care about these things, I shall not at once release him and go away: I shall question him and cross-examine him and test him. If I think that he has not attained excellence, though he says that he has, I shall reproach him for undervaluing the most valuable things, and overvaluing those that are less valuable. This I shall do to everyone whom I meet, young or old, citizen or stranger, but especially to citizens, since they are more closely related to me. This, you must recognize, the god has commanded me to do. And I think that no greater good has ever befallen you in the state than my service to the god. For I spend my whole life in going about and persuading you all to give your first and greatest care to the improvement of your souls, and not till you have done that to think of your bodies or your wealth. And I tell you that wealth does not bring excellence, but that wealth, and every other good thing which men have, whether in public or in private, comes from excellence. If then I corrupt the youth by this teaching, these things must be harmful. But if any man says that I teach anything else, there is nothing in what he says. And therefore, Athenians, I say, whether you are persuaded by Anytus or not, whether you acquit me or not, I shall not change my way of life; no, not if I have to die for it many times.

Do not interrupt me, Athenians, with your shouts. Remember the request which I made to you, and do not interrupt my words. I think that it will profit you to hear them. I am going to say something more to you, at which you may be inclined to protest, but do not do that. Be sure that if you put me to death, I who am what I have told you that I am, you will do yourselves more harm than me. Meletus and Anytus can do me no harm: that is impossible, for I am sure it is not allowed that a good man be injured by a worse. He may indeed kill me, or drive me into exile, or deprive me of my civil rights. Perhaps Meletus and others think those things great evils. But I do not think so. I think it is a much greater evil to do what he is doing now, and to try to put a man to death unjustly. And now, Athenians, I am not arguing in my own defense at all, as you might expect me to do, but rather in yours in order you may not make a mistake about the gift of the god to you by condemning me. For if you put me to death, you will not easily find another who, if I may use a ludicrous comparison, clings to the state as a sort of gadfly to a horse that is large and well-bred but rather sluggish because of its size, so that it needs to be aroused. It seems to me that the god has attached me like that to the state, for I am constantly alighting upon you at every point to arouse, persuade, and reproach each of you all day long. You will not easily find anyone else, my friends, to fill my place; and if you are persuaded by me, you will spare my life. You are indignant, as drowsy persons are when they are awakened, and, of course, if you are persuaded by Anytus, you could easily kill me with a single blow, and then sleep on undisturbed for the rest of your lives, unless the god in his care for you sends another to arouse you. And you may easily see that it is the god who has given me to your city; for it is not human, the way in which I have neglected all my own interests and allowed my private affairs to be neglected for so many years, while occupying myself unceasingly in your interests, going to each of you privately, like a father or an elder brother, trying to persuade him to care for human excellence. There would have been a reason for it, if I had gained any advantage by this, or if I had been paid for my exhortations; but you see yourselves that my accusers, though they accuse me of everything else without shame, have not had the shamelessness to say that I ever either exacted or demanded payment. To that they have no witness. And I think that I have sufficient witness to the truth of what I say—my poverty.

Perhaps it may seem strange to you that, though I go about giving this advice privately and meddling in others' affairs, yet I do not venture to come forward in the assembly and advise the state. You have often heard me speak of my reason for this, and in many places: it is that I have a certain divine guide, which is what Meletus has caricatured in his indictment. I have had it from childhood. It is a kind of voice which, whenever I hear it, always turns me back from something which I was going to do, but never urges me to act. It is this which forbids me to take part in politics. And I think it does well to forbid me. For, Athenians, it is quite certain that, if I had attempted to take part in politics, I should have perished at once and long ago without doing any good either to you or to myself. And do not be indignant with me for telling the truth. There is no man who will preserve his life for long, either in Athens or elsewhere, if he firmly opposes the multitude, and tries to prevent the commission of much injustice and illegality in the state. He who would really fight for justice must do so as a private citizen, not as a political figure, if he is to preserve his life, even for a short time. d e 32

I will prove to you that this is so by very strong evidence, not by mere words, but by what you value more—actions. Listen, then, to what has happened to me, that you may know that there is no man who could make me consent to commit an unjust act from the fear of death, but that I would perish at once rather than give way. What I am going to tell you may be commonplace in the law court; nevertheless, it is true. The only office that I ever held in the state, Athenians, was that of councilor. When you wished to try the ten admirals who did not rescue their men after the battle of Arginusae as a group, which was illegal, as you all came to think afterwards, the executive committee was composed of members of the tribe Antiochis, to which I belong.* On that occasion I alone of the committee members opposed your illegal action and gave my vote against you. The orators were ready to impeach me and arrest me; and you were clamoring and urging them on with your shouts. But I thought that I ought to face the danger, with law and justice on my side, rather than join with you in your unjust proposal, from fear of imprisonment or death. That was when the state was democratic. When the oligarchy came in, The Thirty sent for me, with four others, to the council-chamber, and ordered us to bring Leon the Salaminian from Salamis, that they might put him to death. They were in the habit of frequently giving similar orders to many others, wishing to implicate as many as possible in their crimes. But then I again proved, not by mere words, but by my actions, that, if I may speak bluntly, I do not care a straw for death; but that I do care very much indeed about not doing anything unjust or impious. That government with all its power did not terrify me into doing anything unjust. When we left the council-chamber, the other four went over to Salamis and brought Leon across to Athens; I went home. And if the rule of The Thirty had not been overthrown soon afterwards, I should very likely have been put to death for what I did then. Many of you will be my witnesses in this matter.** e

*The Council was the administrative body in Athens. Actual administrative functions were performed by an executive committee of the Council, and the members of this committee were recruited from each tribe in turn. The case Socrates is alluding to was that of the admirals who were accused of having failed to rescue the crews of ships that sank during the battle of Arginusae. The six admirals who were actually put on trial were condemned as a group and executed.

**There is evidence that Meletus was one of the four who turned in Leon. Socrates' recalling this earlier lapse from legal procedure is probably also a thrust at Anytus. The Thirty successfully implicated so many Athenians in their crimes that an amnesty was declared, which Anytus strongly favored, in order to enlist wider support for the restored democracy. Thus those who were really implicated could now no longer be prosecuted legally, but Socrates is himself being illegally prosecuted (as he now goes on to suggest) because he was guilty of having associated with such "pupils" as Critias, who was a leader of The Thirty.

Now do you think that I could have remained alive all these years if I had taken part in public affairs, and had always maintained the cause of justice like a good man, and had held it a paramount duty, as it is, to do so? Certainly not, Athenians, nor could any other man. But throughout my whole life, both in private and in public, whenever I have had to take part in public affairs, you will find I have always been the same and have never yielded unjustly to anyone; no, not to those whom my enemies falsely assert to have been my pupils. But I was never anyone's teacher. I have never withheld myself from anyone, b young or old, who was anxious to hear me converse while I was making my investigation; neither do I converse for payment, and refuse to converse without payment. I am ready to ask questions of rich and poor alike, and if any man wishes to answer me, and then listen to what I have to say, he may. And I cannot justly be charged with causing these men to turn out good or bad, for I never either taught or professed to teach any of them any knowledge whatever. And if any man asserts that he ever learned or heard anything from me in private which everyone else did not hear as well as he, be sure that he does not speak the truth.

Why is it, then, that people delight in spending so much time in my company? You c have heard why, Athenians. I told you the whole truth when I said that they delight in hearing me examine persons who think that they are wise when they are not wise. It is certainly very amusing to listen to. And, as I have said, the god has commanded me to examine men, in oracles and in dreams and in every way in which the divine will was ever declared to man. This is the truth, Athenians, and if it were not the truth, it would be easily refuted. For d if it were really the case that I have already corrupted some of the young men, and am now corrupting others, surely some of them, finding as they grew older that I had given them bad advice in their youth, would have come forward today to accuse me and take their revenge. Or if they were unwilling to do so themselves, surely their relatives, their fathers or brothers, or others, would, if I had done them any harm, have remembered it and taken their e revenge. Certainly I see many of them in court. Here is Crito, of my own district and of my own age, the father of Critobulus; here is Lysanias of Sphettus, the father of Aeschines; here is also Antiphon of Cephissus, the father of Epigenes. Then here are others whose brothers have spent their time in my company—Nicostratus, the son of Theozotides and brother of Theodotus—and Theodotus is dead, so he at least cannot entreat his brother to be silent; here is Paralus, the son of Demodocus and the brother of Theages; here is Adeimantus, the 34 son of Ariston, whose brother is Plato here; and Aeantodorus, whose brother is Aristodorus. And I can name many others to you, some of whom Meletus ought to have called as witnesses in the course of his own speech; but if he forgot to call them then, let him call them now—I will yield the floor to him—and tell us if he has any such evidence. No, on the contrary, my friends, you will find all these men ready to support me, the corrupter who has b injured their relatives, as Meletus and Anytus call me. Those of them who have been already corrupted might perhaps have some reason for supporting me, but what reason can their relatives have who are grown up, and who are uncorrupted, except the reason of truth and justice that they know very well that Meletus is lying, and that I am speaking the truth?

Well, my friends, this, and perhaps more like this, is pretty much all I have to offer in my defense. There may be some one among you who will be indignant when he c remembers how, even in a less important trial than this, he begged and entreated the judges, with many tears, to acquit him, and brought forward his children and many of his friends and relatives in court in order to appeal to your feelings; and then finds that I shall do none of these things, though I am in what he would think the supreme danger. Perhaps he will harden himself against me when he notices this; it may make him angry, and he may cast his vote in anger. If it is so with any of you—I do not suppose that it is, but in d case it should be so—I think that I should answer him reasonably if I said: "My friend,

I have relatives, too, for, in the words of Homer, I am ‘not born of an oak or a rock’* but of flesh and blood.” And so, Athenians, I have relatives, and I have three sons, one of them nearly grown up, and the other two still children. Yet I will not bring any of them forward before you and implore you to acquit me. And why will I do none of these things? It is not from arrogance, Athenians, nor because I lack respect for you—whether e
or not I can face death bravely is another question—but for my own good name, and for your good name, and for the good name of the whole state. I do not think it right, at my age and with my reputation, to do anything of that kind. Rightly or wrongly, men have made up their minds that in some way Socrates is different from the multitude of men. And it will be shameful if those of you who are thought to excel in wisdom, or in bravery, 5
or in any other excellence, are going to act in this fashion. I have often seen men of reputation behaving in an extraordinary way at their trial, as if they thought it a terrible fate to be killed, and as though they expected to live for ever if you did not put them to death. Such men seem to me to bring shame upon the state, for any stranger would suppose that the best and most eminent Athenians, who are selected by their fellow citizens b
to hold office, and for other honors, are no better than women. Those of you, Athenians, who have any reputation at all ought not to do these things, and you ought not to allow us to do them. You should show that you will be much more ready to condemn men who make the state ridiculous by these pathetic performances than men who remain quiet.

But apart from the question of reputation, my friends, I do not think that it is right to entreat the judge to acquit us, or to escape condemnation in that way. It is our duty to c
teach and persuade him. He does not sit to give away justice as a favor, but to pronounce judgment; and he has sworn, not to favor any man whom he would like to favor, but to judge according to law. And, therefore, we ought not to encourage you in the habit of breaking your oaths; and you ought not to allow yourselves to fall into this habit, for then neither you nor we would be acting piously. Therefore, Athenians, do not require me to do these things, for I believe them to be neither good nor just nor pious; especially, do not ask me to do them today when Meletus is prosecuting me for impiety. For d
were I to be successful and persuade you by my entreaties to break your oaths, I should be clearly teaching you to believe that there are no gods, and I should be simply accusing myself by my defense of not believing in them. But, Athenians, that is very far from the truth. I do believe in the gods as no one of my accusers believes in them; and to you and to the god I commit my cause to be decided as is best for you and for me.

(He is found guilty by 281 votes to 220.)

I am not indignant at the verdict which you have given, Athenians, for many reasons. I expected that you would find me guilty; and I am not so much surprised at that as e
at the numbers of the votes. I certainly never thought that the majority against me would 36
have been so narrow. But now it seems that if only thirty votes had changed sides, I should have escaped. So I think that I have escaped Meletus, as it is; and not only have I escaped him, for it is perfectly clear that if Anytus and Lycon had not come forward to accuse me, too, he would not have obtained the fifth part of the votes, and would have b
had to pay a fine of a thousand drachmae.

So he proposes death as the penalty. Be it so. And what alternative penalty shall I propose to you, Athenians?*** What I deserve, of course, must I not? What then do I deserve to pay or to suffer for having determined not to spend my life in ease? I

*Homer, *Odyssey*, xix, 163.

***For certain crimes no penalty was fixed by Athenian law. Having reached a verdict of guilty, the court had still to decide between the alternative penalties proposed by the prosecution and the defense.

- neglected the things which most men value, such as wealth, and family interests, and military commands, and public oratory, and all the civic appointments, and social clubs, and political factions, that there are in Athens; for I thought that I was really too honest a man to preserve my life if I engaged in these affairs. So I did not go where I should have done no good either to you or to myself. I went, instead, to each one of you privately to do him, as I say, the greatest of benefits, and tried to persuade him not to think of his affairs until he had thought of himself and tried to make himself as good and wise as possible, nor to think of the affairs of Athens until he had thought of Athens herself; and to care for other things in the same manner. Then what do I deserve for such a life?
- d Something good, Athenians, if I am really to propose what I deserve; and something good which it would be suitable for me to receive. Then what is a suitable reward to be given to a poor benefactor who requires leisure to exhort you? There is no reward, Athenians, so suitable for him as receiving free meals in the prytaneum. It is a much more suitable reward for him than for any of you who has won a victory at the Olympic games with his horse or his chariots. Such a man only makes you seem happy, but I
- e make you really happy; he is not in want, and I am. So if I am to propose the penalty
- 37 which I really deserve, I propose this—free meals in the prytaneum.

- Perhaps you think me stubborn and arrogant in what I am saying now, as in what I said about the entreaties and tears. It is not so, Athenians. It is rather that I am convinced that I never wronged any man voluntarily, though I cannot persuade you of that, since we have conversed together only a little time. If there were a law at Athens, as
- b there is elsewhere, not to finish a trial of life and death in a single day, I think that I could have persuaded you; but now it is not easy in so short a time to clear myself of great prejudices. But when I am persuaded that I have never wronged any man, I shall certainly not wrong myself, or admit that I deserve to suffer any evil, or propose any evil for myself as a penalty. Why should I? Lest I should suffer the penalty which Meletus proposes when I say that I do not know whether it is a good or an evil? Shall I choose instead of it something which I know to be an evil, and propose that as a
- c penalty? Shall I propose imprisonment? And why should I pass the rest of my days in prison, the slave of successive officials? Or shall I propose a fine, with imprisonment until it is paid? I have told you why I will not do that. I should have to remain in prison, for I have no money to pay a fine with. Shall I then propose exile? Perhaps you would agree to that. Life would indeed be very dear to me if I were unreasonable enough to
- d expect that strangers would cheerfully tolerate my discussions and arguments when you who are my fellow citizens cannot endure them, and have found them so irksome and odious to you that you are seeking now to be relieved of them. No, indeed, Athenians, that is not likely. A fine life I should lead for an old man if I were to withdraw from Athens and pass the rest of my days in wandering from city to city, and continually being expelled. For I know very well that the young men will listen to me wherever I go, as they do here. If I drive them away, they will persuade their elders to expel me; if I do
- e not drive them away, their fathers and other relatives will expel me for their sakes.

- Perhaps someone will say, “Why cannot you withdraw from Athens, Socrates, and hold your peace?” It is the most difficult thing in the world to make you understand why I cannot do that. If I say that I cannot hold my peace because that would be to disobey the god, you will think that I am not in earnest and will not believe me. And if I tell you that
- 38 no greater good can happen to a man than to discuss human excellence every day and the other matters about which you have heard me arguing and examining myself and others and that an unexamined life is not worth living, then you will believe me still less. But that is so, my friends, though it is not easy to persuade you. And, what is more, I am not

Despite refuting his accusers (as recorded in the *Apology*), Socrates was found guilty of impiety toward the gods and of corrupting the youth. He was sentenced to die by drinking the poison hemlock. (©PHAS/Getty)

accustomed to think that I deserve anything evil. If I had been rich, I would have proposed as large a fine as I could pay: that would have done me no harm. But I am not rich enough to pay a fine unless you are willing to fix it at a sum within my means. Perhaps I could pay you a mina, so I propose that. Plato here, Athenians, and Crito, and Critobulus, and Apollodorus bid me propose thirty minae, and they guarantee its payment. So I propose thirty minae. Their security will be sufficient to you for the money.

(He is condemned to death.)

You have not gained very much time, Athenians, and at the price of the slurs of those who wish to revile the state. And they will say that you put Socrates, a wise man, to death. For they will certainly call me wise, whether I am wise or not, when they want to reproach you. If you had waited for a little while, your wishes would have been fulfilled in the course of nature; for you see that I am an old man, far advanced in years, and near to death. I am saying this not to all of you, only to those who have voted for my death. And to them I have something else to say. Perhaps, my friends, you think that I have been convicted because I was wanting in the arguments by which I could have persuaded you to acquit me, if I had thought it right to do or to say anything to escape punishment. It is not so. I have been convicted because I was wanting, not in arguments, but in impudence and shamelessness—because I would not plead before you as you would have liked to hear me plead, or appeal to you with weeping and wailing, or say and do

- many other things which I maintain are unworthy of me, but which you have been accustomed to from other men. But when I was defending myself, I thought that I ought not to do anything unworthy of a free man because of the danger which I ran, and I have not changed my mind now. I would very much rather defend myself as I did, and die,
- 39 than as you would have had me do, and live. Both in a lawsuit and in war, there are some things which neither I nor any other man may do in order to escape from death. In battle, a man often sees that he may at least escape from death by throwing down his arms and falling on his knees before the pursuer to beg for his life. And there are many other ways of avoiding death in every danger if a man is willing to say and to do anything.
- b But, my friends, I think that it is a much harder thing to escape from wickedness than from death, for wickedness is swifter than death. And now I, who am old and slow, have been overtaken by the slower pursuer: and my accusers, who are clever and swift, have been overtaken by the swifter pursuer—wickedness. And now I shall go away, sentenced by you to death; they will go away, sentenced by truth to wickedness and injustice. And I abide by this award as well as they. Perhaps it was right for these things to be so. I think that they are fairly balanced.
- c And now I wish to prophesy to you, Athenians, who have condemned me. For I am going to die, and that is the time when men have most prophetic power. And I prophesy to you who have sentenced me to death that a far more severe punishment than you have inflicted on me will surely overtake you as soon as I am dead. You have done this thing, thinking that you will be relieved from having to give an account of
- d your lives. But I say that the result will be very different. There will be more men who will call you to account, whom I have held back, though you did not recognize it. And they will be harsher toward you than I have been, for they will be younger, and you will be more indignant with them. For if you think that you will restrain men from reproaching you for not living as you should, by putting them to death, you are very much mistaken. That way of escape is neither possible nor honorable. It is much more honorable and much easier not to suppress others, but to make yourselves as good as you can.
- e This is my parting prophecy to you who have condemned me.
- With you who have acquitted me I should like to discuss this thing that has happened, while the authorities are busy, and before I go to the place where I have to die. So, remain with me until I go: there is no reason why we should not talk with
- 40 each other while it is possible. I wish to explain to you, as my friends, the meaning of what has happened to me. An amazing thing has happened to me, judges—for I am right in calling you judges.* The prophetic guide has been constantly with me all through my life till now, opposing me even in trivial matters if I were not going to act rightly. And now you yourselves see what has happened to me—a thing which
- b might be thought, and which is sometimes actually reckoned, the supreme evil. But the divine guide did not oppose me when I was leaving my house in the morning, nor when I was coming up here to the court, nor at any point in my speech when I was going to say anything; though at other times it has often stopped me in the very act of speaking. But now, in this matter, it has never once opposed me, either in my words or my actions. I will tell you what I believe to be the reason. This thing that
- c has come upon me must be a good; and those of us who think that death is an evil must needs be mistaken. I have a clear proof that that is so; for my accustomed guide

*The form of address hitherto has always been "Athenians," or "my friends." The "judges" in an Athenian court were simply the members of the jury.

would certainly have opposed me if I had not been going to meet with something good.

And if we reflect in another way, we shall see that we may well hope that death is a good. For the state of death is one of two things: either the dead man wholly ceases to be and loses all consciousness or, as we are told, it is a change and a migration of the soul to another place. And if death is the absence of all consciousness, and like the sleep of one whose slumbers are unbroken by any dreams, it will be a wonderful gain. For if a man had to select that night in which he slept so soundly that he did not even dream, and had to compare with it all the other nights and days of his life, and then had to say how many days and nights in his life he had spent better and more pleasantly than this night, I think that a private person, nay, even the Great King of Persia himself, would find them easy to count, compared with the others. If that is the nature of death, I for one count it a gain. For then it appears that all time is nothing more than a single night. But if death is a journey to another place, and what we are told is true—that all who have died are there—what good could be greater than this, my judges? Would a journey not be worth taking, at the end of which, in the other world, we should be delivered from the pretended judges here and should find the true judges who are said to sit in judgment below, such as Minos and Rhadamanthus and Aeacus and Triptolemus, and the other demigods who were just in their own lives? Or what would you not give to converse with Orpheus and Musaeus and Hesiod and Homer? I am willing to die many times if this be true. And for my own part I should find it wonderful to meet there Palamedes, and Ajax the son of Telamon, and the other men of old who have died through an unjust judgment, and to compare my experiences with theirs. That I think would be no small pleasure. And, above all, I could spend my time in examining those who are there, as I examine men here, and in finding out which of them is wise, and which of them thinks himself wise when he is not wise. What would we not give, my judges, to be able to examine the leader of the great expedition against Troy, or Odysseus, or Sisyphus, or countless other men and women whom we could name? It would be an inexpressible happiness to converse with them and to live with them and to examine them. Assuredly there they do not put men to death for doing that. For besides the other ways in which they are happier than we are, they are immortal, at least if what we are told is true.

And you too, judges, must face death hopefully, and believe this one truth, that no evil can happen to a good man, either in life or after death. His affairs are not neglected by the gods; and what has happened to me today has not happened by chance. I am persuaded that it was better for me to die now, and to be released from trouble; and that was the reason why the guide never turned me back. And so I am not at all angry with my accusers or with those who have condemned me to die. Yet it was not with this in mind that they accused me and condemned me, but meaning to do me an injury. So far I may blame them.

Yet I have one request to make of them. When my sons grow up, punish them, my friends, and harass them in the same way that I have harassed you, if they seem to you to care for riches or for any other thing more than excellence; and if they think that they are something when they are really nothing, reproach them, as I have reproached you, for not caring for what they should, and for thinking that they are something when really they are nothing. And if you will do this, I myself and my sons will have received justice from you.

But now the time has come, and we must go away—I to die, and you to live. Which is better is known to the god alone.

Socrates

Crito

Scene—The Prison of Socrates

- 43 SOCRATES: Why have you come at this hour, Crito? Is it not still early?
 CRITO: Yes, very early.
 SOCRATES: About what time is it?
 CRITO: It is just daybreak.
 SOCRATES: I wonder that the jailer was willing to let you in.
 CRITO: He knows me now, Socrates; I come here so often, and besides, I have
 given him a tip.
 SOCRATES: Have you been here long?
 CRITO: Yes, some time.
- b SOCRATES: Then why did you sit down without speaking? Why did you not wake
 me at once?
 CRITO: Indeed, Socrates, I wish that I myself were not so sleepless and sorrowful.
 But I have been wondering to see how soundly you sleep. And I purposely did not wake
 you, for I was anxious not to disturb your repose. Often before, all through your life, I
 have thought that your temperament was a happy one; and I think so more than ever
 now when I see how easily and calmly you bear the calamity that has come to you.
- c SOCRATES: Nay, Crito, it would be absurd if at my age I were disturbed at having
 to die.
 CRITO: Other men as old are overtaken by similar calamities, Socrates; but their
 age does not save them from being disturbed by their fate.
 SOCRATES: That is so; but tell me why are you here so early? Crito. I am the bearer
 of sad news, Socrates; not sad, it seems, for you, but for me and for all your friends, both
 sad and hard to bear; and for none of them, I think, is it as hard to bear as it is for me.
- d SOCRATES: What is it? Has the ship come from Delos, at the arrival of which I am
 to die?
 CRITO: No, it has not actually arrived, but I think that it will be here today, from the
 news which certain persons have brought from Sunium, who left it there. It is clear from
 their report that it will be here today; and so, Socrates, tomorrow your life will have to end.
- 44 SOCRATES: Well, Crito, may it end well. Be it so, if so the gods will. But I do not
 think that the ship will be here today,
 CRITO: Why do you suppose not?
 SOCRATES: I will tell you. I am to die on the day after the ship arrives, am I not?*
- CRITO: That is what the authorities say.
 SOCRATES: Then I do not think that it will come today, but tomorrow. I am count-
 ing on a dream I had a little while ago in the night, so it seems to be fortunate that you
 did not wake me.

*Criminals could not be put to death while the sacred ship was away on its voyage.

CRITO: And what was this dream?

SOCRATES: A fair and beautiful woman, clad in white, seemed to come to me, and call me and say, "O Socrates—On the third day shall you fertile Phthia reach."* b

CRITO: What a strange dream, Socrates!

SOCRATES: But its meaning is clear, at least to me, Crito.

CRITO: Yes, too clear, it seems. But, O my good Socrates, I beg you for the last time to listen to me and save yourself. For to me your death will be more than a single disaster; not only shall I lose a friend the like of whom I shall never find again, but many persons who do not know you and me well will think that I might have saved you if I ad been willing to spend money, but that I neglected to do so. And what reputation could be more disgraceful than the reputation of caring more for money than for one's friends? The public will never believe that we were anxious to save you, but that you yourself refused to escape. c

SOCRATES: But, my dear Crito, why should we care so much about public opinion? Reasonable men, of whose opinion it is worth our while to think, will believe that we acted as we really did.

CRITO: But you see, Socrates, that it is necessary to care about public opinion, too. This very thing that has happened to you proves that the multitude can do a man not the least, but almost the greatest harm, if he is falsely accused to them. d

SOCRATES: I wish that the multitude were able to do a man the greatest harm, Crito, for then they would be able to do him the greatest good, too. That would have been fine. But, as it is, they can do neither. They cannot make a man either wise or foolish: they act wholly at random.

CRITO: Well, as you wish. But tell me this, Socrates. You surely are not anxious about me and your other friends, and afraid lest, if you escape, the informers would say that we stole you away, and get us into trouble, and involve us in a great deal of expense, or perhaps in the loss of all our property, and, it may be, bring some other punishment upon us besides? If you have any fear of that kind, dismiss it. For of course we are bound to run these risks, and still greater risks than these, if necessary, in saving you. So do not, I beg you, refuse to listen to me. e 45

SOCRATES: I am anxious about that, Crito, and about much besides.

CRITO: Then have no fear on that score. There are men who, for no very large sum, are ready to bring you out of prison into safety. And then, you know, these informers are cheaply bought, and there would be no need to spend much upon them. My fortune is at your service, and I think that it is adequate; and if you have any feeling about making use of my money, there are strangers in Athens whom you know, ready to use theirs; and one of them, Simmias of Thebes, has actually brought enough for this very purpose. And Cebes and many others are ready, too. And therefore, I repeat, do not shrink from saving yourself on that ground. And do not let what you said in the court—that if you went into exile you would not know what to do with yourself—stand in your way; for there are many places for you to go to, where you will be welcomed. If you choose to go to Thessaly, I have friends there who will make much of you and protect you from any annoyance from the people of Thessaly. b c

And besides, Socrates, I think that you will be doing what is unjust if you abandon your life when you might preserve it. You are simply playing into your enemies' hands; it is exactly what they wanted—to destroy you. And what is more, to me you seem to be abandoning your children, too. You will leave them to take their chance in

*Homer, *Iliad*, ix, 363.

d life, as far as you are concerned, when you might bring them up and educate them. Most likely their fate will be the usual fate of children who are left orphans. But you ought not to bring children into the world unless you mean to take the trouble of bringing them up and educating them. It seems to me that you are choosing the easy way, and not the way of a good and brave man, as you ought, when you have been talking all your life e long of the value that you set upon human excellence. For my part, I feel ashamed both for you and for us who are your friends. Men will think that the whole thing which has happened to you—your appearance in court to face trial, when you need not have appeared at all; the very way in which the trial was conducted; and then last of all this, the crowning absurdity of the whole affair—is due to our cowardice. It will look as if 46 we had shirked the danger out of miserable cowardice; for we did not save you, and you did not save yourself, when it was quite possible to do so if we had been good for anything at all. Take care, Socrates, lest these things be not evil only, but also dishonorable to you and to us. Reflect, then, or rather the time for reflection is past; we must make up our minds. And there is only one plan possible. Everything must be done tonight. If we delay any longer, we are lost. Socrates, I implore you not to refuse to listen to me.

b SOCRATES: My dear Crito, if your anxiety to save me be right, it is most valuable; but if not, the greater it is the harder it will be to cope with. We must reflect, then, whether we are to do as you say or not; for I am still what I always have been—a man who will accept no argument but that which on reflection I find to be truest. I cannot cast aside my former arguments because this misfortune has come to me. They seem to c me to be as true as ever they were, and I respect and honor the same ones as I used to. And if we have no better argument to substitute for them, I certainly shall not agree to your proposal, not even though the power of the multitude should scare us with fresh terrors, as children are scared with hobgoblins, and inflict upon us new fines and imprisonments, and deaths. What is the most appropriate way of examining the question? Shall we go back first to what you say about opinions, and ask if we used to be d right in thinking that we ought to pay attention to some opinions, and not to others? Were we right in saying so before I was condemned to die, and has it now become apparent that we were talking at random and arguing for the sake of argument, and that it was really nothing but playful nonsense? I am anxious, Crito, to examine our former argument with your help, and to see whether my present circumstance will appear to me to have affected its truth in any way or not; and whether we are to set it aside, or to yield assent to it. Those of us who thought at all seriously always used to say, I think, exactly e what I said just now, namely, that we ought to respect some of the opinions which men form, and not others. Tell me, Crito, I beg you, do you not think that they were right? 47 For you in all probability will not have to die tomorrow, and your judgment will not be biased by that circumstance. Reflect, then, do you not think it reasonable to say that we should not respect all the opinions of men but only some, nor the opinions of all men but only of some men? What do you think? Is not this true?

CRITO: It is.

SOCRATES: And we should respect the good opinions, and not the worthless ones?

CRITO: Yes.

SOCRATES: But the good opinions are those of the wise, and the worthless ones those of the foolish?

CRITO: Of course.

b SOCRATES: And what did we say about this? Does a man who is in training, and who is serious about it, pay attention to the praise and blame and opinion of all men, or only of the one man who is a doctor or a trainer?

CRITO: He pays attention only to the opinion of the one man.

SOCRATES: Then he ought to fear the blame and welcome the praise of this one man, not of the multitude?

CRITO: Clearly.

SOCRATES: Then he must act and exercise, and eat and drink in whatever way the one man who is his director, and who understands the matter, tells him; not as others tell him?

CRITO: That is so.

SOCRATES: Good. But if he disobeys this one man, and disregards his opinion and his praise, and respects instead what the many say, who understand nothing of the matter, will he not suffer for it? c

CRITO: Of course he will.

SOCRATES: And how will he suffer? In what way and in what part of himself?

CRITO: Of course in his body. That is disabled.

SOCRATES: You are right. And, Crito, to be brief, is it not the same in everything? And, therefore, in questions of justice and injustice, and of the base and the honorable, and of good and evil, which we are now examining, ought we to follow the opinion of the many and fear that, or the opinion of the one man who understands these matters (if we can find him), and feel more shame and fear before him than before all other men? For if we do not follow him, we shall corrupt and maim that part of us which, we used to say, is improved by justice and disabled by injustice. Or is this not so? d

CRITO: No, Socrates, I agree with you.

SOCRATES: Now, if, by listening to the opinions of those who do not understand, we disable that part of us which is improved by health and corrupted by disease, is our life worth living when it is corrupt? It is the body, is it not? e

CRITO: Yes.

SOCRATES: Is life worth living with the body corrupted and crippled?

CRITO: No, certainly not.

SOCRATES: Then is life worth living when that part of us which is maimed by injustice and benefited by justice is corrupt? Or do we consider that part of us, whatever it is, which has to do with justice and injustice to be of less consequence than our body? 48

CRITO: No, certainly not.

SOCRATES: But more valuable?

CRITO: Yes, much more so.

SOCRATES: Then, my good friend, we must not think so much of what the many will say of us; we must think of what the one man who understands justice and injustice, and of what truth herself will say of us. And so you are mistaken, to begin with, when you invite us to regard the opinion of the multitude concerning the just and the honorable and the good, and their opposites. But, it may be said, the multitude can put us to death?

CRITO: Yes, that is evident. That may be said, Socrates. b

SOCRATES: True. But, my good friend, to me it appears that the conclusion which we have just reached is the same as our conclusion of former times. Now consider whether we still hold to the belief that we should set the highest value, not on living, but on living well?

CRITO: Yes, we do.

SOCRATES: And living well and honorably and justly mean the same thing: do we hold to that or not?

CRITO: We do.

SOCRATES: Then, starting from these premises, we have to consider whether it is just or not for me to try to escape from prison, without the consent of the Athenians. If we find c

that it is just, we will try; if not, we will give up the idea. I am afraid that considerations of expense, and of reputation, and of bringing up my children, of which you talk, Crito, are only the opinions of the many, who casually put men to death, and who would, if they could, as casually bring them to life again, without a thought. But reason, which is our guide, shows us that we can have nothing to consider but the question which I asked just now—namely, shall we be acting justly if we give money and thanks to the men who are
 d to aid me in escaping, and if we ourselves take our respective parts in my escape? Or shall we in truth be acting unjustly if we do all this? And if we find that we should be acting unjustly, then we must not take any account either of death, or of any other evil that may be the consequence of remaining here, where we are, but only of acting unjustly.

CRITO: I think that you are right, Socrates. But what are we to do?

SOCRATES: Let us examine this question together, my friend, and if you can contradict anything that I say, do so, and I shall be persuaded. But if you cannot, do not go on repeating to me any longer, my dear friend, that I should escape without the consent of the Athenians. I am very anxious to act with your approval and consent. I do not want
 e you to think me mistaken. But now tell me if you agree with the premise from which
 49 I start, and try to answer my questions as you think best.

CRITO: I will try.

SOCRATES: Ought we never to act unjustly voluntarily? Or may we act unjustly in some ways, and not in others? Is it the case, as we have often agreed in former times, that it is never either good or honorable to act unjustly? Or have all our former conclusions been overturned in these few days; and did we at our age fail to recognize all
 b along, when we were seriously conversing with each other, that we were no better than children? Is not what we used to say most certainly the truth, whether the multitude agrees with us or not? Is not acting unjustly evil and shameful in every case, whether we incur a heavier or a lighter punishment as the consequence? Do we believe that?

CRITO: We do.

SOCRATES: Then we ought never to act unjustly?

CRITO: Certainly not.

SOCRATES: If we ought never to act unjustly at all, ought we to repay injustice with injustice, as the multitude thinks we may?

c CRITO: Clearly not.

SOCRATES: Well, then, Crito, ought we to do evil to anyone?

CRITO: Certainly I think not, Socrates.

SOCRATES: And is it just to repay evil with evil, as the multitude thinks, or unjust?

CRITO: Certainly it is unjust.

SOCRATES: For there is no difference, is there, between doing evil to a man and acting unjustly?

CRITO: True.

SOCRATES: Then we ought not to repay injustice with injustice or to do harm to
 d any man, no matter what we may have suffered from him. And in conceding this, Crito, be careful that you do not concede more than you mean. For I know that only a few men hold, or ever will hold, this opinion. And so those who hold it and those who do not have no common ground of argument; they can of necessity only look with contempt on each other's belief. Do you therefore consider very carefully whether or not you agree with me and share my opinion. Are we to start in our inquiry from the premise that it is never right either to act unjustly, or to repay injustice with injustice, or to avenge ourselves on any man who harms us, by harming him in return? Or do you disagree with
 e me and dissent from my premise? I myself have believed in it for a long time, and

I believe in it still. But if you differ in any way, explain to me how. If you still hold to our former opinion, listen to my next point.

CRITO: Yes, I hold to it, and I agree with you. Go on.

SOCRATES: Then, my next point, or rather my next question, is this: Ought a man to carry out his just agreements, or may he shuffle out of them?

CRITO: He ought to carry them out.

SOCRATES: Then consider. If I escape without the state's consent, shall I be injuring those whom I ought least to injure, or not? Shall I be abiding by my just agreements or not? 50

CRITO: I cannot answer your question, Socrates. I do not understand it.

SOCRATES: Consider it in this way. Suppose the laws and the commonwealth were to come and appear to me as I was preparing to run away (if that is the right phrase to describe my escape) and were to ask, "Tell us, Socrates, what have you in your mind to do? What do you mean by trying to escape but to destroy us, the laws and the whole state, so far as you are able? Do you think that a state can exist and not be overthrown, in which the decisions of law are of no force, and are disregarded and undermined by private individuals?" How shall we answer questions like that, Crito? Much might be said, especially by an orator, in defense of the law which makes judicial decisions supreme. Shall I reply, "But the state has injured me by judging my case unjustly?" Shall we say that? c

CRITO: Certainly we will, Socrates.

SOCRATES: And suppose the laws were to reply, "Was that our agreement? Or was it that you would abide by whatever judgments the state should pronounce?" And if we were surprised by their words, perhaps they would say, "Socrates, don't be surprised by our words, but answer us; you yourself are accustomed to ask questions and to answer them. What complaint have you against us and the state, that you are trying to destroy us? Are we not, first of all, your parents? Through us your father took your mother and brought you into the world. Tell us, have you any fault to find with those of us that are the laws of marriage?" "I have none," I should reply. "Or have you any fault to find with those of us that regulate the raising of the child and the education which you, like others, received? Did we not do well in telling your father to educate you in music and athletics?" "You did," I should say. "Well, then, since you were brought into the world and raised and educated by us, how, in the first place, can you deny that you are our child and our slave, as your fathers were before you? And if this be so, do you think that your rights are on a level with ours? Do you think that you have a right to retaliate if we should try to do anything to you? You had not the same rights that your father had, or that your master would have had if you had been a slave. You had no right to retaliate if they ill-treated you, or to answer them if they scolded you, or to strike them back if they struck you, or to repay them evil with evil in any way. And do you think that you may retaliate in the case of your country and its laws? If we try to destroy you, because we think it just, will you in return do all that you can to destroy us, the laws, and your country, and say that in so doing you are acting justly—you, the man who really thinks so much of excellence? Or are you too wise to see that your country is worthier, more to be revered, more sacred, and held in higher honor both by the gods and by all men of understanding, than your father and your mother and all your other ancestors; and that you ought to reverence it, and to submit to it, and to approach it more humbly when it is angry with you than you would approach your father; and either to do whatever it tells you to do or to persuade it to excuse you; and to obey in silence if it orders you to endure flogging or imprisonment, or if it sends you to battle to be wounded or to die? That is just. You must not give way, nor retreat, nor desert your station. In war, and in the court of justice, and everywhere, you must do whatever your state and your country c

tell you to do, or you must persuade them that their commands are unjust. But it is impious to use violence against your father or your mother; and much more impious to use violence against your country." What answer shall we make, Crito? Shall we say that the laws speak the truth, or not?

CRITO: I think that they do.

SOCRATES: "Then consider, Socrates," perhaps they would say, "if we are right in saying that by attempting to escape you are attempting an injustice. We brought you into the world, we raised you, we educated you, we gave you and every other citizen a share of all the good things we could. Yet we proclaim that if any man of the Athenians is dissatisfied with us, he may take his goods and go away wherever he pleases; we give that privilege to every man who chooses to avail himself of it, so soon as he has reached manhood, and sees us, the laws, and the administration of our state. No one of us stands in his way or forbids him to take his goods and go wherever he likes, whether it be to an Athenian colony or to any foreign country, if he is dissatisfied with us and with the state. But we say that every man of you who remains here, seeing how we administer justice, and how we govern the state in other matters, has agreed, by the very fact of remaining here, to do whatsoever we tell him. And, we say, he who disobeys us acts unjustly on three counts: he disobeys us who are his parents, and he disobeys us who reared him, and he disobeys us after he has agreed to obey us, without persuading us that we are wrong. Yet we did not tell him sternly to do whatever we told him. We offered him an alternative; we gave him his choice either to obey us or to convince us that we were wrong; but he does neither.

"These are the charges, Socrates, to which we say that you will expose yourself if you do what you intend; and you are more exposed to these charges than other Athenians." And if I were to ask, "Why?" they might retort with justice that I have bound myself by the agreement with them more than other Athenians. They would say, "Socrates, we have very strong evidence that you were satisfied with us and with the state. You would not have been content to stay at home in it more than other Athenians unless you had been satisfied with it more than they. You never went away from Athens to the festivals, nor elsewhere except on military service; you never made other journeys like other men; you had no desire to see other states or other laws; you were contented with us and our state; so strongly did you prefer us, and agree to be governed by us. And what is more, you had children in this city, you found it so satisfactory. Besides, if you had wished, you might at your trial have offered to go into exile. At that time you could have done with the state's consent what you are trying now to do without it. But then you gloried in being willing to die. You said that you preferred death to exile. And now you do not honor those words: you do not respect us, the laws, for you are trying to destroy us; and you are acting just as a miserable slave would act, trying to run away, and breaking the contracts and agreement which you made to live as our citizen. First, therefore, answer this question. Are we right, or are we wrong, in saying that you have agreed not in mere words, but in your actions, to live under our government?" What are we to say, Crito? Must we not admit that it is true?

CRITO: We must, Socrates.

SOCRATES: Then they would say, "Are you not breaking your contracts and agreements with us? And you were not led to make them by force or by fraud. You did not have to make up your mind in a hurry. You had seventy years in which you might have gone away if you had been dissatisfied with us, or if the agreement had seemed to you unjust. But you preferred neither Sparta nor Crete, though you are fond of saying that they are well governed, nor any other state, either of the Greeks or the Barbarians. You

went away from Athens less than the lame and the blind and the crippled. Clearly you, 53
far more than other Athenians, were satisfied with the state, and also with us who are its
laws; for who would be satisfied with a state which had no laws? And now will you not
abide by your agreement? If you take our advice, you will, Socrates; then you will not
make yourself ridiculous by going away from Athens.

“Reflect now. What good will you do yourself or your friends by thus trans-
gressing and breaking your agreement? It is tolerably certain that they, on their part, b
will at least run the risk of exile, and of losing their civil rights, or of forfeiting their
property. You yourself might go to one of the neighboring states, to Thebes or to
Megara, for instance—for both of them are well governed—but, Socrates, you will
come as an enemy to these governments, and all who care for their city will look
askance at you, and think that you are a subverter of law. You will confirm the judges c
in their opinion, and make it seem that their verdict was a just one. For a man who is
a subverter of law may well be supposed to be a corrupter of the young and thought-
less. Then will you avoid well-governed states and civilized men? Will life be worth
having, if you do? Will you associate with such men, and converse without shame—
about what, Socrates? About the things which you talk of here? Will you tell them
that excellence and justice and institutions and law are the most valuable things that
men can have? And do you not think that that will be a disgraceful thing for Socrates? d
You ought to think so. But you will leave these places; you will go to the friends of
Crito in Thessaly. For there is found the greatest disorder and license, and very likely

Socrates' Prison, near the Acropolis, Athens. The traditional site of the prison where Socrates was held while awaiting execution. (Forrest E. Baird)

- they will be delighted to hear of the ludicrous way in which you escaped from prison, dressed up in peasant's clothes, or in some other disguise which people put on when they are running away, and with your appearance altered. But will no one say how you, an old man, with probably only a few more years to live, clung so greedily to life
- e that you dared to break the highest laws? Perhaps not, if you do not annoy them. But if you do, Socrates, you will hear much that will make you blush. You will pass your life as the flatterer and the slave of all men; and what will you be doing but feasting in Thessaly?*
- 54 It will be as if you had made a journey to Thessaly for a banquet. And where will be all our old arguments about justice and excellence then? But you wish to live for the sake of your children? You want to bring them up and educate them? What? Will you take them with you to Thessaly, and bring them up and educate them there? Will you make them strangers to their own country, that you may bestow this benefit of exile on them too? Or supposing that you leave them in Athens, will they be brought up and educated better if you are alive, though you are not with them? Yes, your friends will take care of them. Will your friends take care of them if you make a
- b journey to Thessaly, and not if you make a journey to Hades? You ought not to think that, at least if those who call themselves your friends are worth anything at all.

- "No, Socrates, be persuaded by us who have reared you. Think neither of children nor of life, nor of any other thing before justice, so that when you come to the other world you may be able to make your defense before the rulers who sit in judgment there. It is clear that neither you nor any of your friends will be happier, or more just, or more pious in this life, if you do this thing, nor will you be happier after you are dead.
- c Now you will go away a victim of the injustice, not of the laws, but of men. But if you repay evil with evil, and injustice with injustice in this shameful way, and break your agreements and covenants with us, and injure those whom you should least injure, yourself and your friends and your country and us, and so escape, then we shall be angry with you while you live, and when you die our brothers, the laws in Hades, will not receive you kindly; for they will know that on earth you did all that you could to destroy
- d us. Listen then to us, and let not Crito persuade you to do as he says."

Be sure, my dear friend Crito, that this is what I seem to hear, as the worshippers of Cybele seem, in their passion, to hear the music of flutes; and the sound of these arguments rings so loudly in my ears, that I cannot hear any other arguments. And I feel sure that if you try to change my mind you will speak in vain. Nevertheless, if you think that you will succeed, speak.

CRITO: I have nothing more to say, Socrates.

- e SOCRATES: Then let it be, Crito, and let us do as I say, since the god is our guide.

*The Athenians disdained the Thessalians as heavy eaters and drinkers.

 The Servant of the Eleven
 Scene—The Prison of Socrates

[*Socrates is speaking*] . . . My dear Cebes, if all things in which there is any life were to die, and when they were dead were to remain in that form and not come to life again, would not the necessary result be that everything at last would be dead, and nothing alive? For if living things were generated from other sources than death, and were to die, the result is inevitable that all things would be consumed by death. Is it not so? 72^d

It is indeed, I think, Socrates, said Cebes; I think that what you say is perfectly true.

Yes, Cebes, he said, I think it is certainly so. We are not misled into this conclusion. The dead do come to life again, and the living are generated from them, and the souls of the dead exist; and with the souls of the good it is well, and with the souls of the evil it is evil. e

And besides, Socrates, rejoined Cebes, if the doctrine which you are fond of stating, that our learning is only a process of recollection, be true, then I suppose we must have learned at some former time what we recollect now. And that would be impossible unless our souls had existed somewhere before they came into this human form. So that is another reason for believing the soul immortal. 73

But, Cebes, interrupted Simmias, what are the proofs of that? Recall them to me; I am not very clear about them at present.

One argument, answered Cebes, and the strongest of all, is that if you question men about anything in the right way, they will answer you correctly of themselves. But they would not have been able to do that unless they had had within themselves knowledge and right reason. Again, show them such things as geometrical diagrams, and the proof of the doctrine is complete. b

And if that does not convince you, Simmias, said Socrates, look at the matter in another way and see if you agree then. You have doubts, I know, how what is called knowledge can be recollection.

Nay, replied Simmias, I do not doubt. But I want to recollect the argument about recollection. What Cebes undertook to explain has nearly brought your theory back to me and convinced me. But I am nonetheless ready to hear you undertake to explain it.

In this way, he returned. We are agreed, I suppose, that if a man remembers anything, he must have known it at some previous time. c

Certainly, he said.

And are we agreed that when knowledge comes in the following way, it is recollection? When a man has seen or heard anything, or has perceived it by some other sense, and then knows not that thing only, but has also in his mind an impression of some other thing, of which the knowledge is quite different, are we not right in saying that he remembers the thing of which he has an impression in his mind?

What do you mean?

I mean this. The knowledge of a man is different from the knowledge of a lyre, is it not?

Certainly.

And you know that when lovers see a lyre, or a garment, or anything that their favorites are wont to use, they have this feeling. They know the lyre, and in their mind they receive the image of the youth whose the lyre was. That is recollection. For instance, someone seeing Simmias often is reminded of Cebes; and there are endless examples of the same thing.

Indeed there are, said Simmias.

Is not that a kind of recollection, he said; and more especially when a man has this feeling with reference to things which the lapse of time and inattention have made him forget?

Yes, certainly, he replied.

Well, he went on, is it possible to recollect a man on seeing the picture of a horse, or the picture of a lyre? Or to recall Simmias on seeing a picture of Cebes?

Certainly.

And it is possible to recollect Simmias himself on seeing a picture of Simmias?

No doubt, he said.

Then in all these cases there is recollection caused by similar objects, and also by dissimilar objects?

There is.

But when a man has a recollection caused by similar objects, will he not have a further feeling and consider whether the likeness to that which he recollects is defective in any way or not?

He will, he said.

Now see if this is true, he went on. Do we not believe in the existence of equality—not the equality of pieces of wood or of stones, but something beyond that—equality in the abstract? Shall we say that there is such a thing, or not?

Yes indeed, said Simmias, most emphatically we will.

And do we know what this abstract equality is?

Certainly, he replied.

Where did we get the knowledge of it? Was it not from seeing the equal pieces of wood, and stones, and the like, which we were speaking of just now? Did we not form from them the idea of abstract equality, which is different from them? Or do you think that it is not different? Consider the question in this way. Do not equal pieces of wood and stones appear to us sometimes equal and sometimes unequal, though in fact they remain the same all the time?

Certainly they do.

But did absolute equals ever seem to you to be unequal, or abstract equality to be inequality?

No, never, Socrates.

Then equal things, he said, are not the same as abstract equality?

No, certainly not, Socrates.

Yet it was from these equal things, he said, which are different from abstract equality, that you have conceived and got your knowledge of abstract equality?

That is quite true, he replied.

And that whether it is like them or unlike them?

Certainly.

But that makes no difference, he said. As long as the sight of one thing brings another thing to your mind, there must be recollection, whether or no the two things are like. d

That is so.

Well then, said he, do the equal pieces of wood, and other similar equal things, of which we have been speaking, affect us at all this way? Do they seem to us to be equal, in the way that abstract equality is equal? Do they come short of being like abstract equality, or not?

Indeed, they come very short of it, he replied.

Are we agreed about this? A man sees something and thinks to himself, "This thing that I see aims at being like some other thing, but it comes short and cannot be like that other thing; it is inferior"; must not the man who thinks that have known at some previous time that other thing, which he says that it resembles, and to which it is inferior? e

He must.

Well, have we ourselves had the same sort of feeling with reference to equal things, and to abstract equality?

Yes, certainly.

Then we must have had knowledge of equality before we first saw equal things, and perceived that they all strive to be like equality, and all come short of it. 73

That is so.

And we are agreed also that we have not, nor could we have, obtained the idea of equality except from sight or touch or some other sense; the same is true of all the senses.

Yes, Socrates, for the purposes of the argument that is so.

At any rate, it is by the senses that we must perceive that all sensible objects strive to resemble absolute equality, and are inferior to it. Is not that so? b

Yes.

Then before we began to see, and to hear, and to use the other senses, we must have received the knowledge of the nature of abstract and real equality; otherwise we could not have compared equal sensible objects with abstract equality, and seen that the former in all cases strive to be like the latter, though they are always inferior to it?

That is the necessary consequence of what we have been saying, Socrates.

Did we not see, and hear, and possess the other senses as soon as we were born?

Yes, certainly.

And we must have received the knowledge of abstract equality before we had these senses? c

Yes.

Then, it seems, we must have received that knowledge before we were born?

It does.

Now if we received this knowledge before our birth, and were born with it, we knew, both before and at the moment of our birth, not only the equal, and the greater, and the less, but also everything of the same kind, did we not? Our present reasoning does not refer only to equality. It refers just as much to absolute good, and absolute d

beauty, and absolute justice, and absolute holiness; in short, I repeat, to everything which we mark with the name of the real, in the questions and answers of our dialectic. So we must have received our knowledge of all realities before we were born.

That is so.

And we must always be born with this knowledge, and must always retain it throughout life, if we have not each time forgotten it, after having received it. For to know means to receive and retain knowledge, and not to have lost it. Do not we mean by forgetting, the loss of knowledge, Simmias?

e Yes, certainly, Socrates, he said.

But, I suppose, if it be the case that we lost at birth the knowledge which we received before we were born, and then afterward, by using our senses on the objects of sense, recovered the knowledge which we had previously possessed, then what we call learning is the recovering of knowledge which is already ours. And are we not right in calling that recollection?

Certainly.

76 For we have found it possible to perceive a thing by sight, or hearing, or any other sense, and thence to form a notion of some other thing, like or unlike, which had been forgotten, but with which this thing was associated. And therefore, I say, one of two things must be true. Either we are all born with this knowledge and retain it all our life; or, after birth, those whom we say are learning are only recollecting, and our knowledge is recollection.

Yes indeed, that is undoubtedly true, Socrates.

b Then which do you choose, Simmias? Are we born with knowledge or do we recollect the things of which we have received knowledge before our birth?

I cannot say at present, Socrates.

Well, have you an opinion about this question? Can a man who knows give an account of what he knows, or not? What do you think about that?

Yes, of course he can, Socrates.

And do you think that everyone can give an account of the ideas of which we have been speaking?

I wish I did, indeed, said Simmias, but I am very much afraid that by this time tomorrow there will no longer be any man living able to do so as it should be done.

c Then, Simmias, he said, you do not think that all men know these things?

Certainly not.

Then they recollect what they once learned?

Necessarily.

And when did our souls gain this knowledge? It cannot have been after we were born men.

No, certainly not.

Then it was before?

Yes.

Then, Simmias, our souls existed formerly, apart from our bodies, and possessed intelligence before they came into man's shape.

Unless we receive this knowledge at the moment of birth, Socrates. That time still remains.

d Well, my friend, and at what other time do we lose it? We agreed just now that we are not born with it; do we lose it at the same moment that we gain it, or can you suggest any other time?

I cannot, Socrates. I did not see that I was talking nonsense.

Then, Simmias, he said, is not this the truth? If, as we are forever repeating, beauty, and good, and the other ideas really exist, and if we refer all the objects of sensible perception to these ideas which were formerly ours, and which we find to be ours still, and compare sensible objects with them, then, just as they exist, our souls must have existed before ever we were born. But if they do not exist, then our reasoning will have been thrown away. Is it so? If these ideas exist, does it not at once follow that our souls must have existed before we were born, and if they do not exist, then neither did our souls? e

Admirably put, Socrates, said Simmias. I think that the necessity is the same for the one as for the other. The reasoning has reached a place of safety in the common proof of the existence of our souls before we were born and of the existence of the ideas of which you spoke. Nothing is so evident to me as that beauty, and good, and the other ideas which you spoke of just now have a very real existence indeed. Your proof is quite sufficient for me. 77

But what of Cebes? said Socrates. I must convince Cebes too.

I think that he is satisfied, said Simmias, though he is the most skeptical of men in argument. But I think that he is perfectly convinced that our souls existed before we were born.

But I do not think myself, Socrates, he continued, that you have proved that the soul will continue to exist when we are dead. The common fear which Cebes spoke of, that she [the soul] may be scattered to the winds at death, and that death may be the end of her existence, still stands in the way. Assuming that the soul is generated and comes together from some other elements, and exists before she ever enters the human body, why should she not come to an end and be destroyed, after she has entered into the body, when she is released from it? b

You are right, Simmias, said Cebes. I think that only half the required proof has been given. It has been shown that our souls existed before we were born; but it must also be shown that our souls will continue to exist after we are dead, no less than that they existed before we were born, if the proof is to be complete. c

That has been shown already, Simmias and Cebes, said Socrates, if you will combine this reasoning with our previous conclusion, that all life is generated from death. For if the soul exists in a previous state and if, when she comes into life and is born, she can only be born from death, and from a state of death, must she not exist after death too, since she has to be born again? So the point which you speak of has been already proved. d

Still I think that you and Simmias would be glad to discuss this question further. Like children, you are afraid that the wind will really blow the soul away and disperse her when she leaves the body, especially if a man happens to die in a storm and not in a calm. e

Cebes laughed and said, Try and convince us as if we were afraid, Socrates; or rather, do not think that we are afraid ourselves. Perhaps there is a child within us who has these fears. Let us try and persuade him not to be afraid of death, as if it were a bugbear.

You must charm him every day, until you have charmed him away, said Socrates.

And where shall we find a good charmer, Socrates, he asked, now that you are leaving us? 78

Hellas is a large country, Cebes, he replied, and good men may doubtless be found in it; and the nations of the Barbarians are many. You must search them all through for such a charmer, sparing neither money nor labor; for there is nothing on which you could spend money more profitably. And you must search for him among yourselves too, for you will hardly find a better charmer than yourselves.

That shall be done, said Cebes. But let us return to the point where we left off, if you will. b

Yes, I will: why not?

Very good, he replied.

Well, said Socrates, must we not ask ourselves this question? What kind of thing is liable to suffer dispersion, and for what kind of thing have we to fear dispersion? And then we must see whether the soul belongs to that kind or not, and be confident or afraid about our own souls accordingly.

That is true, he answered.

- c Now is it not the compound and composite which is naturally liable to be dissolved in the same way in which it was compounded? And is not what is uncompounded alone not liable to dissolution, if anything is not?

I think that that is so, said Cebes.

And what always remains in the same state and unchanging is most likely to be uncompounded, and what is always changing and never the same is most likely to be compounded, I suppose?

Yes, I think so.

Now let us return to what we were speaking of before in the discussion, he said.

- d Does the being, which in our dialectic we define as meaning absolute existence, remain always in exactly the same state, or does it change? Do absolute equality, absolute beauty, and every other absolute existence, admit of any change at all? Or does absolute existence in each case, being essentially uniform, remain the same and unchanging, and never in any case admit of any sort or kind of change whatsoever?

It must remain the same and unchanging, Socrates, said Cebes.

And what of the many beautiful things, such as men, and horses, and garments, and the like, and of all which bears the names of the ideas, whether equal, or beautiful, or anything else? Do they remain the same or is it exactly the opposite with them? In short, do they never remain the same at all, either in themselves or in their relations?

- e These things, said Cebes, never remain the same.

- 79 You can touch them, and see them, and perceive them with the other senses, while you can grasp the unchanging only by the reasoning of the intellect. These latter are invisible and not seen. Is it not so?

That is perfectly true, he said.

Let us assume then, he said, if you will, that there are two kinds of existence, the one visible, the other invisible.

Yes, he said.

And the invisible is unchanging, while the visible is always changing.

Yes, he said again.

- b Are not we men made up of body and soul?

There is nothing else, he replied.

And which of these kinds of existence should we say that the body is most like, and most akin to?

The visible, he replied; that is quite obvious.

And the soul? Is that visible or invisible?

It is invisible to man, Socrates, he said.

But we mean by visible and invisible, visible and invisible to man; do we not?

Yes; that is what we mean.

Then what do we say of the soul? Is it visible or not visible?

It is not visible.

Then is it invisible?

Yes.

Then the soul is more like the invisible than the body; and the body is like the visible. That is necessarily so, Socrates. c

Have we not also said that, when the soul employs the body in any inquiry, and makes use of sight, or hearing, or any other sense—for inquiry with the body means inquiry with the senses—she is dragged away by it to the things which never remain the same, and wanders about blindly, and becomes confused and dizzy, like a drunken man, from dealing with things that are ever changing?

Certainly.

But when she investigates any question by herself, she goes away to the pure, and eternal, and immortal, and unchangeable, to which she is akin, and so she comes to be ever with it, as soon as she is by herself, and can be so; and then she rests from her wanderings and dwells with it unchangingly, for she is dealing with what is unchanging. And is not this state of the soul called wisdom? d

Indeed, Socrates, you speak well and truly, he replied.

Which kind of existence do you think from our former and our present arguments e that the soul is more like and more akin to?

I think, Socrates, he replied, that after this inquiry the very dullest man would agree that the soul is infinitely more like the unchangeable than the changeable.

And the body?

That is like the changeable.

Consider the matter in yet another way. When the soul and the body are united, nature ordains the one to be a slave and to be ruled, and the other to be master and to rule. Tell me once again, which do you think is like the divine, and which is like the mortal? Do you not think that the divine naturally rules and has authority, and that the mortal naturally is ruled and is a slave? 80

I do.

Then which is the soul like?

That is quite plain, Socrates. The soul is like the divine, and the body is like the mortal.

Now tell me, Cebes, is the result of all that we have said that the soul is most like the divine, and the immortal, and the intelligible, and the uniform, and the indissoluble, b and the unchangeable; while the body is most like the human, and the mortal, and the unintelligible, and the multiform, and the dissoluble, and the changeable? Have we any other argument to show that this is not so, my dear Cebes?

We have not.

Then if this is so, is it not the nature of the body to be dissolved quickly, and of the soul to be wholly or very nearly indissoluble?

Certainly. c

You observe, he said, that after a man is dead, the visible part of him, his body, which lies in the visible world and which we call the corpse, which is subject to dissolution and decomposition, is not dissolved and decomposed at once? It remains as it was for a considerable time, and even for a long time, if a man dies with his body in good condition and in the vigor of life. And when the body falls in and is embalmed, like the mummies of Egypt, it remains nearly entire for an immense time. And should it d decay, yet some parts of it, such as the bones and muscles, may almost be said to be immortal. Is it not so?

Yes.

And shall we believe that the soul, which is invisible, and which goes hence to a place that is like herself, glorious, and pure, and invisible, to Hades, which is rightly

called the unseen world, to dwell with the good and wise God, whither, if it be the will of God, my soul too must shortly go—shall we believe that the soul, whose nature is so glorious, and pure, and invisible, is blown away by the winds and perishes as soon as she leaves the body, as the world says? Nay, dear Cebes and Simmias, it is not so. I will tell you what happens to a soul which is pure at her departure, and which in her life has had no intercourse that she could avoid with the body, and so draws after her, when she dies, no taint of the body, but has shunned it, and gathered herself into herself, for such has been her constant study—and that only means that she has loved wisdom rightly, and has truly practiced how to die. Is not this the practice of death?

Yes, certainly.

Does not the soul, then, which is in that state, go away to the invisible that is like herself, and to the divine, and the immortal, and the wise, where she is released from error, and folly, and fear, and fierce passions, and all the other evils that fall to the lot of men, and is happy, and for the rest of time lives in very truth with the gods, as they say that the initiated do? Shall we affirm this, Cebes?

Yes, certainly, said Cebes.

But if she be defiled and impure when she leaves the body, from being ever with it, and serving it and loving it, and from being besotted by it and by its desires and pleasures, so that she thinks nothing true but what is bodily and can be touched, and seen, and eaten, and drunk, and used for men's lusts; if she has learned to hate, and tremble at, and fly from what is dark and invisible to the eye, and intelligible and apprehended by philosophy—do you think that a soul which is in that state will be pure and without alloy at her departure?

No, indeed, he replied.

She is penetrated, I suppose, by the corporeal, which the unceasing intercourse and company and care of the body has made a part of her nature.

Yes.

And, my dear friend, the corporeal must be burdensome, and heavy, and earthy, and visible; and it is by this that such a soul is weighed down and dragged back to the visible world, because she is afraid of the invisible world of Hades, and haunts, it is said, the graves and tombs, where shadowy forms of souls have been seen, which are the phantoms of souls which were impure at their release and still cling to the visible; which is the reason why they are seen.

That is likely enough, Socrates.

That is likely, certainly, Cebes; and these are not the souls of the good, but of the evil, which are compelled to wander in such places as a punishment for the wicked lives that they have lived; and their wanderings continue until, from the desire for the corporeal that clings to them, they are again imprisoned in a body.

And, he continued, they are imprisoned, probably, in the bodies of animals with habits similar to the habits which were theirs in their lifetime.

What do you mean by that, Socrates?

I mean that men who have practiced unbridled gluttony, and wantonness, and drunkenness probably enter the bodies of asses and suchlike animals. Do you not think so?

Certainly that is very likely.

And those who have chosen injustice, and tyranny, and robbery enter the bodies of wolves, and hawks, and kites. Where else should we say that such souls go?

No doubt, said Cebes, they go into such animals.

In short, it is quite plain, he said, whither each soul goes; each enters an animal with habits like its own.

Certainly, he replied, that is so.

And of these, he said, the happiest, who go to the best place, are those who have practiced the popular and social virtues which are called temperance and justice, and which come from habit and practice, without philosophy or reason. b

And why are they the happiest?

Because it is probable that they return into a mild and social nature like their own, such as that of bees, or wasps, or ants; or, it may be, into the bodies of men, and that from them are made worthy citizens.

Very likely.

But none but the philosopher or the lover of knowledge, who is wholly pure when he goes hence, is permitted to go to the race of the gods; and therefore, my friends, Simmias and Cebes, the true philosopher is temperate and refrains from all the pleasures of the body, and does not give himself up to them. It is not squandering his substance and poverty that he fears, as the multitude and the lovers of wealth do; nor again does he dread the dishonor and disgrace of wickedness, like the lovers of power and honor. It is not for these reasons that he is temperate. c

No, it would be unseemly in him if he were, Socrates, said Cebes.

Indeed it would, he replied, and therefore all those who have any care for their souls, and who do not spend their lives in forming and molding their bodies, bid farewell to such persons, and do not walk in their ways, thinking that they know not whither they are going. They themselves turn and follow whithersoever philosophy leads them, for they believe that they ought not to resist philosophy, or its deliverance and purification. d

How, Socrates?

I will tell you, he replied. The lovers of knowledge know that when philosophy receives the soul, she is fast bound in the body, and fastened to it; she is unable to contemplate what is, by herself, or except through the bars of her prison house, the body; and she is wallowing in utter ignorance. And philosophy sees that the dreadful thing about the imprisonment is that it is caused by lust, and that the captive herself is an accomplice in her own captivity. The lovers of knowledge, I repeat, know that philosophy takes the soul when she is in this condition, and gently encourages her, and strives to release her from her captivity, showing her that the perceptions of the eye, and the ear, and the other senses are full of deceit, and persuading her to stand aloof from the senses and to use them only when she must, and exhorting her to rally and gather herself together, and to trust only to herself and to the real existence which she of her own self apprehends, and to believe that nothing which is subject to change, and which she perceives by other faculties, has any truth, for such things are visible and sensible, while what she herself sees is apprehended by reason and invisible. The soul of the true philosopher thinks that it would be wrong to resist this deliverance from captivity, and therefore she holds aloof, so far as she can, from pleasure, and desire, and pain, and fear; for she reckons that when a man has vehement pleasure, or fear, or pain, or desire, he suffers from them not merely the evils which might be expected, such as sickness or some loss arising from the indulgence of his desires; he suffers what is the greatest and last of evils, and does not take it into account. e
83
b

What do you mean, Socrates? asked Cebes. c

I mean that when the soul of any man feels vehement pleasure or pain, she is forced at the same time to think that the object, whatever it be, of these sensations is the most distinct and truest, when it is not.

114e . . . A man should be of good cheer about his soul if in his life he has renounced the pleasures and adornments of the body, because they were nothing to him, and because he thought that they would do him not good but harm; and if he has instead earnestly
 115 pursued the pleasures of learning, and adorned his soul with the adornment of temperance, and justice, and courage, and freedom, and truth, which belongs to her and is her own, and so awaits his journey to the other world, in readiness to set forth whenever fate calls him. You, Simmias and Cebes, and the rest will set forth at some future day, each at his own time. But me now, as a tragic poet would say, fate calls at once; and it is time for me to betake myself to the bath. I think that I had better bathe before I drink the poison, and not give the women the trouble of washing my dead body.

b When he had finished speaking Crito said, Be it so, Socrates. But have you any commands for your friends or for me about your children, or about other things? How shall we serve you best?

Simply by doing what I always tell you, Crito. Take care of your own selves, and you will serve me and mine and yourselves in all that you do, even though you make no promises now. But if you are careless of your own selves, and will not follow the path of life which we have pointed out in our discussions both today and at other times, all
 c your promises now, however profuse and earnest they are, will be of no avail.

We will do our best, said Crito. But how shall we bury you?

As you please, he answered; only you must catch me first and not let me escape you. And then he looked at us with a smile and said, My friends, I cannot convince Crito
 d that I am the Socrates who has been conversing with you and arranging his arguments in order. He thinks that I am the body which he will presently see a corpse, and he asks how he is to bury me. All the arguments which I have used to prove that I shall not remain with you after I have drunk the poison, but that I shall go away to the happiness of the blessed, with which I tried to comfort you and myself, have been thrown away on him. Do you therefore be my sureties to him, as he was my surety at the trial, but in a different way. He was surety for me then that I would remain; but you must be my
 e sureties to him that I shall go away when I am dead, and not remain with you; then he will feel my death less; and when he sees my body being burned or buried, he will not be grieved because he thinks that I am suffering dreadful things; and at my funeral he will not say that it is Socrates whom he is laying out, or bearing to the grave, or burying. For, dear Crito, he continued, you must know that to use words wrongly is not only a fault in itself, it also creates evil in the soul. You must be of good cheer, and say that you
 116 are burying my body; and you may bury it as you please and as you think right.

With these words he rose and went into another room to bathe. Crito went with him and told us to wait. So we waited, talking of the argument and discussing it, and then again dwelling on the greatness of the calamity which had fallen upon us: it seemed as if
 b we were going to lose a father and to be orphans for the rest of our lives. When he had bathed, and his children had been brought to him—he had two sons quite little, and one grown up—and the women of his family were come, he spoke with them in Crito's presence, and gave them his last instructions; then he sent the women and children away and returned to us. By that time it was near the hour of sunset, for he had been a long while within. When he came back to us from the bath he sat down, but not much was said after
 c that. Presently the servant of the Eleven came and stood before him and said, "I know that I shall not find you unreasonable like other men, Socrates. They are angry with me and curse me when I bid them drink the poison because the authorities make me do it. But I have found you all along the noblest and gentlest and best man that has ever come
 d here; and now I am sure that you will not be angry with me, but with those who you

know are to blame. And so farewell, and try to bear what must be as lightly as you can; you know why I have come." With that he turned away weeping, and went out.

Socrates looked up at him and replied, Farewell, I will do as you say. Then he turned to us and said, How courteous the man is! And the whole time that I have been here, he has constantly come in to see me, and sometimes he has talked to me, and has been the best of men; and now, how generously he weeps for me! Come, Crito, let us obey him; let the poison be brought if it is ready, and if it is not ready, let it be prepared.

Crito replied: But, Socrates, I think that the sun is still upon the hills; it has not set. Besides, I know that other men take the poison quite late, and eat and drink heartily, and even enjoy the company of their chosen friends, after the announcement has been made. So do not hurry; there is still time. e

Socrates replied: And those whom you speak of, Crito, naturally do so, for they think that they will be gainers by so doing. And I naturally shall not do so, for I think that I should gain nothing by drinking the poison a little later, but my own contempt for so greedily saving a life which is already spent. So do not refuse to do as I say. 117

Then Crito made a sign to his slave who was standing by; and the slave went out, and after some delay returned with the man who was to give the poison, carrying it prepared in a cup. When Socrates saw him, he asked, You understand these things, my good man, what have I to do?

You have only to drink this, he replied, and to walk about until your legs feel heavy, and then lie down; and it will act of itself. b

With that he handed the cup to Socrates, who took it quite cheerfully, Echecrates, without trembling, and without any change of color or of feature, and looked up at the

man with that fixed glance of his, and asked, What say you to making a libation from this draught? May I, or not?

c We only prepare so much as we think sufficient, Socrates, he answered.

I understand, said Socrates. But I suppose that I may, and must, pray to the gods that my journey hence may be prosperous. That is my prayer; may it be so. With these words he put the cup to his lips and drank the poison quite calmly and cheerfully.

Till then most of us had been able to control our grief fairly well; but when we saw him drinking and then the poison finished, we could do so no longer: my tears came fast in spite of myself, and I covered my face and wept for myself; it was not for him,
d but at my own misfortune in losing such a friend. Even before that Crito had been unable to restrain his tears, and had gone away; and Apollodorus, who had never once ceased weeping the whole time, burst into a loud wail and made us one and all break down by his sobbing, except Socrates himself.

e What are you doing, my friends? he exclaimed. I sent away the women chiefly in order that they might not behave in this way; for I have heard that a man should die in silence. So calm yourselves and bear up.

When we heard that, we were ashamed, and we ceased from weeping. But he walked about, until he said that his legs were getting heavy, and then he lay down on his back, as he was told. And the man who gave the poison began to examine his feet and legs from time to time. Then he pressed his foot hard and asked if there was any feeling
118 in it, and Socrates said, No; and then his legs, and so higher and higher, and showed us that he was cold and stiff. And Socrates felt himself and said that when it came to his heart, he should be gone. He was already growing cold about the groin, when he uncovered his face, which had been covered, and spoke for the last time. Crito, he said, I owe a cock to Asclepius; do not forget to pay it.*

It shall be done, replied Crito. Is there anything else that you wish? He made no answer to this question; but after a short interval there was a movement, and the man uncovered him, and his eyes were fixed. Then Crito closed his mouth and his eyes.

Such was the end, Echecrates, of our friend, a man, I think, who was the wisest and justest, and the best man I have ever known.

*[Asclepius was the Greek god of healing. When one recovered from an illness it was customary to offer a cock as a sacrifice, so Socrates' last words imply that death is a kind of healing. See, for instance 66b ff., 67c.]

BOOK I

* * *

[SOCRATES:] And when Thrasymachus many times, even while we were in the middle of our conversation, was making motions to take over the argument, he was prevented by those sitting by him, who wanted to hear the argument out. But when we paused as I said this, he could no longer keep still, but having gathered himself to spring like a wild animal, he launched himself at us as if to tear us to pieces. Both I and Polemarchus were quaking in fear, and he, snarling into our midst, said: “What drivels are you people full of now, Socrates? And why do you act like idiots kowtowing to each other? But if you truly want to know what’s just, don’t merely ask and then, as befits someone with a passion for honor, cross-examine whenever anybody answers, knowing that it’s easier to ask than to answer, but also answer yourself and tell what you claim the just thing is. And don’t give me any of that about how it’s the needful or the beneficial or the profitable or the gainful or the advantageous, but tell me clearly and precisely what you mean, since I won’t stand for it if you talk in such empty words.”

*The only speaker in the dialogue is Socrates. He begins recounting a conversation he had on the occasion of a foreign religious festival that took place just outside Athens. Between the day and night portions of the festivities, a group of young men latches on to Socrates, who could be expected to provide entertaining talk. Polemarchus takes the group to his house, where they meet his father Cephalus, a very old man preoccupied with making amends before his death for any injustices in his life. Socrates asks him what he understands justice to be and begins to examine the implications of his answer. [We pick up the conversation as Thrasymachus, a well-known sophist, breaks in to the conversation.]

Plato, *Republic* (Book I, 336b–342e, 347b–e; Book II, 357a–362c, 368a–376e; Book III, 412b–417b; Book IV, 427c–445e; Book V, 449–462e, 473b–e; Book VI–VII, 502c–521b), translated by Joe Sachs (Newburyport, MA: Focus Philosophical Library, 2007). Reprinted by permission of Focus Publishing/R Pullins Company.

And I was flabbergasted when I heard this, and was afraid as I looked at him, and it seemed to me that if I had not seen him before he saw me I would have been struck dumb.* But as it was, just as he was beginning to be driven wild by the argument I looked at him first, and so I was able to answer him, and said, trembling a little, “Don’t be rough on us, Thrasymachus. If we’re mistaken in any point in the examination of the argument, I and this fellow here, you can be assured that we’re going astray unwillingly. For don’t even imagine, when, if we were looking for gold, we wouldn’t be willing to kowtow to each other in the search and ruin our chances of finding it, that when we’re looking for justice, a thing more valuable than much gold, we’d be so senseless as to defer to each other and not be as serious as possible about bringing it to light. Don’t so much as imagine that, friend. But I imagine we don’t have the power to find it. So it’s much more fitting anyway for us to be pitied by you clever people instead of being roughed up.”

And hearing this, he burst out laughing with great scorn and said “Oh Heracles, this is that routine irony of Socrates. I knew about this, and I kept telling these people before that you wouldn’t be willing to answer, but you’d be ironic and do everything else but answer if anyone asked you anything.”

“That’s because you’re wise, Thrasymachus,” I said, “so you know very well that if you asked anyone how much twelve is, and in asking demanded of him in advance, ‘don’t give me any of that, fellow, about how twelve is two times six or three times four or six times two or four times three, since I won’t stand for such drivel from you,’ it was clear to you, I imagine, that no one could answer someone who interrogated him that way. But if he said to you, ‘Thrasymachus, how do you mean it? That I must give none of the answers you prohibited in advance? Not even, you strange fellow, if it happens to be one of these, but instead I have to say something other than the truth? Or how do you mean it?’ What would you say to him about that?”

“Oh sure,” he said, “as if this was like that.”

“Nothing prevents it,” I said. “But then even if it isn’t like it, but appears to be to someone who is asked such a question, do you imagine he’ll any the less answer the question the way it appears to him, whether we forbid it or not?”

“So what else,” he said; “are you going to do the same thing? Are you going to give any of those answers I banned?” “I wouldn’t be surprised,” I said, “if it seemed that way to me when I had examined it.”

“Then what if I show you a different answer about justice,” he said, “beyond all these, better than they are? What penalty would you think you deserve to suffer?”

“What other penalty,” I said, “than the one it’s fitting for someone who doesn’t have knowledge to suffer? And it’s fitting, no doubt, for him to learn from someone who has knowledge. So I think I too deserve to suffer this penalty.”

“You’re amusing,” he said, “but in addition to learning, pay a penalty in money too.”

“Okay, whenever I get any,” I said.

“He’s got it,” said Glaucon. “So as far as money’s concerned, Thrasymachus, speak up, since all of us will chip in for Socrates.”

“I imagine you will,” he said, “so Socrates can go on with his usual routine: he won’t answer but when somebody else answers he’ll grab hold of his statement and cross-examine him.”

“Most skillful one,” I said, “how could anyone give an answer who in the first place doesn’t know and doesn’t claim to know, and then too, even if he supposes something

*[A popular superstition, that if a wolf sees you first, you become dumb.]

about these things, would be banned from saying what he believes by no inconsiderable man? So it's more like it for you to speak, since you do claim to know and to have something to say. So don't do anything else but gratify me by answering, and don't be grudging about teaching Glaucon here as well as the others." 338a

And when I'd said these things, Glaucon and the others kept begging him not to do otherwise. And Thrasymachus was obviously longing to speak in order to be well thought of, believing that he had an answer of overwhelming beauty. But he made a pretense of battling eagerly for me to be the one that answered. But making an end of this, he gave way, and then said, "This is the wisdom of Socrates; he himself is not willing to teach, but he goes around learning from others and doesn't even pay them any gratitude." b

"In saying that I learn from others," I said, "you tell the truth, Thrasymachus, but when you claim that I don't pay for it in full with gratitude, you lie, for I pay all that is in my power. I have the power only to show appreciation, since I don't have money. And how eagerly I do this, if anyone seems to me to speak well, you'll know very well right away when you answer, for I imagine you'll speak well." c

"Then listen," he said. "I assert that what's just is nothing other than what's advantageous to the stronger. So why don't you show appreciation? But you won't be willing to."

"First I need to understand what you mean," I said, "since now I don't yet know. You claim that what's advantageous to the stronger is just. Now whatever do you mean by this, Thrasymachus? For I'm sure you're not saying this sort of thing: that if Polydamas the no-holds-barred wrestler is stronger than we are, and bull's meat is advantageous to him for his body, this food would also be advantageous, and at the same time just, for us who are weaker than he is." d

"You're nauseating, Socrates," he said, "and you grab hold of the statement in the way that you can do it the most damage."

"Not at all, most excellent man," I said, "just say more clearly what you mean."

"So you don't know," he said, "that some cities are run tyrannically, some democratically, and some aristocratically?"

"How could I not?"

"And so this prevails in strength in each city, the ruling part?"

"Certainly."

"And each ruling power sets up laws for the advantage of itself, a democracy setting up democratic ones, a tyranny tyrannical ones, and the others likewise. And having set them up, they declare that this, what's advantageous for them, is just for those who are ruled, and they chastise someone who transgresses it as a lawbreaker and a person doing injustice. So this, you most skillful one, is what I'm saying, that the same thing is just in all cities, what's advantageous to the established ruling power. And this surely prevails in strength, so the conclusion, for someone who reasons correctly, is that the same thing is just everywhere, what's advantageous to the stronger." e 339a

"Now," I said, "I understand what you mean. But whether it's true or not, I'll try to learn. So you too answer that the advantageous is just, Thrasymachus, even though you made a prohibition for me that I could not give this answer, though there is added to it 'for the stronger.' " b

"A small addendum, no doubt," he said.

"It's not clear yet whether it's a big one. But it is clear that whether you're speaking the truth needs to be examined. For since you're saying and I'm agreeing that what's

just is something advantageous, but you're making an addition and claiming it to be that of the stronger, while I don't know that, it needs to be examined."

"So examine it," he said.

"That will be done," I said. "Now tell me, do you not claim, though, that it's also just to obey the rulers?"

"I do."

c "And are the rulers in each city infallible, or the sort of people who also make mistakes?"

"By all means," he said, "they're surely the sort of people who also make mistakes."

"So when they try to set up laws, they set up some correctly and certain others incorrectly?"

"I certainly imagine so."

"Then to set them up correctly is to set up laws that are advantageous to themselves, and incorrectly, disadvantageous ones? Or how do you mean it?"

"That's the way."

"But whatever they set up needs to be done by those who are ruled, and this is what is just?"

"How could it be otherwise?"

d "Then according to your statement, not only is it just to do what's advantageous to the stronger, but also to do the opposite, what's disadvantageous."

"What do you mean?" he said.

"What you mean, it seems to me; but let's examine it better. Wasn't it agreed that when the rulers command those who are ruled to do certain things they're sometimes completely mistaken about what's best for themselves, but what the rulers command is just for those who are ruled to do? Wasn't this agreed?"

"I certainly imagine so," he said.

e "Well then," I said, "imagine also that it was agreed by you that doing what's disadvantageous for those who rule and are stronger is just, whenever the rulers unwillingly command things that are bad for themselves, while you claim that for the others to do those things which they commanded is just. So then, most wise Thrasymachus, doesn't it turn out necessarily in exactly this way, that it's just to do the opposite of what you say? For what's disadvantageous to the stronger is without doubt commanded to the weaker to do."

340a "By Zeus, yes, Socrates," said Polemarchus, "most clearly so."

"If you're going to be a witness for him," Cleitophon interjected.

"And what need is there for a witness? Thrasymachus himself agrees that the rulers sometimes command things that are bad for themselves, and that for the others to do these things is just."

"That's because Thrasymachus set it down, Polemarchus, that doing what's ordered by the rulers is just."

b "Because he also set it down, Cleitophon, that what's advantageous to the stronger is just. And having set down both these things, he agreed next that sometimes the stronger order things that are disadvantageous to themselves for those who are weaker and ruled to do. And from these agreements what's advantageous to the stronger would be no more just than what's disadvantageous."

"But," said Cleitophon, "he meant that the advantage of the stronger is what the stronger believes is advantageous to himself; this is what needs to be done by the weaker, and he set this down as what's just."

"But he didn't say it that way," said Polemarchus.

"It makes no difference, Polemarchus," I said, "but if Thrasymachus says it this way now, let's accept it this way from him. And tell me, Thrasymachus, was this what you wanted to say the just is, what seems to the stronger to be the advantage of the stronger, whether it might be advantageous or not? Shall we say you mean it that way?" c

"That least of all," he said. "Do you imagine that I call someone who makes a mistake stronger when he's making a mistake?"

"I did imagine that you were saying that," I said, "when you agreed that the rulers are not infallible but are even completely mistaken about some things." d

"That's because you're a liar who misrepresents things in arguments, Socrates. To start with, do you call someone who's completely mistaken about sick people a doctor on account of that very thing he's mistaken about? Or call someone skilled at arithmetic who makes a mistake in doing arithmetic, at the time when he's making it, on account of this mistake? I imagine instead that we talk that way in a manner of speaking, saying that the doctor made a mistake, or the one skilled at arithmetic made a mistake, or the grammarian. But I assume that each of these, to the extent that this is what we address him as, never makes a mistake, so that in precise speech, since you too are precise in speech, no skilled worker makes a mistake. For it's by being deficient in knowledge that the one who makes a mistake makes it, in respect to which he is not a skilled worker. So no one who's a skilled worker or wise or a ruler makes a mistake at the time when he is a ruler, though everyone would say that the doctor made a mistake or the ruler made a mistake. Take it then that I too was answering you just now in that sort of way. But the most precise way of speaking is exactly this, that the one who rules, to the extent that he is a ruler, does not make mistakes, and in not making a mistake he sets up what is best for himself, and this needs to be done by the one who is ruled. And so I say the very thing I've been saying from the beginning is just, to do what's advantageous to the stronger." e 341a

"Okay, Thrasymachus," I said. "I seem to you to misrepresent things by lying?"

"Very much so," he said.

"Because you imagine that I asked the question the way I did out of a plot to do you harm in the argument?"

"I know that very well," he said. "And it's not going to do you any good, because you couldn't do me any harm without it being noticed, and without being unnoticed you wouldn't have the power to do violence with the argument." b

"I wouldn't even try, blessed one," I said. "But in order that this sort of thing doesn't happen to us again, distinguish the way you mean someone who rules and is stronger, whether it's the one who is so called or the one in precise speech whom you just now mentioned, for whose advantage, since he's stronger, it will be just for the weaker to act."

"The one who's a ruler in the most precise speech," he said. "Do harm to that and misrepresent it by lies if you have any power to—I ask for no mercy from you—but you won't be able to." c

"Do you imagine," I said, "that I'm crazy enough to try to shave a lion or misrepresent Thrasymachus by lies?"

"You certainly tried just now," he said, "but you were a zero even at that."

"That's enough of this sort of thing," I said. "But tell me, the doctor in precise speech that you were just now talking about, is he a moneymaker or a healer of the sick? And speak about the one who is a doctor."

"A healer of the sick," he said.

d “And what about a helmsman? Is the one who’s a helmsman in the correct way a ruler of sailors or a sailor?”

“A ruler of sailors.”

“I assume there’s no need to take into account that he does sail in the ship, and no need for him to be called a sailor, since it’s not on account of sailing that he’s called a helmsman, but on account of his art and his ruling position among the sailors.”

“That’s true,” he said.

“Then for each of the latter there’s something advantageous?”

“Certainly.”

“And isn’t art by its nature for this,” I said, “for seeking and providing what’s advantageous in each case?”

“For that,” he said.

“Then is there any advantage for each of the arts other than to be as complete as possible?”

e “In what sense are you asking this?”

“In the same sense,” I said, “as, if you were to ask me whether it’s sufficient for a body to be a body or whether it needs something extra, I’d say ‘Absolutely it needs something extra, and it’s for that reason that the medical art has now been discovered, because a body is inadequate and isn’t sufficient to itself to be the sort of thing it is. So it’s for this reason, in order that it might provide the things that are advantageous for the body, that the art was devised.’ Would I seem to you to be speaking correctly in saying this,” I said, “or not?”

342a “It’s correct,” he said.

“What then? Is the medical art itself—or any other art—inadequate, and is it the case that it has need of some extra virtue? Just as eyes need sight and ears need hearing and for these reasons there is need of some art applied to them that will consider and provide what’s advantageous for these things, is there then in the art itself some inadequacy in it too, and a need for each art to have another art that will consider what’s advantageous for it, and for the one that will consider that to have another art in turn of that kind, and this is unending? Or will it consider what’s advantageous for itself? Or is there no additional need either for it or for any other art to consider what’s advantageous for its inadequacy, because there is no inadequacy or mistake present in any art, nor is it appropriate for an art to look out for the advantage of anything other than that with which the art is concerned, but it itself is without defect and without impurity since it is correct as long as each is the whole precise art that it is. Consider it in that precise speech now: is that the way it is, or is it some other way?”

b “That way,” he said, “as it appears.”

c “So then,” I said, “the medical art considers what’s advantageous not for the medical art but for a body.”

“Yes,” he said.

“And horsemanship considers what’s advantageous not for horsemanship but for horses, and neither does any other art consider what’s advantageous for itself, since there’s no extra need for that, but for that with which the art is concerned.”

“So it appears,” he said.

“But surely, Thrasymachus, the arts rule over and have power over that with which they’re concerned.”

He went along with that too, very grudgingly.

“Then no sort of knowledge considers or commands what’s advantageous for the stronger, but what’s advantageous for what’s weaker and ruled by it.” d

He finally agreed with this too, though he tried to make a fight about it, and when he agreed I said, “So does anything else follow except that no doctor, to the extent he is a doctor, considers or commands what’s advantageous for a doctor, but instead for someone who’s sick? For it was agreed that the doctor is precisely a ruler of bodies but not a moneymaker. Or was that not agreed?”

He said so.

“Then the helmsman too was agreed to be precisely a ruler of sailors but not a sailor?” e

“It was agreed.”

“Then this sort of helmsman and ruler at any rate will not consider and command what’s advantageous for a helmsman, but what’s advantageous for the sailor who’s ruled.”

He said so, grudgingly.

“Therefore, Thrasymachus,” I said, “neither will anyone else in any ruling position, to the extent he is a ruler, consider or command what’s advantageous for himself, but what’s advantageous for whatever is ruled, for which he himself is a skilled workman, and looking toward that, and to what’s advantageous and appropriate for that, he both says and does everything that he says and does.”

* * *

“You know that people are said to be passionate for honor and money as a reproach, and it is one?” 347b

“I do,” he said.

“So,” I said, “that’s why good people aren’t willing to rule for the sake of either money or honor. They don’t want to be called mercenary if they openly get wages for the ruling office, or thieves if they secretly take money from the office themselves. And they don’t rule for the sake of honor either, since they aren’t passionate for honor. So there needs to be a necessity attached to it for them, and a penalty, if they’re going to be willing to rule; that’s liable to be where it comes from that it’s considered shameful to go willingly to rule rather than to await necessity. And the greatest sort of penalty is to be ruled by someone less worthy, if one is not oneself willing to rule. It’s on account of fearing this that decent people appear to me to rule, when they do rule, and then they go to rule not as though they were heading for something good or as though they were going to have any enjoyment in it, but as though to something necessary, since they have no one better than or similar to themselves to entrust it to. Because, if a city of good men were to come into being, they’d be liable to have a fight over not ruling just as people do now over ruling, and it would become obvious there that the person who is a true ruler in his being is not of such a nature as to consider what’s advantageous for himself rather than for the one ruled. So everyone with any discernment would choose to be benefited by someone else rather than to have the trouble of benefiting someone else. On this point, then, I by no means go along with Thrasymachus that what’s just is what’s advantageous for the stronger. e

* * *

BOOK II

- 357a Now when I said these things, I imagined I'd be released from discussion, but as it seems, it was just a prologue. For Glaucon is always most courageous in confronting everything, and in particular he wouldn't stand for Thrasymachus's giving up, but said
- b "Socrates, do you want to seem to have persuaded us or truly persuade us that in every way it's better to be just than unjust?"
- "If it would be up to me," I said, "I'd choose truly."
- "Then you're not doing what you want. For tell me, does it seem to you there's a certain kind of good that we'd take hold of not because we desire its consequences, but to embrace it itself for its own sake, such as enjoyment and any of the pleasures that are harmless and from which nothing comes into the succeeding time other than to enjoy having them?"
- c "It seems to me," I said, "that there is such a thing."
- "Then what about the kind that we love both itself for its own sake and for the things that come from it, such as thinking and seeing and being healthy? For presumably we embrace such things for both reasons."
- "Yes," I said.
- "And do you see a third form of good," he said, "in which there's gymnastic exercise, and being given medical treatment when sick, and giving medical treatment, as well as the rest of moneymaking activity? Because we'd say these are burdensome, but
- d for our benefit, and we wouldn't take hold of them for their own sake, but we do for the sake of wages and of all the other things that come from them."
- "There is also this third kind," I said, "but what about it?"
- "In which of these kinds," he said, "do you put justice?"
- 358a "I imagine in the most beautiful kind," I said, "which must be loved both for itself and for the things that come from it by someone who's going to be blessedly happy."
- "Well it doesn't seem that way to most people," he said, "but to belong to the burdensome kind that ought to be pursued for the sake of the wages and reputation that come from opinion, but ought to be avoided itself on its own account as being something difficult."
- "I know it seems that way," I said, "and a while ago it was condemned by Thrasymachus as being that sort of thing, while injustice was praised, but, as it seems, I'm a slow learner."
- b "Come then," he said, "and listen to me, if the same things still seem true to you, because Thrasymachus appears to me to have been charmed by you like a snake, sooner than he needed to be. But to my way of thinking, no demonstration has taken place yet about either one, since I desire to hear what each of them is and what power it has itself by itself when it's present in the soul, and to say goodbye to the wages and the things that come from them."
- "So I'm going to do it this way, if that seems good to you too: I'll revive
- c Thrasymachus's argument, and I'll say first what sort of thing people claim justice is and where they say it comes from, and second that everyone who pursues it pursues it unwillingly as something necessary but not good, and third that they do it fittingly since the life of someone who's unjust is much better than that of someone who's just—as they say, since it doesn't seem that way to me at all, Socrates, though I'm stumped as
- d my ears are talked deaf when I listen to Thrasymachus and tens of thousands of other people, while I haven't yet heard the argument on behalf of justice, that it's better than

injustice, from anyone in the way I want it. I want to hear it itself by itself praised, and I assume that I'd hear this most of all from you.

"That's why I'll strain myself to speak in praise of the unjust life, and as I speak I'll point out to you in what way I want to hear you in turn condemn injustice and praise justice. But see if what I'm saying is to your liking."

"Most of all," I said, "for what would anyone who has any sense enjoy more to talk about and hear about repeatedly?"

"You're speaking most beautifully," he said. "Listen then to what I said I'd talk about first, what sort of thing justice is and where it comes from. People claim that doing injustice is by its nature good and suffering injustice is bad, but that suffering injustice crosses over farther into bad than doing injustice does into good, so that when people both do injustice to and suffer it from each other and get a taste of both, it seems profitable to the ones who don't have the power to avoid the latter and choose the former to make a contract with each other neither to do injustice nor suffer it. And from then on they begin to set up laws and agreements among themselves and to name what's commanded by the law both lawful and just, and so this is the origin and being of justice, being in the middle between what is best, if one could do injustice and not pay a penalty, and what is worst, if one were powerless to take revenge when suffering injustice. What's just, being at a mean between these two things, is something to be content with not as something good, but as something honored out of weakness at doing injustice, since someone with the power to do it and who was truly a man would never make a contract with anyone neither to do nor suffer injustice. He'd be insane.

"So, Socrates, it's the nature of justice to be this and of this sort, and these are the sorts of things it comes from by its nature, as the argument goes. The fact that those who pursue it pursue it unwillingly from a lack of power to do injustice, we might perceive most clearly if we were to do something like this in our thinking: by giving to each of them, the just and the unjust, freedom to do whatever he wants, we could then follow along and see where his desire will lead each one. Then we could catch the just person in the act of going the same route as the unjust one because of greed for more, which is what every nature, by its nature, seeks as good, though it's forcibly pulled aside by law to respect for equality.

"The sort of freedom I'm talking about would be most possible if the sort of power ever came to them that people say came to the ancestor of Gyges the Lydian. They say he was a shepherd working as a hired servant to the one who then ruled Lydia, when a big storm came up and an earthquake broke open the earth, and there was a chasm in the place where he was pasturing the sheep. Seeing it and marveling, he went down and saw other marvels people tell legends about as well as a bronze horse, hollowed out, that had windows in it, and when he stooped down to look through them he saw a dead body inside that appeared bigger than a human being. And this body had on it nothing else but a gold ring around its finger, which he took off and went away.

"And when the customary gathering of the shepherds came along, so that they could report each month to the king about his flocks, he too came and had on the ring. Then while he was sitting with the others, he happened to turn the stone setting of the ring around toward himself into the inside of his hand, and when this happened he became invisible to those sitting beside him, and they talked about him as though he'd gone away. He marveled, and running his hand over the ring again he twisted the stone setting outward, and when he had twisted it he became visible. And reflecting on this,

he tried out whether the ring had this power in it, and it turned out that way for him, to become invisible when he twisted the stone setting in and visible when he twisted it out.

b Perceiving this, he immediately arranged to become one of the messengers attending the king, and went and seduced the king's wife, and with her attacked and killed the king and took possession of his reign.

- "Now if there were a pair of rings of that sort, and a just person put on one while an unjust person put on the other, it would seem that there could be no one so inflexible that he'd stand firm in his justice and have the fortitude to hold back and not lay a hand on things belonging to others, when he was free to take what he wanted from the marketplace, and to go into houses and have sex with anyone he wanted, and to kill and set loose from chains everyone he wanted, and to do everything he could when he was the equal of a god among human beings. And in acting this way, he would do nothing different from the other, but both would go the same route.
- c

- "And surely someone could claim this is a great proof that no one is just willingly, but only when forced to be, on the grounds that it is not for his private good, since wherever each one imagines he'll be able to do injustice he does injustice. Because every man assumes that injustice is much more profitable to him privately than justice, and the one saying the things involved in this sort of argument will claim that he's assuming the truth, because if anyone got hold of such freedom and was never willing to do injustice or lay a hand on things belonging to others, he'd seem to be utterly miserable to those who observed it, and utterly senseless as well, though they'd praise him to each other's faces, lying to one another from fear of suffering injustice.
- d

- "So that's the way that part goes. But as for the choice itself of the life of the people we're talking about, we'll be able to decide it correctly if we set the most just person opposite the most unjust; if we don't, we won't be able to. What then is the way of opposing them? This: we'll take nothing away either from the injustice of the unjust person or from the justice of the just person, but set out each as complete in his own pursuit. First, then, let the unjust one do as clever workmen do; a top helmsman, for instance, or doctor, distinguishes clearly between what's impossible in his art and what's possible, and attempts the latter while letting the former go, and if he still slips up in any way, he's competent to set himself right again. So too, let the unjust person, attempting his injustices in the correct way, go undetected, if he's going to be surpassingly unjust. Someone who gets caught must be considered a sorry specimen, since the ultimate injustice is to seem just when one is not.
- e
- 361a

- "So one must grant the completely unjust person the most complete injustice, and not take anything away but allow him, while doing the greatest injustices, to secure for himself the greatest reputation for justice; and if thereafter he slips up in anything, one must allow him to have the power to set himself right again, and to be competent both to speak so as to persuade if he's denounced for any of his injustices, and to use force for everything that needs force, by means of courage and strength as well as a provision of friends and wealth. And having set him up as this sort, let's stand the just person beside him in our argument, a man simple and well bred, wishing not to seem but be good, as Aeschylus puts it.
- b

- "So one must take away the seeming, for if he's going to seem to be just there'll be honors and presents for him as one seeming that way. Then it would be unclear whether he would be that way for the sake of what's just or for the sake of the presents and honors. So he must be stripped bare of everything except justice and
- c

made to be situated in a way opposite to the one before, for while he does nothing unjust, let him have a reputation for the greatest injustice, in order that he might be put to the acid test for justice: its not being softened by bad reputation and the things that come from that. Let him go unchanged until death, seeming to be unjust throughout life while being just, so that when both people have come to the ultimate point, one of justice and the other of injustice, it can be decided which of the pair is happier.” d

“Ayayay, Glaucon my friend,” I said, “how relentlessly you scrub each of them pure, like a statue, for the decision between the two men.”

“As much as is in my power,” he said, “and now that the two are that way, there’s nothing difficult any more, as I imagine, about going on through in telling the sort of life that’s in store for each of them. e

“So it must be said, and if in fact it’s said too crudely, don’t imagine I’m saying it, Socrates, but the people who praise injustice in preference to justice.

“They’ll say this: that situated the way he is, the just person will be beaten with whips, stretched on the rack, bound in chains, have both eyes burned out, and as an end after suffering every evil he’ll be hacked in pieces, and know that one ought to wish not to be but seem just. And therefore the lines of Aeschylus would be much more correct to speak about the unjust person, since they’ll claim that the one who is unjust in his being, inasmuch as he’s pursuing a thing in contact with truth and not living with a view to opinion, wishing not to seem but be unjust 362a

Gathers in the fruit cultivated deep in his heart
From the place where wise counsels breed.

b

In the first place, he rules in his city as one who seems to be just; next, he takes a wife from wherever he wants, and gives a daughter to whomever he wants; he contracts to go in partnership with whomever he wishes; and besides benefiting from all these things, he gains by not being squeamish about doing injustice. So when he goes into competition both in private and in public, he overcomes his enemies and comes out with more, and since he has more he is rich and does good to his friends and damages his enemies. And to the gods he makes sacrifices in an adequate way and dedicates offerings in a magnificent way, and does much better service to the gods, and to the human beings it pleases him to, than the just person does, so that in all likelihood it’s more suitable for him, rather than the just person, to be dearer to the gods. c

“In that way, Socrates, they claim that, on the part of both gods and human beings, a better life is provided for the unjust person than for the just.”

* * *

[Socrates responds to Glaucon and Adeimantus]: “You’ve experienced something godlike if you haven’t been persuaded that injustice is better than justice, though you have the power to speak that way on behalf of it. And you seem to me truly not persuaded, but I gather this from other indications of your disposition, since from your arguments I’d distrust you. But to the degree that I trust you more, I’m that much more stumped as to how I can be of use, and I have no way to help out, since I seem to myself to be powerless. A sign of this for me is that I imagined what I said to Thrasymachus demonstrated that justice is better than injustice, but you didn’t let 368a

b

c my argument stand. But neither is there any way for me not to help out, since I'm afraid that it would be irreverent to be standing by while justice is being defamed and not help out as long as I'm still breathing and have the power to utter a sound. So what has the most force is for me to come to its defense in whatever way is in my power."

d Then Glaucon and the others begged me in every way to help out and not give up the argument, but to track down what each of them is and what the truth is about the sort of benefit that goes with the two of them. So I said exactly what seemed to me the case: "The inquiry we're setting ourselves to is no inconsiderable thing, but for someone sharp-sighted, as it appears to me. So since we aren't clever," I said, "the sort of inquiry for us to make about it seems to me exactly like this: if someone had ordered people who were not very sharp-sighted to read small print from a distance, and then it occurred to someone that maybe the same letters are also somewhere else, both bigger and on something bigger, it would plainly be a godsend, I assume, to read those first and examine the smaller ones by that means, if they were exactly the same."

e "Certainly," Adeimantus said, "but Socrates, what have you spotted in the inquiry about justice that's of that sort?"

"I'll tell you," I said. "There's justice, we claim, of one man, and there's presumably also justice of a whole city?"

"Certainly," he said.

"Isn't a city a bigger thing than one man?"

"It's bigger," he said.

369a "Then maybe more justice would be present in the bigger thing, and it would be easier to understand it clearly. So if you people want to, we'll inquire first what sort of thing it is in cities, and then we'll examine it by that means also in each one of the people, examining the likeness of the bigger in the look of the smaller."

"You seem to me to be saying something beautiful," he said.

"Then if we were to look at a city as it comes into being in speech," I said, "would we see the justice and injustice that belong to it coming into being as well?"

"Probably so," he said.

b "And then, once it has come into being, is there a hope of seeing what we're looking for more readily?"

"Very much so."

"Does it seem good, then, that we should try to accomplish this? Because I imagine it's not a small task, so you people consider it."

"It's been considered," Adeimantus said. "Don't do anything else."

"Okay," I said. "A city, as I imagine, comes into being because it happens that each of us is not self-sufficient, but needs many things. Or do you imagine a city is founded from any other origin?"

"None at all," he said.

c "So then when one person associates with another for one use, and with another for another use, since they need many things, and many people assemble in one dwelling place as partners and helpers, to this community we give the name city, don't we?"

"Certainly."

"And they share things one with another, if they give or take shares of anything, because each supposes it to be better for himself?"

"Certainly."

Ostraka from 428 B.C., found on the north side of the Acropolis. These clay disks were used in ostracism voting. Each eligible male Athenian citizen scratched the name of the man he thought most undesirable. The “candidate” with the most votes was obliged to leave Athens for ten years. Given that “each of us is not self-sufficient” (*Republic* 369b) and all are dependent on the community, this was a severe punishment. (Leemage/Universal Images Group Universal Images Group/Newscom)

“Come then,” I said, “and let’s make a city from the beginning in our speech. And it seems like what will make it will be our need.”

“What else could it be?”

“But surely the first and greatest of needs is the provision of food for the sake of being and living.”

“Absolutely.”

“And second is the need for a dwelling place, and third for clothes and such things.”

“That’s so.”

“Well then,” I said, “how big a city will be sufficient to provide this much? Is it anything else than one person as a farmer, another a housebuilder, and some other a weaver? Or shall we add to it a leatherworker or someone who attends to something else for the body?”

“Certainly.”

“And the city that’s most necessary anyway would consist of four or five men.”

“So it appears.”

“And then what? Should each one of these put in his own work for them all in common, with the farmer, say, who is one, providing food for four and spending four times the time and effort in the provision of food for the others too to share, or paying no attention to that, make a fourth part of this food for himself alone in a fourth part of the time and devote one of the other three to providing for a house, another to a cloak,

370a

and the other to shoes, and not have the trouble of sharing things with others but do himself, by himself, the things that are for himself?"

And Adeimantus said, "Probably, Socrates, the first way would be easier than that one."

b "And by Zeus, there's nothing strange about that," I said. "For I'm thinking too myself, now that you mention it, that in the first place, each of us doesn't grow up to be entirely like each, but differing in nature, with a different person in practice growing toward a different sort of work. Or doesn't it seem that way to you?"

"It does to me."

"Then what? Would someone do a more beautiful job who, being one, worked at many arts, or when one person works at one art?"

"When one person works at one art," he said.

"And I assume this too is clear, that if anyone lets the critical moment in any work go by, it's ruined."

"That's clear."

c "Because I don't imagine the thing that's being done is willing to wait for the leisure of the person who's doing it, but it's necessary for the one doing it to keep on the track of the thing he's doing, not when the turn comes for a sideline."

"That's necessary."

"So as a result of these things, everything comes about in more quantity, as more beautiful, and with more ease when one person does one thing in accord with his nature and at the right moment, being free from responsibility for everything else."

"Absolutely so."

d "So there's need for more than four citizens, Adeimantus, for the provisions we were talking about, since the farmer himself, as seems likely, won't make his own plow, if it's going to be beautifully made, or his pickax, or any of the other tools for farming. And neither will the housebuilder, and there's need of many things for that, and likewise with the weaver and the leatherworker."

"That's true."

"So with carpenters and metalworkers and many such particular kinds of craftsmen coming in as partners in our little city, they'll make it a big one."

"Very much so."

e "But it still wouldn't be a very big one if we add cattlemen and shepherds to them, and other herdsmen, so that the farmers would have oxen for plowing, and the housebuilders along with the farmers could use teams of animals for hauling, and the weavers and leatherworkers could use hides and wool."

"It wouldn't be a small city either," he said, "when it had all these."

"But still," I said, "even to situate the city itself in the sort of place in which it won't need imported goods is just about impossible."

"It's impossible."

"Therefore there's still a further need for other people too who'll bring it what it needs from another city."

"There'll be a need."

371a "And if the courier goes empty-handed, carrying nothing those people need from whom ours will get the things for their own use, he'll leave empty-handed, won't he?"

"It seems that way to me."

"Then they'll need to make not only enough things to be suitable for themselves, but also the kinds and quantity of things suitable for those people they need things from."

"They'll need to."

"So our city will need more of the farmers and other craftsmen."

"More indeed."

"And in particular other couriers no doubt, who'll bring in and carry away each kind of thing, and these are commercial traders aren't they?"

"Yes."

"So we'll also need commercial traders."

"Certainly."

"And if the commerce is carried on by sea, there'll be an additional need for many other people gathered together who know the work connected with the sea." b

"Very many."

"And how about in the city itself? How are they going to share out with each other the things each sort makes by their work? It was for the sake of this that we even went into partnership and founded the city."

"It's obvious," he said: "by selling and buying."

"So a marketplace will arise out of this for us, and a currency as a conventional medium of exchange?"

"Certainly."

"But if, when the farmer or any other workman has brought any of the things he produces into the marketplace, he doesn't arrive at the same time as those who need to exchange things with him, is he going to stay unemployed at his craft sitting in the marketplace?" c

"Not at all," he said, "but there are people who, seeing this, take this duty on themselves; in rightly managed cities it's pretty much for the people who are weakest in body and useless for any other work to do. Because there's a need for it, so they stay around the marketplace to give money in exchange to those who need to sell something and to exchange in turn for money with all those who need to buy something." d

"Therefore," I said, "this useful service makes for the origin of retail tradesmen in the city. Don't we call people retail tradesmen who are set up in the marketplace providing the service of buying and selling, but call those who travel around to cities commercial traders?"

"Certainly."

"And as I imagine, there are still certain other serviceable people, who don't entirely merit sharing in the partnership for things that involve thinking but have sufficient strength of body for labors, so since they sell the use of their strength and call this payment wages, they are called, as I imagine, wage laborers, aren't they?" e

"Yes."

"And the wage laborers, as seems likely, are the component that fills up the city?"

"It seems that way to me."

"Well then Adeimantus, has our city already grown to be complete?"

"Maybe."

"Then where in it would the justice and the injustice be? And together with which of the things we examined did they come to be present?"

"I have no idea, Socrates," he said, "unless it's somewhere in some usefulness of these people themselves to each other." 372a

"And maybe you're putting it beautifully," I said. "We need to examine it though and not be shy about it. So first, let's consider what style of life people will lead who've been provided for in this way. Will they do otherwise than produce grain and wine and cloaks and shoes? And when they've built houses, by summer they'll work at most things lightly clad and barefoot, but in winter adequately clothed and in shoes. And they'll nourish themselves b

by preparing cereal from barley and flour from wheat, baking the latter and shaping the former by hand, and when they've set out fine cakes of barley meal and loaves of wheat bread on some sort of straw or clean leaves, reclining on leafy beds spread smooth with yew and myrtle, they and their children will feast themselves, drinking wine to top it off, while crowned with wreaths and singing hymns to the gods, joining with each other pleasurably, and not producing children beyond their means, being cautious about poverty or war."

And Glaucon broke in, saying "It looks like you're making your men have a feast without any delicacies."

"That's true," I said. "As you say, I forgot that they'll have delicacies too, salt obviously, as well as olives and cheese, and they'll boil up the sorts of roots and greens that are cooked in country places. And as sweets we'll doubtless set out for them some figs and chickpeas and beans, and at the fire they'll roast myrtle berries and acorns, while sipping wine in moderation. And in this way it's likely that, going through life in peace combined with health and dying in old age, they'll pass on another life of this sort to their offspring."

And he said, "And if you were making provisions for a city of pigs, Socrates, what would you fatten them on besides this?"

"But how should they be provided for, Glaucon?" I said.

"With the very things that are customary," he said. "I assume they'll lie back on couches so they won't get uncomfortable, and take their meals from tables, and have exactly those delicacies and sweets that people do now."

"Okay, I understand," I said. "We're examining, it seems, not just how a city comes into being, but a city that lives in luxury. And maybe that's not a bad way to do it, since by examining that kind of city we might quickly spot the way that justice and injustice take root in cities. Now it seems to me though that the true city is the one we've gone over, just as it's a healthy one. But if you want us also to look in turn at an infected city, nothing prevents it. For these things, it seems, aren't sufficient for some people, and neither is this way of life, but couches and tables and the other furnishings will be added, and especially delicacies as well as perfumed ointments and incense and harem girls and pastries, and each of these in every variety. And so it's no longer the necessities we were speaking of at first—houses, cloaks, and shoes—that have to be put in place, but painting and multicolored embroidery have to be set in motion, and gold and ivory and all that sort of thing have to be acquired, don't they?"

"Yes," he said.

"Isn't there a need then to make the city bigger again? Because that healthy one isn't sufficient any longer, but is already filled with a mass of things and a throng of people, things that are no longer in the cities for the sake of necessity, such as all the hunters as well as the imitators [i.e., artists], many of whom are concerned with shapes and colors, many others with music, and also the poets and their assistants, the reciters, actors, dancers, theatrical producers, and craftsmen for all sorts of gear, including makeup for women and everything else. And we'll especially need more providers of services, or doesn't it seem there'll be a need for tutors, wet nurses, nannies, beauticians, barbers, and also delicacy-makers and chefs? Furthermore, there'll be an extra need for pig farmers; this job wasn't present in our earlier city because there was no need for it, but in this one there's the extra need for this too. And there'll be a need for a great multitude of other fattened livestock too, if one is going to eat them. Isn't that so?"

"How could it be otherwise?"

"Then won't we be much more in need of doctors when people live this way instead of the earlier way?"

"Very much so."

"And doubtless the land that was sufficient then to feed the people will now have gone from sufficient to small. Or how do we put it?"

"That way," he said.

"Then does something have to be cut off by us from our neighbors' land if we're going to have enough to graze on and plow, and by them in turn from ours if they too give themselves over to the unlimited acquisition of money, exceeding the limit of necessities?" e

"That's a great necessity, Socrates," he said.

"So what comes after this, Glaucon, is that we go to war? Or how will it be?"

"That way," he said.

"And let's say nothing yet, at any rate," I said, "about whether war accomplishes anything bad or good, but only this much, that we have discovered in its turn the origin of war, in those things out of which most of all cities incur evils both in private and in public, when they do incur them."

"Very much so."

"So, my friend, there's a need for the city to be still bigger, not by a small amount but by a whole army, which will go out in defense of all their wealth and in defense of the things we were just now talking about, and do battle with those who come against them." 374a

"Why's that?" he said. "Aren't they themselves sufficient?"

"Not if it was beautifully done," I said, "for you and all of us to be in agreement when we were shaping the city; surely we agreed, if you recall, that one person has no power to do a beautiful job at many arts."

"What you say is true," he said.

"Then what?" I said. "Does the contest involved in war not seem to you to require art?" b

"Much of it," he said.

"So is there any need to go to more trouble over leatherworking than over warfare?"

"By no means."

"But that's the very reason we prevented the leatherworker from attempting at the same time to be a farmer or a weaver or a housebuilder, but just be a leatherworker, so that the work of leathercraft would be done beautifully for us, and in the same way we gave out one job to one person for each of the others, the job into which each had grown naturally and for which he was going to stay at leisure from the other jobs, working at it throughout life and not letting the critical moments slip by to accomplish it beautifully. But isn't it of the greatest consequence that the things involved in war be accomplished well? Or are they so easy that even some farmer is going to be skilled at warfare at the same time, or a leatherworker or anyone working at any other art whatever, while no one could become sufficiently skillful at playing checkers or dice who didn't practice that very thing from his youth but treated it as a sideline? And someone who picks up a shield or any other weapon or implement of war, on that very day is going to be an adequate combatant in heavy-armor fighting or any other sort of battle that's needed in war, when no other implement that's picked up is going to make anyone a craftsman or fighter or even be usable to someone who hasn't gotten any knowledge about it or been supplied with adequate training?" c d

"Those implements would be worth a lot," he said.

"So then," I said, "to the extent that the work of the guardians is the most important, would it also be in need of the most leisure compared to other pursuits, as well as of the greatest art and care?" e

"I certainly imagine so," he said.

"So wouldn't it also need a nature adapted to that very pursuit?"

"How could it not?"

"So it would be our task, likely, if we're going to be capable of it, to pick out which and which sort of natures are adapted to the guarding of the city."

"Ours indeed."

"By Zeus," I said, "it's no light matter we've called down as a curse on ourselves. Still, it's not something to run away from in fear, at least to the extent our power permits."

375a "Certainly not," he said.

"So do you imagine that for guarding?" I said, "there's any difference in nature between a pure bred puppy and a well bred young man?"

"What sort of nature are you talking about?"

"For instance, each of the pair, I suppose, needs to be sharp at perceiving things, nimble at pursuing what it perceives, and also strong, if it needs to fight when it catches something."

"There is certainly a need for all these things," he said.

"And to be courageous too, if it's going to fight well."

"How could it be otherwise?"

b "But will a horse or a dog or any other animal whatever that's not spirited be likely to be courageous? Or haven't you noticed how indomitable and invincible spiritedness is, and how, when it's present, every soul is both fearless and unyielding against everything?"

"I've noticed."

"And surely it's obvious what the guardian needs to be like in the things that belong to his body."

"Yes."

"And particularly in what belongs to the soul, that he has to be spirited."

"That too."

"Then how, Glaucon," I said, "when they're that way in their natures, will they not be fierce toward each other and toward the other citizens?"

"By Zeus," he said, "not easily."

c "But surely they need to be gentle toward their own people but rough on their enemies, and if they aren't, they won't wait for others to destroy them but do it first themselves."

"True," he said.

"So what will we do?" I said. "Where are we going to find a character that's gentle and high-spirited at the same time? For presumably a gentle nature is opposite to a spirited one."

"So it appears."

d "But surely if someone lacks either one of these things, he won't become a good guardian. But these things seem like impossibilities, and so it follows that a good guardian becomes an impossibility."

"It's liable to be that way," he said.

I too was stumped and was thinking over what had been said before, and I said, "Justly are we stumped, my friend, because we've gotten away from the image we were setting up."

"How do you mean that?"

"We didn't notice that there are natures, after all, of the sort we were imagining there aren't, that have these opposites in them."

"But where?"

e "One might see it in other animals too, though not least in the one we set beside the guardian for comparison. Because you know, no doubt, about pure bred dogs, that this is their character by nature, to be as gentle as possible with those they're accustomed to and know, but the opposite with those they don't know."

"Certainly I know it."

"Therefore," I said, "this is possible, and it's not against nature for the guardian to be of the sort we're looking for."

"It doesn't seem like it."

"Well then, does it seem to you that there's still a further need for this in the one who'll be fit for guarding, that in addition to being spirited he also needs to be a philosopher by nature?"

"How's that?" he said. "I don't get it."

376a

"You'll notice this too in dogs," I said, "which is also worth wondering at in the beast."

"What sort of thing?"

"That when it sees someone it doesn't know, it gets angry, even when it hasn't been treated badly by that person before, while anyone familiar it welcomes eagerly, even when nothing good has ever been done to it by that one. Or haven't you ever wondered at this?"

"Till this moment," he said, "I haven't paid it any mind at all. That they do this, though, is certainly obvious."

"But surely it shows an appealing attribute of its nature and one that's philosophic in a true sense." b

"In what way?"

"In that it distinguishes a face as friend or enemy," I said, "by nothing other than the fact that it has learned the one and is ignorant of the other. And indeed, how could it not be a lover of learning when it determines what's its own and what's alien to it by means of understanding and ignorance?"

"There's no way it couldn't," he said.

"But surely," I said, "the love of learning and the love of wisdom are the same thing?"

"They're the same," he said.

"Then shall we have the confidence to posit for a human being too, that if he's going to be at all gentle to his own people and those known to him, he needs to be by nature a lover of wisdom and of learning?" c

"Let's posit it."

"So someone who's going to be a beautiful and good guardian of our city will be philosophic, spirited, quick, and strong by nature."

"Absolutely so," he said.

"So he'd start out that way. But now in what manner will they be brought up and educated by us? And if we examine it, is there anything that gets us forward toward catching sight of the thing for the sake of which we're examining all this, the manner in which justice and injustice come into being in a city? The point is that we might not allow enough discussion, or we might go through a long one." d

And Glaucon's brother said, "For my part, I expect this examination to be one that gets us very far along into that."

"By Zeus, Adeimantus my friend," I said, "it's not to be given up then, even if it happens to be overlong."

"Not at all."

"Come then, and just as if they were in a story and we were telling the story and remaining at leisure, let's educate the men in our speech."

"We should do just that."

BOOK III

* * *

- 412b “Okay,” I said, “what would be the next thing after that for us to distinguish?
 c Wouldn’t it be which of these same people will rule and which will be ruled?”
 “Sure.”
 “And it’s clear that the older ones should be the rulers and the younger should be ruled?”
 “That’s clear.”
 “And that it should be the best among them?”
 “That too.”
 “And aren’t the best farmers the ones most adept at farming?”
 “Yes.”
 “But since in this case they need to be the best among the guardians, don’t they need to be the most adept at safeguarding the city?”
 “Yes.”
 “So don’t they need, to start with, to be intelligent at that as well as capable, and also protective of the city?”
 d “That’s so.”
 “But someone would be most protective of that which he happened to love.”
 “Necessarily.”
 “And surely someone would love that thing most which he regarded as having the same things advantageous to it as to himself, and believed that when it fared well it followed that he himself fared well, and the other way around when it didn’t.”
 “That’s the way it is,” he said.
 “Therefore the men who need to be selected from among the rest of the guardians
 e are those who appear to us, when we examine the whole course of their lives, as if they most of all would do wholeheartedly whatever they’d regard as advantageous to the city, and who wouldn’t be willing in any way to do what was not.”
 “They’d be suited to it,” he said.
 “It seems to me, then, that they need to be observed in all stages of life to see if they’re adept guardians of this way of thinking, and don’t drop it when they’re bewitched or subjected to force, forgetting their opinion that they ought to do what’s best for the city.”
 “What do you mean by dropping?” he said.
 “I’ll tell you,” I said. “It appears to me that an opinion goes away from one’s
 413a thinking either willingly or unwillingly. A false one goes away willingly from someone who learns differently, but every true one unwillingly.”
 “The case of the willing dropping I understand,” he said, “but I need to learn about the unwilling case.”
 “What?” I said. “Don’t you too believe human beings are deprived of good things unwillingly but of bad ones willingly? Isn’t it a bad thing to think falsely about the truth and a good thing to think truly? Or doesn’t believing things that are seem to you to be thinking truly?”
 “You’re certainly speaking rightly,” he said, “and it does seem to me that people are unwilling to be deprived of the truth.”
 b “And don’t they suffer this by being robbed, bewitched, or overpowered?”

“Now I’m not understanding again,” he said.

“I guess I’m speaking like a tragedy,” I said. “By those who are robbed, I mean people who are persuaded to change their minds and people who forget, because from the latter, time, and from the former, speech takes opinions away without their noticing it. Now presumably you understand?”

“Yes.”

“And by those who are overpowered I mean people that some grief or pain causes to change their opinions.”

“I understand that too,” he said, “and you’re speaking rightly.”

“And I imagine that you too would claim that people are bewitched who change their opinions when they’re either entranced by pleasure or in dread of something frightening.” c

“Yes,” he said, “it’s likely that everything that fools people is bewitching.”

“Then as I was just saying, one needs to find out which of them are the best guardians of the way of thinking they have at their sides, that the thing they always need to do is to do what seems to them to be best for the city. So they need to be observed right from childhood by people who set tasks for them in which someone would be most likely to forget such a thing or be fooled out of it; anyone who remembers it and is hard to fool is to be chosen and anyone who doesn’t is to be rejected. Isn’t that so?” d

“Yes.”

“And laborious jobs, painful sufferings, and competitions also need to be set up for them in which these same things are to be observed.”

“That’s right,” he said.

“Thus a contest needs to be made,” I said, “for the third form as well, that of bewitchment, and it needs to be watched. The same way people check out whether colts are frightened when they lead them into noisy commotions, the guardians, when young, need to be taken into some terrifying situations and then quickly shifted into pleasant ones, so as to test them much more than gold is tested in a fire. If someone shows himself hard to bewitch and composed in everything, a good guardian of himself and of the musical style that he learned, keeping himself to a rhythm and harmony well-suited to all these situations, then he’s just the sort of person who’d be most valuable both to himself and to a city. And that one among the children and the youths and the men who is tested and always comes through unscathed is to be appointed as ruler of the city as well as guardian, and honors are to be given to him while he’s living and upon his death, when he’s allotted the most prized of tombs and other memorials. Anyone not of that sort is to be rejected. It seems to me, Glaucon,” I said, “that the selection and appointment of rulers and guardians is something like that, described in outline, not with precision.” 414a

“It looks to me too like it would be done some such way,” he said.

“Isn’t it most correct, then, to call these the guardians in the true sense, complete guardians for outside enemies and also for friends inside, so that the latter won’t want to do any harm and the former won’t have the power to? The young ones that we’ve been calling guardians up to now, isn’t it most correct to call auxiliaries and reinforcements for the decrees of the rulers?” b

“It seems that way to me,” he said.

“Then could we come up with some contrivance,” I said, “from among the lies that come along in case of need, the ones we were talking about just now, some one noble lie told to persuade at best even the rulers themselves, but if not, the rest of the city?” c

“What sort of thing?” he said.

"Nothing new," I said, "but something Phoenician* that has come into currency in many places before now, since the poets assert it and have made people believe; but it hasn't come into currency in our time and I don't know if it could—it would take a lot of persuading."

"You seem a lot like someone who's reluctant to speak," he said.

"And I'll seem to you very appropriately reluctant," I said, "when I do speak."

"Speak," he said. "Don't be shy."

- d "I'll speak, then. And yet I don't know how I'll get up the nerve or find the words to tell it. First I'll try my hand at persuading the rulers themselves and the soldiers, and then also the rest of the city, that, after all, the things we nurtured and educated them on were like dreams; they seemed to be experiencing all those things that seemed to be happening around them, but in truth they themselves were at the time under the soil
- e inside the earth being molded and cultivated, and their weapons and other gear were being crafted, and when they were completely formed, the earth, that was their mother, made them spring up. So now, as if the land they dwell in were a mother and nurse, it's up to them to deliberate over it, to defend it if anyone were to attack, and to take thought on behalf of the rest of the citizens as their earthborn siblings."

"It's not without reason," he said, "that you were ashamed for so long to tell the lie."

- 415a "It was entirely reasonable," I said. "But all the same, listen to the rest of the story as well. What we'll say in telling them the story is: 'All of you in the city are brothers, but the god, when he molded those of you who are competent to be rulers, mixed gold into them at their formation—that's why they're the most honorable—but all the auxiliaries have silver in them, and there's iron and bronze in the farmers and other skilled
- b workers. So since you're all kin, for the most part you'll produce children like yourselves, but it's possible for a silver offspring sometimes to be born from a gold parent, and a gold from a silver, and all the others likewise from one another. So the god exhorts the rulers first and foremost to be good guardians of their children, of nothing more diligently than that, and to keep watch for nothing so diligently as for what they have inter-
- c mixed in their souls. And if a child of theirs is born with bronze or iron mixed in it, they'll by no means give way to pity, but paying it the honor appropriate to its nature, they'll drive it out among the craftsmen or farmers, and if in turn any children are born from those parents with gold or silver mixed in them, they'll honor them and take them up, some to the guardian group, the others to the auxiliary, because there's an oracle foretelling that the city will be destroyed when an iron or bronze guardian has guardianship over it.' So do you have any contrivance to get them to believe this story?"

- d "There's no way," he said, "at least for these people themselves. There might be one, though, for their sons and the next generation and the rest of humanity after that."

- "But even that," I said, "would get things going well toward their being more protective of the city and of one another, because I understand pretty well what you mean. And that's that it will carry on the way an oral tradition leads it. But once we've armed these offspring of the earth, let's bring them forth with their rulers in the lead. And when they've come, let them look for the most beautifully situated spot in the city to set up a
- e military camp, from which they could most effectively restrain the people in the city if

*Cadmus, the legendary founder of the Greek city Thebes, came from Phoenicia (the region roughly the same as modern Lebanon). To found the city he had to kill a dragon. A god told him to plant the dragon's teeth, and the first inhabitants of the city sprang up from those seeds. When Socrates says the story was current in many places, he means there were other local legends of races sprung from the ground they now live on, all originally brothers and sisters whose first mother is the land that feeds them and that they defend and love.

any of them were unwilling to obey the laws, and defend against those outside it if any enemy, like a wolf, were to attack the flock. And when they've set up the camp and offered sacrifices to those whom they ought, let them make places to sleep. Or how should it be?"

"That way," he said.

"The sort of places that would be adequate to give shelter in both winter and summer?"

"Of course," he said, "because you seem to be talking about dwellings."

"Yes," I said, "dwellings for soldiers anyway, but not for moneymakers."

"How do you mean the one differs from the other?" he said.

416a

"I'll try to tell you," I said. "Because it's surely the most dreadful and shameful of all things for a shepherd to raise dogs as auxiliaries for the flock that are of the sort and brought up in such a way that, from intemperance or hunger or some bad habit of another kind, the dogs themselves try to do harm to the sheep, acting like wolves instead of dogs."

"It is dreadful," he said; "how could it be anything else?"

"Then isn't there a need to be on guard in every way so that our auxiliaries won't do that sort of thing to the citizens, since they're the stronger, becoming like savage masters instead of benevolent allies?"

b

"There's a need to be on guard," he said.

"And wouldn't they have been provided with the most effective safeguard if they've been beautifully educated in their very being?"

"But surely they have been," he said.

And I said, "That's not something that deserves to be asserted with certainty, Glaucon my friend. What we were saying just now does deserve to be, though, that they need to get the right education, whatever it is, if they're going to what's most important for being tame, both toward themselves and toward those who are guarded by them."

c

"That's certainly right," he said.

"Now in addition to this education, any sensible person would claim that they need to be provided with dwellings and other property of that sort, whatever it takes for them not to be stopped from being the best possible guardians and not to be tempted to do harm to the citizens."

d

"And he'll be claiming something true."

"Then see whether they need to live and be housed in some such way as this," I said, "if they're going to be that sort of people. First, no private property that's not completely necessary is to be possessed by any of them. Next, there's to be no house or treasure room belonging to any of them except one that everyone who wants to will enter. Provisions, of all things men need who are moderate and courageous fighters in war, they're to receive at fixed times from the other citizens as recompense for guarding them, of such an amount that they have nothing over and nothing lacking each year. Going regularly to public dining halls, they're to live in common like soldiers in a camp. About gold and silver, it's to be said to them that they have the divine sort from gods always in their souls, and have no further need of the human sort, and that it's not pious to defile their possession of the former by mixing with it the possession of mortal gold, because many impious deeds have occurred over the currency most people use, while the sort they have with them is uncorrupted. And for them alone of those in the city, it's not lawful to handle or touch gold and silver, or even to go under the same roof with them, or wear them as ornaments, or drink out of silver or gold cups."

e

417a

“And in this way they’d keep themselves and the city safe. But whenever they possess private land and houses and currency, they’ll be heads of households and farm owners instead of guardians, and they’ll become hostile masters instead of allies of the other citizens, and spend their whole lives hating and being hated, and plotting and being plotted against, fearing those inside the city instead of and much more than the enemies outside it, as they and the rest of the city race onward, already very close to destruction.

“For all these reasons, then,” I said, “we’ll declare that’s the way the guardians need to be provided for in the matter of housing and the rest, and we’ll set these things down as laws, won’t we?”

“Very much so,” said Glaucon.

BOOK IV

* * *

427c “Your city, son of Ariston,” I said, “[has] now be founded. So after that, take a
d look around in it yourself, once you’ve provided a light from somewhere, and call in your brother and Polemarchus and the others, if in any way we might see wherever its justice might be, and its injustice, and what differentiates the pair from each other, and which of the two someone who’s going to be happy ought to get hold of, whether he goes unnoticed or not by all gods and human beings.”

e “You’re talking nonsense,” said Glaucon. “You took it on yourself to search for it because it’s irreverent for you not to come to the aid of justice in every way to the limit of your power.”

“It’s true,” I said, “as you remind me, and so it must be done, but you folks need to do your part too.”

“Well that’s what we’ll do,” he said.

“Then I hope to find it this way,” I said. “I imagine our city, if in fact it’s been correctly founded, is completely good.”

“Necessarily,” he said.

“So it’s clear that it’s wise and courageous and moderate and just.”

“That’s clear.”

428a “Then whatever we find in it from among them, the leftover part will be what hasn’t been found?”

“Of course.”

“Then just as with any other four things, if we were looking for a particular one of them in whatever it was, whenever we recognized that one first that would be good enough for us, but if we recognized the three first, by that very means we would have recognized the thing we’re looking for, because it’s obvious that it couldn’t any longer be anything else than the thing left over.”

“You’re saying it correctly,” he said.

“So for these things too, since they happen to be four, they need to be looked for in the same way?”

“Obviously.”

“Well then, the first thing that seems to me to be clearly visible in it is wisdom. b
And there seems to be something strange about it.”

“What?” he said.

“The city that we went over seems to me to be wise in its very being. Because it is well-counseled, isn’t it?”

“Yes.”

“And surely it’s clear that this very thing, good counsel, is a certain kind of knowledge, since it’s presumably not by ignorance but by knowledge that people counsel well.”

“That’s clear.”

“But many kinds of knowledge of all varieties are surely present in the city.”

“How could there not be?”

“Then is it on account of the carpenters’ knowledge that the city is called wise and well-counseled?”

“Not at all,” he said, “on account of that it’s called skilled in carpentry.” c

“Then it’s not on account of the knowledge that counsels about how wooden equipment would be best that a city is called wise.”

“No indeed.”

“Well then, is it the knowledge about things made of bronze or anything else of that sort?”

“None whatever of those,” he said.

“And it’s not the knowledge about growing the fruits of the earth; that makes it skilled in farming.”

“It seems that way to me.”

“What about it, then?” I said. “Is there any knowledge in the city just now founded by us, on the part of any of its citizens, by which it counsels not about things in the city pertaining to someone in particular, but about itself as a whole, and in what way it would interact best within itself and with other cities?” d

“There certainly is.”

“What is it,” I said, “and in which of them?”

“It’s guardianship,” he said, “and it’s in those rulers whom we were just now naming complete guardians.”

“So on account of this sort of knowledge, what do you call the city?”

“Well-counseled,” he said, “and wise in its very being.”

“Now do you imagine,” I said, “that there will be more metalworkers present in our city than these true guardians?” e

“A lot more metalworkers,” he said.

“And compared also to all the rest who are given names for having any particular kinds of knowledge, wouldn’t these guardians be the fewest of them all?”

“By a lot.”

“Therefore it’s by means of the smallest group and part of itself, the part that directs and rules, and by the knowledge in it, that a whole city founded in accord with nature would be wise. And it seems likely that this turns out by nature to be the smallest class, the one that’s appropriately allotted a share of that knowledge which, alone among the other kinds of knowledge, ought to be called wisdom.” 429a

“Very true, just as you say,” he said.

“So we’ve discovered this one of the four—how we did it I don’t know—both it and where in the city it’s lodged.”

“It seems to me at any rate,” he said, “to have been discovered well enough.”

"But as for courage, it and the part of the city it lies in, and through which the city is called courageous, are surely not very hard to see."

"How so?"

b "Who," I said, "would say a city was cowardly or courageous by looking to anything other than that part of it which defends it and takes the field on its behalf?"

"No one," he said, "would look to anything else."

"Because I don't imagine," I said, "that whether the other people in it are cowards or courageous would be what determines it to be the one sort or the other."

"No."

c "Then a city is also courageous by means of a certain part of itself, by its having in it a power such that it will safeguard through everything its opinion about what's to be feared, that it's the same things or the sorts of things that the lawgiver passed on to them in their education. Or isn't that what you call courage?"

"I haven't quite understood what you're saying," he said; "just say it again."

"I mean," I said, "that courage is a certain kind of preservation."

"What kind of preservation exactly?"

d "Of the opinion instilled by law through education about what things and what sorts of things are to be feared. By preserving it through everything I meant keeping it intact when one is in the midst of pains and pleasures and desires and terrors and not dropping it. I'm willing to make an image of what it seems to me to be like if you want me to."

"I want you to."

e "You know, don't you," I said, "that dyers, when they want to dye wool so it will be purple, first select, from among the many colors, wool of the single nature belonging to white things, and then prepare it in advance, taking care with no little preparation that it will accept the pigment as much as possible, and only so dip it in the dye? And what is dyed in this way becomes impervious to fading, and washing it, whether without soaps or with them, has no power to remove the color from it, but what is not done that way—well, you know what it comes out like, whether one dyes it with other colors or this one without having taken care in advance."

"I know," he said, "that it's washed out and laughable."

430a "Then understand," I said, "that we too were doing something like that to the extent of our power when we were selecting the soldiers and educating them with music and gymnastic training. Don't imagine that we devised that for any reason other than so they, persuaded by us, would take the laws into themselves like a dye in the most beautiful way possible, so that their opinion about what's to be feared, and about everything else, would become impervious to fading, because they'd had the appropriate nature and upbringing, and the dye couldn't be washed out of them by those soaps that are so formidable at scouring, either pleasure, which is more powerful at doing that than every sort of lye and alkaline ash, or pain, terror, and desire, more powerful than any other soaps. This sort of power and preservation through everything of a right and lawful opinion about what is and isn't to be feared, I for my part call courage, and I set it down as such unless you say otherwise."

b "No," he said, "I don't say anything different, because it seems to me that you're considering the right opinion about these same things that comes about without education, as animal-like or slavish, and not entirely reliable, and that you'd call it something other than courage."

c "Entirely true," I said, "as you say."

"Then I accept this as being courage," he said.

"Yes, do accept it," I said, "but as a citizen's courage, and you'll be accepting it the right way. We'll go over something still more beautiful in connection with it later

if you want, because what we've been looking for now is not that but justice. For the inquiry about that, I imagine this is sufficient."

"Yes," he said, "beautifully said."

"So two things are still left," I said, "that it's necessary to catch sight of in the city, moderation, and the one for the sake of which we're looking for them all, justice." d

"Quite so."

"How, then, might we discover justice so that we won't have to bother any more about moderation?"

"Well," he said, "I don't know and I wouldn't want it to come to light first anyway if we're no longer going to examine moderation. So if you want to gratify me, consider this before that."

"I certainly do want to," I said; "unless I'd be doing an injustice."

"Consider it, then," he said. e

"It's got to be considered," I said, "and as seen from where we are, it looks more like a sort of consonance and harmony than the ones before."

"How?"

"Presumably," I said, "moderation is a certain well-orderedness, and a mastery over certain pleasures and desires, as people say—being stronger than oneself—though in what way they mean that I don't know. And some other things of that sort are said that are like clues to it, aren't they?"

"They most of all," he said.

"But then isn't being stronger than oneself absurd? Because the one who's stronger than himself would presumably also be weaker than himself, and the weaker stronger, since the same person is referred to in all these terms." 431a

"How could it not be the same one?"

"But it appears to me," I said, "that this phrase intends to say that there's something to do with the soul within a human being himself that has something better and something worse in it, and whenever what's better by nature is master over what's worse, calling this 'being stronger than oneself' at least praises it. But whenever, from a bad upbringing or some sort of bad company, the better part that's smaller is mastered b by the larger multitude of the worse part, this as a reproach is blamed and called 'being weaker than oneself,' and the person so disposed is called intemperate."

"That's likely it," he said.

"Then look over toward our new city," I said, "and you'll find one of these things present in it. Because you'll claim that it's justly referred to as stronger than itself, if in fact something in which the better rules over the worse ought to be called moderate and stronger than itself."

"I am looking over at it," he said, "and you're telling the truth." c

"And surely one would find a multitude and variety of desires as well as pleasures and pains, in children especially, and in women and menial servants, and also in most of the lower sorts of people among those who are called free."

"Very much so."

"But you'll meet with simple and measured desires and pleasures, which are guided by reasoning with intelligence and right opinion, in few people, who are both best in nature and best educated."

"True," he said.

"Then don't you see that these too are present in your city, and that the desires in most people and those of the lower sorts are mastered there by the desires and intelligence of the lesser number of more decent people?" d

"I do," he said.

"So if one ought to refer to any city as stronger than pleasures and desires, and than itself, that needs to be applied to this one."

"Absolutely so," he said.

"So then isn't it moderate too in all these respects?"

"Very much so," he said.

"And also, if in any city the same opinion is present in both the rulers and the ruled about who ought to rule, it would be present in this one. Doesn't that seem so?"

"Emphatically so," he said.

"Then as for being moderate, in which group of citizens will you say it's present when they're in this condition, in the rulers or in the ruled?"

"In both, presumably," he said.

"So do you see," I said, "that we had an appropriate premonition just now that moderation is like a certain harmony?"

"Why's that?"

"Because it's not like courage and wisdom, each of which by its presence in a certain part showed the city to be either wise or courageous. It doesn't act that way, but is in fact stretched through the whole across the scale, showing the weakest, the strongest, and those in between to be singing the same song together, whether you want to rank them in intelligence, or, if you want, in strength, or even by their number or their money or by anything whatever of that sort. So we'd be most correct in claiming that this like-mindedness is moderation, a concord of the naturally worse and better about which ought to rule, both in the city and in each one."

"The way it seems to me is completely in accord with that," he said.

"Well then," I said, "three of them have been spotted in our city—at least it seems that way. So what would be the remaining form by which the city would further partake in virtue? For it's clear that this is justice."

"That's clear."

"So now, Glaucon, don't we need to take up positions like hunters in a circle around a patch of woods and concentrate our attention, so that justice doesn't escape anywhere, disappear from our sight, and become obscure? Because it's evident that it's in there somewhere. So look and make a spirited effort to catch sight of it, in case you spot it in any way before I do, and you'll show it to me."

"If only I were able to," he said. "Instead, if you treat me as a follower who's capable of seeing what's pointed out to him, you'll be handling me in an entirely sensible way."

"Follow then," I said, "after offering up prayers along with me."

"I'll do that," he said; "just you lead."

"The place sure does look like an inaccessible and shadowy one," I said; "at any rate it's dark and hard to scout through. But still, one needs to go on."

"Yes, one does need to go on," he said.

And spotting something, I called, "Got it! Got it, Glaucon! We've probably got its trail, and I don't think it's going to get away from us at all."

"You bring good tidings," he said.

"But oh what a slug-like condition we were in," I said.

"In what sort of way?"

"All this time, you blessed fellow, and it seems it's been rolling around in front of our feet from the beginning, and we didn't see it for all that, but were utterly ridiculous; the way people holding something in their hands sometimes look for the things they're

holding, we too weren't looking at the thing itself but were gazing off into the distance somewhere, which is probably the very reason it escaped our notice."

"How do you mean?" he said.

"Like this," I said: "it seems to me that although we've been saying it and hearing it all along, we haven't learned from our own selves that we were in a certain way saying it."

"That's a long prologue for someone who's eager to hear," he said.

"Well then, hear whether I mean anything after all," I said.

433a

"Because from the beginning the thing we've set down as what we needed to do all through everything when we were founding the city, this, it seems to me, or else some form of this, is justice. Surely we set down, and said often, if you remember, that each one person needed to pursue one of the tasks that are involved in the city, the one to which his nature would be naturally best adapted."

"We did say that."

"And surely we've heard it said by many others that doing what's properly one's own and not meddling in other people's business is justice, and we've said it often ourselves."

b

"We have said that."

"This, then, my friend," I said, "when it comes about in a certain way, is liable to be justice, this doing what's properly one's own. Do you know where I find an indication of this?"

"No, tell me," he said.

"It seems to me," I said, "that the thing that's left over in the city from the ones we've considered—moderation, courage, and wisdom—is what provided all of them with the power to come into being in it and provides their preservation once they've come into being, for as long as it's in it. And in fact we were claiming that justice would be what was left over from them if we were to find the three."

c

"And that is necessary," he said.

"And certainly," I said, "if one had to judge which of these would do our city the most good by coming to be present in it, it would be hard to decide whether it's the agreement of opinion of the rulers and ruled, or the preservation of a lawful opinion that arises in the soldiers about what things are and aren't to be feared, or the judgment and guardianship present in the rulers, or whether it's this that does it the most good by being in it, in a child and a woman and a slave and a free person and a craftsman and a ruler and one who's ruled, the fact that each of them, being one person, did what was properly his own and didn't meddle in other people's business."

d

"It's hard to decide," he said; "how could it not be?"

"Therefore, it seems that, with a view to a city's virtue, the power that comes from each person's doing what's properly his own in it is a match for its wisdom and moderation and courage."

"Very much so," he said.

"And wouldn't you place justice as a match for these as to a city's virtue?"

"Absolutely so."

"Then consider whether it will seem that way in this respect too: will you assign the judging of lawsuits in the city to the rulers?"

e

"Certainly."

"And will they judge them with their sights on anything else besides this, that each party not have another's property or be deprived of his own?"

"No, only on that."

"Because it's the just thing?"

"Yes."

434a "Then in this respect too, having and doing what's properly one's own would be agreed to be justice."

"That's so."

"Now see if the same thing seems so to you that does to me. If a carpenter tries to work at the job of a leatherworker, or a leatherworker at that of a carpenter, or if they trade their tools and honors with each other, or even if the same person tries to do both jobs, and everything else gets traded around, would it seem to you to do the city any great harm?"

"Not very great," he said.

b "But I imagine when someone who's a craftsman by nature, or some other sort of moneymaker, but proud of his wealth or the multitude of his household or his strength or anything else of the sort, tries to get in among the warrior kind, or one of the warriors into the deliberative and guardian kind when he doesn't merit it, and they trade their tools and honors with each other, or when the same person tries to do all these jobs at the same time, then I imagine it would seem to you too that this change and meddling among them would be the ruin of the city."

"Absolutely so."

c "Therefore among the three classes there are, any meddling or changing into one another is of the greatest harm to the city, and would most correctly be referred to as the greatest wrongdoing."

"Precisely so."

"And wouldn't you say the greatest wrongdoing toward one's own city is injustice?"

"How could it not be?"

"So this is injustice. And let's say this the other way around; the minding of their own business by the moneymaking, auxiliary, and guardian classes, when each of them does what properly belongs to it in a city, is the opposite of that and would be justice and would show the city to be just?"

"It doesn't seem to be any other way than that to me," he said.

d "Let's not say it in quite so rigid a way yet, but if this form is agreed by us to be present in each one of the people as well and to be justice there, then we'll join in going along with it. What more would there be to say? And if not, then we'll consider something else. But for now let's complete the examination by which we imagined it would be easier to catch sight of what sort of thing justice is in one human being if we tried to see
e it first in some bigger thing that has justice in it. And it seemed to us that a city is just that, and so we founded the best one in our power, knowing well that it would be present in a good one at least. So let's carry over what came to light for us there to one person,
435a and if they're in accord, it will turn out beautifully; but if something different shows up in the single person, we'll go back to the city again and test it. And maybe, by examining them side by side and rubbing them together like sticks, we could make justice flame forth from them, and once it's become evident we could substantiate it for ourselves."

"Then it's down the road you indicate," he said, "and it behooves us to go there too."

"Well then," I said, "does the bigger or smaller thing that someone refers to by the same name happen to be unlike the other one in the respect in which it's called the same, or like it?"

"Like it," he said.

b "Therefore a just man will not differ at all from a just city with respect to the form of justice, but he'll be like it."

"He'll be like it," he said.

"But the city seemed to be just because each of the three classes of natures present in it did what properly belonged to it, while it seemed also to be moderate, courageous, and wise on account of certain other attributes and characteristic activities of these same classes."

"True," he said.

"Therefore, my friend, we'll regard a single person in this way too, as having these same forms in his soul, and as rightly deserving to have the same names applied to them as in the city as a result of the same attributes." c

"There's every need to," he said.

"It's certainly a light question about the soul we've landed ourselves into now, you strange fellow," I said, "whether it has these three forms in it or not."

"It's not quite such a light one we seem to me to be in," he said. "It's probably because the saying is true, Socrates, that beautiful things are difficult."

"So it appears," I said. "And know for sure, Glaucon, that it's my opinion we'll never get hold of this in a precise way along the sorts of paths we're now taking in our arguments, because there's another, longer and more rigorous road that leads to it. Maybe, though, we can get hold of it in a way worthy, at least, of the things that have already been said and considered." d

"Isn't that something to be content with?" he said. "For me, at present anyway, it would be good enough."

"Yes, certainly," I said, "that will be quite sufficient for me too."

"Don't get tired, then," he said; "just examine it."

"Well then," I said, "isn't there a great necessity for us to agree that the same forms and states of character are present in each of us as are in the city? Because presumably they didn't get there from anywhere else. It would be ridiculous if anyone imagined the spirited character didn't come to be in the cities from particular people who also have this attribute, like those in Thrace and Scythia, and pretty generally in the northern region, or similarly with the love of learning, which one might attribute especially to the region round about us, or the love of money that one might claim to be not least round about the Phoenicians and those in Egypt." e 436a

"Very much so," he said.

"That's just the way it is," I said, "and it's not difficult to recognize."

"Certainly not."

"But this now is difficult: whether we act each way by means of the same thing, or in the different ways by means of different things, of which there are three—whether we learn by means of one of the things in us, become spirited by means of another, and feel desires in turn by means of a third for the pleasures having to do with nourishment and procreation and as many things as are closely related to these, or whether we act by means of the whole soul in each of them, once we're aroused. These are the things that will be difficult to determine in a manner worthy of the discussion." b

"It seems that way to me too," he said.

"Then let's try to mark out whether they're the same as one another or different, in this way."

"How?"

"It's obvious that the same thing isn't going to put up with doing or undergoing opposite things in the same respect and in relation to the same thing at the same time, so presumably if we find that happening in the things in question, we'll know that they're not the same but more than one thing." c

"Okay."

"Then consider what I say."

"Say it," he said.

"Does the same thing have the power to stand still and move," I said, "at the same time in the same respect?"

"Not at all."

"Then let's agree about it in a still more precise way, so that we won't be quibbling as we go on. Because if anyone were to say of a person who was standing still but moving his hands and his head, that the same person was standing still and moving at the same time, I imagine we wouldn't consider that he ought to say it that way, but that some one thing about the person stands still while another moves. Isn't that so?"

"It's so."

"So if the one who said that were to get still more cute, making the subtle point that tops stand still as a whole and move at the same time, when they spin around with the point fixed in the same place, or that anything else going around in a circle on the same spot does that, we wouldn't accept it, since it's not with respect to the same things about themselves that such things are in that case staying in place and being carried around, but we'd claim that they have in them something straight and something surrounding it, and stand still with respect to the straight part, since they don't tilt in any direction, but move in a circle with respect to the surrounding part; and when the straight axis is leaning to the right or the left, or forward or back, at the same time it's spinning around, then it's not standing still in any way."

"You've got that right," he said.

"Therefore, when such things are said they won't knock us off course at all, any more than they'll persuade us that in any way, the same thing, at the same time, in the same respect, in relation to the same thing, could ever undergo, be, or do opposite things."

"Not me at any rate," he said.

"Be that as it may," I said, "in order that we won't be forced to waste time going through all the objections of that sort and establishing that they aren't true, let's go forward on the assumption that this is how it is, having agreed that, if these things should ever appear otherwise than that, all our conclusions from it will have been refuted."

"That's what one ought to do," he said.

"Well then, would you place nodding 'yes' as compared to shaking one's head 'no' among things that are opposite to each other, and having a craving to get something as compared to rejecting it, and drawing something to oneself as compared to pushing it away, and everything of that sort? Whether they're things one does actively or experiences passively, there won't be any difference on that account."

"Sure," he said, "they're opposites."

"And what about thirst and hunger and the desires in general," I said, "as well as wishing and wanting? Wouldn't you place all these things somewhere in those forms just mentioned? For example, wouldn't you claim that the soul of someone who desires either has a craving for what it desires, or draws to itself what it wants to become its own, or, in turn, to the extent it wishes something to be provided to it, nods its assent to this to itself as though it had asked some question, stretching out toward its source?"

"I would indeed."

"And what about this? Won't we place not wanting and not wishing and not desiring in with pushing away and banishing from itself and in with all the opposites of the former things?"

"How could we not?"

"Now these things being so, are we going to claim that there's a form consisting of desires, and that among these themselves, the most conspicuous ones are what we call thirst and what we call hunger?"

"We're going to claim that," he said.

"And the one is for drink, the other for food?"

"Yes."

"Now to the extent that it's thirst, would it be a desire in the soul for anything beyond that of which we say it's a desire? For instance, is thirst a thirst for a hot drink or a cold one, or a big or a little one, or in a word, for any particular sort of drink? Or, if there's any heat present in addition to the thirst, wouldn't that produce an additional desire for cold, or if cold is present, a desire for heat? And if by the presence of magnitude the thirst is a big one, that will add a desire for a big drink, or of smallness, for a little one? But being thirsty itself will never turn into a desire for anything other than the very thing it's naturally for, for drink, or being hungry in turn for food?" e

"It's like that," he said; "each desire itself is only for the very thing it's naturally for, while the things attached to it are for this or that sort."

"Then let's not be unprepared, and let someone get us confused, on the grounds that no one desires drink, but decent quality drink, and not food but decent quality food, since everyone, after all, desires good things. So if thirst is a desire, it would be for a decent quality of drink, or of whatever else it's a desire for, and the same way with the other desires." 438a

"Well, maybe there could seem to be something in what he's saying," he said, "when he says that."

"But surely," I said, "with all such things that are related to something, the ones that are of particular kinds are related to something of a particular kind, as it seems to me, while the sorts that are just themselves are related only to something that's just itself." b

"I don't understand," he said.

"Don't you understand," I said, "that what's greater is of such a sort as to be greater than something?"

"Certainly."

"Than a lesser thing?"

"Yes."

"And a much greater thing than one that's much less, right?"

"Yes."

"And also a thing that was greater than one that was less, and a thing that's going to be greater than one that's going to be less?"

"Yes, of course," he said.

"And something more numerous is related to something that's fewer, and something twice as many to something that's half as many, and all that sort of thing, and also something heavier to something lighter and faster to slower, and in addition, hot things are related to cold things, and isn't everything like that the same way?" c

"Very much so."

"And what about the kinds of knowledge? Aren't they the same way? Knowledge just by itself is knowledge of what's learnable just by itself, or of whatever one ought to set down knowledge as being of, while a particular knowledge or a particular sort is of a particular thing or a particular sort of thing. I mean this sort of thing: when a knowledge of constructing houses came into being, didn't it differ from the other kinds of knowledge so that it got called housebuilding?" d

"Certainly."

"And wasn't that because it's a particular kind of knowledge, and any of the others is a different sort?"

"Yes."

“And wasn’t it because it was about a particular sort of thing that it too came to be of a particular sort, and the same way for the other arts and kinds of knowledge?”

“That’s the way it is.”

“Well then,” I said, “if you’ve understood it now, call that what I meant to say then, e that with all the things that are such as to be about something, the ones that are only themselves are about things that are only themselves, while the ones that are of particular kinds are about things of particular kinds. And I’m not saying at all that the sorts of things they’re about are the same sorts they themselves are, as a result of which the knowledge of what’s healthy and sick would be healthy and sickly, and the knowledge of bad and good things would be bad and good; instead, I’m saying that when a knowledge came into being that was not just about the very thing knowledge is about, but about a particular thing, and that was what’s healthy and sick, it too as a result came to be of a particular sort. And this made it no longer be called simply knowledge, but, with the particular sort included, medicine.”

“I’ve understood it,” he said, “and it does seem that way to me.”

439a “So wouldn’t you place thirst,” I said, “among those things in which to be for something is exactly what they are? Thirst is, of course, for something.”

“I would, yes,” he said; “it’s for drink anyway.”

“And isn’t a particular sort of thirst for a particular sort of drink, while thirst itself is not for a lot or a little, or for a good or a bad one, or, in a word, for any particular sort, but thirst itself is naturally just for drink itself?”

“Absolutely so.”

b “Therefore the soul of someone who’s thirsty, to the extent he’s thirsty, wants nothing other than to drink, and stretches out to this, and sets itself in motion toward it.”

“Clearly so.”

“So if anything ever pulls it back when it’s thirsty, it would be some different thing in it from the very thing that’s thirsty, and that tows it like an animal toward drinking? Because we claim that the same thing couldn’t be doing opposite things in the same part of itself in relation to the same thing at the same time.”

“No, it couldn’t.”

c “In the same way, I imagine, one doesn’t do well to say about an archer that his hands push and pull the bow at the same time, but rather that one hand is the one pushing it and the other the one pulling it.”

“Absolutely so,” he said.

“Now do we claim that there are some people who sometimes, while they’re thirsty, aren’t willing to drink?”

“Very much so,” he said, “many people and often.”

“Well what should one say about them?” I said. “Isn’t there something in their soul telling them to drink and something preventing them from it that’s different from and mastering what’s telling them to?”

“It seems that way to me,” he said.

d “And doesn’t the thing that prevents such things come about in it, when it does come about, from reasoning? But the things that tug and pull come to it from passions and disorders?”

“It looks that way.”

“So not unreasonably will we regard them as being two things and different from each other, referring to that in the soul by which it reasons as its reasoning part, and that by which it feels erotic love, hunger, and thirst, and is stirred with the other desires, as its irrational and desiring part, associated with certain satisfactions and pleasures.”

“No, we’d regard them that way quite reasonably,” he said.

“So let these two forms be marked off in the soul,” I said. “But is the part that has to do with spiritedness, and by which we’re spirited, a third thing, or would it be of the same nature as one of these two?” e

“Maybe the same as one of them,” he said, “the desiring part.”

“But I once heard something that I believe,” I said, “about how Leontius, Aglaion’s son, was going up from Piraeus along the outside of the north wall, and noticed dead bodies lying beside the executioner. He desired to see them, but at the same time felt disgust and turned himself away; for a while he struggled and covered his eyes, but then he was overcome by his desire, and running toward the bodies holding his eyes wide open, he said, ‘See for yourselves, since you’re possessed! Take your fill of the lovely sight.’” 440a

“I’ve heard that myself,” he said.

“This story certainly indicates,” I said, “that anger sometimes makes war against the desires as though it were one thing acting against another.”

“It does indicate that,” he said.

“And don’t we often observe it in many other ways as well,” I said, “when desires overpower someone contrary to his reasoning part, that he scolds himself and is aroused against the part in him that’s overpowering him, and just as if there were a pair of warring factions, the spiritedness of such a person becomes allied with his reason? But as for its making a partnership with the desires to act in defiance when reason has decided what ought not to be done, I don’t suppose you’d claim you’d ever noticed such a thing happening in yourself, or, I imagine, in anyone else.” b

“No, by Zeus!” he said.

“Then what about when someone thinks he’s being unjust?” I said. “The more noble he is, won’t he be that much less capable of getting angry at being hungry or cold or suffering anything else at all of the sort from the person he thinks is doing those things to him justly, and won’t he be unwilling, as I’m saying, for his spirit to be aroused against that person?” c

“That’s true,” he said.

“But what about when he regards himself as being treated unjustly? Doesn’t the spirit in him seethe and harden and ally itself with what seems just, and submitting to suffering through hunger and cold and all such things, it prevails and doesn’t stint its noble struggles until it gains its end or meets its death, or else, called back, like a dog by a herdsman, by the reason that stands by it, it becomes calm?” d

“It is very much like what you describe,” he said. “And certainly in our city we set up the auxiliaries like dogs obedient to the rulers, who were like shepherds of the city.”

“You conceive what I want to say beautifully,” I said, “especially if you’ve taken it to heart in this respect in addition to that one.”

“In what sort of respect?”

“That it’s looking the opposite of the way it did to us just now with the spirited part, because then we imagined it was something having to do with desire, but now we’re claiming that far from that, it’s much more inclined in the faction within the soul to take arms on the side of the reasoning part.” e

“Absolutely,” he said.

“Then is it different from that too, or some form of the reasoning part, so that there aren’t three but two forms in the soul, a reasoning one and a desiring one? Or just as, in the city, there were three classes that held it together, moneymaking, auxiliary, and deliberative, so too in the soul is there this third, spirited part, which is by nature an auxiliary to the reasoning part, unless it’s corrupted by a bad upbringing?” 441a

“It’s necessarily a third part,” he said.

“Yes,” I said, “as long as it comes to light as something differing from the reasoning part, the same way it manifested itself as different from the desiring part.”

“But it’s not hard to make that evident,” he said, “since one could see this even in small children, that they’re full of spiritedness right from birth, while some of them
b seem to me never to get any share of reasoning, and most get one at a late time of life.”

“Yes, by Zeus,” I said, “you put it beautifully. And also in animals one could see that what you’re describing is that way. And in addition to these things, what we cited from Homer in some earlier place in the conversation will bear witness to it:

Striking his chest, he scolded his heart with words.

Here Homer has clearly depicted that which reflects on the better and the worse as one
c thing rebuking another, that which is irrationally spirited.”

“You’ve said it exactly right,” he said.

“Well, with a lot of effort we’ve managed to swim through these waters, and we’re tolerably well agreed that the same classes in the city are present in the soul of each one person, and are equal in number.”

“They are.”

“Isn’t it already a necessary consequence, then, that a private person is wise in the same manner and by the same means that a city was wise?”

“How else?”

“And the means by which and manner in which a private person is courageous is
d that by which and in which a city was courageous, and everything else related to virtue is the same way for both?”

“Necessarily.”

“So, Glaucon, I imagine we’ll claim also that a man is just in the very same manner in which a city too was just.”

“This too is entirely necessary.”

“But surely we haven’t forgotten somewhere along the way that the city was just because each of the three classes that are in it do what properly belongs to them.”

“We don’t seem to me to have forgotten that,” he said.

“Therefore we need to remember also that for each of us, that whoever has each
e of the things within him doing what properly belongs to it will be just himself and be someone who does what properly belongs to him.”

“It needs to be remembered very well indeed,” he said.

“Then isn’t it appropriate for the reasoning part to rule, since it’s wise and has forethought on behalf of the whole soul, and for the spirited part to be obedient to it and allied with it?”

“Very much so.”

“Then as we were saying, won’t a blending of music with gymnastic exercise
442a make them concordant, tightening up the one part and nourishing it with beautiful speeches and things to learn while relaxing the other with soothing stories, taming it with harmony and rhythm?”

“Exactly so,” he said.

“So once this pair have been nurtured in this way, and have learned and been educated in the things that truly belong to them, they need to be put in charge of the desiring part, which is certainly the largest part of the soul in each person and by nature the most insatiable for money. This part needs to be watched over so that it doesn’t get filled with the so-called pleasures of the body and, when it becomes big
b and strong, not do the things that properly belong to it, but try to enslave and rule over

things that are not of a kind suited to it, so that it turns the whole life of all the parts upside-down.”

“Very much so,” he said.

“And wouldn’t this pair also stand guard on behalf of the whole soul and body against their external enemies in the most beautiful way,” I said, “one part deliberating while the other goes to war, following its ruler and accomplishing with its courage the things that have been decided?”

“That’s the way it is.”

“And I imagine we call each one person courageous on account of this part, when the spirited part of him preserves through pains and pleasures what’s been passed on to it by speeches as something to be feared or not.”

“Rightly so,” he said.

“And wise by that little part, the one that ruled in him and passed those things on, and it in turn has knowledge in it of what’s advantageous for each part and for the whole consisting of the three of them in common.”

“Very much so.”

“And what next? Isn’t each person moderate by the friendship and concord among these same things, when the ruling part and the pair that are ruled are of the same opinion that the reasoning part ought to rule and aren’t in revolt against it?”

“Moderation is certainly nothing other than that,” he said, “in a city or a private person.”

“But each person will be just on account of the thing we repeat so often, and in that manner.”

“That’s a big necessity.”

“Then what about this?” I said. “Surely it hasn’t gotten fuzzy around the edges for us in any way, has it, so it would seem to be some other sort of justice than the one that came to light in the city?”

“It doesn’t seem to me it has,” he said.

“Well,” I said, “we could establish this beyond all doubt, if anything in our soul still stands unconvinced, by applying the commonplace standards to it.”

“What sort of standards exactly?”

“For example, if we were asked to come to an agreement about that city and the man who’s like that by nature and upbringing, as to whether it seemed such a man would steal a deposit of gold or silver he’d accepted in trust, do you think anyone would imagine he’d be more likely to do that than all those not of his sort?”

“No one would,” he said.

“And wouldn’t temple robberies, frauds, and betrayals, either of friends in private or cities in public capacities, be out of the question for this person?”

“Out of the question.”

“And in no way whatever would he be unfaithful to oaths or other agreements.”

“How could he?”

“And surely adultery, neglect of parents, and lack of attentiveness to the gods belong more to any other sort of person than to this one.”

“Any other sort for sure,” he said.

“And isn’t the thing responsible for all that the fact that each of the parts within him does what properly belongs to it in connection with ruling and being ruled?”

“That and nothing else.”

“So are you still looking for justice to be anything other than the power that produces men and cities of that sort?”

“By Zeus,” he said, “not I.”

- c “So our dream has come to complete fulfillment; we said we suspected, right from when we started founding the city, that by the favor of some god we were liable to have gotten to an origin and outline of justice.”

“Absolutely so.”

“And what it was in fact, Glaucon—and this is why it was so helpful—was an image of justice, that it was right for the natural leatherworker to do leatherwork and not do anything else, and for the carpenter to do carpentry, and the same way for the rest.”

“So it appears.”

- d “And the truth is, justice was something like that, as it seems, but not anything connected with doing what properly belongs to oneself externally, but with what’s on the inside, that truly concerns oneself and properly belongs to oneself, not allowing each thing in him to do what’s alien to it, or the classes of things in his soul to meddle with one another, but setting his own house in order in his very being, he himself ruling over and bringing order to himself and becoming his own friend and harmonizing three things, exactly like the three notes marking a musical scale at the low end, the high end, and the middle; and if any other things happen to be between them, he binds all of them together and becomes entirely one out of many, moderate and harmonized. Only when he’s in this condition does he act, if he performs any action having to do with acquiring money, or taking care of the body, as well as anything of a civic kind or having to do with private transactions; in all these cases he regards an action that preserves that condition and helps to complete it as a just and beautiful act, and gives it that name, and regards as wisdom the knowledge that directs that action. Anything that always breaks down that condition, he regards as an unjust action, and the opinion that directs that, he regards as ignorance.”

“You’re absolutely telling the truth, Socrates,” he said.

“Okay,” I said, “if we were to claim that we’ve discovered the just man and the just city, and exactly what justice is in them, I imagine we wouldn’t seem to be telling a total lie.”

“By Zeus, certainly not,” he said.

“Shall we claim that, then?”

“Let’s claim it.”

“So be it,” I said. “What needs to be examined after this, I imagine, is injustice.”

“Clearly.”

- b “Doesn’t it in turn have to be some sort of faction among these three things, a meddling and butting in and an uprising of a certain part of the soul against the whole, in order to rule in it when that’s not appropriate, because it’s of such a kind by nature that it’s only fitting for it to be a slave? I imagine we’ll claim something like that, and that the disorder and going off course of these parts is injustice as well as intemperance, cowardice, foolishness, and all vice put together.”

- c “Those are the very things it is,” he said.

“Then as for doing unjust things and being unjust,” I said, “and in turn doing just things, isn’t it by now patently obvious exactly what all these are, if indeed that’s so for both injustice and justice?”

“How so?”

“Because,” I said, “they don’t happen to be any different from what’s healthy or diseased; what those are in a body, these are in a soul.”

“In what way?” he said.

“Presumably, healthful things produce health and diseased things produce disease.”

“Yes.”

- d “Then is it also the case that doing just things produces justice, while doing unjust things produces injustice?”

“Necessarily.”

“And producing health is settling the things in the body into a condition of mastering and being mastered by one another in accord with nature, while producing disease is settling them into ruling and being ruled one by another contrary to nature.”

“That’s it.”

“Then in turn, as for producing justice,” I said, “isn’t that settling the things in the soul into a condition of mastering and being mastered by one another in accord with nature, while producing injustice is settling them into ruling and being ruled one by another contrary to nature?”

“Exactly,” he said.

“Therefore, it seems likely that virtue would be a certain health, beauty, and good condition of the soul, while vice would be a disease, deformity, and weakness.” e

“That’s what they are.”

“And don’t beautiful practices lead to the acquisition of virtue, and shameful ones to vice?”

“Necessarily.”

“So what remains at this point, it seems, is for us to consider next whether it’s profitable to perform just actions, pursue beautiful practices, and be just, whether or not it goes unnoticed that one is of that sort, or to do injustice and be unjust, so long as one doesn’t pay the penalty or become better by being corrected.” 445a

“But Socrates,” he said, “the question already appears to me to have become laughable, whether, when life doesn’t seem worth living with the body’s nature corrupted, even with all the foods and drinks and every sort of wealth and political rule, it will then be worth living with the nature of that very thing by which we live disordered and corrupted, even if someone does whatever he wants, but not the thing by which he’ll get rid of vice and injustice and acquire justice and virtue, seeing as how it’s become obvious that each of them is of the sort we’ve gone over.” b

“It is laughable,” I said. “Nevertheless, since we’ve come this far, far enough to be able to see clearly that this is the way it is, it wouldn’t be right to get tired out.”

“By Zeus,” he said, “getting tired out is the last thing we ought to do.”

“Come up to the mark now,” I said, “so you too can see how many forms vice has, the way it seems to me, at least the ones that are even worth looking at.” c

“I’m following,” he said; “just speak.”

“Well,” I said, “as though from a lookout spot, since we’ve climbed up to this point in the discussion, there appears to me to be one look that belongs to virtue and infinitely many to vice, but some four among them that are even worth mentioning.”

“How do you mean?” he said.

“There are liable to be as many dispositions of a soul,” I said, “as there are dispositions among polities that have looks to them.”

“How many, exactly?” d

“Five for polities,” I said, “and five for a soul.”

“Say which ones,” he said.

“I say that one,” I said, “would be this type of polity we’ve been going over, but it could be named in two ways, since if one exceptional man arose among the rulers it would be called kingship, but aristocracy if there were more than one.”

“True,” he said.

“This, then,” I said, “is one form that I’m talking about, since whether one or more than one man arose, it wouldn’t change any of the laws of the city worthy of mention, since the upbringing and education they got would be the way we went over.” e

“Likely not,” he said.

BOOK V

449 “Well, I call that kind of city and polity, and that kind of man, good and right, and if this sort are right, the rest are bad and wrong, in the ways the cities are managed and the way the soul’s disposition is constituted in private persons, and the badness takes four forms.”

“What sorts are they?” he said.

And I was going on to describe them in order, the way it appeared to me they
b change out of one another in each case, but Polemarchus, who was sitting a little way from Adeimantus, reached out his hand and grabbed him from above by his cloak at the shoulder, drew him near, stretching himself forward, and was saying something while stooping toward him, of which we heard nothing but this: “Shall we let it go, then,” he said, “or what shall we do?”

“Not in the least,” said Adeimantus, now speaking loudly.

And I said, “What in particular won’t you let go?”

“You,” he said.

c “Because of what in particular?” I said.

“You seem to us to be taking the lazy way out,” he said, “and to be cheating us out of a whole form that belongs to the argument, and not the least important one, to avoid going over it, and you seem to have imagined you’d get away with speaking of it dismissively, saying it’s obvious, about women and children, that what belongs to friends will be shared in common.”

“And wasn’t I right, Adeimantus?” I said.

“Yes,” he said, “but this ‘right’ needs explanation, like the rest of it, about what
d the manner of the sharing would be, since there could be many. So don’t pass over which of them you’re talking about, since we’ve been waiting all this time imagining you’d make some mention somewhere about the procreation of children, how they’ll be produced and once they’re born how they’ll be raised, and of this whole sharing of women and children you’re talking about. Because we think it has a big bearing, in fact a total impact, on whether the polity comes into being in the right way or not. But now, since you’re taking on another polity before you’ve determined these things sufficiently,
450a it seemed right to us to do what you’ve heard, to refuse to let you go until you’ve gone over all these things just like the rest.”

“Me too,” said Glaucon; “put me down as a partner in this vote.”

“Don’t worry,” said Thrasymachus, “consider these things as having seemed good to all of us, Socrates.”

“Oh what you folks have done by ambushing me,” I said. “So much discussion about the polity you’re setting in motion again, as though from the beginning, when I was rejoicing at having already gotten to the end of it, feeling content if anyone would
b leave these things alone and accept them the way they were stated then. You have no idea what a big swarm of arguments you’ve stirred up with the things you’re now demanding; since I saw that at the time I passed it by, fearing it would cause a lot of trouble.”

“What!” said Thrasymachus. “Do you imagine these people have come this far now to fritter away their time looking for gold rather than to listen to arguments?”

“All well and good,” I said, “but within measure.”

“The measure in hearing such arguments, Socrates,” said Glaucon, “for anyone who has any sense, is a whole life. So give up on that as far as we’re concerned; just see

that you don't get tired in any way of going all through the way it seems to you about the things we're asking, what the sharing of children and women will be among our guardians, and about the rearing of those who are still young that takes place in the time between birth and education, which seems to be the most troublesome time. So try to say in what way it needs to happen." c

"It's not easy to go through, you happy fellow," I said, "because it has a lot of doubtful points, even more than the things we went through before. It could even be doubted that what's spoken of is possible, and even if it came about as much as it possibly could, there will also be doubts even in that case that this would be the best thing. That's why there was a certain reluctance to touch on these things, for fear, dear comrade, the argument would seem to be only a prayer." d

"Don't be reluctant at all," he said, "since your listeners won't be unfair or disbelieving or ill-disposed."

And I said, "Most excellent fellow, I take it you're saying that to give me courage?"

"I am," he said.

"Well you're doing exactly the opposite," I said. "If I believed I knew what I was talking about, your pep talk would have been a beautiful one; to speak when one knows the truth, among people who are intelligent and friendly, about things that are of greatest importance and dear to us, is secure and encouraging, but to make one's arguments at the same time one is doubtful and searching, which is exactly what I'm doing, is a frightening and perilous thing. It's not because I'm liable to be laughed at—that's childish—but from fear that I'll not only tumble away myself from the truth, about things one least ought to fall down on, but that I'll also be lying in ruins with the friends I've dragged down with me. So instead I'll fall on my face in obeisance to Adrasteia, Glaucon, for her favor for what I'm about to say. I hope it's a lesser sin to become an unwilling murderer of someone than a deceiver about what's beautiful and good and just and lawful. That's a risk it's better to run among enemies rather than friends, so it's a good thing you gave me encouragement." 451a

And Glaucon, with a laugh, said, "Okay, Socrates, if we experience anything discordant from what you say, we'll release you like someone purified from being a murderer and cleared as no deceiver of us. Just speak up boldly." b

"Well, certainly someone who's released even in that situation is purified," I said, "as the law says, so it's likely that if it's that way there, it is here too."

"Speak, then," he said, "with that assurance."

"It's necessary to go back again now," I said, "and say what probably should have been said then in the proper place. And maybe this would be the right way, after the male drama has been completely finished, to finish the female drama in turn, especially since you're calling for it this way. To my way of thinking, for human beings born and educated in the way we went over, there is no other right way for them to get and treat children and women than to hasten down that road on which we first started them. We tried, I presume, in the argument, to set the men up like guardians of a herd." c

"Yes."

"Then let's follow that up by giving them the sort of birth and rearing that closely resemble that, and consider whether it suits us or not." d

"How?" he said.

"This way. Do we imagine that the females among the guard dogs ought to join in guarding the things the males guard, and hunt with them and do everything else in

common, or should they stay inside the house as though they were disabled by bearing and nursing the puppies, while the males do the work and have all the tending of the flock?"

"Everything in common," he said, "except that we'd treat the females as weaker and the males as stronger."

e "Is it possible, then," I said, "to use any animal for the same things if you don't give it the same rearing and training?"

"It's not possible."

"So if you're going to make use of women at the same tasks as men, they'll also have to be taught the same things."

"Yes."

452a "Music and gymnastic exercise were given to the men."

"Yes."

"Therefore this pair of arts needs to be made available to the women too, as well as the things connected with war, and they need to be applied in the same manner."

"It's likely, based on what you're saying," he said.

"Probably," I said, "many of the things being talked about now would look absurd if they're done the way they're being described, just because they're contrary to custom."

"Very much so indeed," he said.

b "Do you see which of them would be most absurd?" I said. "Isn't it obvious that it would be for the women to be exercising naked in the wrestling schools alongside the men, and not just the young ones but also those who're already on the older side, like the old men who're still devoted to exercising in the gyms when they're wrinkled and not a pleasant sight?"

"By Zeus," he said, "that would look absurd, at least the way things are at present."

c "But as long as we've got ourselves started talking about it, we shouldn't be afraid, should we, of all the jokes of whatever sort from witty people at the advent such a change in both gymnastic exercise and music, and not least about having war 'tools' and 'mounting' horses?"

"You've got that right," he said.

d "Instead, since we have started to talk about it, we need to pass right to the tough part of the law, asking these guys not to do what properly belongs to them but to be serious, and to recall that it's not much time since it seemed to the Greeks the way it does now to many of the barbarians, that it's shameful and absurd to look at a naked man, and when the people of Crete first introduced gymnasiums, and then the Spartans, the fashionable people of the time took the opportunity to ridicule all that. Don't you imagine they did?"

"I do."

e "But since it appeared to those who adopted the practice, I imagine, that it was better to uncover all such things than to hide them, what had been absurd in their eyes was stripped away by what was exposed as best in their reasoning. And this reveals that one who considers anything absurd other than what's bad is empty-headed, as is one who tries to get a laugh by looking at any other sight as laughable than one that's senseless and bad, or who takes seriously any mark of what's beautiful that he's set up other than what's good."

"Absolutely so," he said.

"Well then, isn't this the first thing that needs to be agreed about these things: whether they're possible or not? And shouldn't a chance for disputes be given to anyone

who wants to dispute it, whether it's someone fun-loving or the serious type, as to whether female human nature is capable of sharing in all the work that belongs to the nature of the male kind, or not in any at all, or in some sorts and not others, and whether in particular this last applies to things connected with war? Wouldn't someone be likely to get to the end of the subject most beautifully by starting off the most beautifully in this way?" 453a

"By far," he said.

"Then do you want us to carry on the dispute ourselves against ourselves, on behalf of the others," I said, "so that the opposing argument won't be under siege undefended?"

"There's no reason not to," he said.

"So let's say, on their behalf, 'Socrates and Glaucon, there's no need for anyone else to dispute with you, because you yourselves, at the beginning of the process of settling the city that you founded, agreed that each one person had to do the one thing that properly belonged to him by nature.'"

"Suppose we did agree to that; how could we not?"

"Well is there any way that a woman isn't completely different from a man in her nature?"

"How could she not be different?"

"Then isn't it also appropriate to assign each of them different work that's in accord with their nature?"

"Of course."

"So why aren't you mistaken now and contradicting yourselves, when you also declare that men and women ought to do the same things, despite having the most diverse natures? Will you be able to make any defense against this, you amazing fellow?"

"Not very easily, just on the spur of the moment," he said; "but I'll ask you, in fact I am asking you, to be the interpreter of the argument on our side too, whatever it is."

"This is what I was afraid of a long time ago, Glaucon," I said, "as well as many other things I foresaw, and I was reluctant to touch on the law about the way of having and bringing up women and children."

"No, by Zeus," he said, "it seems like it's no easy matter to digest."

"No, it's not," I said. "But it's like this: whether one falls into a little swimming tank or into the middle of the biggest sea, all the same one just swims none the less."

"Quite so."

"Well then, don't we too have to swim and try to save ourselves from the argument, and just hope for some dolphin to pick us up on his back or for some other sort of rescue that's hard to count on?"

"It looks that way," he said.

"Come on then," I said, "let's find a way out somewhere if we can. Because we're agreed that a different nature needs to follow a different pursuit, and that a woman and a man are different in nature; but we're claiming now that these different natures need to follow the same pursuits. Are these the things we're accused of?"

"Precisely."

"Oh Glaucon," I said, "what a noble power the debater's art has."

"Why in particular?"

"Because many people even seem to me to fall into it unwillingly," I said, "and imagine they're not being contentious but having a conversation, because they're not

able to examine something that's being said by making distinctions according to forms, but pounce on the contradiction in what's been said according to a mere word, subjecting one another to contention and not conversation."

"That is exactly the experience of many people," he said, "but that surely doesn't apply to us in the present circumstance, does it?"

b "It does absolutely," I said. "At any rate, we're running the risk of engaging in debate unintentionally."

"How?"

"We're pouncing, in an altogether bold and contentious manner, on 'the nature that's not the same' as a result of a word, because that's what's required not to have the same pursuits, but we didn't give any consideration whatever to what form of different or same nature we were marking off, and how far it extended, at the time when we delivered up different pursuits to a different nature and the same ones to the same nature."

"No, we didn't consider that," he said.

c "Well, according to that, then," I said, "it seems like we're entitled to ask ourselves whether it's the same nature that belongs to bald people as to longhaired ones, and not the opposite one, and whenever we agree that it's opposite, if bald people do leatherwork, not allow longhaired people to, or if the longhaired ones do, not allow the others."

"That would certainly be ridiculous," he said.

d "Well is it ridiculous for any other reason," I said, "than because we weren't reckoning on every sort of same and different nature at the time, but only watching out for that form of otherness and likeness that was relevant to the pursuits themselves? For example, with a male doctor and a female doctor, we meant that it's the soul that has the same nature. Don't you think so?"

"I do."

"But with a male doctor and a male carpenter, it's different?"

"Completely different, I presume."

e "So," I said, "if the men's or women's kind is manifestly superior in relation to any art or other pursuit, won't we claim that this needs to be given over to that one of the two? But if they apparently differ only in that the female bears the young and the male mounts the female, we'll claim instead that it hasn't yet been demonstrated in any way that a woman differs from a man in respect to what we're talking about, and we'll still believe that our guardians and the women with them ought to pursue the same activities."

"Rightly so," he said.

455a "Now after this, don't we invite the one who says the opposite to teach us this very thing, what art or what pursuit it is, among those involved in the setup of the city, for which the nature of a woman is not the same as but different from that of a man?"

"That's the just thing to do, anyway."

"And perhaps someone else as well might say the very thing you were saying a little while ago, that it's not easy to say anything adequate on the spot, but not hard if someone has been considering it."

"He would say that."

b "Then do you want us to ask the person who contradicts this sort of thing to follow us, if we somehow show him that no pursuit related to the running of a city is uniquely for a woman?"

"Certainly."

"'Come on then,' we'll say to him, 'answer: is this the way you meant that one person is naturally fitted for something and another isn't, that in it the one learns something

easily, the other with difficulty? And that the one, on the basis of a brief study, would be apt to discover a lot about what he'd learned, while the other, even when he's gotten a lot of study and practice, couldn't even hang on to what he'd learned? And for the one, the aptitudes of his body would adequately serve the purposes of his thinking, while for the other it would be the opposite? Are there any other things than these by which you marked off the one naturally suited for each thing from the one who's not?"

"No one's going to claim there're any others," he said.

"Then do you know of anything practiced by human beings in which the man's kind isn't of a condition that surpasses the woman's in all these respects? Or shall we make a long story out of it, talking about the art of weaving, and tending to things that are baked or boiled, the activities in which the female kind is held in high repute and for which it's most absurd of all for it to be outdone?"

"You're telling the truth," he said, "that the one kind is dominated by the other by far in everything, as one might put it. But many women are certainly better than many men at many things, though on the whole it's the way you say."

"Therefore, my friend, there isn't any pursuit of the people who run a city that belongs to a woman because she's a woman or to a man because he's a man, but the kinds of natures are spread around among both kinds of animal alike, and by nature a woman takes part in all pursuits and a man in them all, but in all of them a woman is weaker than a man."

Steps in Cloth-Making. Black-figure lekythos (oil jug) attributed to the potter Amasis (sixth century B.C.).

The women on the left are hand spinning thread; those in the center are weaving wool. Given that Greek women generally remained at home fulfilling such domestic occupations, Plato's suggestions in the *Republic* were quite revolutionary. Though he claims that in all pursuits "a woman is weaker than a man," Plato's character, Socrates, concludes, "... there isn't any pursuit of the people who run a city that belongs to a woman because she's a woman or to a man because he's a man, but the kinds of natures are spread around among both. . . ." (Image copyright ©The Metropolitan Museum of Art. Image source: Art Resource, NY)

"Quite so."

"So are we going to assign all of them to men and none to women?"

"Really, how could we?"

"But we'll claim, I imagine, that there's a woman with an aptitude for the medical art and another without it, and a woman with an aptitude for music and another who's unmusical by nature."

"Of course."

456a "Then isn't there a woman with an aptitude for gymnastic training and warfare, and one who's unwarlike and not fond of gymnastic exercise?"

"I imagine so."

"What else? Is one woman philosophic and another antiphilosophic? Is one spirited and another lacking in spirit?"

"These things are possible too."

"Then it's also possible for there to be a woman with an aptitude as a guardian, and another without one. Wasn't it that sort of nature we also selected as belonging to the men with an aptitude for being guardians?"

"That very sort."

"And therefore the same nature for guardianship of a city belongs to a woman as to a man, except to the extent that one is weaker or stronger."

"So it appears."

b "And so women of that sort need to be selected to live together and guard together with men of that sort, since they're competent and are akin to them in their nature."

"Entirely so."

"And don't the same pursuits need to be assigned to the same natures?"

"The same ones."

"Then we've come back around to what we said before, and we're agreed that it's not contrary to nature for the women among the guardians to be assigned to music and gymnastic training."

"Absolutely so."

c "So we weren't legislating things that are impossible or like prayers, since we set down the law in accord with nature. But it seems instead that it's the things that are done now, contrary to these, that are done contrary to nature."

"So it seems."

"Wasn't our question whether the things we'd be talking about are possible and best?"

"It was indeed."

"And it's been agreed that they're possible?"

"Yes."

"And that they're best is the thing that needs to be agreed to next?"

"Clearly."

d "Now as for turning out a woman skilled at guardianship, one education won't produce men for us and another one women, will it, especially since it gets the same nature to work with?"

"No other one."

"Then what's the state of your opinion about this in particular?"

"About what exactly?"

"About assuming in your own estimation that one man is better and another worse. Or do you regard them as all alike?"

"Not at all."

"Then in the city we've been founding, which do you imagine would turn out as better men, the guardians, when they've gotten the education we went over, or the leatherworkers, educated in leathercraft?"

"You're asking a ridiculous question," he said.

"I understand," I said. "What about it then? Compared to the rest of the citizens, aren't these the best men?"

"By far."

"And what about the women? Won't these be the best among the women?" e

"They too, by far," he said.

"And is there anything better for a city than for the best possible women and men to arise in it?"

"There isn't."

"And music and gymnastic training, when they come to their aid in the way we've gone over, bring this about?" 457a

"How could they not?"

"Therefore the ordinance we set down for the city is not only something possible but also the best thing."

"So it is."

"Then the women among the guardians need to take off their clothes, since they're going to be clothed in virtue instead of a cloak, and they need to share in war and the rest of the guardianship connected with the city, and not engage in other activities, but less arduous parts of these same activities need to be given to the women than to the men because of the weakness of their kind. And a man who laughs at naked women engaged in gymnastic exercise for the sake of what's best 'plucks a laugh from his wisdom while it's still an unripe fruit,' having no idea, it seems, what he's laughing at or what he's doing. For the most beautiful thing that's being said or will have been said is this: that what's beneficial is beautiful and what's harmful is ugly."

"Absolutely so."

"Then shall we claim that we're escaping from one wave, so to speak, by saying this about the law pertaining to women, so that we don't get completely swamped when we set it down that our male and female guardians must pursue all things in common, but that in a way the argument that says that's possible and beneficial is in agreement with itself?" c

"And it's certainly no small wave you're escaping," he said.

"But you'll claim it's no big one either," I said, "when you see what comes after this."

"Speak, then, and I'll see," he said.

"A law that goes along with this one," I said, "and with the others that preceded it, is, as I imagine, the following."

"What?"

"That all these women are to be shared among all these men, and none of the women is to live together privately with any of the men, and their children are to be shared too; a parent is not to know the offspring that are its own, or a child its parent." d

"This is much bigger than the former one," he said, "in respect to doubtfulness about both what's possible and what's beneficial."

"About what's beneficial, anyway," I said, "I don't imagine there'd be any arguing that it's not the greatest good for the women to be shared or for the children to be shared, if possible; but about whether it's possible or not, I imagine there'd be a very great dispute."

"There could very well be dispute about both," he said. e

"You're talking about a unified front among arguments," I said, "and here I was imagining I could run away from one of them, if it seemed to you to be beneficial, and I'd have the one about whether it's possible or not left."

"But you didn't get away with running away," he said, "so give an account of yourself on both counts."

458a "I'll have to stand trial," I said. "Do me this much of a favor though; let me go about it holiday-style, like dawdlers who're in the habit of feasting on their own thoughts when they're walking by themselves. People like that, you know, before finding out how there can be some thing they desire, put that aside so they won't wear themselves out pondering about what's possible or not, and taking it for granted that the thing they want is already there, they're already arranging the rest and enjoying going
b through the sorts of things they'll do when it happens, and otherwise making a lazy soul even lazier. I've gotten soft myself by now, and on those questions I desire to put them off and consider later how they're possible, but now, taking it for granted that they're possible, if you let me, I'll consider how the rulers will organize them when they happen, and what would be the most advantageous way, for both the city and the guardians, for them to be done. I'll try together with you to consider these things first, and those later, if you give permission."

"I do give permission," he said; "go ahead and consider."

c "I imagine, then," I said, "if in fact the rulers are going to be worthy of that name, and their auxiliaries by the same token worthy of theirs, the ones will wish to follow orders and the others to give them, while the latter themselves obey the laws on some matters, but imitate the laws on all the other matters that we'll leave up to their judgment."

"That sounds right," he said.

d "Then you," I said, "as their lawgiver, once you've selected the women in the same way you also selected the men, will distribute them as far as possible to those with similar natures; and they, since they have their houses and meals in common, and none of them possesses any property of that sort privately, will be together, and while they're mingled together in the gyms and in the rest of their upbringing, they'll be led, I imagine, by an inborn necessity, toward mingling with each other sexually. Or do the things I'm talking about not seem necessary to you?"

"Not in the geometrical sense anyway," he said, "but they seem to be necessities of an erotic sort, which are liable to be sharper than the former at persuading and attracting most of the populace."

e "Very much so," I said. "But the next thing to consider, Glaucon, is that unregulated sexual contact with one another, or doing anything else at all of that sort, isn't pious in a city of people favored by destiny, and the rulers aren't going to allow it."

"No, it wouldn't be just," he said.

"So it's clear that the next thing we'll do is make marriages sacred to the greatest extent possible, and it's the most beneficial ones that would be sacred."

"Absolutely so."

459a "So in what way will they be the most beneficial? Tell me this, Glaucon, because I see in your household both hunting dogs and true-bred birds in great numbers. Well, by Zeus, have you paid any attention to their matings and breeding?"

"To what sort of thing?" he said.

"First, among those of the same kind, even though they're true bred, aren't there some that also turn out best?"

"There are."

"Then do you breed from all of them alike, or are you eager to breed as much as possible from the best ones?"

"From the best ones."

"And then what? From the youngest, or from the oldest, or as much as possible from those in their prime?" b

"From those in their prime."

"And if they weren't bred that way, do you expect the race of birds or of dogs would be much worse?"

"I do," he said.

"And what do you suppose about horses," I said, "and the rest of the animals? That it would be any different?"

"That would certainly be strange," he said.

"Ayayay, dear comrade," I said, "how greatly in need we are, then, of top-notch rulers if it's also the same way with the human race." c

"Well it is the same way," he said, "but what does that have to do with the rulers?"

"There'll be a necessity," I said, "for them to use a lot of medicines. Presumably we believe that for bodies that don't need medicines, those of people willing to follow a prescribed way of life, even a rather ordinary doctor is sufficient; but when there's a need to use medicine, we know that a more courageous doctor is needed."

"True, but what point are you making?"

"This one," I said: "our rulers are liable to need to use falsehood and deception in abundance for the benefit of those they rule. And we claimed, of course, that all that sort of thing is useful in the form of medicine." d

"And rightly so," he said.

"Well, it seems like it's not least in the marriages and procreation that this rightness comes into play."

"How so?"

"It follows from the things that have been agreed to," I said, "that as often as possible the best men ought to have sex with the best women, and the worst on the contrary with the worst, and the offspring of the former ought to be reared, but not those of the latter, if the flock is going to be of top quality to the highest degree possible. And all these things ought to happen without the notice of anyone except the rulers themselves, if the guardians' herd is also going to be as free as possible of internal conflict." e

"With the utmost rightness," he said.

"Then don't some sort of festivals and sacrifices need to be set up by law, in which we'll bring together the brides and grooms, and suitable hymns need to be made by our poets for the marriages that take place? We'll make the number of marriages be up to the rulers, in order that they might preserve the same number of men as much as they can, having regard to wars, diseases, and everything of the sort, and in order that, as far as possible, our city might not become either big or little." 460a

"Rightly," he said.

"I imagine some ingenious lotteries need to be made up, so that the ordinary man mentioned before will blame chance and not the rulers for each marriage pairing."

"Very much so," he said.

"And presumably those among the young men who are good in war or anywhere else need to be given special honors and prizes, and among other things a more unrestricted privilege to sleep with the women, so that on this pretext, as great a number of children as possible would also at the same time be begotten by such people." b

"Rightly so."

"And won't the officials set up for this purpose take over the offspring born on each occasion, male or female officials or both, since, of course, the ruling offices are shared among the women and men?"

"Yes."

- c "So I expect they'll take those born to the good ones into the fold and turn them over to some sort of nurses who live separately in a certain part of the city; but the offspring of the worse sort of people, and any of the others that might have been born with defects, they'll hide away in a place not spoken of and not seen, as is fitting."

"If indeed the race of the guardians is going to be pure," he said.

- d "Won't these officials also be in charge of the feeding, bringing the mothers to the fold when they're swollen with milk, contriving every sort of means so that none of them will recognize her own child, and providing other women who have milk if they don't have enough, and see to it that the mothers themselves suckle for a moderate time, but turn over the watchfulness and other work to wet nurses and nurses?"

"You're describing a great ease of childbearing," he said, "for the women among the guardians."

"And it's appropriate," I said. "Let's go on to the next thing we proposed, since we claimed that the offspring ought to be born particularly from those in their prime."

"True."

- e "Then do you share my opinion that twenty years is the average time of the prime of life for a woman, and thirty for a man?"

"Which of the years?" he said.

"Starting from her twentieth and up to her fortieth, for a woman to bear children for the city," I said, "and for a man, once he passes his swiftest peak at running, to beget children for the city from then until his fifty-fifth."

- 461a "For them both," he said, "that's certainly their prime both in body and in intelligence."

"Then if someone older or younger than that engages in generating offspring into the community, we'll claim it's a transgression that's not pious or just, since it produces for the city a child that, if it escapes notice, will have been brought forth without being born with the sacrifices and prayers that would be offered at every marriage by priestesses, priests, and the whole city together, that from good and beneficial people better and more beneficial offspring might always come forth; instead, it will have been born under cover of darkness in the presence of terrible unrestraint."

- b "We'll rightly make that claim," he said.

"And the same law applies," I said, "if any of the men still propagating has sexual contact with any of the women who are of childbearing age when a ruler hasn't joined him with her; we'll charge him with bringing a bastard child into the city, unsanctioned and unconsecrated."

"Quite rightly," he said.

- c "But, I imagine, when both the women and the men get beyond the age to reproduce, we'll no doubt leave them free to have sex with anyone they want, except with a daughter, a mother, a daughter's children, a mother's parent, or the women with a son or his children or with a father or his parent, and all that only after it's been insisted that they take the most zealous care not to bring forth even a single fetus into the light of day, if one is conceived, and if any is forced on them, to handle it on the understanding that there's to be no raising of such a child."

"These things too are reasonably said," he said; "but how are they going to distinguish their fathers and daughters, and the others you just mentioned, one from another?"

“There’s no way,” I said. “But from that day on which any of them becomes a bridegroom, whatever offspring are born in the tenth month after that, or even the seventh, to all of these he’ll apply the name sons to the males and daughters to the females, and they’ll call him father, and in the same way he’ll call their offspring his grandchildren, and they in turn will call people like him grandfathers and grandmothers, and they’ll call those who were born at the same time their mothers and fathers were producing children sisters and brothers, so that, as we were just saying, they won’t have sexual contact with one another. But the law will grant brothers and sisters permission to be joined together if the lottery falls out that way and the Pythia* confirms it.”

“Quite rightly,” he said.

“So, Glaucon, this or something like it is the way of sharing women and children among the guardians of your city. The next thing after this ought to be to have it established out of the argument that this goes along with the rest of the polity and is by far the best way. Or how should we proceed?”

“That way, by Zeus,” he said.

“Well then, wouldn’t this be a source from which an agreement might come, that we ask ourselves what’s the greatest good we can state in the organization of a city, at which the lawgiver ought to aim in setting down the laws, and what’s the greatest evil, and then consider on that basis whether the things we were just now going over fit into the footprint of the good while they don’t fit into that of the evil?”

“That most of all would be the way,” he said.

“Then can we have any greater evil in a city than that which tears it apart and makes it many instead of one? Or a greater good than that which binds it together and makes it one?”

“No we can’t.”

“And doesn’t the sharing of pleasure and pain bind it together, when as much as possible all the citizens feel joy and pain in almost the same way at the coming into being and passing away of the same things?”

“Absolutely so,” he said.

“But the private appropriation of such things dissolves it, when some people become overwhelmed with pain and others overcome with joy at the same experiences of the city and of the people in the city?”

“How could it not?”

“And doesn’t that sort of thing come from this, that people in the city don’t utter such words as mine and not mine at the same time, and the same with somebody else’s?”

“Exactly so.”

“So isn’t that city governed best in which the most people say this mine and not mine on the same occasion about the same things?”

“Much the best.”

“And this is precisely whichever city is in a condition closest to that of a single human being? For instance, whenever a finger of any of us is wounded, presumably the whole community extending from the body to the soul in a single ordering under the ruler within it would be aware of it, and it all would suffer pain as a whole together with the part that’s afflicted, and is that the sense in which we mean that a human being has a pain in his finger? And is it the same story for any other part of a human being whatever, both for a part afflicted with pain and for one that’s eased by pleasure?”

*The priestess of Apollo at Delphi. Presumably the rulers would know which cases involved actual incest and avoid them, and would take her into their confidence.

"It's the same," he said, "and as for what you're asking, the best constituted city is the one situated closest to such a condition."

- e "So I imagine that when one of its citizens undergoes anything at all, good or bad, such a city most of all will claim the thing that happened to him as its own, and all of it will share the pleasure or share the pain."

"Necessarily," he said, "if it's one with good laws, anyway."

* * *

- 473b "It looks like the next thing for us to do is try to search out and demonstrate whatever is now done badly in cities, on account of which they aren't managed this way, and what would be the smallest change by which a city could come into this mode of political association— preferably a change of one thing, or if not that, of two, and if not that, of as few things as possible in number and the smallest in strength."

- c "Absolutely so," he said.

"Well with one change," I said, "it seems to me we can show that it could be transformed, though it's not a small or easy one, but it is possible."

"What's that?" he said.

"I'm in for it now," I said, "up against what we likened to the biggest wave. But it's got to be said, even if, literally just like an uproarious wave, it's going to drown me in laughter and humiliation. Consider what I'm about to say."

"Say it," he said.

- d "Unless philosophers rule as kings in their cities," I said, "or those now called kings and supreme rulers genuinely and adequately engage in philosophy, and this combination of political power and philosophy joins together in the same position, while the many natures that are now carried away to one of the two in isolation are forcibly blocked off from that, there is no rest from evils for the cities, dear Glaucon, or, I think, for the human race, and this polity that we've now gone over in speech will never before
e that sprout as far as it can and see the light of the sun. This is what's been putting a reluctance to speak in me all this time, my seeing that it would be proclaimed to be far beyond belief, because it's hard to see that in no other way would anyone be happy in private, or any city in public."

* * *

BOOK VI

* * *

- 502c "Then since, by effort, [our discussion of lawgiving has] reached an end, don't the things that remain after it need to be spoken about: in what manner, by what kinds of
d things learned and pursued, the saviors of the polity will be present among us, and at what ages each group of them will take up each activity?"

"That surely needs to be spoken about," he said.

"It didn't turn out to be a wise thing in the earlier discussion," I said, "for me to have left out the objectionable matter of possessing women, the propagation of children, and

the instituting of the rulers, even though I knew that the complete truth would be offensive and a hard thing to bring about, because as it is, the need to go through these things came along nonetheless. And while the particular things about women and children are finished, it's necessary to go into the ones about the rulers as if from the beginning. And we were saying, if you recall, that they must be seen to be passionately devoted to the city, standing the test amid pleasures and pains, and being seen not to drop this conviction through drudgery or terrors or any other vicissitude, or else the person who's incapable is to be rejected, while the one who comes through untarnished in every way, like gold tested in the fire, is to be established as a ruler and given honors and prizes both while living and at his death. Some such things as that were being said when the discussion slipped past them with its face covered, in fear of setting in motion what's now at hand." 503a

"You're telling the exact truth," he said; "I do recall." b

"I was reluctant, dear friend," I said, "to state what has now been daringly exposed, but now let it be boldly stated: it's imperative to put philosophers in place as guardians in the most precise sense."

"Let it be so stated," he said.

"Then consider it likely that you'll have few of them, since the nature we went through needs to belong to them, but its parts are rarely inclined to grow together in the same place, but in most cases grow as something severed."

"How do you mean?" he said.

"With natures that are good learners, have memories, are intellectually flexible, are quick, and have everything else that goes with these things, and are youthfully spirited and lofty in their thinking as well, you know that they aren't willing at the same time to grow up being the sort of natures that want to live with calmness and stability in an orderly way, but instead are the kind that are carried off wherever their quickness happens to take them, and everything stable goes right out of them." c

"You're telling the truth," he said.

"But with those natures with stable characters, on the other hand, that are not easily changeable, those one would treat as more trustworthy and that would be unmoved confronting terrors in war, wouldn't they be the same way confronting things to be learned also? They're hard to move and slow to learn as though they'd been numbed, and they're full of sleepiness and yawning whenever anything of the sort needs to be worked at." d

"That's how they are," he said.

"But we claimed it was necessary to have a good-sized and high-quality share of both, or else not be allowed to take part in the most precise sort of education or in honor or in ruling."

"Rightly," he said.

"And don't you imagine that will be rare?"

"How could it not be?"

"So not only does it need to be tested in the labors, terrors, and pleasures we spoke of then but also, something we passed over then and speak of now, one needs to give it exercise in many kinds of studies to examine whether it will be capable of holding up under the greatest studies, or whether it will shy away like people who show cowardice in other areas." e 504a

"It's certainly appropriate to examine it that way," he said, "but what sort of studies in particular are you saying are the greatest?"

"No doubt you remember," I said, "that we pieced together what justice, moderation, courage, and wisdom each would be by distinguishing three forms that belong to the soul."

"If I didn't remember that," he said, "it would be just for me not to hear the rest."

"And what about what was said by way of preface to that?"

"What was it?"

- b "We were saying something to the effect that getting the most beautiful possible look at these things would take another, longer way around, which would make them become evident to someone who traveled that road, though it would be possible to provide illustrations approximating to the things that had already been said earlier, and you folks declared that would be sufficient. And so the things said at that time, as far as precision goes, as it appeared to me, were deficient; as for whether they were satisfactory to you people, that's something you could say."

"To me? In a measured way," he said, "and it looked like they were to the others as well."

- c "My friend," I said, "measuredness in such matters that stops short in any respect whatever of what *is* turns out not to measure anything at all, because nothing incomplete is a measure of anything.

"But sometimes it seems to some people that they're well enough off already and don't need to search any further."

"A great many people feel that way a lot," he said, "because of laziness."

"That feeling, anyway," I said, "is one there's the least need for in a guardian of a city and its laws."

"Likely so," he said.

- d "So, my comrade," I said, "it's necessary for such a person to go around by the longer road, and he needs to work as a learner no less hard than at gymnastic training, or else, as we were just saying, he'll never get to the end of the greatest and most relevant study."

"So these aren't the greatest ones," he said, "but there's something still greater than justice and the things we've gone over?"

- e "Not only is there something greater," I said, "but even for those things themselves, it's necessary not just to look at a sketch, the way we've been doing now, but not to stop short of working them out to their utmost completion. Wouldn't it be ridiculous to make a concentrated effort in every way over other things of little worth, to have them be as precise and pure as possible, while not considering the greatest things to be worthy of the greatest precision?"

"Very much so," he said, "and a creditable thought it is, but what you mean by the greatest study, and what it's about—do you imagine," he said, "that anyone's going to let you off without asking you what it is?"

- 505a "Not at all," I said. "Just you ask. For all that, you've heard it no few times, but now you're either not thinking of it or else, by latching onto me, you think you'll cause me trouble. But I imagine it's more the latter, since you've often heard that the greatest learnable thing is the look of the good, which just things and everything else need in addition in order to become useful and beneficial. So now you know pretty well that I'm going to say that, and in addition to it that we don't know it well enough. But if we don't know it, and we do know everything else as much as possible without it, you can be sure
b that nothing is any benefit to us, just as there would be none if we possessed something without the good. Or do you imagine it's any use to acquire any possession that's not good? Or to be intelligent about everything else without the good, and have no intelligence where anything beautiful and good is concerned?"

"By Zeus, I don't!" he said.

"And surely you know this too, that to most people, the good seems to be pleasure, and to the more sophisticated ones, intelligence."

"How could I not?"

"And, my friend, that the ones who believe the latter can't specify what sort of intelligence, but are forced to end up claiming it's about the good."

"It's very ridiculous," he said.

"How could it be otherwise," I said, "if after reproaching us because we don't know what's good they turn around and speak to us as though we do know? Because they claim that it's intelligence about the good as though we for our part understand what they mean when they pronounce the name of the good." c

"That's very true," he said.

"And what about the people who define the good as pleasure? Are they any less full of inconsistency than the others? Aren't they also forced to admit that there are bad pleasures?"

"Emphatically so."

"So I guess they turn out to be conceding that the same things that are good are also bad. Isn't that so?"

"Certainly." d

"Then isn't it clear that the disagreements about it are vast and many?"

"How could it not be clear?"

"And what about this? Isn't it clear that many people would choose the things that seem to be just and beautiful, and even when they aren't, would still do them, possess them, and have the seeming, though no one is content to possess what seems good, but people seek the things that are good, and in that case everyone has contempt for the seeming?"

"Very much so," he said.

"So this is exactly what every soul pursues, for the sake of which it does everything, having a sense that it's something but at a loss and unable to get an adequate grasp of what it is, or even have the reliable sort of trust it has about other things; because of this it misses out even on any benefit there may have been in the other things. On such a matter, of such great importance, are we claiming that even the best people in the city, the ones in whose hands we're going to put everything, have to be in the dark in this way?" e 506a

"Not in the least," he said.

"I imagine anyway," I said, "that when there's ignorance of the way in which just and beautiful things are good, they won't have gotten a guardian for themselves who's worth much of anything, in someone who's ignorant of that, and I have a premonition that no one's going to discern them adequately before that."

"You're very good at premonitions," he said.

"Then won't our polity be perfectly ordered if that sort of guardian does watch over it, one who knows these things?" b

"Necessarily," he said. "But you in particular, Socrates, do you claim the good is knowledge or pleasure or some other thing besides these?"

"That's a man for you," I said; "you've done a beautiful job of making it plain all along that the way things seem to others about these things won't be good enough for you."

"But it doesn't seem just to me either, Socrates," he said, "to be able to state the opinions of others but not one's own, when one has been concerned about these things for such a long time." c

"Well does it seem to you to be just," I said, "to talk about things one doesn't know as though one knew them?"

"Not by any means as though one knew them," he said, "but certainly it's just to be willing to say what one thinks as something one thinks."

"What?" I said, "Haven't you noticed about opinions without knowledge that they're all ugly? The best of them are blind. Or do people who hold any true opinion

without insight seem to you to be any different from blind people who travel along the right road?"

"No different," he said.

"Then do you want to gaze on ugly things, blind and crooked, when you'll be able to hear bright and beautiful ones from others?"

d "Before Zeus, Socrates," said Glaucon, "you're not going to stand down as if you were at the end. It'll be good enough for us if, the same way you went over what has to do with justice and moderation and the other things, you also go over what has to do with the good."

e "For me too, comrade," I said, "and more than good enough. But I'm afraid I won't be capable of it, but I'll make a fool of myself in my eagerness and pay for it in ridicule. But, you blessed fellows, let's leave aside for the time being what the good itself is, since it appears to me to be beyond the trajectory of the impulse we've got at present to reach the things that now seem to me to be the case. But I'm willing to speak about what appears to be an offspring of the good and most like it, if that's also congenial to you folks, or if not, to let it go."

"Just speak," he said, "and some other time you'll pay off the balance with a description of the father."

507a "I'd like to have the power to pay it in full and for you folks to receive it, and not just the interest on it as you will now. Give a reception, then, to this dividend and offspring of the good itself. Be on your guard, though, in case I unintentionally deceive you by paying my account with counterfeit interest."

"We'll be on guard according to our power," he said, "so just speak."

"After I've gotten your agreement," I said, "and reminded you of things mentioned in the previous discussion and often spoken of before now elsewhere."

"What sort of things?" he said.

b "We claim that there are many beautiful things," I said, "and many good things, and the same way for each kind, and we distinguish them in speech."

"We do."

"But also a beautiful itself, and a good itself, and the same way with everything we were then taking as many, we go back the other way and take according to a single look of each kind, as though there is only one, and we refer to it as what each kind is."

"That's it."

"And we claim that the former are seen but not thought, while the 'looks' in turn are thought but not seen."

"Completely and totally so."

c "And by which of the things within ourselves do we see the ones that are seen?"

"By sight," he said.

"And perceive the things heard by hearing, and all the perceptible things by the other senses?" I said.

"Of course."

"Well," I said, "have you reflected about the craftsman of the senses, how he was by far the most bountiful in crafting the power of seeing and being seen?"

"Not at all," he said.

d "Then look at it this way: for one thing to hear and another to be heard, is there any need for another kind of thing in addition to the sense of hearing and a sound, such that, if that third thing isn't present, the first won't hear and the second won't be heard?"

"There's nothing like that," he said.

“And I don’t imagine,” I said, “that there are many others either, not to say none, that have any additional need for such a thing, or can you name any?”

“Not for my part,” he said.

“But don’t you realize that the power of sight and being seen does have an additional need?”

“How’s that?”

“Presumably you’re aware that when sight is present in eyes and the one who has it attempts to use it, and color is present there in things, unless there’s also a third kind of thing present, of a nature specifically for this very purpose, sight will see nothing and colors will be invisible.” e

“What’s this thing you’re speaking of?” he said.

“The one you call light,” I said.

“It’s true, as you say,” he said.

“Then the sense of sight and the power of being seen have been bound together by a bond more precious, by no small look, than that uniting other pairs, unless light is something to be despised.” 508a

“Surely it’s far from being despised,” he said.

“And which of the divine beings in the heavens can you point out as the ruling power responsible for this, whose light makes our sight see and visible things be seen as beautifully as possible?”

“The same one you and everyone else would,” he said, “since it’s obvious you’re asking about the sun.”

“And is it this way that sight is by its nature related to this god?”

“How?”

“The sun is not sight itself, nor is it that in which sight is present, what we call an eye.” b

“No indeed.”

“But I imagine that’s the most sunlike of the sense organs.”

“By far.”

“And doesn’t it acquire the power that it has as an overflow from that which is bestowed by the sun?”

“Very much so.”

“So while the sun isn’t sight, but is the thing responsible for it, isn’t it seen by that very thing?”

“That’s how it is,” he said.

“Now then,” I said, “say that this is what I’m calling the offspring of the good, which the good generated as something analogous to itself; the very thing the good itself is in the intelligible realm in relation to insight and the intelligible things, this is in the visible realm in relation to sight and the visible things.” c

“How so?” he said. “Go into it more for me.”

“With eyes,” I said, “do you know that when one no longer turns them on those things to whose colors the light of day extends, but on those on which nocturnal lights fall, they grow dim, and appear nearly blind, just as though no pure sight was present in them?”

“Very much so,” he said.

“But I imagine that whenever one turns them to the things the sun illumines, they see them clearly, and pure sight is manifestly present in these very same eyes.” d

“Certainly.”

“In this manner, think of the power of the soul too as being the same way. Whenever it becomes fixed on that which truth and being illumine, it has insight, discerns, and shows itself to have an intellect, but whenever it becomes fixed on something mixed with

darkness, something that comes into and passes out of being, it deals in seeming and grows dim, changing its opinions up and down, and is like something that has no intellect.”

“It does seem like that.”

e “Then say that what endows the things known with truth, and gives that which knows them its power, is the look of the good. Since it’s the cause of knowledge and truth, think of it as something known, but though both of these, knowing and truth, are so beautiful, by regarding it as something else, still more beautiful than they are, you’ll regard it
509a rightly. And as far as knowledge and truth are concerned, just as it’s right over there to consider light and sight sunlike, but isn’t right to consider them to be the sun, so too here it’s right to consider both of these as like the good, but not right to regard either of them as being the good; the condition of the good requires that it be held in still greater honor.”

“You’re talking about a beauty hard to conceive,” he said, “if it endows things with knowledge and truth but is itself beyond these in beauty, because it’s sure not pleasure you mean.”

“Watch your mouth,” I said; “but look into the image of it still more closely.”

“In what way?”

b “I imagine you’d claim that the sun not only endows the visible things with their power of being seen, but also with their coming into being, their growth, and their nurture, though it’s not itself coming-into-being.”

“How could it be?”

“Then claim as well that the things that are known not only get their being-known furnished by the good, but they’re also endowed by that source with their very being and their being what they are, even though the good is not being, but something over and above being, beyond it in seniority and surpassing it in power.”

c And Glaucon, in a very comical manner, said “By Apollo, that’s a stupendous stretcher.”

“You’re to blame for it,” I said, “for forcing me to tell the way things seem to me about it.”

“And don’t by any means stop,” he said, “not if there are any other things for you to go over in the likeness to the sun, in case you’re leaving something out anywhere.”

“That’s for sure,” I said; “I’m leaving out scads of things.”

“Well don’t skip over any little bit,” he said.

“I suspect I’ll skip over a lot,” I said, “but be that as it may, as far as it’s possible at present, I won’t willingly leave anything out.”

“See that you don’t,” he said.

d “Well then, as we’re saying,” I said, “think of them as being a pair, one ruling as king over the intelligible race and realm, and the other, for its part, over the visible—note that I’m not saying ‘over the heavens,’ so I won’t seem to you to be playing verbal tricks with the name. But do you grasp these two forms, visible, intelligible?”

“I’ve got them.”

“Then take them as being like a line divided into two unequal segments, one for the visible class and the other for the intelligible, and cut each segment again in the same ratio, and you’ll get the parts to one another in their relation of clarity and obscurity; in the visible section, one segment [A] will be for images, and by images I mean
510a first of all shadows, then semblances formed in water and on all dense, smooth, bright surfaces, and everything of that sort, if you get the idea.”

“I get it.”

“Then in the other part [B], put what this one is likened to, the animals around us, and every plant, and the whole class of artificial things.”

OBJECTS		STATES OF MIND	
INTELLIGIBLE WORLD	Forms	D	Knowledge / Active Insight <episteme>
	Mathematical Objects	C	Discursive Thinking <dianoia>
VISIBLE WORLD	Visible Things	B	Belief / Trust <pistis>
	Images, Shadows, Reflections	A	Imagination <eikasia> Opinion <doxa>

“I’m putting them,” he said.

“And would you also be willing to claim,” I said, “that it’s divided with respect to truth and its lack, such that the copy is to the thing it’s copied from as a seeming is to something known?”

“I would,” he said, “very much so.”

“Then consider next the way the division of the intelligible part needs to be made.”

“What way is that?”

“Such that in one part of it [C] a soul takes as images the things that were imitated before, and is forced to inquire based on presuppositions, proceeding not to a beginning but to an end, while in the other part [D] it goes from a presupposition to a beginning free of presuppositions, without the images involved in the other part, making its investigation into forms themselves and by means of them.”

“I didn’t sufficiently understand what you mean by these things,” he said.

“Once more, then,” I said; “since you’ll understand more easily after the following preface. [C] Now I imagine you know that people who concern themselves with matters of geometry and calculation and such things presuppose in accord with each investigation the odd and the even, the geometrical shapes, the three kinds of angles, and other things related to these; treating these as known and making them presuppositions, they don’t think it’s worth giving any further account of them either to themselves or to anyone else, as though they were obvious to everyone, but starting from these things and going through the subsequent things from that point, they arrive at a conclusion in agreement with that from which they set their inquiry in motion.”

"I do know that very well," he said.

"Then you also know that they make additional use of visible forms, and make their arguments about them, even though they're thinking not about these but about those things these are images of, since it's in regard to the square itself, and its diagonal itself, that they're making those arguments, and not in regard to the one that they draw, and likewise in the other cases; these very things that they model and draw, which also have their own shadows and images in water, they are now using as images in their turn, in an attempt to see those things themselves that one could not see* in any other way than by the power of thinking."

"What you're saying is true," he said.

"The latter, then, is what I meant by the intelligible form, and it's for the inquiry about it that the soul is forced to make use of presuppositions, not going to the source, because it doesn't have the power to step off above its presuppositions, but using as images those things that are themselves imaged down below, in comparison with which these images are reputed to be of preeminent clarity and are treated with honor."

"I understand," he said; "you're talking about the things dealt with by geometrical studies and the arts akin to that."

"Then understand me to mean the following by the other segment of the intelligible part [D]: what rational speech itself gets hold of by its power of dialectical motion, making its presuppositions not sources but genuinely standing places, like steppingstones and springboards, in order that, by going up to what is presuppositionless at the source of everything and coming into contact with this, by following back again the things that follow from it, rational speech may descend in that way to a conclusion, making no more use in any way whatever of anything perceptible, but dealing with forms themselves, arriving at them by going through them, it ends at forms as well."

"I understand," he said, "though not sufficiently, because you seem to me to be talking about a tremendous amount of work; however, I understand that you want to mark off that part of what is and is intelligible that's contemplated by the knowledge that comes from dialectical thinking as being clearer than what's contemplated by what are called arts, which have presuppositions as their starting points. Those who contemplate things by means of the arts are forced to contemplate them by thinking and not by sense perception, but since they examine things not by going up to the source but on the basis of presuppositions, they seem to you to have no insight into them, even though, by means of their starting point, they're dealing with things that are intelligible. And you seem to me to be calling the activity of geometers and such people thinking but not insight, on the grounds that thinking is something in between opinion and insight."

"You took it in utterly sufficiently," I said. "Along with me, take it too that for the four segments of the line there are these four kinds of experiences that arise in the soul, active insight for the highest and thinking for the second, and assign the names trust to the third and imagination to the last, drawing them up as a proportion and holding that, in the same manner these experiences have their shares of clarity, the things they're directed to have corresponding shares of truth."

"I understand," he said, "and I go along with it and rank them as you say."

*A geometrical line is understood as having no breadth, and a plane figure as having no depth. A drawing in the sand, a shape cut out of some flat material, or even any appearance in our pictorial imaginations must falsify what it images if it is to image it at all.

BOOK VII

“Next,” I said, “make an image of our nature as it involves education and the lack of it, by likening it to a condition such as the following: picture human beings in a cave-like dwelling underground, having a long pathway open to the light all across the cave. They’re in it from childhood on with their legs and necks in restraints, so that they’re held in place and look only to the front, restricted by the neck-restraint from twisting their heads around. For them, the light is from a fire burning up above and a long way behind them, and between the fire and the prisoners there’s an upper road. Picture a little wall built along this road, like the low partitions puppeteers use to screen the humans who display the puppets above them.” 514a

“I see it,” he said.

“Then see the humans going along this little wall carrying all sorts of articles that jut out over the wall, figurines of men and other animals fashioned out of stone and wood and materials of all kinds, with some of the people carrying them past making appropriate sounds and others silent.” 515a

“You’re describing a bizarre image and bizarre prisoners,” he said.

“Like us,” I said. “First of all, do you imagine such people would have seen anything of themselves or one another other than the shadows cast by the fire onto the part of the cave right across from them?”

“How could they,” he said, “if they were forced to keep their heads immobile throughout life?” b

“And what would they have seen of the things carried past? Wouldn’t that be the same thing?”

“What else?”

“So if they were able to converse with one another, don’t you think they’d speak of these very things they see as the beings?”

“Necessarily.”

“And what if their prison also had an echo from the side across from them? Any time any of the people carrying things past uttered a sound, do you imagine they’d believe anything other than the passing shadow had made the sound?”

“By Zeus, I don’t,” he said.

“So in every way,” I said, “such people wouldn’t consider anything to be the truth other than the shadows of artificial things.” c

“That’s a great necessity,” he said.

“Then consider,” I said, “what their release would be like, and their recovery from their restraints and their delusion, if things like that were to happen to them by nature. Whenever one of them would be released, and suddenly required to stand up, and turn his neck around, and walk, and look up toward the light, he’d suffer pain from doing all these things, and because of the blazes of light, he wouldn’t have the power to get a clear sight of the things whose shadows he’d seen before. What do you imagine he’d say if someone were to tell him that he’d been seeing rubbish then, but now, somewhat nearer to what is and turned toward the things that have more being, he was seeing more accurately? And especially if, pointing to each of the things passing by, one forced him to answer as he asked what they are, don’t you imagine he’d be at a loss and believe the things he’d seen before were truer than the ones pointed out to him now?” d

“Very much so,” he said.

Adapted from N. Jordan, *Western Philosophy: From Antiquity to the Middle Ages* (Pearson, 1987), p. 75.

“And if one forced him to look at the light itself, wouldn’t he have pain in his eyes and escape by turning back toward those things he was able to make out, and consider them clearer in their very being than the ones pointed out to him?” e

“That’s how it would be,” he said.

“And if one were to drag him away from there by force,” I said, “along the rough, steep road up, and didn’t let go until he’d dragged him out into the light of the sun, wouldn’t he be feeling pain and anger from being dragged, and when he came into the light and had his eyes filled with its dazzle, wouldn’t he be unable to see even one of the things now said to be the true ones?” 516a

“That’s right,” he said, “at least not right away.”

“So I imagine he’d need to get accustomed to it, if he were going to have sight of the things above. At first, he’d most easily make out the shadows, and after that the images of human beings and other things in water, and only later the things themselves; and turning from those things, he’d gaze on the things in the heavens, and at the heavens themselves, more easily by night, looking at the starlight and moonlight, than by day, at the sun and its light.” b

“How could it be otherwise?”

“Then at last, I imagine, he’d gain sight of the sun, not its appearances in water or in any setting foreign to it, but he’d have the power to see it itself, by itself, in its own realm, and contemplate it the way it is.”

“Necessarily,” he said.

“And after that, he could now draw the conclusion about it that this is what provides the seasons and the years, and has the governance of all things in the visible realm, and is in a certain manner the cause of all those things they’d seen.” c

“It’s clear that he’d come to these conclusions after those experiences,” he said.

“And then what? When he recalled his first home and the wisdom there and the people he was imprisoned with then, don’t you imagine he’d consider himself happy because of the change and pity the others?”

“Greatly so.”

“And if there had been any honors and commendations and prizes for them then from one another for the person who had the sharpest sight of the things passing by and remembered best all the things that usually passed by before and after them and at the same time, and based on those things had greatest ability to predict what was going to come, do you think he’d be longing for those rewards and feel jealousy toward the ones honored by those people and in power among them, or would he feel what Homer depicts, and wish powerfully d

To be a bond-servant to another, tilling the soil
For a man without land of his own,

and submit to anything whatever rather than hold those opinions and live that way?”

“The latter, I imagine,” he said; “he’d submit to enduring everything rather than live in that way.” e

“Then give this some thought too,” I said. “If such a person were to go back down and sit in the same spot, wouldn’t he get his eyes filled with darkness by coming suddenly out of the sun?”

“Indeed he would,” he said.

“And if he had to compete with those who’d always been imprisoned, at passing judgments on those shadows, at a time when his sight was dim before his eyes settled 517a

back in, and if this period of adjustment was not very short, wouldn't he make a laughingstock of himself, and wouldn't it be said about him that after having gone up above he returned with his eyes ruined, and that it's not worth it even to make the effort to go up? And as for anyone who attempted to release them and lead them up, if they had the power in any way to get him into their hands and kill him, wouldn't they kill him?"

"Ferociously," he said.

- b "Now this image, dear Glaucon," I said, "needs to be connected as a whole with what was said before, by likening the realm disclosed by sight to the prison dwelling, and the light of the fire within it to the power of the sun; and if you take the upward journey and sight of the things above as the soul's road up into the intelligible region, you won't miss my intended meaning, since you have a desire to hear about that. No doubt a god knows whether it happens to be true. What appears true to me appears this way: in the knowable region, the last thing to be seen, with great effort, is the look of the good, but
- c once it's been seen, it has to be concluded that it's the very cause, for all things, of all things right and beautiful, that it generates light and its source in the visible realm, and is itself the source that bestows truth and insight in the intelligible realm. Anyone who's going to act intelligently in private or in public needs to have sight of it."

"I too join in assuming that," he said, "at least in whatever way I'm able to."

- "Come, then," I said, "and join in assuming the following as well, and don't be surprised that those who've come to this point aren't willing to do what belongs to
- d human beings, but their souls are eager to spend all their time up above; presumably it's likely to be that way, if this also stands in accord with the image already described."

"It's certainly likely," he said.

"And what about this? Do you imagine it's anything surprising," I said, "if someone coming from contemplation of divine things to things of a human sort is awkward and looks extremely ridiculous while his sight is still dim and if, before he's become sufficiently accustomed to the darkness around him, he's forced, in law courts or anywhere else, to contend over the shadows of the just or the images they're the shadows of, and to compete about that in whatever way these things are understood by people

e who've never looked upon justice itself?"

"It's not surprising in any way whatsoever," he said.

- 518a "But if someone had any sense," I said, "he'd remember that two sorts of disturbances occur in the eyes from two causes, when they're removed from light into darkness as well as from darkness into light. If he regarded these same things as occurring also with the soul, when he saw one that was confused and unable to make anything out, he wouldn't react with irrational laughter but would consider whether it had come from
- b a brighter life and was darkened by its unaccustomed condition, or was coming out of a greater ignorance into a brighter place and was overwhelmed by the dazzle of a greater radiance. That way, he'd congratulate the one soul on the happiness of its experience and life and pity the other, and if he did want to laugh at that one, he'd be less laughable for laughing at it than someone who laughed at the one coming out of the light above."

"You're speaking in a very balanced way," he said.

- "So," I said, "if those things are true, we ought to regard them in the following way: education is not the sort of thing certain people who claim to be professors of it
- c claim that it is. Surely they claim they put knowledge into a soul it wasn't present in, as though they were putting sight into blind eyes."

"Indeed they do claim that," he said.

"But the current discussion indicates," I said, "that this power is present in the soul of each person, and the instrument by which each one learns, as if it were an eye

that's not able to turn away from darkness toward the light in any other way than along with the whole body, needs to be turned around along with the whole soul, away from what's fleeting, until it becomes able to endure gazing at what is and at the brightest of what is, and this, we're claiming, is the good. Isn't that right?" d

"Yes."

"Then there would be an art to this very thing," I said, "this turning around, having to do with the way the soul would be most easily and effectively redirected, not an art of implanting sight in it, but of how to contrive that for someone who has sight, but doesn't have it turned the right way or looking at what it needs to."

"That seems likely," he said.

"Then the other virtues said to belong to a soul probably tend to be near the things belonging to the body, since they're not present in the being of the soul before they've been inculcated by habits and practice, but the virtue involving understanding, more than all, attains to being something more divine, as it seems, which never loses its power, but by the way it's turned becomes either useful and beneficial or useless and harmful. Or haven't you ever reflected about the people said to be depraved but wise, how penetrating a gaze their little souls have and how sharply they discern the things they're turned toward, since they don't have poor sight but force it to serve vice, so that the more sharply it sees, that much more evil it accomplishes?" e 519a

"Very much so," he said.

"But surely," I said, "if, straight from childhood, this tendency of such a nature had been curtailed by having the edges knocked off that have an affinity with becoming, like lead weights that, through eating and the pleasures and greediness involved in such things, get to be growths on the soul that turn its sight excessively downward, and if, freed from them, it was turned toward things that are true, this same power of these same people would have seen them too most sharply, just as it sees the ones it's now turned toward." b

"Very likely," he said.

"And what about this?" I said. "Isn't it likely, even necessary from what's been said before, that those who are uneducated and lacking experience with truth could never adequately manage a city, and neither could those who've been allowed to devote all their time to education—the former because they don't have any one goal in life that they need to aim at in doing all the things they do in private and in public, and the latter because they wouldn't willingly engage in action, believing they'd taken up residence in the Isles of the Blessed while still living?" c

"True," he said.

"So our job as founders," I said, "is to require the best natures to get to the study we were claiming earlier is the greatest thing, to see the good as well as to climb the path up to it, and when, having climbed up, they've seen it sufficiently, not to allow what they're now permitted to do." d

"What in particular?"

"To stay there," I said, "and not be willing to come back down among those prisoners or take part beside them in their labors and honors, the more frivolous ones or even the more serious."

"What?" he said. "Are we going to do them an injustice and make them live worse when it's possible for them to live better?"

"My friend," I said, "you let it slip back out of your memory that this is no concern of the law, for some one class of people in a city to be exceptionally well off, but that it contrive things so that this arises in the city as a whole, by harmonizing the citizens through persuasion and compulsion and making them contribute to one another a share of e 520a

the benefit with which each sort is capable of improving the community; the law doesn't produce men of this sort in the city to allow them to turn whichever way each one wants but so that it may make full use of them for the binding together of the city."

"That's true," he said; "that did slip my mind."

- "Then consider, Glaucon," I said, "that we won't be doing any injustice anyway to the philosophers who arise among us, but we'll be asking just things of them in requiring
 b them also to care for the other people and watch over them. We'll tell them that when people of their sort come along in other cities, it's reasonable for them not to share the burdens in those cities, since they spring up spontaneously in each of them against the will of the polity, and something that grows up on its own, not owing its upbringing to anyone, has just cause not to be too keen on paying for its support. 'But we've bred you both for
 c yourselves and for the rest of the city like the rulers and kings in beehives, to be educated in a better and more complete way than the others and more capable of taking part in both ways of life. So it's necessary for each of you in turn to go down into the communal dwelling and to get used to gazing at dark objects with the others, because when you're used to it you'll see thousands of times better than the people there, and recognize each sort of image for what it is and what it's an image of, from having seen the truth about beautiful and just and good things. And so the city will be governed by you and by us wide
 d awake, and not in a dream the way most are governed now by people who fight with each other over shadows and form factions over ruling, as though that were some great good. But the truth is surely this: that city in which those who are going to rule are least eager to rule is necessarily governed best and with the least divisiveness, while the one that gets the opposite sort of rulers is governed in the opposite way.'"

"Quite so," he said.

"Then do you imagine those who've been brought up will be unpersuaded by us when they hear these things, and be unwilling to share, each in turn, in the labors of the city while dwelling among themselves a lot of the time in the pure region?"

- e "It's not possible," he said, "because we'll be giving just obligations to people who are just. More than anything, each of them will go into ruling as something unavoidable, which is opposite to what those who rule in each city now do."

- 521a "That's how it is, my comrade," I said; "if you find a way of life better than ruling for those who are going to rule, there's a possibility for a well-governed city to come into being for you, because only in it will the rulers be those who are rich in their very being, not in gold but in that in which someone who's happy needs to be rich: a good and intelligent life. But if beggars and people hungry for private goods go into public life imagining that's where they need to go to steal off with the good, there's no possibility, because when ruling becomes something that's fought over, since that sort of war, being domestic and internal, destroys them and the rest of the city."

"Very true," he said.

- b "Well," I said, "do you know of any way of life other than that of true philosophy that looks down on political offices?"

"No, by Zeus," he said.

"It's necessary, though, for people who aren't in love with ruling to go after it; if they don't, the rival lovers will do battle."

"Certainly."

"And who else are you going to require to go into guarding the city than the people who are most thoughtful about those things by which a city is governed best, and who have other honors and a better life than the political sort?"

"None other than they," he said.

ARISTOTLE

384–322 B.C.

Aristotle was born in Stagira, on the border of Macedonia. His mother, Phaestis, was from a family of doctors, and his father, Nicomachus, was the court physician to the king of Macedonia. At seventeen, Aristotle was sent to Athens. There he studied in Plato's Academy for two decades, but, as he later wrote, he loved the truth more than he loved Plato, and so he had no mind to remain a mere disciple. In 347 B.C., after Plato's death, he left Athens and spent the next four years conducting zoological investigations on the islands of Assos and Lesbos.

About 343 B.C., he was called to Macedonia by King Philip to tutor the king's son—the future Alexander the Great. Upon Alexander's ascension to the throne seven years later, Aristotle returned to Athens to set up the Lyceum, a rival to the Academy. Aristotle did much of his teaching walking up and down the colonnades with advanced students. As a result, his school and philosophy came to be called by the Greek word for walking around: *<peripatetikos>*, from which we get our word "peripatetic." Tradition has it that as Alexander the Great moved east, conquering Persia and moving into India, he would send back biological specimens for Aristotle's school. Although most scholars doubt this popular story, it is nevertheless clear that under Alexander's patronage, the Lyceum flourished.

However, the connection to Alexander proved a liability in the end. On Alexander's death in 323 B.C., Athenians went on a rampage against any and all associated with him. Indicted on charges of impiety, Aristotle fled Athens, "lest," as he put it, "the Athenians sin twice against philosophy" (referring, of course, to the unjust trial and death of Socrates). Aristotle died a year later. A popular but again highly questionable story says he drowned investigating marine life.

There is no doubt that after Plato, Aristotle is the most influential philosopher of all time. In the early Middle Ages, his thought was preserved and commented

upon by the great Arab philosophers. He dominated later medieval philosophy to such an extent that St. Thomas Aquinas referred to him simply as *philosophus*, the “philosopher.” Logic, as taught until about the time of World War II, was essentially Aristotle’s logic. His *Poetics* is still a classic of literary criticism, and his dicta on tragedy are widely accepted even today. Criticism of Aristotle’s metaphysical and epistemological views has spread ever since Bacon and Descartes inaugurated modern philosophy; but for all that, the problems Aristotle saw, the distinctions he introduced, and the terms he defined are still central in many, if not most, philosophical discussions. His influence and prestige, like Plato’s, are international and beyond all schools.

* * *

Aristotle found Plato’s theory of Forms unacceptable. Like Plato, he wanted to discover universals, but he did not believe they existed apart from particulars. The form of a chair, for instance, can be thought of apart from the matter out of which the chair is made, but the form does not subsist as a separate invisible entity. The universal of “chairness” exists only in particular chairs—there is no other-worldly “Form of Chairness.” Accordingly, Aristotle began his philosophy not with reflection on or dialogue about eternal Forms but with observations of particular objects.

In observing the world, Aristotle saw four “causes” responsible for making an object what it is: the material, formal, efficient, and final. In the case of a chair, for example, the chair’s material cause is its wood and cloth, its formal cause is the structure or form given in its plan or blueprint, its efficient cause is the worker who made it, and its final cause is sitting. The material cause, then, is that *out of which* a thing is made, the formal cause is that *into which* a thing is made, the efficient cause is that *by which* a thing is made, and the final cause is that *for which* a thing is made. It is the last of these, the final cause, that Aristotle held to be most important, for it determined the other three. The “goal” or “end” (*telos* in Greek), the final cause, of any given substance is the key to its understanding. This means that all nature is to be understood in terms of final causes or purposes. This is known as a “teleological” explanation of reality.

As Aristotle applied these insights to human beings, he asked what the *telos* of a person could be. By observing what is unique to persons and what they, in fact, do seek, Aristotle came to the conclusion that the highest good or end for humans is *eudaimonia*. While this word is generally translated as “happiness,” one must be careful to acknowledge that Aristotle’s understanding of “happiness” is rather different from ours. *Eudaimonia* happiness is not a feeling of euphoria—in fact, it is not a feeling at all. It is rather “activity in accordance with virtue.” Much of the material from the *Nicomachean Ethics* presented here is devoted both to clarifying the word and to discovering how this kind of “happiness” is to be achieved.

* * *

Aristotle’s extant works lack the literary grace of Plato’s. Like Plato, Aristotle is said to have written popular dialogues—the “exoteric” writings intended for those who were not students at the Lyceum—but they have not survived. What we have instead are the difficult “esoteric” works: lecture notes for classes at school.

According to some scholars, these are not even Aristotle's notes, but the notes of students collected by editors. In any case, the writings as we have them contain much overlapping, repetition, and apparent contradiction.

Book II of the *Physics*, with which we begin, deals with some of the main questions of physical science. After defining the term "nature," Aristotle discusses change and necessity. And making a distinction between physics and mathematics, he discusses the four causes. Throughout this text, Aristotle displays his teleological understanding of nature—that is, that natural processes operate for an end or purpose.

The *Metaphysics* probably consists of several independent treatises. Book I (*Alpha*) of this collection develops Aristotle's four causes and reviews the history of philosophy to his time. Book XII (*Lambda*) employs many of the concepts previously introduced, such as substance, actuality, and potency, and then moves to Aristotle's theology of the Unmoved Mover. The work concludes with Aristotle's rejection of Platonic Forms as separate, mathematical entities. Apparently Aristotle was responding to Plato's successors, who emphasized the mathematical nature of the Forms.

The first part of the selection presented from Aristotle's *On the Soul* (*De Anima*) gives a definition of the soul and distinguishes its faculties. The second part discusses the passive and the active mind. As this selection makes clear, Aristotle rejected Plato's view of a soul separate from the body. The selections from *Physics*, *Metaphysics*, and *On the Soul* are all translated by Joe Sachs.

The *Nicomachean Ethics*, is still considered one of the greatest works in ethics. Named for Aristotle's son, Nicomachus, it discusses the nature of the good and of moral and intellectual virtues, as well as investigating specific virtues. The lengthy selection presented here (about one-half of the complete work) reflects this vast range of topics and includes discussions of the subject matter and nature of ethics; of the good for an individual; of moral virtue; of the mean; of the conditions of responsibility for an action; of pride, vanity, humility, and the great-souled man (Aristotle's ideal); of the superiority of loving over being loved; and finally, of human happiness. The translation is Martin Ostwald's.

The marginal page numbers, with their "a" and "b," are those of all scholarly editions—Greek, English, German, French, and others.

* * *

Timothy A. Robinson, *Aristotle in Outline* (Indianapolis, IN: Hackett, 1995) provides an excellent short introduction for the beginning student. W.K.C. Guthrie, *A History of Greek Philosophy, VI: Aristotle: An Encounter* (Cambridge: Cambridge University Press, 1981) and the classic W.D. Ross, *Aristotle* (1923; reprinted in New York: Meridian Books, 1959) are more advanced studies. John Herman Randall, Jr., *Aristotle* (New York: Columbia University Press, 1960); Marjorie Grene, *A Portrait of Aristotle* (Chicago: University of Chicago Press, 1963); J.L. Ackrill, *Aristotle the Philosopher* (Oxford: Oxford University Press, 1981); Jonathan Barnes, *Aristotle* (Oxford: Oxford University Press, 1982); Jonathan Lear, *Aristotle: The Desire to Understand* (Cambridge: Cambridge University Press, 1988); Terence Irwin, *Aristotle's First Principles* (Oxford: Oxford University Press, 1988); Jonathan Barnes, ed., *The Cambridge Companion to Aristotle* (Cambridge: Cambridge University Press, 1995); Kenneth McLeish, *Aristotle* (London: Routledge, 1999);

and Christopher Shields, *Aristotle* (London: Routledge, 2006) also provide helpful overviews of Aristotle's life and thought. For general collections of essays, see R. Bambrough, ed., *New Essays on Plato and Aristotle* (London: Routledge & Kegan Paul, 1965); J.M.E. Moravcsik, ed., *Aristotle: A Collection of Critical Essays* (New York: Anchor Doubleday, 1967); J. Barnes, M. Schofield, and R. Sorabji, eds., *Articles on Aristotle*, four volumes (London: Duckworth, 1979); Terence Irwin, ed., *Aristotle's Ethics*, *Aristotle: Substance, Form, and Matter* and *Aristotle: Metaphysics, Epistemology, Natural Philosophy* (all three, Hamden, CT: Garland Publishing, 1995); Cynthia A. Freeland, ed., *Feminist Interpretations of Aristotle* (College Park, PA: Pennsylvania State University Press, 1998); Lloyd P. Gerson, ed., *Aristotle* (London: Routledge, 1999); and George Klosko, ed., *Aristotle* (Burlington, VT: Ashgate, 2007). For help with specific works (besides the *Nicomachean Ethics*), see Lindsay Judson, ed., *Aristotle's Physics: A Collection of Essays* (Oxford: Oxford University Press, 1991); Helen S. Lang, *Aristotle's Physics and Its Medieval Varieties* (Albany: SUNY Press, 1992); Martha C. Nussbaum and Amelie O. Rorty, eds., *Essays on Aristotle's De Anima* (Oxford: Oxford University Press, 1992); Michael Durrant, ed., *Aristotle's De Anima in Focus* (Oxford: Routledge, 1993); Helen S. Lang, *The Order of Nature in Aristotle's Physics* (Cambridge: Cambridge University Press, 1998); Wolfgang-Rainer Mann, *The Discovery of Things: Aristotle's Categories and Their Context* (Princeton: Princeton University Press, 2000); C.D.C. Reeve, *Substantial Knowledge: Aristotle's Metaphysics* (Indianapolis, IN: Hackett, 2000); Vasilas Politis, *Routledge Philosophy Guidebook to Aristotle and the Metaphysics* (London: Routledge, 2004); and Ronald Polansky, *Aristotle's De Anima: A Critical Commentary* (Cambridge: Cambridge University Press, 2007). The *Nicomachean Ethics* has been such an influential book that many commentaries and essays have been written about it. Among these are H.H. Joachim, *Aristotle: The Nicomachean Ethics*, edited by D.A. Rees (Oxford: Clarendon Press, 1951); W.F.R. Hardie, *Aristotle's Ethical Theory*, 2nd edition (Oxford: Oxford University Press, 1980); Amelie O. Rorty, ed., *Essays on Aristotle's Ethics* (Berkeley: University of California Press, 1980); J.O. Urmson, *Aristotle's Ethics* (Oxford: Basil Blackwell, 1988); Sarah Brodie, *Ethics with Aristotle* (Oxford: Oxford University Press, 1991); Francis Sparshott, *Taking Life Seriously: A Study of the Argument of the Nicomachean Ethics* (Toronto: University of Toronto Press, 1994); Nancy Sherman, ed., *Aristotle's Ethics: Critical Essays* (Lanham, MD: Rowman and Littlefield, 1999); Gerard J. Hughes, *Routledge Philosophy Guidebook to Aristotle on Ethics* (NY: Routledge, 2001); Michael Pakaluk, *Aristotle's Nicomachean Ethics: An Introduction* (Cambridge: Cambridge University Press, 2005); and Christopher Warne, *Aristotle's Nicomachean Ethics: A Reader's Guide* (London: Continuum, 2006). Alasdair C. MacIntyre's pair of books, *After Virtue: A Study in Moral Theory* (Notre Dame, IN: University of Notre Dame Press, 1981) and *Whose Justice? Which Rationality?* (Notre Dame, IN: University of Notre Dame Press, 1988) are interesting examples of recent attempts to apply Aristotle's ethics to contemporary moral problems.

PHYSICS (in part)

BOOK II

1. Of the things that are, some are by nature, others through other causes: by nature 192^b
are animals and their parts, plants, and the simple bodies, such as earth, fire, air, and
water (for these things and such things we say to be by nature), and all of them obviously
differ from the things not put together by nature. For each of these has in itself a source
of motion and rest, either in place, or by growth and shrinkage, or by alteration; but a bed 15
or a cloak, or any other such kind of thing there is, in the respect in which it has happened
upon each designation and to the extent that it is from art, has no innate impulse of
change at all. But in the respect in which they happen to be of stone or earth or a mixture 20
of these, they do have such an impulse, and to that extent, since nature is a certain source
and cause of being moved and of coming to rest in that to which it belongs primarily, in
virtue of itself and not incidentally. (I say not incidentally because someone might him-
self become a certain cause of health in himself if he is a doctor. Still, it is not in the 25
respect in which he is cured that he has the medical art, but it happens to the same person
to be a doctor and be cured, on account of which they are also sometimes separated from
each other.) And similarly with each of the other things produced: for none of them has
in itself the source of its making, but some in other things and external, such as a house 30
and each of the other products of manual labor, others in themselves but not from them-
selves, as many as incidentally become causes for themselves.

Nature then is what has been said, and as many things have a nature as have such
a source. And every thing that has a nature is an independent thing, since it is something
that underlies [and persists through change], and nature is always in an underlying
thing. According to nature are both these things and as many things as belong to these 35
in virtue of themselves, as being carried up belongs to fire. For this is not a nature, nor
does it have a nature, but it is something by nature and according to nature. What nature
is, then, has been said, and what is something by nature and according to nature. *That*
nature is, it would be ridiculous to try to show, for it is clear that among the things that
are, such things are many. But to show things that are clear by means of things that are
unclear is the act of one who cannot distinguish what is known through itself from what
is known not through itself. (That it is possible to suffer this is not unclear, for someone 5
blind from birth might reason about colors.) So it is necessary that the speech of such
people be about names, while they have insight into nothing.

Now to some it seems that nature or the thinghood* of things by nature is the first 10
thing present in each which is unarranged as far as it itself is concerned; thus the nature
of a bed would be wood, and of a statue, bronze. And Antiphon says that a sign of this
is that, if someone were to bury a bed, and what rotted had the power to put up a sprout,
it would not become a bed but wood, since what belongs to it by accident is the 15

*<ousia>, often translated “substance,” means (as our translator puts it) “the way of being that belongs to anything which has attributes but is not an attribute of anything, which is also separate and a *this*. Whatever has being in this way is an independent thing.”

arrangement according to convention and art, while the thinghood of it is that which remains continuously even while it is undergoing these things. And if each of *these* things is in the same case in relation to something else (as bronze or gold to water, and bones or wood to earth, and similarly with anything else at all), *that* would be the nature and thinghood of them. On account of which, some say fire, some earth, some air, some water, some say some of these, and some all of these to be the nature of things that are. For whatever from among these anyone supposes to be such, whether one of them or more, this one or this many he declares to be all thinghood, while everything else is an attribute or condition or disposition of these; and whatever is among these he declares to be eternal (since for them there could be no change out of themselves), while the other things come into being and pass away an unlimited number of times.

In one way then, nature is spoken of thus, as the first material underlying each of the things that have in themselves a source of motion and change, but in another way as the form, or the look that is disclosed in speech. For just as art is said of what is according to art or artful, so also nature is said of what is according to nature and natural. We would not yet say anything to be according to art if it is only potentially a bed and does not yet have the look of a bed, nor that it is art, and similarly not in the case of things composed by nature. For what is potentially flesh or bone does not yet have its own nature, until it takes on the look that is disclosed in speech, that by means of which we define when we say what flesh or bone is, and not until then is it by nature. So in this other way, nature would be, of the things having in themselves a source of motion, the form or look, which is not separate other than in speech. (What comes from these, such as a human being, is not nature but by nature.)

And this form or look is nature more than the material is. For each thing is meant when it is fully at work, more than when it *is* potentially. Moreover, a human being comes about from a human being, but not a bed from a bed. On this account, they say that not the shape but the wood is the nature, since if it were to sprout, it would become not a bed but wood. But if, therefore, this is nature, then also the form is nature, for from a human being comes a human being. And still further, the nature spoken of as coming into being is a road into nature. For it is not like the process of medicine, which is meant to be a road not into the medical art but into health, for it is necessary that the medical process be from the medical art and not into it. But not thus is nature related to nature, but the growing thing, insofar as it grows, does proceed from something into something. What then is it that grows? Not the from-which, but the to-which. Therefore nature is the form.

But form and nature are meant in two ways, for deprivation is a sort of form. But whether in the case of a simple coming-into-being there is or is not a deprivation and an opposite, must be looked into later.

2. Now that nature has been marked off in a number of ways, after this one must see how the mathematician differs from one who studies nature (for natural bodies too have surfaces and solids and lengths and points, about which the mathematician inquires), and whether astronomy is different from or part of the study of nature. For if it belongs to the one who studies nature to know what the sun and moon are, but none of the properties that belong to them in themselves, this would be absurd, both in other ways and because those concerned with nature obviously speak about the shape of the moon and sun and especially whether the earth and the cosmos are of spherical shape or not.

The mathematician does busy himself about the things mentioned, but not insofar as each is a limit of a natural body, nor does he examine their properties insofar as they

belong to them because they pertain to natural bodies. On account of this also he separates them. For in his thinking they are separated from motion, and it makes no difference, nor do they become false by being separated. Those who speak of the forms also do this, but without being aware of it, for they separate the natural things, which are less separable than the mathematical ones. This would become clear if one should try to state the definitions of each of these things, both of themselves and of their properties. For the odd and even, and the straight and the curved, and further, number, line, and figure will be without motion, but no longer so with flesh, bone, or human being, but these are spoken of like a snub-nose and not like the curved. The more natural of the mathematical studies, such as optics, harmonics, and astronomy, also show this, for they in a certain way stand contrariwise to geometry. For geometry inquires about a natural line, but not as natural, but optics about a mathematical line, not as mathematical but as natural.

But since nature is twofold, and is both form and material, we must consider it as though we were inquiring about what snubness is. As a result, such things will be neither without material, nor determined by their material. And in fact, since there are two natures, one might be at an impasse about which of them belongs to the study of nature. Or is it about that which comes from both? But if it is about that which comes from both, it is also about each of the two. Then does it belong to the same study or different ones to know each? If one looks to the ancients, it would seem to be about material (for only a little bit did Empedocles and Democritus touch on form or the what-it-is-to-be of things). But if art imitates nature, and if it belongs to the same knowledge to know the form and the material to some extent (as it is the doctor's job to know health and also bile and phlegm, in which health is, and the housebuilder's to know both the form of a house and its material, that it is bricks and lumber, and in like manner with the rest), it would also be part of the study of nature to pay attention to both natures.

Further, that for the sake of which, or the end, as well as whatever is for the sake of these, belong to the same study. But nature is an end and a that-for-the-sake-of-which. (For of those things of which there is an end, if the motion is continuous, the end is both the last stage and that for the sake of which; which induced the poet to say, absurdly, "He has his death, for the sake of which he was born." For not every last thing professes itself to be an end, but only what is best.) And the arts make even their material, some simply and others working it up, and we make use of everything there is as though it is for our sake (for we are also in some way an end, and "that for the sake of which" is double in meaning, but this is discussed in the writings on philosophy). But the arts which govern and understand the material are two, one of using and one of directing the making. The art of using is for that very reason somehow directive of the making, but they differ in that the one is attentive to the form, the other, as productive, to the material. For the steersman recognizes and gives orders about what sort of form belongs to the rudder, but someone else about what sort of wood and processes it will come from. In things that come from art, then, we make the material for the sake of the work, but in natural things it is in being from the beginning. Further, material is among the relative things: for a different form, a different material.

To what extent is it necessary for the one who studies nature to know the form or whatness? Is it just as the doctor knows connective tissue or the metal-worker knows bronze, to the extent of knowing what each is for the sake of, even about those things which, while separate in form, are present in material? For both a human being and the sun beget a human being. But what manner of being the separate thing and the whatness have, it is the work of first philosophy to define.

3. These things having been marked out, it is necessary to examine the causes, both what sort there are and how many in number. For since this work is for the sake of knowing, but we think we do not yet know each thing until we have taken hold of the why of it (and to do this is to come upon the first cause), it is clear that we too must do this about both coming into being and passing away and about every natural change, so that, once we know them, we may try to lead back to them each of the things we inquire about.

25 One way cause is meant, then, is that out of which something comes into being, still being present in it, as bronze of a statue or silver of a bowl, or the kinds of these. In another way it is the form or pattern, and this is the gathering in speech of the what-it-is-for-it-to-be, or again the kinds of this (as of the octave, the two-to-one ratio, or generally number), and the parts that are in its articulation. In yet another it is that from
30 which the first beginning of change or of rest is, as the legislator is a cause, or the father of a child, or generally the maker of what is made, or whatever makes a changing thing change. And in still another way it is meant as the end. This is that for the sake of which, as health is of walking around. Why is he walking around? We say “in order to be
35 healthy,” and in so saying think we have completely given the cause. Causes also are as many things as come between the mover of something else and the end, as, of health, fasting or purging or drugs or instruments. For all these are for the sake of the end, but
195^a they differ from one another in that some are deeds and others tools.

Bust of Aristotle, first century copy of Greek sculpture, Louvre. Using Aristotle's Four Causes, we would say the *material cause* of this bust is marble (that *out of which* it was made), the *formal cause* is a bust of Aristotle (that *into which* it was made), the *efficient cause* is the sculptor who carved it (that *by which* it was made), and the *final cause* is to honor or memorialize Aristotle (that *for the sake of which* it was made). (©Print Collector/Getty)

The causes then are meant in just about this many ways, and it happens, since they are meant in more than one way, that the non-accidental causes of the same thing are also many, as of the statue both the art of sculpture and bronze, not as a consequence of anything else but just as a statue, though they are not causes in the same way, but the one as material and the other as that from which the motion was. And there are also in a certain way causes of one another, as hard work is a cause of good condition and this in turn is a cause of hard work, though again not in the same way, but the one as end and the other as source of motion. Further, the same thing is a cause of opposite things. For the present thing is responsible for this result, and we sometimes blame it, when it is absent, for the opposite result, as the absence of the pilot for the ship's overturning, whose presence was the cause of its keeping safe. But all the causes now being spoken of fall into four most evident ways. For the letters of syllables and the material of processed things and fire (and such things) of bodies and parts of a whole and hypotheses of a conclusion are causes as that out of which, and while the one member of each of these pairs is a cause as what underlies, such as parts, the other is so as the what-it-is-for-it-to-be, a whole or composite or form. But the semen and the doctor and the legislator, and generally the maker, are all causes as that from which the source of change or rest is, but other things are causes as the end or the good of the remaining ones. For that-for-the-sake-of-which means to be the best thing and the end of the other things, and let it make no difference to say the good itself or the apparent good.

The causes then are these and are so many in form, but the ways the causes work are many in number, though even these are fewer if they are brought under headings. For cause is meant in many ways, and of those of the same form, as preceding and following one another. For example, the cause of health is the doctor and also the skilled knower, and of the octave the double and also number, and always comprehensive things in relation to particular ones. Further, there is what is incidental, and the kinds of these, as of the statue, in one way Polycleitus and in another the sculptor, because it is incidental to the sculptor to be Polycleitus. And there are the things comprehensive of the incidental cause, as if a human being were the cause of a statue, or generally, an animal. And also among incidental things, some are more remote and others nearer, as if the pale man or the one with a refined education were said to be the cause of a statue. And all of them, both those meant properly and those incidentally, are meant some as potential and others as at-work, as of building a house, either the builder or the builder building. And similarly to the things that have been said, an account will be given for those things of which the causes are causes, as of this statue or a statue or in general an image, and of this bronze or of bronze or in general of material, and likewise with the incidental things. Further, things tangling these and those together will be said, such as not Polycleitus nor a sculptor but the sculptor Polycleitus.

Nevertheless, all these are six in multitude, but spoken of in a twofold way: there is the particular or the kind, the incidental or the kind of the incidental thing, and these entangled or spoken of simply, and all as either at-work or in potency. And they differ to this extent, that what is at-work and particular is and is not at the same time as that of which it is the cause, as this one healing with this one being cured or this one building with this thing being built, but not always so with what is potential. The house and the housebuilder are not finished off simultaneously.

And it is necessary always to seek out the ultimate cause of each thing, and in just the same way as with the others. (For example, a man builds because he is a builder, but is a builder as a result of the housebuilder's art; this, then, is the prior cause, and thus with everything.) Further, the kinds belong to the kinds and the particulars to the

particulars (as a sculptor to a statue, but this sculptor to this statue). Also the potencies belong to the potencies, but what is at work corresponds to what is being worked upon.
 30 How many then are the causes and in what way they are causes, let it have been marked out sufficiently for us.

4. Fortune and chance are spoken of among the causes, and many things are said
 35 to be and to come about through fortune or through chance. In what way, then, fortune and chance are among these causes, and whether fortune and chance are the same or different, and in general what fortune and chance are, must be examined. For some people
 196^a are at an impasse even about whether they exist or not. For they say nothing comes about from fortune, but that, for everything whatever that we say comes from chance or fortune, there is some definite cause; for example, of coming by fortune into the marketplace and catching up with someone whom one wanted, but did not expect, to find, the cause is wanting to go to use the marketplace. And similarly with the rest of the things said to be from fortune, there is always something to take as the cause, but not
 5 fortune, since if fortune were anything it would seem strange, and truly so; and one might find it impossible to understand why in the world none of the ancient wise men, speaking about the causes of coming-to-be and passing away, demarcated anything
 10 about fortune, but as it seems, they too regarded nothing as being from fortune. But this too is to be wondered at. For many things both come about and are from fortune and from chance, which everyone, though not ignorant that it is possible to refer each of them back to some cause of its coming about, which the earlier argument declared to be
 15 the abolition of fortune, nevertheless says are from fortune, some of them, though some are not. For this reason they were obliged to make some mention of it in some way. But surely they did not regard fortune to be any of those things such as friendship and strife, or intellect, or fire, or anything else of that sort. It is strange, then, either if they did not acknowledge it to be, or if, supposing it, they left it aside, despite even sometimes making
 20 use of it, as Empedocles says that the air is not always separated in the highest place, but however it falls out. Certainly he says in his cosmogony that "it fell out thus as it was flowing at one time, but often otherwise." And most of them say that the parts of animals have come into being from fortune.

25 There are some who make chance responsible for this cosmos and all worlds. For they say that by chance there came about a vortex and a motion of separating out and settling into this arrangement of the whole. And this itself is in fact mightily worth wondering at. For they are saying that animals and plants neither are nor come to be by
 30 fortune, but that either nature or intellect or some other such thing is the cause (for what comes into being from each seed is not whatever falls out, but from this one an olive tree, from that one a human being), but that the heavens and the most divine of visible things have come from chance, and there is in no way such a cause as there is
 35 of the animals and plants. But if this is the way things are, this itself is worth bringing one to a stop, and it would have been good for something to have been said about it.
 196^b In this respect as well as others, what is said is strange, and it is stranger still to say these things when one sees nothing in the heavens happening by chance, but many things falling out by fortune among the things not assigned to fortune, though it would surely seem that the opposite would happen.

5 There are others to whom it seems that fortune is a cause, but one not disclosed to human understanding, as though it were something divine and more appropriate to miraculous agency. So it is necessary to examine what each is, and whether chance and fortune are the same or different, and how they fall in with the causes that have been marked out.

5. First, then, since we see some things always happening in a certain way, and others for the most part, it is clear that of neither of these is fortune or what comes from fortune said to be the cause, neither of what is out of necessity and always, nor of what is for the most part. But since there are other things besides these that happen, and everyone says that they are from fortune, it is clear that fortune or chance is in some way. For we know that things of this kind are from fortune and that things from fortune are of this kind.

Now of things that happen, some happen for the sake of something and some not (and of the former, some in accordance with choice, some not in accordance with choice, but both are among things for the sake of something), so that it is clear that even among things apart from what is necessary or for the most part, there are some to which it is possible that being for the sake of something belongs. And for the sake of something are as many things as are brought about from thinking or from nature. But whenever such things come about incidentally, we say that they are from fortune. (For just as a thing is something either in virtue of itself or incidentally, so also is it possible to be a cause, as of a house, the cause in virtue of itself is the builder's art, but an incidental one is the pale or educated man; the cause in virtue of itself, then, is definite, but the incidental one indefinite, for to one thing, infinitely many things incidentally belong.) Just as was said, then, whenever this happens among things happening for the sake of something, in that case it is said to be from chance or from fortune. (The difference between these in relation to one another is something that must be distinguished later; for now let this be clearly seen, that both are among the things for the sake of something.) For example, someone gathering contributions would have come for the sake of collecting money, if he had known; but he came not for the sake of this, but it happened to him incidentally to go and to do this. And this was not through frequenting the place for the most part or out of necessity, but the end, the collection, though not belonging to the causes in him, is among choices and things that result from thinking. And in this case he is said to have come by fortune, but if he had chosen to, and for the sake of this, or if he frequented the place always or for the most part, not by fortune. It is clear then that fortune is an incidental cause among things proceeding from choice, which in turn are among those for the sake of something. Whence thinking and fortune concern the same thing, for there is no choice without thinking.

It is necessary, then, that the causes be indefinite from which what arises from fortune comes about. Whence fortune too seems to be indefinite, and obscure to humans, and it is possible for it to seem that nothing comes about from fortune. For all these things are said correctly, reasonably. That is, there are things that come about from fortune: they come about incidentally, and fortune is an incidental cause, but of nothing is it the cause simply. As of a house, the cause is the builder's art, but incidentally a flute-player, also of coming to collect money when one has not come for the sake of this, the multitude of causes is unlimited. One wanted either to see someone, or look for someone, or get away from someone, or see a show. It is even correct to say that fortune is something non-rational, for a reasoned account belongs to what happens either always or for the most part, and fortune is among things that come about outside of these ways. Thus, since causes of this kind are indefinite, fortune too is indefinite. Still, in some situations, one might be at a loss whether the things that happen to occur would become causes of fortune, as of health, the wind or the sun's warmth, but not having had a haircut. For among incidental causes, some are nearer than others.

Whenever something good turns out, fortune is called good, or indifferent when it is something indifferent, but good fortune or ill fortune are only spoken of when these

outcomes are of some magnitude. For this reason too, to come within a hairsbreadth of obtaining some great evil or good is to be fortunate or unfortunate, because our thinking picks out what comes out, but seems to hold off what was within a hairsbreadth as nothing. Further, good fortune is unstable, and reasonably, for fortune is unstable, since it is not possible for any of the things from fortune to be always or for the most part. Both, then, are causes, incidental ones as was said, both fortune and chance, among those things which admit of coming into being neither simply nor for the most part, belonging in turn to those which could come about for the sake of something.

6. They differ because chance is more extensive, for everything from fortune is from chance, but not everything from it is from fortune. For fortune and what comes from fortune are present to beings to whom being fortunate, or generally, action, might belong. For this reason also, fortune is necessarily concerned with actions. (A sign is that good fortune seems to be either the same thing as happiness or nearly so, while happiness is a kind of action, namely doing well.) So whatever cannot act cannot do anything as a result of fortune either. And for this reason no inanimate thing nor any animal or small child can do anything as a result of fortune, because they do not have the power to choose in advance. Neither good fortune nor misfortune belongs to them, except metaphorically, as Protarchus says the stones out of which altars are made are fortunate, because they are honored, while their quarry-mates are trampled on. But it belongs even to these things to be affected by fortune, whenever an active being acts on them in some way that results from fortune, but in no other way. Chance, though, belongs to the other animals and to many inanimate things, as we say a horse came along by chance, because he was saved by his coming, though he did not come for the sake of the being saved. Or a tripod fell down by chance, for it stood there in order to be sat upon, but did not fall down in order to be sat upon. So it is clear, among things happening for the sake of something simply, whenever they happen not for the sake of what turned out, of which the cause was external, we then say that they are from chance. And as many of these things that happen by chance are choices, and happen to those having the power of choice, as are from fortune.

A sign of this is the phrase "in vain," which is said whenever what is for the sake of another thing does not come to pass for the sake of that, as, if taking a walk were for the sake of evacuation, but when one had walked this did not happen, we would say that having walked was vain and taking a walk futile, as though this was the "in vain": for something by nature for the sake of another thing, the not being brought to accomplishment of that for the sake of which it was and to which it was naturally disposed, since if someone said he had bathed in vain because the sun was not eclipsed, it would be ridiculous, for this was not for the sake of that. Thus, even from its name, chance [*to automaton*] is that which itself happens in vain [*to auto maten*]. For the stone fell not for the sake of knocking someone out; therefore the stone fell by chance, because it could have fallen by some agency and for the sake of the knocking out.

Chance is separated most of all from what comes from fortune in things that happen by nature. For whenever something happens contrary to nature, we say that it happened not by fortune but by chance. But it is also possible that this is for a different reason, since of the one the cause is outside, of the other inside.

What, then, chance and fortune are has been said, and how they differ from each other. And of the ways of being a cause, both of them are among things from which the source of motion is; for they are always among either things in some way by nature, or causes that come from thinking, but the multitude of them is infinite. But since chance

and fortune are causes of things for which either intelligence or nature might have been responsible, whenever something incidentally becomes responsible for these same things, but nothing incidental is prior to things in virtue of themselves, it is clear that neither is the incidental cause prior to what is in virtue of itself. Therefore chance and fortune are subordinate to intelligence and nature, so that if chance is responsible for the heavens as much as possible, it is necessary that intelligence and nature have a prior responsibility, not only for many other things, but also for this whole.

7. That there are causes, and that they are as many in number as we said, is clear, for the why includes so many in number. For the why ultimately leads back either to the what-it-is, among motionless things (as in mathematics, for it ultimately leads back to the definition of straight or commensurable or something else), or to the first source of motion (as, Why did they go to war? Because they were plundered), or something for the sake of which (in order to rule), or, among things that come into being, the material.

That the causes, then, are these and this many, is clear; and since there are four causes, it belongs to the one who studies nature to know about all of them, and he will supply what is due in the way of natural inquiry by tracing back the why to them all: the material, the form, the mover, and that for the sake of which. But often three of them turn back into one, for the what-it-is and that for the sake of which are one, and that whence the motion first is, is the same in form with these; for a human being brings forth a human being, and in general, as many things as, being moved themselves, cause motion, are the same in form with the things moved. (Whatever is not like this does not belong to the study of nature. For it causes motion not by having motion or a source of motion in itself, but being motionless. On which account there are three studies, one about motionless things, one about things moved but indestructible, and one about destructible things.) So they supply what is due by tracing back the why to the material, and to the what-it-is, and to the first mover. About coming into being, they examine the cause mostly in this way: what comes about after what, and what did it do first, or how was it acted upon, and so on always in succession.

The sources which bring about motion naturally are twofold, of which one kind is not natural, for sources of that kind do not have in themselves a source of motion. And of this kind is whatever causes motion without being moved, as does not only what is completely motionless and the first of all beings, but also the what-it-is or form, for it is an end and that for the sake of which. So, since nature is for the sake of something, it is also necessary to know this, and one must supply the why completely: for example, that from this necessarily comes that (from this either simply or for the most part), *and* that if it is going to be, this will be (as from the premises, the conclusion), and that this is what it is for it to be, and because it is better thus, not simply, but in relation to the thinghood of each thing.

8. One must say, first, why nature is among the causes for the sake of something, then, about the necessary, how it holds a place among natural things. For everybody traces things back to this cause, inasmuch as, since the hot and the cold and each thing of this kind are by nature a certain way, these things are and come into being out of necessity. For even if they also speak of another cause, they send it on its way after only so much as touching on it, one on friendship and strife, another on intellect.

Here is an impasse: what prevents nature from doing things not for the sake of anything, nor because they are best, but just as Zeus rains, not in order that the grain might grow, but out of necessity? (For it is necessary that what is taken up be cooled,

20 and that what is cooled, becoming water, come down; when this happens, growing incidentally happens to the grain.) Likewise, if the grain is ruined on the threshing-floor, not for the sake of this did it rain, to spoil it, but this was incidental. So what prevents the parts in something that is by nature from being the same way, say the teeth growing
 25 with the front ones sharp out of necessity, suitable for tearing, but the molars flat and useful for grinding the food, although not happening for the sake of this, but just falling together? Likewise with the other parts, to however many being for the sake of something seems to belong, wherever everything happened to come together just as if it had been for the sake of something, these were preserved, having been put together advantageously by chance. Anything that is not like that has perished and still perishes, just as Empedocles says of man-headed offspring of cattle.

The account, then, by means of which one might come to an impasse, is this one or any other that might be of this kind; but it is impossible for things to be this way. For
 35 these things and all things that are by nature come about as they do either always or for the most part, but none of the things from fortune or chance do. For it does not seem to be from fortune or by coincidence that it rains often in winter, but it does if this happens
 199^a in the dog days, nor scorching heat in the dog days, but in winter. If, then, it seems that something is either by coincidence or for the sake of something, and if things by nature cannot be by either coincidence or chance, they would be for the sake of something. But
 5 surely such things are all by nature, as even those making these arguments would say. Therefore, there is being-for-the-sake-of-something among things that happen and are by nature.

Further, among all things that are for some end, it is for the sake of this that what precedes it in succession is done. Accordingly, in the way that one performs an action,
 10 so also are things by nature, and as things are by nature, so does one perform each action unless something interferes. But one acts for the sake of something, and therefore what is by nature is for the sake of something. For example, if a house were something that came into being by nature, it would come about in just the way that it now does by art, and if the things by nature were to come about not only by nature but also by art,
 15 they too would come about in exactly the same way as they do by nature. Therefore each is for the sake of another. And in general, art in some cases completes what nature is unable to finish off, but in others imitates nature. If then, what comes from art is for the sake of something, it is clear that what comes from nature is too, for the series of things from art and from nature are alike, each to each, in the way that the later things are related to the earlier.

20 This is clear most of all in the other animals, which do nothing by art, inquiry, or deliberation; for which reason some people are completely at a loss whether it is by intelligence or in some other way that spiders, ants, and such things work. But if we move forward little by little in this way, it becomes apparent that even in plants what is
 25 brought together comes about in relation to the end, as the leaves for the sake of protection for the fruit. So if both by nature and for the sake of something the swallow makes a nest and the spider a web, and the plants make their leaves for the sake of their fruit, and their roots not upward but downward for the sake of nourishment, it is clear that
 30 there is such a cause in things that come into being and are by nature. And since nature is twofold, both material and form, and the latter is an end but the former is for the sake of an end, the form would be the cause for the sake of which.

Now missing the mark happens even among things done according to art (for the
 199^b grammarian on occasion writes, or the doctor gives out a drug, incorrectly), so it is clear that this is possible also among things done by nature. But if there are some things

according to art in which what is done correctly is for the sake of something, but in the ones that miss the mark what is done is for the sake of something that is attempted but missed, it is the same among natural things, and monsters are failures of that for the sake of which they are. Therefore even the cattle-offspring, in their original constitution, if they were not able to come to some limit and end, would have come into being when some originating cause in them was disabled, as might happen now with the seed. Still it is necessary that a seed come into being first, and not straightaway the animals; “first the mixed-natured” was the seed. That for the sake of which is also present in plants, though less articulated. So then did there come about among the plants, like the man-headed offspring of cattle, also olive-headed offspring of grapevines, or not? It would be strange, but it would be necessary, if it also happened among animals.

In general, it would be necessary, among seeds, that whatever chanced come into being, but the one speaking this way abolishes nature and what is by nature. For by nature are as many things as, moved continuously by some source in themselves, reach some end; from each beginning does not come the same end for them all, nor just what chances, but each always reaches the same end unless something interferes. That for the sake of which, and that which is for the sake of this, might also happen by fortune, as we say that a stranger came by fortune and, having paid the ransom, went away, when he acted as though having come for the sake of this, but did not come for the sake of this. And this is incidental (for fortune is among the incidental causes, just as we said before), but whenever this happens always or for the most part, it is neither incidental nor by fortune. But among natural things, things happen always in the same way, unless something interferes.

It is absurd to think that a thing does not happen for the sake of something if we do not see what sets it in motion deliberating. Surely even art does not deliberate. If shipbuilding were present in wood, it would act in the same way as nature does, so if being for the sake of something is present in art, it is also present in nature. This is most clear when someone practices medicine himself on himself; for nature is like that. That, then, nature is a cause, and in this way, for the sake of something, is clear.

9. Does what is by necessity belong to things conditionally or simply? For now people suppose that what is by necessity is in the coming into being of things, as if someone were to think that the wall of a house came into being by necessity, because the heavy things are of a nature to be carried downward and the light ones on top, so that the stones and foundations are at the bottom, the earth above on account of its lightness, and at the very top the wood, since it is lightest. But even though it did not come into being without these things, it surely did not do so as a result of them, except as by means of material, but rather for the sake of enclosing and sheltering certain things. And similarly with everything else, in whatever being-for-the-sake-of something is present, each thing is neither without things having necessity in their nature, nor as a result of them other than as material, but for the sake of something. For example, why is a saw thus? In order to do this and for the sake of this. But this which it is for the sake of would be incapable of coming about if it were not made of iron. It is necessary, therefore, that it be of iron if the saw and its work are to be. So the necessary is conditional, unlike the end. For the necessary is in the material, but that for the sake of which is in what is grasped in speech.

The necessary is present both in mathematics and in things that come about by nature, in ways closely resembling one another. For since the straight is a certain way, it is necessary that the triangle be equal to two right angles, but not the former because of

the latter, despite the fact that were this not so, neither would the straight be as it is. But
 20 in things that come to be for the sake of something, contrariwise, if the end is to be or is,
 then what precedes it will be or is; and if not, just as there [in mathematics] the first
 principle will not be so when the conclusion is not, so also here [in nature] with the end
 and that for the sake of which. For this too is a starting point, not of action but of reason-
 25 ing (and of reasoning there; for there are no actions). So that if a house is to be, it is
 necessary that there come into being or be present or in general be these things as mate-
 rial for the sake of something, such as bricks and stones if it is a house. Nevertheless,
 the end is not present as a result of these, other than as material, nor will it be, just
 because of them. In general, however, neither the house nor the saw will be if the bricks,
 in the former case, and the iron in the latter, are not; for neither will the starting points
 30 be the case there if the triangle is not two right angles.

It is clear that the necessary in natural things is the so-called material and its
 motions. And both must be stated as causes by the one who studies nature, but more so
 that for the sake of which. For this is responsible for the material, but the material is not
 responsible for the end. And the end is that for the sake of which, and the beginning
 200^b comes from the definition and that which is grasped in speech; just as in things that
 come from art, since the house is such, these things must come into being or be present
 necessarily, and since health is such, *these* things must come into being or be present
 necessarily—so also if a human being is such, these things, but if these, these others in
 turn. Perhaps the necessary is even in the definition. For the work of sawing having
 5 been defined as a certain kind of dividing, this will not be unless it has teeth of a certain
 kind, and these will not be of that kind unless they are of iron. For even in the definition
 there are certain parts, as material of the definition.

METAPHYSICS (in part)

BOOK I

980^a 1. All human beings by nature stretch themselves out toward knowing. A sign of
 this is our love of the senses; for even apart from their use, they are loved on their own
 25 account, and above all the rest, the one through the eyes. For not only in order that we
 might act, but even when we are not going to act at all, we prefer seeing, one might say,
 as against everything else. And the cause is that, among the senses, this one most of all
 makes us discover things, and makes evident many differences. By nature, then, the ani-
 980^b mals come into being having sense perception, though in some of them memory does
 not emerge out of this, while in others it does. And for this reason, these latter are more
 intelligent and more able to learn than those that are unable to remember, while as many
 of them as are not able to hear sounds are intelligent without learning (such as a bee, or
 25 any other kind of animal that might be of this sort), but as many do learn as have this

sense in addition to memory. So the other animals live by images and memories, but have a small share of experience, but the human race lives also by art and reasoning. And for human beings, experience arises from memory, since many memories of the same thing bring to completion a capacity for one experience. 981^a

Now experience seems to be almost the same thing as knowledge or art, but for human beings, knowledge and art result from experience, for experience makes art, as Polus says and says rightly, but inexperience makes chance. And art comes into being whenever, out of many conceptions from experience, one universal judgment arises about those that are similar. For to have a judgment that this thing was beneficial to Callias when he was sick with this disease, and to Socrates, and one by one in this way to many people, belongs to experience. But the judgment that it was beneficial to all such people, marked out as being of one kind, when they were sick with this disease, such as to sluggish or irritable people when they were feverish with heat, belongs to art. For the purpose of acting, experience doesn't seem to differ from art at all, and we even see people with experience being more successful than those who have a rational account without experience. (The cause of this is that experience is familiarity with things that are particular, but art with those that are universal, while actions and all becoming are concerned with what is particular. For the doctor does not cure a human being, except incidentally, but Callias or Socrates or any of the others called by such a name, who happens to be a human being. So if someone without experience has the reasoned account and is familiar with the universal, but is ignorant of what is particular within it, he will often go astray in his treatment, since what is treated is particular.) 15

Nevertheless, we think that knowing and understanding are present in art more than is experience and we take the possessors of arts to be wiser than people with experience, as though in every instance wisdom is more something resulting from and following along with knowing; and this is because the ones know the cause while the others do not. For people with experience know the what, but do not know the why, but the others are acquainted with the why and the cause. For this reason we also think the master craftsmen in each kind of work are more honorable and know more than the manual laborers, and are also wiser, because they know the causes of the things they do, as though people are wiser not as a result of being skilled at action, but as a result of themselves having the reasoned account and knowing the causes. And in general, a sign of the one who knows and the one who does not is being able to teach, and for this reason we regard the art, more than the experience, to be knowledge, since the ones can, but the others cannot, teach. 25

Further, we consider none of the senses to be wisdom, even though they are the most authoritative ways of knowing particulars; but they do not pick out the why of anything, such as why fire is hot, but only that it is hot. So it is likely that the one who first discovered any art whatever that was beyond the common perceptions was wondered at by people, not only on account of there being something useful in his discoveries, but as someone wise and distinguished from other people. But once more arts had been discovered, and some of them were directed toward necessities but others toward a way of living, it is likely that such people as were discoverers of the latter kind were always considered wiser, because their knowledge was not directed toward use. Hence when all such arts had been built up, those among the kinds of knowledge directed at neither pleasure nor necessity were discovered, and first in those places where there was leisure. It is for this reason that the mathematical arts were first constructed in the neighborhood of Egypt, for there the tribe of priests was allowed to live in leisure. 25

Now it has been said in the writings on ethics what the difference is among art, demonstrative knowledge, and the other things of a similar kind, but the purpose for which we are now making this argument is that all people assume that what is called wisdom is concerned with first causes and origins. Therefore, as was said above, the person with experience seems wiser than those who have any perception whatever, the artisan wiser than those with experience, the master craftsman wiser than the manual laborer, and the contemplative arts more so than the productive ones. It is apparent, then, that wisdom is a knowledge concerned with certain sources and causes.

2. Since we are seeking this knowledge, this should be examined: about what sort of causes and what sort of sources wisdom is the knowledge. Now if one takes the accepted opinions we have about the wise man, perhaps from this it will become more clear. We assume first that the wise man knows all things, in the way that it is possible, though he does not have knowledge of them as particulars. Next, we assume that the one who is able to know things that are difficult, and not easy for a human being to know, is wise; for perceiving is common to everyone, for which reason it is an easy thing and nothing wise. Further, we assume the one who has more precision and is more able to teach the causes is wiser concerning each kind of knowledge. And among the kinds of knowledge, we assume the one that is for its own sake and chosen for the sake of knowing more to be wisdom than the one chosen for the sake of results, and that the more ruling one is wisdom more so than the more subordinate one; for the wise man ought not to be commanded but to give orders, and ought not to obey someone else, but the less wise ought to obey him.

We have, then, such and so many accepted opinions about wisdom and those who are wise. Now of these, the knowing of all things must belong to the one who has most of all the universal knowledge, since he knows in a certain way all the things that come under it; and these are just about the most difficult things for human beings to know, those that are most universal, since they are farthest away from the senses. And the most precise of the kinds of knowledge are the ones that are most directed at first things, since those that reason from fewer things are more precise than those that reason from extra ones, as arithmetic is more precise than geometry. But surely the skill that is suited to teach is the one that has more insight into causes, for those people teach who give an account of the causes about each thing. And knowing and understanding for their own sakes belong most to the knowledge of what is most knowable. For the one who chooses what is known through itself would most of all be choosing that which is knowledge most of all, and of this sort is the knowledge of what is most knowable. But what are most knowable are the first things and the causes, for through these and from these the other things are known, but these are not known through what comes under them. And the most ruling of the kinds of knowledge, or the one more ruling than what is subordinate to it, is the one that knows for what purpose each thing must be done; and this is the good of each thing, and in general the best thing in the whole of nature. So from all the things that have been said, the name sought falls to the same kind of knowledge, for it must be a contemplation of the first sources and causes, since also the good, or that for the sake of which, is one of the causes.

That it is not a productive knowledge is clear too from those who first engaged in philosophy. For by way of wondering, people both now and at first began to philosophize, wondering first about the strange things near at hand, then going forward little by little in this way and coming to impass about greater things, such as about the attributes of the moon and things pertaining to the sun and the stars and the coming into

being of the whole. But someone who wonders and is at an impasse considers himself to be ignorant (for which reason the lover of myth is in a certain way philosophic, since a myth is composed of wonders). So if it was by fleeing ignorance that they philosophized, it is clear that by means of knowing they were in pursuit of knowing, and not for the sake of any kind of use. And the following testifies to the same thing: for it was when just about all the necessities were present, as well as things directed toward the greatest ease and recreation, that this kind of understanding began to be sought. It is clear then that we seek it for no other use at all, but just as that human being is free, we say, who has his being for his own sake and not for the sake of someone else, so also do we seek it as being the only one of the kinds of knowledge that is free, since it alone is for its own sake.

For this reason one might justly regard the possession of it as not appropriate to humans. For in many ways human nature is slavish, so that, according to Simonides, “only a god should have this honor,” but a man is not worthy of seeking anything but the kind of knowledge that fits him. If indeed the poets have a point and it is the nature of the divine power to be jealous, it would be likely to happen most of all in this case, and all extraordinary people would be ill-fated. But it is not even possible for the divine power to be jealous, but according to the common saying “many lyrics are lies,” and one ought not to regard anything else as more honorable than this knowledge. For the most divine is also the most honorable, and this knowledge by itself would be most divine in two ways. For what most of all a god would have is that among the kinds of knowledge that is divine, if in fact any of them were about divine things. But this one alone happens to have both these characteristics; for the divine seems to be among the causes for all things, and to be a certain source, and such knowledge a god alone, or most of all, would have. All kinds of knowledge, then, are more necessary than this one, but none is better.

It is necessary, however, for the possession of it to settle for us in a certain way into the opposite of the strivings with which it began. For everyone begins, as we are saying, from wondering whether things are as they seem, such as the self-moving marvels, or about the reversals of the sun or the incommensurability of the diagonal (for it seems amazing to all those who have not yet seen the cause if anything is not measured by the smallest part). But it is necessary to end in what is opposite and better, as the saying goes, just as in these cases when people understand them; for nothing would be so surprising to a geometer as if the diagonal were to become commensurable. What, then, is the nature of the knowledge being sought, has been said, and what the object is on which the inquiry and the whole pursuit must alight.

3. Since it is clear that one must take hold of a knowledge of the causes that originate things (since that is when we say we know each thing, when we think we know its first cause), while the causes are meant in four ways, of which one is thinghood,* or what it is for something to be (since the why leads back to the ultimate reasoned account, and the first why is a cause and source), another is the material or underlying thing, a third is that from which the source of motion is, and the fourth is the cause opposite to that one, that for the sake of which or the good (since it is the completion of every coming-into-being and motion), which have been sufficiently looked into by us in the writings about nature, still, let us take up also those who came before us into the

**ousia*, often translated “substance,” means (as our translator puts it) “the way of being that belongs to anything which has attributes but is not an attribute of anything, which is also separate and a *this*. Whatever has being in this way is an independent thing.”

inquiry about beings and philosophized about truth. For it is clear that they too speak of certain sources and causes. So for those who go back over these things, there will be some profit for the present pursuit; for we will either find out some other kind of cause or be more persuaded about the ones we are now speaking of. Of those who first engaged in philosophy, most thought that the only sources of all things were of the species of material; that of which all things are made, out of which they first come into being and into which they are at last destroyed, its thinghood abiding but changing in its attributes, this they claim is the element and origin of things, for which reason nothing ever comes into being or perishes, since this sort of nature is always preserved, just as we would not say either that Socrates simply comes into being when he becomes beautiful or educated in refined pursuits, or that he perishes when he sheds these conditions, since the underlying thing, Socrates himself, persists, so neither does anything else. For there must be some nature, either one or multiple, out of which the other things come into being while that one is preserved. About the number and kind of such sources, however, they do not all say the same thing, but Thales, the founder of this sort of philosophy, says it is water (for which reason too he declared that the earth is on water), getting hold of this opinion perhaps from seeing that the nourishment of all things is fluid, and that heat itself comes about from it and lives by means of it (and that out of which things come into being is the source of them all). So he got hold of this opinion by this means, and because the seeds of all things have a fluid nature, while water is in turn the source of the nature of fluid things.

There are some who think that very ancient thinkers, long before the present age, who gave the first accounts of the gods, had an opinion of this sort about nature. For they made Ocean and Tethys the parents of what comes into being, and made the oath of the gods be by water, called Styx by them; for what is oldest is most honored, and that by which one swears is the most honored thing. But whether this opinion about nature is something archaic and ancient might perhaps be unclear, but Thales at least is said to have spoken in this way about the first cause. (One would not consider Hippo worthy to place among these, on account of his cut-rate thinking.) Anaximenes and Diogenes set down air as more primary than water and as the most originative of the simple bodies, while Hippasus of Metapontium and Heraclitus of Ephesus set down fire, and Empedocles, adding earth as a fourth to those mentioned, sets down the four (for he says these always remain and do not come into being except in abundance or fewness, being combined and separated into or out of one). Anaxagoras of Clazomenae, who was before Empedocles in age but after him in his works, said the sources were infinite; for he said that almost all homogeneous things are just like water or fire in coming into being or perishing only by combination and separation, but otherwise neither come into being nor perish but remain everlasting.

From these things, then, one might suppose that the only cause is the one accounted for in the species of material; but as people went forward in this way, their object of concern itself opened a road for them, and contributed to forcing them to inquire along it. For no matter how much every coming-into-being and destruction is out of some one or more kinds of material, why does this happen and what is its cause? For surely the underlying material itself does not make itself change. I mean, for example, neither wood nor bronze is responsible, respectively, for its own changing, nor does the wood make a bed or the bronze a statue, but something else is responsible for the change. But to inquire after this is to seek that other kind of source, which we would call that from which the origin of motion is. Now some of these who from the very beginning applied themselves to this sort of pursuit and said that the underlying material was one

thing, were not at all displeased with their own accounts, but some of those who said it was one, as though defeated by this inquiry, said that the one and the whole of nature were motionless, not only with respect to coming into being and destruction (for this is present from the beginning and everyone agrees to it), but also with respect to every other kind of change, and this is peculiar to them. So of those who said that the whole is one, none happened to catch sight of this sort of cause unless in fact Parmenides did, and he only to the extent that he set down the causes as being not only one but in some way two. But it is possible to say so about those who made things more than one, such as hot and cold, or fire and earth; for they use the nature of fire as having the power to set things in motion, but water and earth and such things as the opposite. 30 984^b 5

But after these people and sources of this kind, since they were not sufficient to generate the nature of things, again by the truth itself, as we say, people were forced to look for the next kind of source. For that some beings are in a good or beautiful condition, or come into being well or beautifully, it is perhaps not likely that fire or earth or any other such thing is responsible, nor that they would have thought so. Nor, in turn, would it be a good idea to turn over so great a concern to chance or luck. So when someone said an intellect was present, just as in animals, also in nature as the cause of the cosmos and of all order, he looked like a sober man next to people who had been speaking incoherently beforehand. Obviously we know that Anaxagoras reached as far as saying these things, but Hermotimus of Clazomenae is given credit for saying them earlier. Those, then, who took things up in this way set down a source which is at the same time the cause of the beautiful among things and the sort of cause from which motion belongs to things. 10 15 20

4. One might suspect that Hesiod was the first one to seek out such a thing, or someone else who had set down love or desire among the beings as a source, as Parmenides also did; for he, in getting things ready for the coming into being of the whole, says that first “of all the gods, [the all-governing divinity] devised love,” while Hesiod says 25

Chaos came into being as the very first of all things, but then
Broad-breasted earth . . . and also
Love, who shines out from among all the immortals,

as though there needed to be present among beings some sort of cause that would move things and draw them together. Now how I ought to distribute their portions to them about who was first, permit me to postpone judging. But since the opposites of the good things are obviously also present in nature, and there is not only order and beauty but also disorder and ugliness, and more bad and ordinary things than good and beautiful ones, in this way someone else brought in friendship and strife, each as the cause of one of these kinds of thing. For if one were to pursue and get hold of Empedocles’ thinking, rather than what he said inarticulately, one would find that friendship was the cause of the good things and strife of the bad. So if one were to claim that Empedocles both says and is the first to say that bad and good are sources, one would perhaps speak rightly, if in fact the cause of all good things is the good itself. 30 985^a 5 10

So these people, as we are saying, evidently got this far with two causes out of those we distinguished in the writings about nature, the material and that from which the motion is, but did so dimly and with no clarity, rather in the way non-athletes do in fights; for while dancing around they often land good punches, but they do not do so out 15

of knowledge, nor do these people seem to know what they are saying. For it is obvious that they use these causes scarcely ever, and only to a tiny extent. For Anaxagoras uses the intellect as a makeshift contrivance for cosmos production, and whenever he comes to an impasse about why something is necessarily a certain way, he drags it in, but in the other cases he assigns as the causes of what happens everything but the intellect; and Empedocles, though he uses his causes more than that, surely does not either use them sufficiently or come up with any consistency with them. Certainly in many places friendship separates things for him, and strife combines things. For whenever the whole is divided by strife into its elements, fire is combined into one, as is each of the other elements; but whenever they come back together into one, the parts must be separated back out of each element. Empedocles was the first who, beyond those before him, brought in this sort of cause by dividing it, making the source of motion not one thing but different and opposite ones, and furthermore, he first spoke of the so-called four elements as the causes in the species of material. (In fact, though, he didn't use them as four, but as though they were only two: fire on one side by itself, and its opposites, earth, air, and water, as one nature on the other side. One may get this by looking carefully at what is in the verses.)

So as we are saying, he claimed that the sources were of this sort and this many. But Leucippus and his colleague Democritus say the elements are the full and the void, of which the one, as what is, is full and solid, while the other, what is not, is void (for which reason they say that being in no sense *is* more than nonbeing, nor body more so than void), and that these are responsible for things as material. And just as those who make the underlying being one, and generate the other things by means of modifications of it, set down the rare and the dense as the sources of the modifications, in the same way these people too say that the differences in the material are responsible for the other things. They, however, say these differences are three: shape, order, and position. For they say that what is differs only by means of "design, grouping, and twist," but of these, design is shape, grouping is order, and twist is position. For A differs from N in shape, AN from NA in order, and Z from N in position. As for motion, from what source or in what way it belongs to things, these people, much like the others, lazily let it go. So about the two causes, as we are saying, the inquiry seems to have gone this far on the part of our predecessors.

* * *

6. After the philosophic speculations that have been mentioned came the careful work of Plato, which in many ways followed the lead of these people, but also had separate features that went beyond the philosophy of the Italians. For having become acquainted from youth at first with Cratylus and the Heracleitean teachings that all sensible things are always in flux and that there is no knowledge of them, he also conceived these things that way later on. And since Socrates exerted himself about ethical matters and not at all about the whole of nature, but in the former sought the universal and was the first to be skilled at thinking about definitions, Plato, when he adopted this, took it up as applying to other things and not to sensible ones, because of this: it was impossible that there be any common definition of any of the perceptible things since they were always changing. So he called this other sort of beings forms, and said the perceptible things were apart from these and all spoken of derivatively from these, for the many things with the same names as the forms were results of participation. He changed only the name participation, for the Pythagoreans said that beings *are* by way of imitation of

the numbers, but Plato by way of participation, having changed the name. What this participation or imitation of the forms might be, however, they were in unison in leaving behind to be sought.

What's more, apart from the sensible things and the forms, he said there were among things mathematical ones, in between, differing from the sensible ones in being everlasting and motionless, and from the forms in that there are any multitude of them alike, while each form itself is only one. And since the forms are the causes of the others, he thought that the elements of the forms were the elements of all beings. As material, then, the great and the small were the sources, and as thinghood, the one, for out of the former, by participation in the one, the forms are composed as numbers. So in saying that the one was an independent thing, and not any other thing said to be one, he spoke in much the same way as the Pythagoreans, and in saying that numbers were the causes of thinghood for other things he spoke exactly as they did; but to have made a dyad in place of the infinite as one thing, and to have made the infinite out of the great and the small, was peculiar to him. It was also peculiar to him to set the numbers apart from the perceptible things, while they had said that the things themselves were numbers, and they did not set the mathematical things between them. Now his having made the one and the numbers be apart from the things we handle, and not the same way the Pythagoreans had said, and his introduction of the forms came about because of his investigation in the realm of definitions (for the earlier thinkers had no part in dialectic), but his having made the other nature a dyad was so that the numbers, outside of the primes, might be generated out of it in a natural way, as though from some sort of modeling clay. 988^a

But surely things happen in the opposite way, for this way is not reasonable. For they make many things out of this material, while the form generates only once, but it is apparent that from one material comes one table, while the person who brings the form to bear, though he is one, makes many tables. And it is similar with the male in relation to the female; for she becomes pregnant by one act of intercourse, while the male is the cause of many pregnancies, and surely these things are images of the origins of things. But Plato made distinctions in this way about the things that are being sought, and it is clear from what has been said that he used only two causes, the one that is responsible for the what-it-is and the one that results from material (for the forms are causes for the other things of what they are, and the one is such a cause for the forms). And it is clear what the underlying material is said to be, over against which the forms are, in the case of perceptible things, and the one, among the forms, that it is the dyad of the great and the small. And further, he referred the cause of what is good and bad respectively to each of the two elements, just as we say certain of the earlier philosophers, such as Empedocles and Anaxagoras, were trying to find a way to do. 15

* * *

9. As far as the Pythagoreans are concerned, then, let the things now said be left alone (for it is enough to touch on them this much). But as for those who set up the forms, first of all, in seeking to understand the causes of the things around us, they brought in other things, equal to these in number, as though someone who wanted to count a smaller number of things thought he couldn't do it, but could count them if he made them more. For the forms are just about equal to, or not fewer than, those things in search of the causes of which they went on from the latter to the former. For over against each particular thing there is something with the same name, and also for the other things besides the beings, to which there belongs a one-over-many, both among 990^b 5

the things around us and among the everlasting things. What's more, of those ways by which we show that there are forms, it is not evident by any of them. For from some of them no necessary conclusion results, while from others there turn out to be forms of those things which we believe do not have them. For as a result of the arguments from the kinds of knowledge, there will be forms of all those things of which there is knowledge, and as a result of the one-over-many there will even be forms of negations, while as a result of the thinking of something that has been destroyed, there will be forms of things that have passed away, since there is an image of these things. On top of this, some of the most precise of the arguments produce forms of relations, which we claim is not a kind in its own right, while other ones imply the third man.*

And in general, the arguments about the forms abolish things which we want there to be, more than we want there to be forms. For it turns out that not the dyad, but number, is primary, and that what is relative is more primary than what *is* in its own right, as well as all those things which certain people who took the opinions about the forms to their logical conclusions showed to be opposed to the original sources of things. What's more, by the assumption by which we say there are forms, there will be forms not only of beings but also of many other things. (For the object of the intellect is one thing not only as concerns beings but also as applied to other things, and there is demonstrative knowledge not only about thinghood but also about other sorts of being, and vast numbers of other such conclusions follow.) But both necessarily and as a result of the opinions about them, if the forms are shared in, there must be forms only of independent things. For things do not share in them incidentally, but must share in each by virtue of that by which it is not attributed to an underlying subject. (I mean, for example, if something partakes of the double, then this also partakes of the everlasting, but incidentally, since it is incidental to the double to be everlasting.) Therefore, the forms will be the thinghood of things, and the same things will signify thinghood there as here. Otherwise, what would the something be that is said to be apart from the things around us, the one-over-many? And if the forms and the things that participate in them have the same form, there would be something common. (For why is *two* one and the same thing as applied both to destructible pairs and to those that are many but everlasting, more so than as applied both to itself and to something?) But if the form is not the same, there would be ambiguity, and it would be just as if someone were to call both Callias and a block of wood "human being" while observing nothing at all common to them.

But most of all, one might be completely at a loss about what in the world the forms contribute to the perceptible things, either to the everlasting ones or to the ones that come into being and perish. For they are not responsible for any motion or change that belongs to them. But they don't assist in any way toward the knowledge of the other things either (for they are not the thinghood of them, since in that case they would be in them), nor toward their being, inasmuch as they are not present in the things that partake of them. In that manner they might perhaps seem to be causes, after the fashion of the white that is mingled in white things, but this argument, which Anaxagoras first, Eudoxus later, and some others made, is truly a pushover (for it is easy to collect many impossibilities related to this opinion). But surely it is not true either that the other things

*["The third man" refers to a problem with Plato's theory of forms. If we say that two things are instances of the same characteristic because they share in a "form," and if the "form" itself has characteristics, then there must be a third thing ("the third man") whose characteristics the original two things and the "form" share. And this third thing, if it also has characteristics, must share with the original two objects and the "form" some fourth thing, and so on, ad infinitum. Plato was aware of this problem, pointing it out himself (but without a solution) in *Parmenides* 132a–133a.]

are made out of the forms in any of the usual ways that is meant. And to say that they are patterns and the other things participate in them is to speak without content and in poetic metaphors. For what is the thing that is at work, looking off toward the forms? And it is possible for anything whatever to be or become like something without being an image of it, so that whether Socrates is or is not, one might become like Socrates, and it is obvious that it would be the same even if Socrates were everlasting. And there would be more than one pattern for the same thing, and so too with the forms; for example, of a human being, there would be animal and at the same time two footed, as well as human being itself. What's more, the forms will be patterns not only of the perceptible things but also of themselves, such as the form *genus*, since it is a genus of forms, and so the same thing would be a pattern and an image. 25 30 991^b

Further, one would think it was impossible for the thinghood and that of which it is the thinghood to be separate: so how could the forms be the thinghood of things if they are separate? In the *Phaedo* it is put this way: that the forms are responsible for both being and becoming. Yet even if there are forms, still the things that partake of them do not come into being if there is not something that causes motion, and many other things do come into being, such as a house or a ring, of which we say there are no forms. So it is clear that the other things too admit of being and becoming by means of the sort of causes which produce the ones just mentioned. 5

Again, if the forms are numbers, how would they be causes? Is it because the beings are various numbers, this number human being, that one Socrates, this other one Callias? Why then are those the causes of these? And it will make no difference if the ones are everlasting and the others not. But if it is because the things here are ratios of numbers, as harmony is, it is clear that there is some one thing of which they are ratios. So if this is something, as material, it is apparent that the numbers themselves will also be particular ratios of one thing to another. I mean, for example, if Callias is a ratio among numbers consisting of fire, earth, water, and air, then the form too will be a number consisting of certain other underlying things, and human being itself, whether or not it is a sort of number, will still be a ratio among numbers of *something*, and not a number, nor would it be on this account a certain number. What's more, from many numbers comes one number, but in what way is one form made of forms? But if it is not made of them but of the things that are in a number, as in ten thousand, how does it stand with the units? For if they are homogeneous, many absurdities will follow, and also if they are not homogeneous, either one the same as another or a whole group the same as a whole group; for in what respect will they differ if they are without attributes? For these things are neither reasonable nor in agreement with a thoughtful viewing of the matter. 10 15 20 25

And on top of this, it is necessary to construct a different kind of number, with which the art of arithmetic is concerned, and all those things that are said by some to be in-between; in what way *are* they and from what sources? Or by what cause are they between the things here and those things? Again, each of the units in the number two comes from some more primary dyad, yet this is impossible. Again, by what cause is a number one thing when it is taken all together? Again, on top of the things that have been said, if the units are to differ, it would behoove one to speak in the same way as those who say there are four, or two, elements. For each of these people speaks of as an element not what is common, such as body, but fire or earth, whether body is something common or not. But as it is, one speaks as though the one were homogeneous, just like fire or water; and if this is so, the numbers will not be independent things. But it is clear that, if there is something that is the one itself, and this is a source, *one* is meant in more than one way, for otherwise it is impossible. 30 992^a 5 10

Now when we want to lead things back to their sources, we set down length as being composed of the short and the long, a certain kind of small and large, and surface of the wide and the narrow, and solid of the deep and the shallow. In what way, though, will the surface have a line in it, or the solid have a line or a surface? For the wide and the narrow are different kinds of thing from the deep and the shallow; so just as number is not present in them either, because the many and the few differ from these, it is clear that neither will any other of the higher things be present in the lower. But surely neither is the wide a class of the deep, for then a solid would be a certain kind of surface. And from what source will the points come to be present in them? Plato used to fight against this class of things as a geometrical dogma, but he called the source of the line—and he set this down often—indivisible lines. And yet there must necessarily be some limit of these; so from the argument from which the line is deduced, the point too is deduced.

In general, though we are seeking wisdom about what is responsible for the appearances, we have ignored this (for we say nothing about the cause from which the source of change is), but supposing that we are speaking about the thinghood of them, we say that there are other independent things, but as for how those are the thinghood of these we speak in vain. For “participating,” as we said before, is no help. But on that which we see to be a cause in the various kinds of knowledge, for the sake of which every intellect and every nature produces things, and on that sort of cause which we say is one of the sources of things, the forms do not even touch, but philosophy has turned into mathematical things for people now, though they claim that it is for the sake of other things that one ought to study them. But still, one might assume that the underlying being which serves as material is too mathematical, and is something to be attributed to or be a distinction within the being or material, rather than being material; for instance, the great and the small are just the same as what the writers on nature call the rare and the dense, claiming that these are the first distinctions within the underlying material, since they are a certain kind of the more and less. And as for motion, if these are a process of moving, it is clear that the forms would be moved; but if they are not, where does it come from? For then the whole investigation about nature would be abolished.

And what seems to be easy, to show that all things are one, does not happen; for from the premises set out, even if one grants them all, it does not come out that all things are one, but that something is the one itself; and not even this comes out if one will not grant that the universal is a genus, which in some cases is impossible. And there is no explanation of the lengths, surfaces, and solids that are present with the numbers, not of how they are or could be nor of what capacity they have; for it is not possible for them to be forms (since they are not numbers), nor the in-between things (since those are the mathematical ones), nor perishable things, but this seems in turn to be some other fourth kind.

In general, to search for the elements of whatever *is* without distinguishing the many ways this is meant, is to seek what is impossible to find, both for those inquiring in other ways and those inquiring in this way about what sort of elements things are made of. For out of what elements acting is made, or being acted upon, or the straight, is just not there to be grasped, but if of anything, it is of independent things alone that it can possibly be. Therefore to suppose that one is seeking or has the elements of *all* beings is not true. And how could anyone learn the elements of all things? For it is clear that it is not possible for someone to begin by knowing it beforehand. For just as it is possible for the one who is learning to do geometry to know other things in advance, though he does not already know any of the things of which geometry is the knowledge and about which he is going to learn, so it is also with other things, so if there is any

knowledge of all things, of the sort that some people say there is, he could not start out already knowing anything. 30

And yet all learning is by means of things all or some of which are already known, whether it is by means of demonstration or by way of definitions (for it is necessary that one already know and be familiar with those things out of which the definition is made), and likewise with learning through examples. But if it happens to be innate, it is surely a wonder how we fail to notice that we have the most powerful kind of knowledge. Furthermore, in what way will one know what something is made of, and how will it be evident? For this too contains an impasse: for one might dispute in the same way as about some syllables. For some people say that *za* is made of *s*, *d*, and *a*, while some others say that it is a distinct sound and not made of any familiar ones. What's more, how could someone know those things of which sense perception consists if he did not have the sense capacity? And yet he must, if indeed the elements out of which all things are made are the same, in just the way that composite sounds are made of the elements that belong to them. 5 993^a 10

* * *

BOOK XII

* * *

6. Now since there are three kinds of thinghood, two of them natural and one motionless, about the latter one must explain that it is necessary for there to be some everlasting motionless independent thing. For independent things are primary among beings, and if they were all destructible, everything would be destructible; but it is impossible for motion either to come into being or to be destroyed (since it always is), and impossible too for time. For if there were no time, there could be no before and after; and motion is continuous in just the way that time is, since time is either the same as or some attribute of motion. But there is no continuous motion other than in place, and among these, other than in a circle. 1071^b 5 10

But surely if there is something capable of moving and producing things, but not at work in any way, there will not be motion; for what has a potency admits of not being at work. Therefore, there is no benefit even if we adopt everlasting independent things, as do those who bring in the forms, unless there is in them some source capable of producing change; moreover, even this is not enough, not even if there is another independent thing besides the forms, since if it is not going to be at work, there will not be motion. What's more, it is not enough even if it will be at work, if the thinghood of it is potency, for there would not be everlasting motion, since what has being in potency admits of not being. Therefore it is necessary that there be a source of such a kind that the thinghood of it is being-at-work.* On top of that, it is necessary that these independent things be without material, for they must be everlasting, if indeed anything else is everlasting. Therefore they are being-at-work. 15 20

**<energeia>*, often translated "actuality." As our translator puts it, "Aristotle's central thought is that all being is being-at-work, and that anything inert would cease to be. The primary sense of the word belongs to activities that are not motions; examples of these are seeing, knowing, and happiness, each understood as an ongoing state that is complete at every instant."

And yet there is an impasse: for it seems that, while everything that is at work is capable of it, not everything that is capable of it is at work, so that the potency would take precedence. But surely if this were so, there would be no beings at all, since it is possible to be capable of being and not yet be. Nevertheless, there is the same impossibility if things are the way those who write about the gods say, who generate all things out of night, or the way of those who write about nature, who say "all things were together." For how will things have been set in motion, if there were not some responsible thing at work? For material itself, at any rate, will not set itself in motion, but a craftsman will cause it to, nor will the menstrual fluid or the earth set themselves in motion, but semen or seeds will cause them to. And this is why some people, such as Leucippus and Plato, bring in an everlasting activity, for they say that there is always motion. But why there is this motion, and what it is, they do not say, nor the cause of its being a certain way or some other way. For nothing moves at random, but always something must be present to it, just as now something moves in a certain way by nature, but in some other way by force or by the action of intelligence or something else. And then, what sort of motion is primary? For this makes so much difference one can hardly conceive it. But surely it is not even possible for Plato to say what he sometimes thinks the source of motion is, which itself sets itself in motion; for the soul is derivative, and on the same level as the heavens, as he says.

Now to suppose that potency takes precedence over being-at-work is in a sense right but in a sense not right (and in what sense has been said); and Anaxagoras testifies that being-at-work takes precedence (since intellect is a being-at-work), as does Empedocles with love and strife, and so do those who say there is always motion, such as Leucippus; therefore there was not chaos or night for an infinite time, but the same things have always been so, either in a cycle or in some other way, if being-at-work takes precedence over potency. So if the same thing is always so in a cycle, it is necessary for something to persist always at work in the same way. But if there is going to be generation and destruction, there must be something else that is always at work in different ways. Therefore it must necessarily be at work in a certain way in virtue of itself, and in another way in virtue of something else, in virtue, that is, of either a different thing or the first one. And it is necessarily in virtue of the first one, since it would in turn be responsible for both itself and that different one. Accordingly it is better that it be the first one, for it was responsible for what is always the same way, while another thing was responsible for what happens in different ways, and obviously both together are responsible for what happens in different ways always. And without doubt motions are this way. Why then must one look for other sources?

7. But since it is possible for it to be this way, and if it is not this way things will come from night and from "all things together" and from not-being, these questions could be resolved; and there is a certain ceaseless motion that is always moving, and it is in a circle (and this is evident not only to reason but in fact), so that the first heaven would be everlasting. Accordingly, there is also something that moves it. And since what is in motion and causes motion is something intermediate, there is also something that causes motion without being in motion, which is everlasting, an independent thing, and a being-at-work. But what is desired and what is thought cause motion in that way: not being in motion, they cause motion. But the primary instances of these are the same things, for what is yearned for is what seems beautiful, while what is wished for primarily is what is beautiful; but we desire something because of the way it seems, rather than its seeming so because we desire it, for the act of thinking is the beginning. But the

power of thinking is set in motion by the action of the thing thought, and what is thought in its own right belongs to an array of affirmative objects of which thinghood is primary, and of this the primary kind is that which is simple and at work. (But what is one and what is simple are not the same, for oneness indicates a measure, but what is simple is itself a certain way.) But surely the beautiful and what is chosen in virtue of itself are also in that same array, and what is primary is always best, or analogous to it. And that-for-the-sake-of-which is possible among motionless things, as the [following] distinction makes evident; for that-for-the-sake-of-which is either *for* something or *belonging to* something, of which the former is and the latter is not present among motionless things. And it causes motion in the manner of something loved, and by means of what is moved moves other things.

Now if something is moved, it admits of being otherwise than it is; and so, even if the primary kind of change of place is a being-at-work, insofar as something is moved, it is in that respect at least capable of being otherwise, with respect to place even if not with respect to thinghood. But since there is something that causes motion while being itself motionless, this does not admit of being otherwise than it is in any respect at all. For among changes, the primary one is change of place, and of this the primary kind is in a circle, but this is what this mover causes. Therefore it is something that has being necessarily, and inasmuch as it is by necessity it is beautiful and in that way a source. For the necessary has this many senses: what is by force because it is contrary to a thing's impulse, that without which something will not be in a good condition, and that which does not admit of being any way other than in a simple condition. On such a source, therefore, the cosmos and nature depend.

And the course of its life is of such a kind as the best we have for a short time. This is because it is always the same way (which for us is impossible), and because its being-at-work is also pleasure (which is what makes being awake, perceiving, and thinking the most pleasant things, while hopes and memories are pleasant on account of these). And the thinking that is just thinking by itself is a thinking of what is best just as itself, and especially so with what is so most of all. But by partaking in what it thinks, the intellect thinks itself, for it becomes what it thinks by touching and contemplating it, so that the intellect and what it thinks are the same thing. For what is receptive of the intelligible and of thinghood is the intellect, and it is at work when it has them; therefore it is the being-at-work rather than the receptivity the intellect has that seems godlike, and its contemplation is pleasantest and best. So if the divine being is always in this good condition that we are sometimes in, that is to be wondered at; and if it is in it to a greater degree than we are, that is to be wondered at still more. And that is the way it is. But life belongs to it too, for the being-at-work of intellect is life, and that being *is* being-at-work, and its being-at-work is in itself the best life and is everlasting. And we say that it is a god who everlastingly lives the best life, so that life and continuous and everlasting duration belong to a god; for this being is god.

And those who assume, as do the Pythagoreans and Speusippus, that what is most beautiful and best is not present in the source of anything, since, while the sources of plants and or animals are responsible for them, what is beautiful and complete is in the effects that come from them, do not think rightly. For the seed comes from other, earlier, complete beings, and what is first is not the seed but the complete being, just as one would say that a human being precedes the germinal fluid, not the one who comes into being from it, but another one from whom the germinal fluid came.

That, then, there is an independent thing that is everlasting, motionless, and separate from perceptible things, is clear from what has been said. And it has also been

demonstrated that this independent thing can have no magnitude, but is without parts and indivisible (for it causes motion for an infinite time, while no finite thing has an infinite power, and since every magnitude must be either infinite or finite, it cannot have magnitude, either finite, for the reason given, or infinite, because there is no infinite magnitude at all). But surely it has also been demonstrated that it cannot be affected or altered, since all other motions are derivative from change of place. So it is clear why these things are this way.

8. But whether one must set down one or more than one such independent thing, and how many, must not go unnoticed; but one has to mention, as far as the pronouncements of others are concerned, that about the number of them they have said nothing which can even be stated clearly. For the assumption about the forms contains no particular speculation about it (for those who speak of the forms say the forms are numbers, and about the numbers, sometimes they speak as though about infinitely many, but sometimes as though they had a limit at the number ten, but why the multitude of the numbers is just so much, nothing is said with a serious effort at demonstrative reasoning). But it is necessary for us to argue from the things that have been laid down and distinguished. For the source and the first of beings is not movable either in its own right or incidentally, but sets in motion the primary motion, that is one and everlasting. But since what is in motion must be moved by something, and the first mover must be itself motionless, and an everlasting motion must be caused by an everlasting source of motion and one motion by one mover, while we see in addition to the simple motion of the whole heaven, which we claim the first motionless independent thing causes, other everlasting motions which belong to the planets (for the body that goes in a circle does so everlastingly and without stopping, which is demonstrated in the writings on nature), it is necessary that each of these motions also be caused by something that is itself motionless and an everlasting independent thing. For the nature of the stars is for each to be an everlasting independent thing, while the mover is everlasting and takes precedence over the thing moved, and what takes precedence over an independent thing must be an independent thing. Accordingly, it is clear that there must be that many independent things and that they must have a nature such that they are everlasting and motionless in virtue of themselves, and, for the reason stated above, without magnitude.

That, then, there are independent things, and of these a first one and a second, following the same order as the motions of the stars, is evident; but the number of motions is already something one must examine from that kind of mathematical knowledge that is the nearest kin to philosophy, namely from astronomy. For this kind makes its study about perceptible, everlasting thinghood, while the others, such as those concerned with numbers and with geometry, are not about thinghood at all. Now the fact that the motions are greater in number than the things moved is clear to those who have touched on the subject even moderately (since each of the wandering stars is carried along more than one motion); but as for how many these happen to be, we now state what some of the mathematicians say, for the sake of a conception of it, in order that some definite number be grasped in our thinking, and as for what remains, it is necessary to inquire into some things ourselves, while listening to what other inquirers say about others. If something should seem to those who busy themselves with these matters to be contrary to what has just now been said, it is necessary to welcome both accounts, but trust the more precise one.

Eudoxus, then, set it down that the motion of both the sun and the moon is in three spheres, of which the first is that of the fixed stars, the second rotates along a path through the midst of the zodiac, and the third along a path inclined along the width of

the zodiac (but with that along which the moon is carried inclined to a greater width than that along which the sun is carried); but he set it down that the motion of each of the wandering stars is in four spheres, of which the first and second are the same as the former ones (for the sphere of the fixed stars is that which moves them all, and the sphere assigned to the place under this and having its motion along a path through the midst of the zodiac is common to them all), while the poles of the third sphere for all of them are in the path through the midst of the zodiac, and the motion of the fourth is along a path inclined to the equator of the third. And he set it down that the poles of the third sphere are peculiar to the different planets, but those for Venus and Mercury are the same. Callippus set down the same arrangement of spheres as did Eudoxus, and gave the same number as he did for Jupiter and Saturn, but for the sun and the moon he thought there were two spheres still to be added if one were going to account for the appearances, and one for each of the remaining planets.

But it is necessary, in order to account for the appearances, if all the spheres are going to be fit together, that there be for each of the planets (less one) other spheres, turning backwards and continuously restoring to the same position the first sphere of the star situated next below; for only in that way is it possible for them all to produce the motion of the planets. Since, then, the spheres in which they themselves are carried are eight [for Jupiter and Saturn] and twenty-five [for the sun and moon, Mars, Venus, and Mercury], and of these one, that in which the star situated lowest is carried, does not need to be counter-turned, the spheres to counter-turn those of the first two planets will be six, while the ones to counter-turn those of the four lower ones will be sixteen; so the number of all the carrying spheres plus those that turn backward against them will be fifty-five. But if one were not to add to the moon and the sun the motions which we mentioned, all the spheres will be forty-seven. So let the number of the spheres be so many, so that it is reasonable to assume that the number of independent things which are motionless sources is also that many (for let the number that is necessary be left for more relentless people to say).

But if it is impossible for there to be any motion that is not directed into the motion of a star, and if in addition every nature and every independent thing that is unaffected and has, by virtue of itself, attained its best condition, must be regarded as an end, there could be no other nature besides these, but this is necessarily the number of independent things. For if there were others, they would be movers as final causes of motion; but it is impossible for there to be other motions besides those mentioned. And this is reasonable to assume from the things that are moved. For if what carries something is naturally for the sake of what is carried, and every motion belongs to something that is carried, no motion could be for the sake of itself or for the sake of another motion, but they are for the sake of the stars. For if there were to be a motion for the sake of a motion, the latter too would have to be for the sake of another one; so since this cannot go to infinity, there will be as an end for every motion one of the divine bodies carried through the heaven. And it is clear that there is one heaven. For if there were a plurality of heavens, as there is of human beings, there would be one *kind* of source for each one, but many of them in number. But those things that are many in number contain material (for one and the same articulation belongs to many things, as does the articulation of a human being, but Socrates is one). But what it primarily is for something to be does not contain material, for it is a being-at-work-staying-itself.*

**<entelecheia>*, often translated "actuality," means (as our translator puts it), "a fusion of the idea of completeness with that of continuity or persistence. Aristotle invents the word by combining *<enteles>* (complete, full-grown) with *<echein>* (to be a certain way by the continuing effort of holding on in that condition.)"

Therefore the first motionless being that causes motion is one both in articulation and in number; and therefore what is moved always and continuously is also one. Therefore there is only one heaven.

1074^b There has been handed down from people of ancient and earliest times a heritage, in the form of myth, to those of later times, that these original beings are gods, and that the divine embraces the whole of nature. The rest of it was presently introduced in mythical
5 guise for the persuasion of the masses and into the laws for use and benefit; for the myths say the gods are of human form or like some of the other animals, and other things that follow along with and approximate these that have been mentioned. If one were to take only the first of these things, separating it out, that they thought the primary independent
10 things were gods, one would regard this as having been said by divine inspiration, and, since it is likely that every kind of art and philosophy has been discovered to the limit of its potential many times, and passed away in turn, one would consider these opinions of those people to have been saved like holy relics up to now. So the opinion of our forefathers that comes from the first ages is clear to us but only to this extent.

15 9. Now concerning the intellect there are certain impasses, for it seems to be the most divine of the things that are manifest to us, but the way it is if it is to be of that sort contains some things that are hard to digest. For if it thinks nothing, what would be solemn about
20 that? Rather, it would be just like someone sleeping. But if it does think, but something else has power over it, then, since it is not thinking but potency that is the thinghood of it, it could not be the best independent thing, for it is on account of its act of thinking that its place of honor belongs to it. And still, whether the thinghood of it is a power of thinking or an activity of thinking, what does it think? For this is either itself or something else, and if it is something else, either always the same one or different ones. And then does it make
25 any difference, or none, whether its thinking is of what is beautiful or of some random thing? Isn't it even absurd for its thinking to be about some things? Surely it is obvious that it thinks the most divine and honorable things, and does not change, since its change would be for the worse, and such a thing would already be a motion. First, then, if it is not an activity of thinking but a potency, it is reasonable to suppose that the continuation of its
30 thinking would be wearisome; and next, it is clear that something else would then be more honorable than the intellect, namely what it thinks. For thinking and the activity of thinking would belong even to something that thinks the worst thing, and if this is to be avoided (for it can even be more advantageous not to see some things than to see them), then the activity of thinking would not be the best thing. Therefore what it thinks is itself, if it is the most excellent thing, and its thinking is a thinking of thinking.

35 But knowledge and perception and opinion and step-by-step thinking seem always to be about something else, and about themselves only as something secondary. What's more, if the thinking and the being thought are different, then in virtue of which of them does what is good belong to it? For to be an act of thinking and to be something
1075^a thought are not the same. Or is it rather that in some cases the knowledge is the thing it is concerned with, so that in the case of the kinds of knowing that make something, the thinghood without material and what it is for something to be, or in the case of the contemplative kinds of knowing, the articulation, is both the thing the knowledge is concerned with and the activity of thinking it? So since what is thought and what is thinking are not different with as many things as have no material, they will be the same, and the act of thinking will be one with what is thought.

5 But there is still an impasse left as to whether what is thought is composite, for then the thinking would be changing among the parts of the whole. Or is it the case that

everything that has no material is indivisible? So the condition the human intellect, or that of any composite being, is in at some period of time (for it does not have hold of what is good at this or that time, but in some whole stretch of time it has hold of what is best, since that is something other than itself), is the condition the thinking that thinks 10 itself is in over the whole of time.

ON THE SOUL (in part)

BOOK II

1. Let this be our discussion of the things handed on about the soul by those who 412^a
came before us. But let us go back again and, as though from the beginning, try to distinguish what the soul is and what articulation of it would be most common to all its 5
instances. One of the most general ways of being we call thinghood;* of this, one sort has being as material, which in its own right is not a *this*, but another sort is the form or look of a thing, directly as a result of which something is called a *this*, and the third sort is what is made out of these. Now the material is a potency, but the form is a being-at-work-staying-itself,** and this in two senses, one in the manner of knowledge, the other 10
in the manner of the act of contemplating.

The things that seem most of all to be independent things are bodies, and of these, the natural ones, for these are the sources of the others. And of natural bodies, some have life while others do not. By life we mean self-nourishing as well as growth and 15
wasting away. So every natural body having a share in life would be an independent thing having thinghood as a composite [of material and form]. And since this is a body, and one of a certain sort, namely having life, the soul could not be a body, since it is not the body that is in an underlying thing, but rather the body has being as an underlying thing and material [for something else]. Therefore it is necessary that the soul have its thinghood as the form of a natural body having life as a potency. But this sort of thing- 20
hood is a being-at-work-staying-itself; therefore the soul is the being-at-work-staying-itself of such a body. But this is meant in two ways, the one in the sense that knowledge is a being-at-work-staying-itself, the other in the sense that the act of contemplating is. It is clear, then, that the soul is a being-at-work-staying-itself in the way that knowledge 25
is, for both sleep and waking are in what belongs to the soul, and waking is analogous to the act of contemplating but sleep to holding the capacity for contemplating while not

**<ousia>*, often translated “substance,” means (as our translator puts it) “the way of being that belongs to anything which has attributes but is not an attribute of anything, which is also separate and a *this*. Whatever has being in this way is an independent thing.”

***<entelecheia>*, often translated “actuality,” means (as our translator puts it), “a fusion of the idea of completeness with that of continuity or persistence. Aristotle invents the word by combining *<enteles>* (complete, full-grown) with *<echein>* (to be a certain way by the continuing effort of holding on in that condition).”

putting it to work. But in the same person it is knowledge that is first in coming into being; for this reason the soul is a being-at-work-staying-itself of the first kind of a natural body having life as a potency. But such a body is organized [i.e., has parts subordinated to the whole as instruments of it]. (And even the parts of plants are organs, though utterly simple ones, as the leaf is a covering for the peel and the peel for the fruit, while the roots are analogous to the mouth, since both take in food.) So if one needs to say what is common to every soul, it would be that it is a being-at-work-staying-itself of the first kind of a natural, organized body. And for this reason it is not necessary to seek out whether the soul and body are one, any more than with wax and the shape molded in it, or generally with the material of each thing and that of which it is the material; for even though *one* and *are* are meant in more than one way, the governing sense of each of them is being-at-work-staying-itself.

So what soul is has been said in general, for it is thinghood as it is unfolded in speech, and this is what such-and-such a body keeps on being in order to be at all. It would be as though some tool, such as an axe, were a natural body, since its being-an-axe would be the thinghood of it, and that would be its soul; for if this were separated from it, it would no longer be an axe, other than ambiguously. But in fact it is an axe, since it is not of this sort of body that the soul is the meaning and the what-it-is-for-it-to-be, but of a certain sort of natural body, one that has a source of motion and rest in itself. But one ought to consider what has been said as applying even to the parts of such a body. For if the eye were an animal, the soul of it would be its sight, since this is the thinghood of an eye as it is disclosed in speech (and the eye is the material of sight); if its sight were left out it would no longer be an eye, except ambiguously, in the same way as a stone eye or a painted one.

Now one should take what applies to the part up to the whole living body, for there is an analogy: as part [of perceiving] is to part [of the body], so is perceiving as a whole to the whole perceptive body as such. And it is not the body that has lost its soul that is in potency to be alive, but the one that has it, and the seed and fruit are in potency to be certain sorts of bodies. So just as the act of cutting is for the axe and the act of seeing for the eye, so too is the waking condition a being-at-work-staying-itself, but as the power of sight is to the eye and the capacity of the tool to the axe, so is the soul a being-at-work-staying-itself, while the body is what has being in potency. But just as the eyeball and the power of sight are the eye, so here the soul and the body are the living thing. So it is not difficult to see why the soul, or at least certain parts of it, is not separate from the body, if the soul is of such a nature as to be divided, since for some parts of the body, the soul is the being-at-work-staying-itself of those parts themselves. Nevertheless, nothing prevents some parts from being separate, so long as they are not the being-at-work* of any part of the body. But it would be difficult to see [why the soul is not separate from the body] if the soul were the being-at-work of the body in the way that the sailor is of the boat. But let this stand as marking off and sketching out in an outline what concerns the soul.

2. Now since what is clear and more knowable by reason arises out of what is unclear but more obvious, it is necessary to try again to go on in this way about the soul.

**<energeia>*, often translated “actuality.” As our translator puts it, “Aristotle’s central thought is that all being is being-at-work, and that anything inert would cease to be. The primary sense of the word belongs to activities that are not motions; examples of these are seeing, knowing, and happiness, each understood as an ongoing state that is complete at every instant.”

For the defining statement not only needs to make clear what something is, as most definitions do, but also needs to include and display the cause. As it is, the statements of definitions are like conclusions. For example, what is squaring? The equality of an equilateral rectangle to an oblong rectangle. But this sort of definition is a statement of the conclusion, while one who says that squaring is the finding of a mean proportional states the cause of the thing. 15 20

So we say, taking this as a starting point for the inquiry, that what is ensouled is distinguished from what is soulless by living. But living is meant in more than one way, and if any one alone of the following is present in something, we say it is alive: intellect, perception, moving and stopping with respect to place, and the motion that results from nourishment, that is, wasting away as well as growing. And for this reason all plants seem to be alive, since they evidently have in themselves this sort of power and source, through which they have growth and decay in opposite directions, for they do not just grow upward but not downward, but in both directions alike, and in every direction, all of them that are continually nourished and live for the sake of their ends, so long as they are able to get food. The latter capacity can be present in separation from the others, but the others cannot be present in separation from it in mortal beings. This is obvious in the case of plants, since no other potency of soul belongs to them. 25 30

Life belongs to living things, then, through this source, but to an animal, first of all, through sense perception; for even those that do not move or change their places, if they have perception, we call animals and do not merely say they are alive. Now of perception, the kind that first belongs to them all is touch, and just as the nutritive power is able to be present separately from touch and all sense perception, so is touch able to be present separately from the other senses. (By the nutritive power, we mean the part of the soul of which the plants have a share; and it is obvious that animals all have the sense of touch.) Through what cause each of these things happens, we will say later. For now, let us say this much only, that the soul is the source of these things that have been mentioned and is defined by them: by nutrition, by sense perception, by thinking things through, and by motion. 413^b 5 10

Whether each of these is a soul or part of a soul, and if a part, whether in such a way as to be separated only in speech or also in place, is for some of these not difficult to see, but some present an impasse. For just as in the case of plants, some parts obviously live when divided and separated from each other, as though the soul in them is one in each plant in the sense of being-at-work-staying-itself but is in potency more than one, so too we see it happen with other capacities of the soul in the case of insects that have been cut in half; for each of the two parts even has both perception and motion with respect to place, and if it has perception, also imagination and appetite, since where there is perception there is also pain and pleasure, and where these are there is necessarily also desire. But about the intellect, that is, the contemplative faculty, nothing is yet clear, but it seems that it is a distinct class of soul and that it alone admits of being separated from body, as the everlasting from the destructible. As for the remaining parts of the soul, it is clear from what has been said that they cannot be separate, as some people say, though it is obvious that they are distinct in speech. For being perceptive is different from being capable of having opinion, if perceiving is also different from having opinion, and similarly with each of the other parts mentioned. Further, some animals have all these capacities, others some of them, and still others only one (and this makes the difference among animals); why this is so must be considered later. And it turns out much the same with the senses, since some animals have them all, others some of them, and still others the one that is most necessary, touch. 15 20 25 30 414^a

- And seeing that the means by which we live and perceive is meant two ways, as is
- 5 the means by which we know (by which is meant in one sense knowledge but in another the soul, since by means of each of these we say we know something), likewise also we are healthy in one sense by means of health, but in another by means of either some part of the body or the whole of it. Now of these, the knowledge or the health is a form, and a certain
- 10 look, and an articulation in speech, and a kind of being-at-work of what is receptive, in the one case a being-at-work of what is capable of knowing, in the other a being-at-work of what is capable of being healthy (for it seems that the being-at-work of what is active is present in what is acted on and placed in a certain condition). So since the soul is that by which in the primary sense we live and perceive and think things through, it would be a certain sort of articulation and form, and not an underlying material. For thinghood is meant in
- 15 three ways, as we said, of which one way is as form, one as material, and one as what is made of both, while of these the material is potency and the form is being-at-work-staying-itself, so since what is ensouled is made of both, it is not the body that is the being-at-work-staying-itself of the soul, but the soul is the being-at-work-staying-itself of some body.

Discus Thrower, by Myron. A Roman copy after a bronze original of ca. 450 B.C. Myron's athlete epitomizes the ideal Olympic goals of godlike perfection and rational beauty. (©Lanmas/Alamy Stock Photo)

For this reason, those who think the soul neither has being without a body, nor is any sort of body, get hold of it well, for it is not a body but something that belongs to a body, and this is why it is present in a body and in a body of a certain kind, and those earlier thinkers did not think well who stuck it into a body without also distinguishing which bodies and of what sort, even though there is no evidence that any random thing admits just any random thing within it. And this happens in accord with reason, since the being-at-work-staying-itself of each thing naturally comes to be present in something that *is* it in potency and in the material appropriate to it. That, then, the soul is a certain being-at-work-staying-itself and articulation of that which has the potency to be in that way, is clear from these things.

3. Now of the potencies of the soul, all of those that have been mentioned belong to some living things, as we said, while to others some of them belong, and to still others only one. The potencies we are speaking of are those for nutrition, perception, motion with respect to place, and thinking things through. And in plants the nutritive potency alone is present, while in other living things this is present along with the perceptive. But if the perceptive potency is present, then so is that of appetite, for appetite consists of desire and spiritedness and wishing, while all animals have at least one of the senses, that of touch, and in that in which sense perception is present there are also pleasure and pain, as well as pleasant and painful sensations, and where these are present so is desire, since this is an appetite for the pleasant. Besides, they have a perception of food, for touch is the sense that perceives food since all animals are nourished by what is dry or moist and warm or cold, of which the sense is touch, though incidentally it is perceptive of other things. For neither sound nor color nor smell contributes anything to nourishment, but the flavor that comes from food is one of the things perceived by touch. Hunger and thirst are desires for, in the former case, what is dry and warm, and in the latter, what is moist and cold, while the flavor is a way of making these pleasant. One must get clear about these things later, but for now let this much be said, that those living things that have touch also have appetite; it is unclear whether they must also have imagination, but this needs to be examined later. And in some living things, in addition to these potencies, there is present also that for motion with respect to place, and in others also the potency for thinking things through as well as intellect, as in human beings and any other living things there might be that are of that sort or more honorable.

So it is clear that there could be a single account of soul in the same way as of geometrical figure; for neither in that case is there any figure aside from the triangle and those that follow in succession, nor in this is there any soul aside from the ones discussed. But even in the case of the figures, there could be a common account which would fit them all, but would be appropriate to none of them in particular, and similarly in the case of the souls that were discussed. Hence it would be ridiculous to inquire after the common account, both in the one case and in the other, which would not be the particular account of any thing there is, nor apply to any proper and indivisible kind, while neglecting an account that is of that sort. (For what applies to the soul is just about the same as what concerns geometrical figures, for always in the one next in succession there is present in potency the previous one, both in figures and in things with souls, as the triangle is in the quadrilateral and the nutritive potency in the perceptive one.) Therefore, for each kind, one needs to inquire what the soul of each is, as for a plant, a human, and a wild animal. And why they are in this sort of succession must be considered. For without the nutritive potency there is no perceptive potency, while the nutritive is present in separation from the perceptive in plants. Again, without the sense of touch

- 5 none of the other senses is present, but touch is present without the others, for many animals have neither sight nor hearing nor a sense of smell. And among animals with the perceptive potency, some have the potency for motion with respect to place while others do not. Last and most rare are reasoning and thinking things through; for in those
- 10 destructible beings in which reasoning is present, all the other potencies are also present, while reasoning is not present in all animals, but some do not even have imagination, though others live by this alone. But about the contemplative intellect there is a different account. It is clear, then, that the account that deals with each of these potencies is also the most appropriate account of the soul.

* * *

BOOK III

- 429^a 4. About the part of the soul by which the soul knows and understands, whether it is a separate part, or not separate the way a magnitude is but in its meaning, one must consider what distinguishing characteristic it has, and how thinking ever comes about. If thinking works the same way perceiving does, it would either be some way
- 15 of being acted upon by the intelligible thing, or something else of that sort. Therefore it must be without attributes but receptive of the form and in potency not to be the form but to be such as it is; and it must be similar so that as the power of perception is to the perceptible things, so is the intellect to the intelligible things. Therefore necessarily, since it thinks all things, it is unmixed, just as Anaxagoras says, in order to master them, that is, in order to know them (since anything alien that appeared in it besides what it thinks would hinder it and block its activity); and so intellect has no nature at all other than this, that it is a potency. Therefore the aspect of the soul that is called intellect (and I mean by intellect that by which the soul thinks things through and conceives that something is the case) is not actively any of the things that *are*
- 25 until it thinks. This is why it is not reasonable that it be mixed with the body, since it would come to be of a certain sort, either cold or warm, and there would be an organ for it, as there is for the perceptive potency, though in fact there is none. And it is well said that the soul is a place of forms, except that this is not the whole soul but the thinking soul, and it is not the forms in its being-at-work-staying-itself, but in potency.
- 30 The absence of attributes is not alike in the perceptive and thinking potencies; this is clear in its application to the sense organs and perception. For the sense is
- 429^b unable to perceive anything from an excessive perceptible thing, neither any sound from loud sounds, nor to see or smell anything from strong colors and odors, but when the intellect thinks something exceedingly intelligible it is not less able to think the lesser things but even more able, since the perceptive potency is not present
- 5 without a body, but the potency to think is separate from body. And when the intellect has come to be each intelligible thing, as the knower is said to do when he is a knower in the active sense (and this happens when he is able to put his knowing to work on his own), the intellect is even then in a sense those objects in potency, but not in the same way it was before it learned and discovered them, and it is then able to think itself.
- 10 Now since a magnitude is different from being a magnitude, and water is different from being water (and so too in many other cases, though not in all, since in some

cases the two are the same), being flesh is distinguished either by a different potency from the one that distinguishes flesh, or by the same one in a different relation. For flesh is not present without material, but like a snub nose, it is this in that. So it is by the perceptive potency that one distinguishes hot and cold, and the other things of which flesh is a certain ratio, but it is by a different potency that one distinguishes the being-flesh, either separate from the first or else with the two having the relation a bent line has to itself straightened out. Among the things that have being in abstraction, straightness is in its way just like snubness, since it is combined with continuity; but what it is for it to be, if being straight is different from what is straight, is something else—let it be twoness. Therefore one distinguishes it by a different potency, or by one in a different relation. So in general, in whatever way things are separate from their material, so too are the potencies that have to do with intellect separate from one another.

But one might find it an impasse, if the intellect is simple and without attributes and has nothing in common with anything, as Anaxagoras says, how it could think, if thinking is a way of being acted upon (for it seems to be by virtue of something common that is present in both that one thing acts and another is acted upon), and also whether the intellect is itself an intelligible thing. For either there would be intellect in everything else, if it is not by virtue of something else that it is itself intelligible, but what is intelligible is something one in kind, or else there would be something mixed in it, which makes it intelligible like other things. As for a thing's being acted upon in virtue of something common, the distinction was made earlier, that the intellect *is* in a certain way the intelligible things in potency, but is actively none of them before it thinks them; it is in potency in the same way a tablet is, when nothing written is present in it actively—this is exactly what happens with the intellect. And it is itself intelligible in the same way its intelligible objects are, for in the case of things without material what thinks and what is thought are the same thing, for contemplative knowing and what is known in that way are the same thing (and one must consider the reason why this sort of thinking is not always happening); but among things having material, each of them is potentially something intelligible, so that there is no intellect present in them (since intellect is a potency to be such things without their material), but there is present in them something intelligible.

5. But since in all nature one thing is the material for each kind (this is what is in potency all the particular things of that kind), but it is something else that is the causal and productive thing by which all of them are formed, as is the case with an art in relation to its material, it is necessary in the soul too that these distinct aspects be present; the one sort is intellect by becoming all things, the other sort by forming all things, in the way an active condition such as light does, for in a certain way light too makes the colors that are in potency be at work as colors. This sort of intellect is separate, as well as being without attributes and unmixed, since it is by its thinghood a being-at-work, for what acts is always distinguished in stature above what is acted upon, as a governing source is above the material it works on. Knowledge, in its being-at-work, is the same as the thing it knows, and while knowledge in potency comes first in time in any one knower, in the whole of things it does not take precedence even in time. This does not mean that at one time it thinks but at another time it does not think, but when separated it is just exactly what it is, and this alone is deathless and everlasting (though we have no memory, because this sort of intellect is not acted upon, while the sort that is acted upon is destructible), and without this nothing thinks.

NICOMACHEAN ETHICS (in part)

BOOK I

1094^a 1. *The Good as the Aim of Action*: Every art or applied science and every systematic investigation, and similarly every action and choice, seem to aim at some good; the good, therefore, has been well defined as that at which all things aim.* But it is clear that there is a difference in the ends at which they aim: in some cases the activity is the end, in others the end is some product beyond the activity. In cases where the end lies beyond the action the product is naturally superior to the activity.

5 Since there are many activities, arts, and sciences, the number of ends is correspondingly large: of medicine the end is health, of shipbuilding a vessel, of strategy, victory, and of household management, wealth. In many instances several such pursuits
10 are grouped together under a single capacity: the art of bridle-making, for example, and everything else pertaining to the equipment of a horse are grouped together under horsemanship; horsemanship in turn, along with every other military action, is grouped together under strategy; and other pursuits are grouped together under other capacities. In all these cases the ends of the master sciences are preferable to the ends of the subordinate sciences, since the latter are pursued for the sake of the former. This is true
15 whether the ends of the actions lie in the activities themselves or, as is the case in the disciplines just mentioned, in something beyond the activities.

20 2. *Politics as the Master Science of the Good*: Now, if there exists an end in the realm of action which we desire for its own sake, an end which determines all our other desires; if, in other words, we do not make all our choices for the sake of something else—for in this way the process will go on infinitely so that our desire would be futile and pointless—then obviously this end will be the good, that is, the highest good. Will
25 not the knowledge of this good, consequently, be very important to our lives? Would it not better equip us, like archers who have a target to aim at, to hit the proper mark? If so, we must try to comprehend in outline at least what this good is and to which branch of knowledge or to which capacity it belongs.

1094^b This good, one should think, belongs to the most sovereign and most comprehensive master science, and politics** clearly fits this description. For it determines which sciences ought to exist in states, what kind of sciences each group of citizens must learn, and what degree of proficiency each must attain. We observe further that the most honored capacities, such as strategy, household management, and oratory, are contained in politics. Since this science uses the rest of the sciences, and since, moreover, it legislates

*We do not know who first gave this definition of the good. It is certainly implied in the Platonic dialogues, especially in *Republic*, Book VI; but the most likely candidate for the formulation here is Eudoxus.

***Politike* is the science of the city-state, the *polis*, and its members, not merely in our narrow “political” sense of the word but also in the sense that a civilized human existence is, according to Plato and Aristotle, only possible in the *polis*. Thus *politike* involves not only the science of the state, “politics,” but of our concept of “society” as well.

what people are to do and what they are not to do, its end seems to embrace the ends of the other sciences. Thus it follows that the end of politics is the good for man. For even if the good is the same for the individual and the state, the good of the state clearly is the greater and more perfect thing to attain and to safeguard. The attainment of the good for one man alone is, to be sure, a source of satisfaction; yet to secure it for a nation and for states is nobler and more divine. In short, these are the aims of our investigation, which is in a sense an investigation of social and political matters. 5 10

3. *The Limitations of Ethics and Politics:* Our discussion will be adequate if it achieves clarity within the limits of the subject matter. For precision cannot be expected in the treatment of all subjects alike, any more than it can be expected in all manufactured articles. Problems of what is noble and just, which politics examines, present so much variety and irregularity that some people believe that they exist only by convention and not by nature. The problem of the good, too, presents a similar kind of irregularity, because in many cases good things bring harmful results. There are instances of men ruined by wealth, and others by courage. Therefore, in a discussion of such subjects, which has to start from a basis of this kind, we must be satisfied to indicate the truth with a rough and general sketch: when the subject and the basis of a discussion consist of matters that hold good only as a general rule, but not always, the conclusions reached must be of the same order. The various points that are made must be received in the same spirit. For a well-schooled man is one who searches for that degree of precision in each kind of study which the nature of the subject at hand admits: it is obviously just as foolish to accept arguments of probability from a mathematician as to demand strict demonstrations from an orator. 15 20 25

Each man can judge competently the things he knows, and of these he is a good judge. Accordingly, a good judge in each particular field is one who has been trained in it, and a good judge in general, a man who has received an all-round schooling. For that reason, a young man is not equipped to be a student of politics; for he has no experience in the actions which life demands of him, and these actions form the basis and subject matter of the discussion. Moreover, since he follows his emotions, his study will be pointless and unprofitable, for the end of this kind of study is not knowledge but action. Whether he is young in years or immature in character makes no difference; for his deficiency is not a matter of time but of living and of pursuing all his interests under the influence of his emotions. Knowledge brings no benefit to this kind of person, just as it brings none to the morally weak. But those who regulate their desires and actions by a rational principle* will greatly benefit from a knowledge of this subject. So much by way of a preface about the student, the limitations which have to be accepted, and the objective before us. 5 10 1095^a

4. *Happiness Is the Good, But Many Views Are Held About It:* To resume the discussion: since all knowledge and every choice is directed toward some good, let us discuss what is in our view the aim of politics, i.e., the highest good attainable by action. As far as its name is concerned, most people would probably agree: for both the common run of 15

*The fundamental meaning of *Logos* is "speech," "statement," in the sense of a coherent and rational arrangement of words; but it can apply to a rational principle underlying many things, and may be translated in different contexts by "rational account," "explanation," "argument," "treatise," or "discussion." In Chapters 7 and 13 below, *Logos* is used in a normative sense, describing the human faculty which comprehends and formulates rational principles and thus guides the conduct of a good and reasonable man.

people and cultivated men call it happiness, and understand by "being happy" the same as "living well" and "doing well." But when it comes to defining what happiness is, they disagree, and the account given by the common run differs from that of the philosophers. The former say it is some clear and obvious good, such as pleasure, wealth, or honor; some say it is one thing and others another, and often the very same person identifies it with different things at different times: when he is sick he thinks it is health, and when he is poor he says it is wealth; and when people are conscious of their own ignorance, they admire those who talk above their heads in accents of greatness. Some thinkers used to believe that there exists over and above these many goods another good, good in itself and by itself, which also is the cause of good in all these things. An examination of all the different opinions would perhaps be a little pointless, and it is sufficient to concentrate on those which are most in evidence or which seem to make some sort of sense.

Nor must we overlook the fact that arguments which proceed from fundamental principles are different from arguments that lead up to them. Plato, too, rightly recognized this as a problem and used to ask whether the discussion was proceeding from or leading up to fundamental principles, just as in a race course there is a difference between running from the judges to the far end of the track and running back again.* Now, we must start with the known. But this term has two connotations: "what is known to us" and "what is known" pure and simple. Therefore, we should start perhaps from what is known to us. For that reason, to be a competent student of what is right and just, and of politics generally, one must first have received a proper upbringing in moral conduct. The acceptance of a fact as a fact is the starting point, and if this is sufficiently clear, there will be no further need to ask why it is so. A man with this kind of background has or can easily acquire the foundations from which he must start. But if he neither has nor can acquire them, let him lend an ear to Hesiod's words:

That man is all-best who himself works out every problem. . . .
That man, too, is admirable who follows one who speaks well.
He who cannot see the truth for himself, nor, hearing it from others, store it away in his mind, that man is utterly useless.

5. *Various Views on the Highest Good:* But to return to the point from which we digressed. It is not unreasonable that men should derive their concept of the good and of happiness from the lives which they lead. The common run of people and the most vulgar identify it with pleasure, and for that reason are satisfied with a life of enjoyment. For the most notable kinds of life are three: the life just mentioned, the political life, and the contemplative life.

The common run of people, as we saw, betray their utter slavishness in their preference for a life suitable to cattle; but their views seem plausible because many people in high places share the feelings of Sardanapallus.** Cultivated and active men, on the other hand, believe the good to be honor, for honor, one might say, is the end of the political life. But this is clearly too superficial an answer: for honor seems to depend on those who confer it rather than on him who receives it, whereas our guess is that the

*A Greek race course was U-shaped with the starting line at the open end, which is also where the judges would have their place. The race was run around a marker set up toward the opposite end of the U, and back again to the starting line.

**Sardanapallus is the Hellenized name of the Assyrian king Ashurbanipal (669–626 B.C.). Many stories about his sensual excesses were current in antiquity.

good is a man's own possession which cannot easily be taken away from him. Furthermore, men seem to pursue honor to assure themselves of their own worth; at any rate, they seek to be honored by sensible men and by those who know them, and they want to be honored on the basis of their virtue or excellence [*aretē*].* Obviously, then, excellence, as far as they are concerned, is better than honor. One might perhaps even go so far as to consider excellence rather than honor as the end of political life. However, even excellence proves to be imperfect as an end: for a man might possibly possess it while asleep or while being inactive all his life, and while, in addition, undergoing the greatest suffering and misfortune. Nobody would call the life of such a man happy, except for the sake of maintaining an argument. But enough of this: the subject has been sufficiently treated in our publications addressed to a wider audience. In the third place there is the contemplative life, which we shall examine later on. As for the money-maker, his life is led under some kind of constraint: clearly, wealth is not the good which we are trying to find, for it is only useful, i.e., it is a means to something else. Hence one might rather regard the aforementioned objects as ends, since they are valued for their own sake. But even they prove not to be the good, though many words have been wasted to show that they are. Accordingly, we may dismiss them.

6. *Plato's View of the Good*: But perhaps we had better examine the universal good and face the problem of its meaning, although such an inquiry is repugnant, since those who have introduced the doctrine of Forms** are dear to us. But in the interest of truth, one should perhaps think a man, especially if he is a philosopher, had better give up even [theories that once were] his own and in fact must do so. Both are dear to us, but it is our sacred duty to honor truth more highly [than friends].

The proponents of this theory did not make Forms out of those classes within which they recognized an order involving priority and posteriority; for that reason they made no provision, either, for a Form comprising all numbers.*** However, the term "good" is used in the categories of substance, of quality, and of relatedness alike; but a thing-as-such, i.e., a substance, is by nature prior to a relation into which it can enter: relatedness is, as it were, an offshoot or logical accident of substance. Consequently, there cannot be a Form common to the good-as-such and the good as a relation.

Secondly, the term "good" has as many meanings as the word "is": it is used to describe substances, e.g., divinity and intelligence are good; qualities, e.g., the virtues are good; quantities, e.g., the proper amount is good; relatedness, e.g., the useful is good; time, e.g., the right moment is good; place, e.g., a place to live is good; and so forth. It is clear, therefore, that the good cannot be something universal, common to all cases, and single; for if it were, it would not be applicable in all categories but only in one.

**Aretē* denotes the functional excellence of any person, animal, or thing—that quality which enables the possessor to perform his own particular function well. Thus the *aretai* (plural) of man in relation to other men are his qualities which enable him to function well in society. The translation "virtue" often seems too narrow, and accordingly "excellence" and "goodness;" or a combination of these, will also be used.

**The reference is of course to Plato's theory of *eide* or *ideai* and especially the Form of the Good, which is Aristotle's chief target here.

***Since for Plato and his followers the Forms are absolute being, in which there is no room for becoming or any kind of development, they do not recognize a Form of a developing series, in which each successive member implies the preceding members of the same series. But, as Aristotle proceeds to show, the term "good" belongs to such a developing series: if we call a certain quality, e.g., blueness, "good," we have to assume first that there is such a thing as blueness; i.e., we have to predicate it in the category of substance before we can predicate it in the category of quality.

30 Thirdly, since the things which are included under one Form are the subject matter of a single science, there should be a single science dealing with all good things. But in actual fact there are many sciences dealing even with the goods that fall into a single category. To take, for example, the right moment: in war it is the proper concern of strategy, whereas in treating a disease it is part of the study of medicine. Or to take the proper amount: in food it is the subject of medicine; in physical training, of gymnastics.

35 One might even [go further and] raise the question what exactly they mean by a
1096^b “thing-as-such”; for the selfsame definition of “man” applies to both “man-as-such” and a particular man. For inasmuch as they refer to “man,” there will be no difference between the two; and if this is true, there will be no difference, either, between “good-as-such” and “good,” since both are good. Nor indeed will the “good-as-such” be more of a good because it is everlasting: after all, whiteness which lasts for a long time is no whiter than whiteness which lasts only for a day.

5 The argument of the Pythagoreans on this point seems to be more convincing. They give unity a place in the column of goods; and indeed even Speusippus* seems to follow them. But more about this elsewhere.

An objection might be raised against what we have said on the ground that the [Platonic] doctrine does not refer to every kind of good, and that only things which are
10 pursued and loved for their own sake are called “good” by reference to one single Form. That which produces good or somehow guarantees its permanence, [the Platonists argue,] or that which prevents the opposite of a good from asserting itself is called “good” because it is conducive to the intrinsically good and in a different sense. Now, the term “good” has obviously two different meanings: (1) things which are intrinsically good, and (2) things which are good as being conducive to the intrinsically good.
15 Let us, therefore, separate the intrinsically good things from the useful things and examine whether they are called “good” by reference to a single Form.

What sort of things could be called intrinsically good? Are they the goods that are pursued without regard to additional benefits, such as thought, sight, certain pleasures and honors? For even if we pursue these also for the sake of something else, one would still classify them among things intrinsically good. Or is nothing good except the Form
20 of Good? If that is the case, the Form will be pointless. But if, on the contrary, thought, sight, etc. also belong to the group of intrinsically good things, the same definition of “good” will have to be manifested in all of them, just as, for example, the definition of whiteness is the same in snow and in white paint. But in actual fact, the definitions of “good” as manifested in honor, thought, and pleasure are different and distinct. The good, therefore, is not some element common to all these things as derived from
25 one Form.

What, then, is the meaning of “good” [in these different things]? Surely, it is not that they merely happen to have the same name. Do we call them “good” because they are derived from a single good, or because they all aim at a single good? Or do we rather call them “good” by analogy, e.g., as sight is good in the body, so intelligence is good in the soul, and so other things are good within their respective fields?

30 But perhaps this subject should be dismissed for the present, because a detailed discussion of it belongs more properly to a different branch of philosophy, [namely, first philosophy]. The same applies to the Form [of the Good]: for, assuming that there is some single good which different things possess in common, or that there exists a good

*Speusippus was Plato’s nephew and disciple who succeeded him as head of the Academy from 347–339 B.C.

absolutely in itself and by itself, it evidently is something which cannot be realized in action or attained by man. But the good which we are now seeking must be attainable.

Perhaps one may think that the recognition of an absolute good will be advantageous for the purpose of attaining and realizing in action the goods which can be attained and realized. By treating the absolute good as a pattern, [they might argue,] we shall gain a better knowledge of what things are good for us, and once we know that, we can achieve them. This argument has, no doubt, some plausibility; however, it does not tally with the procedure of the sciences. For while all the sciences aim at some good and seek to fulfill it, they leave the knowledge of the absolute good out of consideration. Yet if this knowledge were such a great help, it would make no sense that all the craftsmen are ignorant of it and do not even attempt to seek it. One might also wonder what benefit a weaver or a carpenter might derive in the practice of his own art from a knowledge of the absolute Good, or in what way a physician who has contemplated the Form of the Good will become more of a physician or a general more of a general. For actually, a physician does not even examine health in this fashion; he examines the health of man, or perhaps better, the health of a particular man, for he practices his medicine on particular cases. So much for this.

35
1097^a

10

7. The Good Is Final and Self-Sufficient; Happiness Is Defined: Let us return again to our investigation into the nature of the good which we are seeking. It is evidently something different in different actions and in each art: it is one thing in medicine, another in strategy, and another again in each of the other arts. What, then, is the good of each? Is it not that for the sake of which everything else is done? That means it is health in the case of medicine, victory in the case of strategy, a house in the case of building, a different thing in the case of different arts, and in all actions and choices it is the end. For it is for the sake of the end that all else is done. Thus, if there is some one end for all that we do, this would be the good attainable by action; if there are several ends, they will be the goods attainable by action.

15
20

Our argument has gradually progressed to the same point at which we were before, and we must try to clarify it still further. Since there are evidently several ends, and since we choose some of these—e.g., wealth, flutes, and instruments generally—as a means to something else, it is obvious that not all ends are final. The highest good, on the other hand, must be something final. Thus, if there is only one final end, this will be the good we are seeking; if there are several, it will be the most final and perfect of them. We call that which is pursued as an end in itself more final than an end which is pursued for the sake of something else; and what is never chosen as a means to something else we call more final than that which is chosen both as an end in itself and as a means to something else. What is always chosen as an end in itself and never as a means to something else is called final in an unqualified sense. This description seems to apply to happiness above all else: for we always choose happiness as an end in itself and never for the sake of something else. Honor, pleasure, intelligence, and all virtue we choose partly for themselves—for we would choose each of them even if no further advantage would accrue from them—but we also choose them partly for the sake of happiness, because we assume that it is through them that we will be happy. On the other hand, no one chooses happiness for the sake of honor, pleasure, and the like, nor as a means to anything at all.

25
30
1097^b
5

We arrive at the same conclusion if we approach the question from the standpoint of self-sufficiency. For the final and perfect good seems to be self-sufficient. However, we define something as self-sufficient not by reference to the “self” alone. We do not

mean a man who lives his life in isolation, but a man who also lives with parents, children, a wife, and friends and fellow citizens generally, since man is by nature a social and political being. But some limit must be set to these relationships; for if they are extended to include ancestors, descendants, and friends of friends, they will go on to infinity. However, this point must be reserved for investigation later. For the present we define as “self-sufficient” that which taken by itself makes life something desirable and deficient in nothing. It is happiness, in our opinion, which fits this description. Moreover, happiness is of all things the one most desirable, and it is not counted as one good thing among many others. But if it were counted as one among many others, it is obvious that the addition of even the least of the goods would make it more desirable; for the addition would produce an extra amount of good, and the greater amount of good is always more desirable than the lesser. We see then that happiness is something final and self-sufficient and the end of our actions.

To call happiness the highest good is perhaps a little trite, and a clearer account of what it is, is still required. Perhaps this is best done by first ascertaining the proper function of man. For just as the goodness and performance of a flute player, a sculptor, or any kind of expert, and generally of anyone who fulfills some function or performs some action, are thought to reside in his proper function, so the goodness and performance of man would seem to reside in whatever is his proper function. Is it then possible that while a carpenter and a shoemaker have their own proper functions and spheres of action, man as man has none, but was left by nature a good-for-nothing without a function? Should we not assume that just as the eye, the hand, the foot, and in general each part of the body clearly has its own proper function, so man too has some function over and above the functions of his parts? What can this function possibly be? Simply living? He shares that even with plants, but we are now looking for something peculiar to man. Accordingly, the life of nutrition and growth must be excluded. Next in line there is a life of sense perception. But this, too, man has in common with the horse, the ox, and every animal. There remains then an active life of the rational element. The rational element has two parts: one is rational in that it obeys the rule of reason, the other in that it possesses and conceives rational rules. Since the expression “life of the rational element” also can be used in two senses, we must make it clear that we mean a life determined by the activity, as opposed to the mere possession, of the rational element. For the activity, it seems, has a greater claim to be the function of man.

The proper function of man, then, consists in an activity of the soul in conformity with a rational principle or, at least, not without it. In speaking of the proper function of a given individual we mean that it is the same in kind as the function of an individual who sets high standards for himself: the proper function of a harpist, for example, is the same as the function of a harpist who has set high standards for himself. The same applies to any and every group of individuals: the full attainment of excellence must be added to the mere function. In other words, the function of the harpist is to play the harp; the function of the harpist who has high standards is to play it well. On these assumptions, if we take the proper function of man to be a certain kind of life, and if this kind of life is an activity of the soul and consists in actions performed in conjunction with the rational element, and if a man of high standards is he who performs these actions well and properly, and if a function is well performed when it is performed in accordance with the excellence appropriate to it; we reach the conclusion that the good of man is an activity of the soul in conformity with excellence or virtue, and if there are several virtues, in conformity with the best and most complete.

But we must add “in a complete life.” For one swallow does not make a spring, nor does one sunny day; similarly, one day or a short time does not make a man blessed* and happy.

This will suffice as an outline of the good: for perhaps one ought to make a general sketch first and fill in the details afterwards. Once a good outline has been made, anyone, it seems, is capable of developing and completing it in detail, and time is a good inventor or collaborator in such an effort. Advances in the arts, too, have come about in this way, for anyone can fill in gaps. We must also bear in mind what has been said above, namely that one should not require precision in all pursuits alike, but in each field precision varies with the matter under discussion and should be required only to the extent to which it is appropriate to the investigation. A carpenter and a geometrician both want to find a right angle, but they do not want to find it in the same sense: the former wants to find it to the extent to which it is useful for his work, the latter, wanting to see truth, tries to ascertain what it is and what sort of thing it is. We must, likewise, approach other subjects in the same spirit, in order to prevent minor points from assuming a greater importance than the major tasks. Nor should we demand to know a causal explanation in all matters alike; in some instances, e.g., when dealing with fundamental principles, it is sufficient to point out convincingly that such-and-such is in fact the case. The fact here is the primary thing and the fundamental principle. Some fundamental principles can be apprehended by induction, others by sense perception, others again by some sort of habituation,** and others by still other means. We must try to get at each of them in a way naturally appropriate to it, and must be scrupulous in defining it correctly, because it is of great importance for the subsequent course of the discussion. Surely, a good beginning is more than half the whole, and as it comes to light, it sheds light on many problems.

8. *Popular Views About Happiness Confirm Our Position:* We must examine the fundamental principle with which we are concerned, [happiness,] not only on the basis of the logical conclusion we have reached and on the basis of the elements which make up its definition, but also on the basis of the views commonly expressed about it. For in a true statement, all the facts are in harmony; in a false statement, truth soon introduces a discordant note.

Good things are commonly divided into three classes: (1) external goods, (2) goods of the soul, and (3) goods of the body. Of these, we call the goods pertaining to the soul goods in the highest and fullest sense. But in speaking of “soul,” we refer to our soul’s actions and activities. Thus, our definition tallies with this opinion which has been current for a long time and to which philosophers subscribe. We are also right in defining the end as consisting of actions and activities; for in this way the end is included among the goods of the soul and not among external goods.

Also the view that a happy man lives well and fares well fits in with our definition: for we have all but defined happiness as a kind of good life and well-being.

Moreover, the characteristics which one looks for in happiness are all included in our definition. For some people think that happiness is virtue, others that it is practical

*The distinction Aristotle seems to observe between *makarios*, “blessed” or “supremely happy,” and *eudaimon*, “happy,” is that the former describes happiness insofar as it is god-given, while the latter describes happiness as attained by man through his own efforts.

**This, according to Aristotle, is the way in which the fundamental principles of ethics are learned, and for that reason a person must be mature in order to be able to study ethics properly. Aristotle is not trying to persuade his listener of the truth of these principles, but takes it for granted that the listener has learned them at home.

wisdom, others that it is some kind of theoretical wisdom; others again believe it to be
 25 all or some of these accompanied by, or not devoid of, pleasure; and some people also
 include external prosperity in its definition.* Some of these views are expressed by
 many people and have come down from antiquity, some by a few men of high prestige,
 and it is not reasonable to assume that both groups are altogether wrong; the presump-
 tion is rather that they are right in at least one or even in most respects.

Now, in our definition we are in agreement with those who describe happiness as
 30 virtue or as some particular virtue, for our term “activity in conformity with virtue”
 implies virtue. But it does doubtless make a considerable difference whether we think
 of the highest good as consisting in the possession or in the practice of virtue, viz., as
 being a characteristic or an activity. For a characteristic may exist without producing
 1099^a any good result, as for example, in a man who is asleep or incapacitated in some other
 respect. An activity, on the other hand, must produce a result: [an active person] will
 necessarily act and act well. Just as the crown at the Olympic Games is not awarded to
 5 the most beautiful and the strongest but to the participants in the contests—for it is
 among them that the victors are found—so the good and noble things in life are won by
 those who act rightly.

The life of men active in this sense is also pleasant in itself. For the sensation of
 pleasure belongs to the soul, and each man derives pleasure from what he is said to love:
 a lover of horses from horses, a lover of the theater from plays, and in the same way a
 10 lover of justice from just acts, and a lover of virtue in general from virtuous acts. In most
 men, pleasant acts conflict with one another because they are not pleasant by nature, but
 men who love what is noble derive pleasure from what is naturally pleasant. Actions
 15 which conform to virtue are naturally pleasant, and, as a result, such actions are not only
 pleasant for those who love the noble but also pleasant in themselves. The life of such
 men has no further need of pleasure as an added attraction, but it contains pleasure within
 itself. We may even go so far as to state that the man who does not enjoy performing
 20 noble actions is not a good man at all. Nobody would call a man just who does not enjoy
 acting justly, nor generous who does not enjoy generous actions, and so on. If this is true,
 actions performed in conformity with virtue are in themselves pleasant.

Of course it goes without saying that such actions are good as well as noble, and
 they are both in the highest degree, if the man of high moral standards displays any right
 judgment about them at all; and his judgment corresponds to our description. So we see
 that happiness is at once the best, noblest, and most pleasant thing, and these qualities
 25 are not separate, as the inscription at Delos makes out:

The most just is most noble, but health is the best, and to win what one loves is
 pleasantest.

For the best activities encompass all these attributes, and it is in these, or in the best one
 30 of them, that we maintain happiness consists.

Still, happiness, as we have said, needs external goods as well. For it is impossi-
 ble or at least not easy to perform noble actions if one lacks the wherewithal. Many

*The view that virtue alone constitutes happiness was espoused by Antisthenes and the Cynics (and later by the Stoics); the doctrine that all virtues are forms of *phronesis* or “practical wisdom” is attributed to Socrates; theoretical wisdom as virtue may perhaps be attributed to Anaxagoras and his doctrine of *Nous*; the view that pleasure must be added to virtue and wisdom is that of Plato; and the ancient commentators on this passage identify Xenocrates, Plato’s pupil and later head of the Academy, as regarding external goods as essential for the good life.

actions can only be performed with the help of instruments, as it were: friends, wealth, and political power. And there are some external goods the absence of which spoils supreme happiness, e.g., good birth, good children, and beauty: for a man who is very ugly in appearance or ill-born or who lives all by himself and has no children cannot be classified as altogether happy; even less happy perhaps is a man whose children and friends are worthless, or one who has lost good children and friends through death. Thus, as we have said, happiness also requires well-being of this kind, and that is the reason why some classify good fortune with happiness, while others link it to virtue.

9. How Happiness Is Acquired: This also explains why there is a problem whether happiness is acquired by learning, by discipline, or by some other kind of training, or whether we attain it by reason of some divine dispensation or even by chance. Now, if there is anything at all which comes to men as a gift from the gods, it is reasonable to suppose that happiness above all else is god-given; and of all things human it is the most likely to be god-given, inasmuch as it is the best. But although this subject is perhaps more appropriate to a different field of study, it is clear that happiness is one of the most divine things, even if it is not god-sent but attained through virtue and some kind of learning or training. For the prize and end of excellence and virtue is the best thing of all, and it is something divine and blessed. Moreover, if happiness depends on excellence, it will be shared by many people; for study and effort will make it accessible to anyone whose capacity for virtue is unimpaired. And if it is better that happiness is acquired in this way rather than by chance, it is reasonable to assume that this is the way in which it is acquired. For, in the realm of nature, things are naturally arranged in the best way possible—and the same is also true of the products of art and of any kind of causation, especially the highest. To leave the greatest and noblest of things to chance would hardly be right.

A solution of this question is also suggested by our earlier definition, according to which the good of man, happiness, is some kind of activity of the soul in conformity with virtue. All the other goods are either necessary prerequisites for happiness, or are by nature co-workers with it and useful instruments for attaining it. Our results also tally with what we said at the outset: for we stated that the end of politics is the best of ends; and the main concern of politics is to engender a certain character in the citizens and to make them good and disposed to perform noble actions.

We are right, then, when we call neither a horse nor an ox nor any other animal happy, for none of them is capable of participating in an activity of this kind. For the same reason, a child is not happy, either; for, because of his age, he cannot yet perform such actions. When we do call a child happy, we do so by reason of the hopes we have for his future. Happiness, as we have said, requires completeness in virtue as well as a complete lifetime. Many changes and all kinds of contingencies befall a man in the course of his life, and it is possible that the most prosperous man will encounter great misfortune in his old age, as the Trojan legends tell about Priam. When a man has met a fate such as his and has come to a wretched end, no one calls him happy.

10. Can a Man Be Called “Happy” During His Lifetime?: Must we, then, apply the term “happy” to no man at all as long as he is alive? Must we, as Solon would have us do, wait to see his end? And, on this assumption, is it also true that a man is actually

*This is one of the main points made by Solon, Athenian statesman and poet of the early sixth century B.C., in his conversation with the Lydian king, Croesus.

happy after he is dead? Is this not simply absurd, especially for us who define happiness as a kind of activity? Suppose we do not call a dead man happy, and interpret Solon's words to mean that only when a man is dead can we safely say that he has been happy, since he is now beyond the reach of evil and misfortune—this view, too, is open to objection. For it seems that to some extent good and evil really exist for a dead man, just as they may exist for a man who lives without being conscious of them, for example, honors and disgraces, and generally the successes and failures of his children and descendants. This presents a further problem. A man who has lived happily to his old age and has died as happily as he lived may have many vicissitudes befall his descendants: some of them may be good and may be granted the kind of life which they deserve, and others may not. It is, further, obvious that the descendants may conceivably be removed from their ancestors by various degrees. Under such circumstances, it would be odd if the dead man would share in the vicissitudes of his descendants and be happy at one time and wretched at another. But it would also be odd if the fortunes of their descendants did not affect the ancestors at all, not even for a short time.

But we must return to the problem raised earlier, for through it our present problem perhaps may be solved. If one must look to the end and praise a man not as being happy but as having been happy in the past, is it not paradoxical that at a time when a man actually is happy this attribute, though true, cannot be applied to him? We are unwilling to call the living happy because changes may befall them and because we believe that happiness has permanence and is not amenable to changes under any circumstances, whereas fortunes revolve many times in one person's lifetime. For obviously, if we are to keep pace with a man's fortune, we shall frequently have to call the same man happy at one time and wretched at another and demonstrate that the happy man is a kind of chameleon, and that the foundations [of his life] are unsure. Or is it quite wrong to make our judgment depend on fortune? Yes, it is wrong, for fortune does not determine whether we fare well or ill, but is, as we said, merely an accessory to human life; activities in conformity with virtue constitute happiness, and the opposite activities constitute its opposite.

The question which we have just discussed further confirms our definition. For no function of man possesses as much stability as do activities in conformity with virtue: these seem to be even more durable than scientific knowledge. And the higher the virtuous activities, the more durable they are, because men who are supremely happy spend their lives in these activities most intensely and most continuously, and this seems to be the reason why such activities cannot be forgotten.

The happy man will have the attribute of permanence which we are discussing, and he will remain happy throughout his life. For he will always or to the highest degree both do and contemplate what is in conformity with virtue; he will bear the vicissitudes of fortune most nobly and with perfect decorum under all circumstances, inasmuch as he is truly good and "four-square beyond reproach."

But fortune brings many things to pass, some great and some small. Minor instances of good and likewise of bad luck obviously do not decisively tip the scales of life, but a number of major successes will make life more perfectly happy; for, in the first place, by their very nature they help to make life attractive, and secondly, they afford the opportunity for noble and good actions. On the other hand, frequent reverses can crush and mar supreme happiness in that they inflict pain and thwart many activities. Still, nobility shines through even in such circumstances, when a man bears many great misfortunes with good grace not because he is insensitive to pain but because he is noble and high-minded.

If, as we said, the activities determine a man's life, no supremely happy man can ever become miserable, for he will never do what is hateful and base. For in our opinion, the man who is truly good and wise will bear with dignity whatever fortune may bring, and will always act as nobly as circumstances permit, just as a good general makes the most strategic use of the troops at his disposal, and a good shoemaker makes the best shoe he can from the leather available, and so on with experts in all other fields. If this is true, a happy man will never become miserable; but even so, supreme happiness will not be his if a fate such as Priam's befalls him. And yet, he will not be fickle and changeable; he will not be dislodged from his happiness easily by any misfortune that comes along, but only by great and numerous disasters such as will make it impossible for him to become happy again in a short time; if he recovers his happiness at all, it will be only after a long period of time, in which he has won great distinctions. 35 1101^a 5 10

Is there anything to prevent us, then, from defining the happy man as one whose activities are an expression of complete virtue, and who is sufficiently equipped with external goods, not simply at a given moment but to the end of his life? Or should we add that he must die as well as live in the manner which we have defined? For we cannot foresee the future, and happiness, we maintain, is an end which is absolutely final and complete in every respect. If this be granted, we shall define as "supremely happy" those living men who fulfill and continue to fulfill these requirements, but blissful only as human beings. So much for this question. 15 20

11. Do the Fortunes of the Living Affect the Dead?: That the fortunes of his descendants and of all those near and dear to him do not affect the happiness of a dead man at all, seems too unfeeling a view and contrary to the prevailing opinions. Many and different in kind are the accidents that can befall us, and some hit home more closely than others. It would, therefore, seem to be a long and endless task to make detailed distinctions, and perhaps a general outline will be sufficient. Just as one's own misfortunes are sometimes momentous and decisive for one's life and sometimes seem comparatively less important, so the misfortunes of our various friends affect us to varying degrees. In each case it makes a considerable difference whether those who are affected by an event are living or dead; much more so than it matters in a tragedy whether the crimes and horrors have been perpetrated before the opening of the play or are part of the plot. This difference, too, must be taken into account and perhaps still more the problem whether the dead participate in any good or evil. These considerations suggest that even if any good or evil reaches them at all, it must be something weak and negligible (either intrinsically or in relation to them), or at least something too small and insignificant to make the unhappy happy or to deprive the happy of their bliss. The good as well as the bad fortunes of their friends seem, then, to have some effect upon the dead, but the nature and magnitude of the effect is such as not to make the happy unhappy or to produce any similar changes. 25 30 35 1101^b 5

12. The Praise Accorded to Happiness: Now that we have settled these questions, let us consider whether happiness is to be classified among the things which we praise or rather among those which we honor; for it is clear that it is not a potential [but an actual good]. 10

The grounds on which we bestow praise on anything evidently are its quality and the relation in which it stands to other things. In other words, we praise a just man, a courageous man, and in general any good man, and also his virtue or excellence, on the basis of his actions and achievements; moreover, we praise a strong 15

man, a swift runner, and so forth, because he possesses a certain natural quality and stands in a certain relation to something good and worth while. Our feelings about praising the gods provide a further illustration of this point. For it is ridiculous to refer the gods to our standards; but this is precisely what praising them amounts to, since praise, as we said, entails a reference to something else. But if praise is appropriate only for relative things, it is clear that the best things do not call for praise but for something greater and better, as indeed is generally recognized: for we call the gods "blessed" and "happy" and use these terms also for the most godlike man. The same is true of good things: no one praises happiness in the same sense in which he praises justice, but he exalts its bliss as something better and more nearly divine.

Eudoxus, too, seems to have used the right method for advocating that pleasure is the most excellent, for he took the fact that pleasure, though a good, is not praised as an indication of its superiority to the things that are praised, as god and the good are, for they are the standards to which we refer everything else.

Praise is proper to virtue or excellence, because it is excellence that makes men capable of performing noble deeds. Eulogies, on the other hand, are appropriate for achievements of the body as well as of the mind. However, a detailed analysis of this subject is perhaps rather the business of those who have made a study of eulogies. For our present purposes, we may draw the conclusion from the preceding argument that happiness is one of the goods that are worthy of honor and are final. This again seems to be due to the fact that it is a starting point or fundamental principle, since for its sake all of us do everything else. And the source and cause of all good things we consider as something worthy of honor and as divine.

13. *The Psychological Foundations of the Virtues:* Since happiness is a certain activity of the soul in conformity with perfect virtue, we must now examine what virtue or excellence is. For such an inquiry will perhaps better enable us to discover the nature of happiness. Moreover, the man who is truly concerned about politics seems to devote special attention to excellence, since it is his aim to make the citizens good and law-abiding. We have an example of this in the lawgivers of Crete and Sparta and in other great legislators. If an examination of virtue is part of politics, this question clearly fits into the pattern of our original plan.

There can be no doubt that the virtue which we have to study is human virtue. For the good which we have been seeking is a human good and the happiness a human happiness. By human virtue we do not mean the excellence of the body, but that of the soul, and we define happiness as an activity of the soul. If this is true, the student of politics must obviously have some knowledge of the workings of the soul, just as the man who is to heal eyes must know something about the whole body. In fact, knowledge is all the more important for the former, inasmuch as politics is better and more valuable than medicine, and cultivated physicians devote much time and trouble to gain knowledge about the body. Thus, the student of politics must study the soul, but he must do so with his own aim in view, and only to the extent that the objects of his inquiry demand: to go into it in greater detail would perhaps be more laborious than his purposes require.

Some things that are said about the soul in our less technical discussions are adequate enough to be used here, for instance, that the soul consists of two elements, one irrational and one rational. Whether these two elements are separate, like the parts of the body or any other divisible thing, or whether they are only logically separable

though in reality indivisible, as convex and concave are in the circumference of a circle, is irrelevant for our present purposes.

Of the irrational element, again, one part seems to be common to all living things and vegetative in nature: I mean that part which is responsible for nurture and growth. We must assume that some such capacity of the soul exists in everything that takes nourishment, in the embryonic stage as well as when the organism is fully developed; for this makes more sense than to assume the existence of some different capacity at the latter stage. The excellence of this part of the soul is, therefore, shown to be common to all living things and is not exclusively human. This very part and this capacity seem to be most active in sleep. For in sleep the difference between a good man and a bad is least apparent—whence the saying that for half their lives the happy are no better off than the wretched. This is just what we would expect, for sleep is an inactivity of the soul in that it ceases to do things which cause it to be called good or bad. However, to a small extent some bodily movements do penetrate to the soul in sleep, and in this sense the dreams of honest men are better than those of average people. But enough of this subject: we may pass by the nutritive part, since it has no natural share in human excellence or virtue. 1102^b

In addition to this, there seems to be another integral element of the soul which, though irrational, still does partake of reason in some way. In morally strong and morally weak men we praise the reason that guides them and the rational element of the soul, because it exhorts them to follow the right path and to do what is best. Yet we see in them also another natural strain different from the rational, which fights and resists the guidance of reason. The soul behaves in precisely the same manner as do the paralyzed limbs of the body. When we intend to move the limbs to the right, they turn to the left, and similarly, the impulses of morally weak persons turn in the direction opposite to that in which reason leads them. However, while the aberration of the body is visible, that of the soul is not. But perhaps we must accept it as a fact, nevertheless, that there is something in the soul besides the rational element, which opposes and reacts against it. In what way the two are distinct need not concern us here. But, as we have stated, it too seems to partake of reason; at any rate, in a morally strong man it accepts the leadership of reason, and is perhaps more obedient still in a self-controlled and courageous man, since in him everything is in harmony with the voice of reason. 15

Thus we see that the irrational element of the soul has two parts: the one is vegetative and has no share in reason at all, the other is the seat of the appetites and of desire in general and partakes of reason insofar as it complies with reason and accepts its leadership; it possesses reason in the sense that we say it is “reasonable” to accept the advice of a father and of friends, not in the sense that we have a “rational” understanding of mathematical propositions. That the irrational element can be persuaded by the rational is shown by the fact that admonition and all manner of rebuke and exhortation are possible. If it is correct to say that the appetitive part, too, has reason, it follows that the rational element of the soul has two subdivisions: the one possesses reason in the strict sense, contained within itself, and the other possesses reason in the sense that it listens to reason as one would listen to a father. 20 25 30 1103^a

Virtue, too, is differentiated in line with this division of the soul. We call some virtues “intellectual” and others “moral”: theoretical wisdom, understanding, and practical wisdom are intellectual virtues, generosity and self-control moral virtues. In speaking of a man’s character, we do not describe him as wise or understanding, but as gentle or self-controlled; but we praise the wise man, too, for his characteristic, and praiseworthy characteristics are what we call virtues. 5 10

BOOK II

1. *Moral Virtue as the Result of Habits*: Virtue, as we have seen, consists of two-
 15 kinds, intellectual virtue and moral virtue. Intellectual virtue or excellence owes its
 origin and development chiefly to teaching, and for that reason requires experience and
 time. Moral virtue, on the other hand, is formed by habit, *ethos*, and its name, *ethike*, is
 20 therefore derived, by a slight variation, from *ethos*. This shows, too, that none of the
 moral virtues is implanted in us by nature, for nothing which exists by nature can be
 changed by habit. For example, it is impossible for a stone, which has a natural down-
 ward movement, to become habituated to moving upward, even if one should try ten
 thousand times to inculcate the habit by throwing it in the air; nor can fire be made to
 move downward, nor can the direction of any nature-given tendency be changed by
 habituation. Thus, the virtues are implanted in us neither by nature nor contrary to
 25 nature: we are by nature equipped with the ability to receive them, and habit brings this
 ability to completion and fulfillment.

Furthermore, of all the qualities with which we are endowed by nature, we are
 provided with the capacity first, and display the activity afterward. That this is true is
 shown by the senses: it is not by frequent seeing or frequent hearing that we acquired
 our senses, but on the contrary we first possess and then use them; we do not acquire
 30 them by use. The virtues, on the other hand, we acquire by first having put them into
 action, and the same is also true of the arts. For the things which we have to learn before
 we can do them we learn by doing: men become builders by building houses, and
 harpists by playing the harp. Similarly, we become just by the practice of just actions,
 1103^b self-controlled by exercising self-control, and courageous by performing acts of
 courage.

This is corroborated by what happens in states. Lawgivers make the citizens good
 by inculcating [good] habits in them, and this is the aim of every lawgiver; if he does
 5 not succeed in doing that, his legislation is a failure. It is in this that a good constitution
 differs from a bad one.

Moreover, the same causes and the same means that produce any excellence or
 virtue can also destroy it, and this is also true of every art. It is by playing the harp that
 men become both good and bad harpists, and correspondingly with builders and all the
 10 other craftsmen: a man who builds well will be a good builder, one who builds badly a
 bad one. For if this were not so, there would be no need for an instructor, but everybody
 would be born as a good or a bad craftsman. The same holds true of the virtues: in our
 15 transactions with other men it is by action that some become just and others unjust, and
 it is by acting in the face of danger and by developing the habit of feeling fear or confi-
 dence that some become brave men and others cowards. The same applies to the
 appetites and feelings of anger: by reacting in one way or in another to given circum-
 stances some people become self-controlled and gentle, and others self-indulgent and
 20 short-tempered. In a word, characteristics develop from corresponding activities. For
 that reason, we must see to it that our activities are of a certain kind, since any variations
 in them will be reflected in our characteristics. Hence it is no small matter whether one
 habit or another is inculcated in us from early childhood; on the contrary, it makes a
 25 considerable difference, or, rather, all the difference.

2. *Method in the Practical Sciences*: The purpose of the present study is not, as it
 is in other inquiries, the attainment of theoretical knowledge: we are not conducting this

inquiry in order to know what virtue is, but in order to become good, else there would be no advantage in studying it. For that reason, it becomes necessary to examine the problem of actions, and to ask how they are to be performed. For, as we have said, the actions determine what kind of characteristics are developed. 30

That we must act according to right reason is generally conceded and may be assumed as the basis of our discussion. We shall speak about it later and discuss what right reason is and examine its relation to the other virtues. But let us first agree that any discussion on matters of action cannot be more than an outline and is bound to lack precision; for as we stated at the outset, one can demand of a discussion only what the subject matter permits, and there are no fixed data in matters concerning action and questions of what is beneficial, any more than there are in matters of health. And if this is true of our general discussion, our treatment of particular problems will be even less precise, since these do not come under the head of any art which can be transmitted by precept, but the agent must consider on each different occasion what the situation demands, just as in medicine and in navigation. But although such is the kind of discussion in which we are engaged, we must do our best. 1104^a
5
10

First of all, it must be observed that the nature of moral qualities is such that they are destroyed by defect and by excess. We see the same thing happen in the case of strength and of health, to illustrate, as we must, the invisible by means of visible examples: excess as well as deficiency of physical exercise destroys our strength, and similarly, too much and too little food and drink destroys our health; the proportionate amount, however, produces, increases, and preserves it. The same applies to self-control, courage, and the other virtues: the man who shuns and fears everything and never stands his ground becomes a coward, whereas a man who knows no fear at all and goes to meet every danger becomes reckless. Similarly, a man who revels in every pleasure and abstains from none becomes self-indulgent, while he who avoids every pleasure like a boor becomes what might be called insensitive. Thus we see that self-control and courage are destroyed by excess and by deficiency and are preserved by the mean. 15
20
25

Not only are the same actions which are responsible for and instrumental in the origin and development of the virtues also the causes and means of their destruction, but they will also be manifested in the active exercise of the virtues. We can see the truth of this in the case of other more visible qualities, e.g., strength. Strength is produced by consuming plenty of food and by enduring much hard work, and it is the strong man who is best able to do these things. The same is also true of the virtues: by abstaining from pleasures we become self-controlled, and once we are self-controlled we are best able to abstain from pleasures. So also with courage: by becoming habituated to despise and to endure terrors we become courageous, and once we have become courageous we will best be able to endure terror. 30
35
1104^b

3. Pleasure and Pain as the Test of Virtue: An index to our characteristics is provided by the pleasure or pain which follows upon the tasks we have achieved. A man who abstains from bodily pleasures and enjoys doing so is self-controlled; if he finds abstinence troublesome, he is self-indulgent; a man who endures danger with joy, or at least without pain, is courageous; if he endures it with pain, he is a coward. For moral excellence is concerned with pleasure and pain; it is pleasure that makes us do base actions and pain that prevents us from doing noble actions. For that reason, as Plato says, men must be brought up from childhood to feel pleasure and pain at the proper things; for this is correct education. 5
10

Furthermore, since the virtues have to do with actions and emotions, and since
 15 pleasure and pain are a consequence of every emotion and of every action, it follows
 from this point of view, too, that virtue has to do with pleasure and pain. This is further
 indicated by the fact that punishment is inflicted by means of pain. For punishment is a
 kind of medical treatment and it is the nature of medical treatments to take effect
 20 through the introduction of the opposite of the disease.* Again, as we said just now,
 every characteristic of the soul shows its true nature in its relation to and its concern
 with those factors which naturally make it better or worse. But it is through pleasures
 and pains that men are corrupted, i.e., through pursuing and avoiding pleasures and
 pains either of the wrong kind or at the wrong time or in the wrong manner, or by going
 wrong in some other definable respect. For that reason some people define the virtues as
 25 states of freedom from emotion and of quietude. However, they make the mistake of
 using these terms absolutely and without adding such qualifications as “in the right
 manner,” “at the right or wrong time,” and so forth. We may, therefore, assume as the
 basis of our discussion that virtue, being concerned with pleasure and pain in the way
 we have described, makes us act in the best way in matters revolving pleasure and pain,
 and that vice does the opposite.

The following considerations may further illustrate that virtue is concerned with
 30 pleasure and pain. There are three factors that determine choice and three that determine
 avoidance: the noble, the beneficial, and the pleasurable, on the one hand, and on the
 other their opposites: the base, the harmful, and the painful. Now a good man will go
 right and a bad man will go wrong when any of these, and especially when pleasure is
 35 involved. For pleasure is not only common to man and the animals, but also accompa-
 1105^a nies all objects of choice: in fact, the noble and the beneficial seem pleasant to us.
 Moreover, a love of pleasure has grown up with all of us from infancy. Therefore, this
 emotion has come to be ingrained in our lives and is difficult to erase. Even in our
 5 actions we use, to a greater or smaller extent, pleasure and pain as a criterion. For this
 reason, this entire study is necessarily concerned with pleasure and pain; for it is not
 unimportant for our actions whether we feel joy and pain in the right or the wrong way.
 Again, it is harder to fight against pleasure than against anger, as Heraclitus says; and
 both virtue and art are always concerned with what is harder, for success is better when
 10 it is hard to achieve. Thus, for this reason also, every study both of virtue and of politics
 must deal with pleasures and pains, for if a man has the right attitude to them, he will be
 good; if the wrong attitude, he will be bad.

We have now established that virtue or excellence is concerned with pleasures
 15 and pains; that the actions which produce it also develop it and, if differently per-
 formed, destroy it; and that it actualizes itself fully in those activities to which it owes
 its origin.

4. *Virtuous Action and Virtue:* However, the question may be raised what we
 mean by saying that men become just by performing just actions and self-controlled by
 practicing self-control. For if they perform just actions and exercise self-control, they
 20 are already just and self-controlled, in the same way as they are literate and musical if
 they write correctly and practice music.

But is this objection really valid, even as regards the arts? No, for it is possible for
 a man to write a piece correctly by chance or at the prompting of another: but he will be

*The idea here evidently is that the pleasure of wrongdoing must be cured by applying its opposite,
 i.e., pain.

literate only if he produces a piece of writing in a literate way, and that means doing it in accordance with the skill of literate composition which he has in himself. 25

Moreover, the factors involved in the arts and in the virtues are not the same. In the arts, excellence lies in the result itself, so that it is sufficient if it is of a certain kind. But in the case of the virtues an act is not performed justly or with self-control if the act itself is of a certain kind, but only if in addition the agent has certain characteristics as he performs it: first of all, he must know what he is doing; secondly, he must choose to act the way he does, and he must choose it for its own sake; and in the third place, the act must spring from a firm and unchangeable character. With the exception of knowing what one is about, these considerations do not enter into the mastery of the arts; for the mastery of the virtues, however, knowledge is of little or no importance, whereas the other two conditions count not for a little but are all-decisive, since repeated acts of justice and self-control result in the possession of these virtues. In other words, acts are called just and self-controlled when they are the kind of acts which a just or self-controlled man would perform; but the just and self-controlled man is not he who performs these acts, but he who also performs them in the way just and self-controlled men do. 30 1105^b 5

Thus our assertion that a man becomes just by performing just acts and self-controlled by performing acts of self-control is correct; without performing them, nobody could even be on the way to becoming good. Yet most men do not perform such acts, but by taking refuge in argument they think that they are engaged in philosophy and that they will become good in this way. In so doing, they act like sick men who listen attentively to what the doctor says, but fail to do any of the things he prescribes. That kind of philosophical activity will not bring health to the soul any more than this sort of treatment will produce a healthy body. 10 15

5. *Virtue Defined: The Genus:* The next point to consider is the definition of virtue or excellence. As there are three kinds of things found in the soul: (1) emotions, (2) capacities, and (3) characteristics, virtue must be one of these. By “emotions” I mean appetite, anger, fear, confidence, envy, joy, affection, hatred, longing, emulation, pity, and in general anything that is followed by pleasure or pain; by “capacities” I mean that by virtue of which we are said to be affected by these emotions, for example, the capacity which enables us to feel anger, pain, or pity; and by “characteristics” I mean the condition, either good or bad, in which we are, in relation to the emotions: for example, our condition in relation to anger is bad, if our anger is too violent or not violent enough, but if it is moderate, our condition is good; and similarly with our condition in relation to the other emotions. Now the virtues and vices cannot be emotions, because we are not called good or bad on the basis of our emotions, but on the basis of our virtues and vices. Also, we are neither praised nor blamed for our emotions: a man does not receive praise for being frightened or angry, nor blame for being angry pure and simple, but for being angry in a certain way. Yet we are praised or blamed for our virtues and vices. Furthermore, no choice is involved when we experience anger or fear, while the virtues are some kind of choice or at least involve choice. Moreover, with regard to our emotions we are said to be “moved,” but with regard to our virtues and vices we are not said to be “moved” but to be “disposed” in a certain way. 20 25 30 1106^a 5

For the same reason, the virtues cannot be capacities, either, for we are neither called good or bad nor praised or blamed simply because we are capable of being affected. Further, our capacities have been given to us by nature, but we do not by nature develop into good or bad men. We have discussed this subject before. Thus, if the 10

virtues are neither emotions nor capacities, the only remaining alternative is that they are characteristics. So much for the genus of virtue.

6. *Virtue Defined: The Differentia*: It is not sufficient, however, merely to define
 15 virtue in general terms as a characteristic: we must also specify what kind of character-
 istic it is. It must, then, be remarked that every virtue or excellence (1) renders good the
 thing itself of which it is the excellence, and (2) causes it to perform its function well.
 For example, the excellence of the eye makes both the eye and its function good, for
 20 good sight is due to the excellence of the eye. Likewise, the excellence of a horse makes
 it both good as a horse and good at running, at carrying its rider, and at facing the
 enemy. Now, if this is true of all things, the virtue or excellence of man, too, will be a
 25 characteristic which makes him a good man, and which causes him to perform his own
 function well. To some extent we have already stated how this will be true; the rest will
 become clear if we study what the nature of virtue is.

- Of every continuous entity that is divisible into parts it is possible to take the
 larger, the smaller, or an equal part, and these parts may be larger, smaller, or equal
 either in relation to the entity itself, or in relation to us. The “equal” part is something
 median between excess and deficiency. By the median of an entity I understand a point
 30 equidistant from both extremes, and this point is one and the same for everybody. By
 the median relative to us I understand an amount neither too large nor too small, and
 this is neither one nor the same for everybody. To take an example: if ten is many and
 two is few, six is taken as the median in relation to the entity, for it exceeds and is
 35 exceeded by the same amount, and is thus the median in terms of arithmetical propor-
 1106^b tion. But the median relative to us cannot be determined in this manner: if ten pounds of
 food is much for a man to eat and two pounds little, it does not follow that the trainer
 will prescribe six pounds, for this may in turn be much or little for him to eat; it may be
 little for Milo* and much for someone who has just begun to take up athletics. The same
 5 applies to running and wrestling. Thus we see that an expert in any field avoids excess
 and deficiency, but seeks the median and chooses it—not the median of the object but
 the median relative to us.

- If this, then, is the way in which every science perfects its work, by looking to the
 median and by bringing its work up to that point—and this is the reason why it is usu-
 10 ally said of a successful piece of work that it is impossible to detract from it or to add to
 it, the implication being that excess and deficiency destroy success while the mean safe-
 guards it (good craftsmen, we say, look toward this standard in the performance of their
 work)—and if virtue, like nature, is more precise and better than any art, we must con-
 15 clude that virtue aims at the median. I am referring to moral virtue: for it is moral virtue
 that is concerned with emotions and actions, and it is in emotions and actions that
 excess, deficiency, and the median are found. Thus we can experience fear, confidence,
 20 desire, anger, pity, and generally any kind of pleasure and pain either too much or too
 little, and in either case not properly. But to experience all this at the right time, toward
 the right objects, toward the right people, for the right reason, and in the right manner—
 that is the median and the best course, the course that is a mark of virtue.

- Similarly, excess, deficiency, and the median can also be found in actions. Now
 25 virtue is concerned with emotions and actions; and in emotions and actions excess and
 deficiency miss the mark, whereas the median is praised and constitutes success. But

*Milo of Croton, said to have lived in the second half of the sixth century B.C., was a wrestler famous for his remarkable strength.

both praise and success are signs of virtue or excellence. Consequently, virtue is a mean in the sense that it aims at the median. This is corroborated by the fact that there are many ways of going wrong, but only one way which is right—for evil belongs to the indeterminate, as the Pythagoreans imagined, but good to the determinate. This, by the way, is also the reason why the one is easy and the other hard: it is easy to miss the target but hard to hit it. Here, then, is an additional proof that excess and deficiency characterize vice, while the mean characterizes virtue: for “bad men have many ways, good men but one.”

We may thus conclude that virtue or excellence is a characteristic involving choice, and that it consists in observing the mean relative to us, a mean which is defined by a rational principle, such as a man of practical wisdom would use to determine it. It is the mean by reference to two vices: the one of excess and the other of deficiency. It is, moreover, a mean because some vices exceed and others fall short of what is required in emotion and in action, whereas virtue finds and chooses the median. Hence, in respect of its essence and the definition of its essential nature virtue is a mean, but in regard to goodness and excellence it is an extreme.

Not every action nor every emotion admits of a mean. There are some actions and emotions whose very names connote baseness, e.g., spite, shamelessness, envy; and among actions, adultery, theft, and murder. These and similar emotions and actions imply by their very names that they are bad; it is not their excess nor their deficiency which is called bad. It is, therefore, impossible ever to do right in performing them: to perform them is always to do wrong. In cases of this sort, let us say adultery, rightness and wrongness do not depend on committing it with the right woman at the right time and in the right manner, but the mere fact of committing such action at all is to do wrong. It would be just as absurd to suppose that there is a mean, an excess, and a deficiency in

According to Aristotle, virtue or excellence “is the mean by reference to two vices: the one of excess and the other of deficiency.” For example, in this drawing the person on the left has an excess of confidence and hence is reckless. The person on the right is deficient in confidence and so is cowardly. In terms of fear, the person on the left has a defect and the person on the right has an excess. In both these cases we should seek to rationally choose the “Golden Mean” of the person in the middle: courage.

an unjust or a cowardly or a self-indulgent act. For if there were, we would have a mean of excess and a mean of deficiency, and an excess of excess and a deficiency of deficiency. Just as there cannot be an excess and a deficiency of self-control and courage—because the intermediate is, in a sense, an extreme—so there cannot be a mean, excess, and deficiency in their respective opposites: their opposites are wrong regardless of how they are performed; for, in general, there is no such thing as the mean of an excess or a deficiency, or the excess and deficiency of a mean.

7. *Examples of the Mean in Particular Virtues:* However, this general statement is not enough; we must also show that it fits particular instances. For in a discussion of moral actions, although general statements have a wider range of application, statements on particular points have more truth in them: actions are concerned with particulars and our statements must harmonize with them. Let us now take particular virtues and vices from the following table.

In feelings of fear and confidence courage is the mean. As for the excesses, there is no name that describes a man who exceeds in fearlessness—many virtues and vices have no name; but a man who exceeds in confidence is reckless, and a man who exceeds in fear and is deficient in confidence is cowardly.

In regard to pleasures and pains—not all of them and to a lesser degree in the case of pains—the mean is self-control and the excess self-indulgence. Men deficient in regard to pleasure are not often found, and there is therefore no name for them, but let us call them “insensitive.”

In giving and taking money, the mean is generosity, the excess and deficiency are extravagance and stinginess. In these vices excess and deficiency work in opposite ways: an extravagant man exceeds in spending and is deficient in taking, while a stingy man exceeds in taking and is deficient in spending. For our present purposes, we may rest content with an outline and a summary, but we shall later define these qualities more precisely.

There are also some other dispositions in regard to money: magnificence is a mean (for there is a difference between a magnificent and a generous man in that the former operates on a large scale, the latter on a small); gaudiness and vulgarity are excesses, and niggardliness a deficiency. These vices differ from the vices opposed to generosity. But we shall postpone until later a discussion of the way in which they differ.

As regards honor and dishonor, the mean is high-mindedness, the excess is what we might call vanity, and the deficiency small-mindedness. The same relation which, as we said, exists between magnificence and generosity, the one being distinguished from the other in that it operates on a small scale, exists also between high-mindedness and another virtue: as the former deals with great, so the latter deals with small honors. For it is possible to desire honor as one should or more than one should or less than one should: a man who exceeds in his desires is called ambitious, a man who is deficient unambitious, but there is no name to describe the man in the middle. There are likewise no names for the corresponding dispositions except for the disposition of an ambitious man which is called ambition. As a result, the men who occupy the extremes lay claim to the middle position. We ourselves, in fact, sometimes call the middle person ambitious and sometimes unambitious; sometimes we praise an ambitious and at other times an unambitious man. The reason why we do that will be discussed in the sequel; for the present, let us discuss the rest of the virtues and vices along the lines we have indicated.

In regard to anger also there exists an excess, a deficiency, and a mean. Although there really are no names for them, we might call the mean gentleness, since we call a

man who occupies the middle position gentle. Of the extremes, let the man who exceeds be called short-tempered and his vice a short temper, and the deficient man apathetic and his vice apathy.

There are, further, three other means which have a certain similarity with one another, but differ nonetheless one from the other. They are all concerned with human relations in speech and action, but they differ in that one of them is concerned with truth in speech and action and the other two with pleasantness: (a) pleasantness in amusement and (b) pleasantness in all our daily life. We must include these, too, in our discussion, in order to see more clearly that the mean is to be praised in all things and that the extremes are neither praiseworthy nor right, but worthy of blame. Here, too, most of the virtues and vices have no name, but for the sake of clarity and easier comprehension we must try to coin names for them, as we did in earlier instances.

To come to the point; in regard to truth, let us call the man in the middle position truthful and the mean truthfulness. Pretense in the form of exaggeration is boastfulness and its possessor boastful, while pretense in the form of understatement is self-depreciation and its possessor a self-depreciator.

Concerning pleasantness in amusement, the man in the middle position is witty and his disposition wittiness; the excess is called buffoonery and its possessor a buffoon; and the deficient man a kind of boor and the corresponding characteristic boorishness.

As far as the other kind of pleasantness is concerned, pleasantness in our daily life, a man who is as pleasant as he should be is friendly and the mean is friendliness. A man who exceeds is called obsequious if he has no particular purpose in being pleasant, but if he is acting for his own material advantage, he is a flatterer. And a man who is deficient and unpleasant in every respect is a quarrelsome and grouchy kind of person.

A mean can also be found in our emotional experiences and in our emotions. Thus, while a sense of shame is not a virtue, a bashful or modest man is praised. For even in these matters we speak of one kind of person as intermediate and of another as exceeding if he is terror-stricken and abashed at everything. On the other hand, a man who is deficient in shame or has none at all is called shameless, whereas the intermediate man is bashful or modest.

Righteous indignation is the mean between envy and spite, all of these being concerned with the pain and pleasure which we feel in regard to the fortunes of our neighbors. The righteously indignant man feels pain when someone prospers undeservedly; an envious man exceeds him in that he is pained when he sees anyone prosper; and a spiteful man is so deficient in feeling pain that he even rejoices [when someone suffers undeservedly].

But we shall have an opportunity to deal with these matters again elsewhere. After that, we shall discuss justice; since it has more than one meaning, we shall distinguish the two kinds of justice and show in what way each is a mean.

8. The Relation between the Mean and Its Extremes: There are, then, three kinds of disposition: two are vices (one marked by excess and one by deficiency), and one, virtue, the mean. Now, each of these dispositions is, in a sense, opposed to both the others: the extremes are opposites to the middle as well as to one another, and the middle is opposed to the extremes. Just as an equal amount is larger in relation to a smaller and smaller in relation to a larger amount, so, in the case both of emotions and of actions, the middle characteristics exceed in relation to the deficiencies and are deficient in relation to the excesses. For example, a brave man seems reckless in relation to a coward, but in relation to a reckless man he seems cowardly. Similarly, a

self-controlled man seems self-indulgent in relation to an insensitive man and insensitive in relation to a self-indulgent man, and a generous man extravagant in relation to a stingy man and stingy in relation to an extravagant man. This is the reason why people at the extremes each push the man in the middle over to the other extreme: a
 25 coward calls a brave man reckless and a reckless man calls a brave man a coward, and similarly with the other qualities.

However, while these three dispositions are thus opposed to one another, the extremes are more opposed to one another than each is to the median; for they are further apart from one another than each is from the median, just as the large is further
 30 removed from the small and the small from the large than either one is from the equal. Moreover, there appears to be a certain similarity between some extremes and their median, e.g., recklessness resembles courage and extravagance generosity; but there is a very great dissimilarity between the extremes. But things that are furthest removed
 35 from one another are defined as opposites, and that means that the further things are removed from one another the more opposite they are.

1109^a In some cases it is the deficiency and in others the excess that is more opposed to the median. For example, it is not the excess, recklessness, which is more opposed to courage, but the deficiency, cowardice; while in the case of self-control it is not the defect, insensitivity, but the excess, self-indulgence which is more opposite. There
 5 are two causes for this. One arises from the nature of the thing itself: when one of the extremes is closer and more similar to the median, we do not treat it but rather the other extreme as the opposite of the median. For instance, since recklessness is believed to be more similar and closer to courage, and cowardice less similar, it is
 10 cowardice rather than recklessness which we treat as the opposite of courage. For what is further removed from the middle is regarded as being more opposite. So much for the first cause which arises from the thing itself. The second reason is found in ourselves: the more we are naturally attracted to anything, the more opposed to the
 15 median does this thing appear to be. For example, since we are naturally more attracted to pleasure we incline more easily to self-indulgence than to a disciplined kind of life. We describe as more opposed to the mean those things toward which our tendency is stronger; and for that reason the excess, self-indulgence, is more opposed to self-control than is its corresponding deficiency.

9. *How to Attain the Mean:* Our discussion has sufficiently established (1) that
 20 moral virtue is a mean and in what sense it is a mean; (2) that it is a mean between two vices, one of which is marked by excess and the other by deficiency; and (3) that it is a mean in the sense that it aims at the median in the emotions and in actions. That is why
 25 it is a hard task to be good; in every case it is a task to find the median: for instance, not everyone can find the middle of a circle, but only a man who has the proper knowledge. Similarly, anyone can get angry—that is easy—or can give away money or spend it; but to do all this to the right person, to the right extent, at the right time, for the right reason, and in the right way is no longer something easy that anyone can do. It is for this reason
 that good conduct is rare, praiseworthy, and noble.

30 The first concern of a man who aims at the median should, therefore, be to avoid the extreme which is more opposed to it, as Calypso advises: “Keep clear your ship of yonder spray and surf.” For one of the two extremes is more in error than the other, and
 35 since it is extremely difficult to hit the mean, we must, as the saying has it, sail in the second best way and take the lesser evil; and we can best do that in the manner we have
 1109^b described.

Moreover, we must watch the errors which have the greatest attraction for us personally. For the natural inclination of one man differs from that of another, and we each come to recognize our own by observing the pleasure and pain produced in us [by the different extremes]. We must then draw ourselves away in the opposite direction, for by pulling away from error we shall reach the middle, as men do when they straighten warped timber. In every case we must be especially on our guard against pleasure and what is pleasant, for when it comes to pleasure we cannot act as unbiased judges. Our attitude toward pleasure should be the same as that of the Trojan elders was toward Helen, and we should repeat on every occasion the words they addressed to her. For if we dismiss pleasure as they dismissed her, we shall make fewer mistakes. 5 10

In summary, then, it is by acting in this way that we shall best be able to hit the median. But this is no doubt difficult, especially when particular cases are concerned. For it is not easy to determine in what manner, with what person, on what occasion, and for how long a time one ought to be angry. There are times when we praise those who are deficient in anger and call them gentle, and other times when we praise violently angry persons and call them manly. However, we do not blame a man for slightly deviating from the course of goodness, whether he strays toward excess or toward deficiency, but we do blame him if his deviation is great and cannot pass unnoticed. It is not easy to determine by a formula at what point and for how great a divergence a man deserves blame; but this difficulty is, after all, true of all objects of sense perception: determinations of this kind depend upon particular circumstances, and the decision rests with our [moral] sense. 15 20

This much, at any rate, is clear: that the median characteristic is in all fields the one that deserves praise, and that it is sometimes necessary to incline toward the excess and sometimes toward the deficiency. For it is in this way that we will most easily hit upon the median, which is the point of excellence. 25

* * *

BOOK IV

* * *

3. *High-Mindedness, Pettiness, and Vanity*: High-mindedness, as its very name suggests, seems to be concerned with great and lofty matters. Let us take the nature of these matters as the first point of our discussion. It makes no difference whether we investigate the characteristic or the man who is characterized by it. A man is regarded as high-minded when he thinks he deserves great things and actually deserves them; one who thinks he deserves them but does not is a fool, and no man, insofar as he is virtuous, is either foolish or senseless. This then is the description of a high-minded man. A person who deserves little and thinks he deserves little is not high-minded, but is a man who knows his limitations. For high-mindedness implies greatness, just as beauty implies stature in body: small people may have charm and proportion but not beauty. A man who thinks he deserves great things but does not deserve them is vain, though not everybody who overestimates himself is vain. One who underestimates himself is small-minded regardless of whether his actual worth is great or moderate, or whether it is small and he thinks that it is smaller still. A man of great deserts, it would seem, is most [liable to be small-minded,] for what would he do if his deserts were not as great as they are? Thus, measured by the standard of greatness, the high-minded man is an 1123^a 1123^b 5 10

- 15 extreme, but by the standard of what is right he occupies the median; for his claims correspond to his deserts, whereas the others exceed or fall short.

Accordingly, if a high-minded man thinks he deserves and actually does deserve great things, especially the greatest, there is one matter that will be his major concern. "Deserts" is a relative term that refers to external goods; and as the greatest external good, we may posit that which we pay as a tribute to the gods, for which eminent people strive most, and which is the prize for the noblest achievements. Honor fits that description, for it is the greatest of external goods. Consequently, it is in matters of honor and dishonor that a high-minded man has the right attitude. It is an obvious fact, and need not be argued, that the high-minded are concerned with honor. For they regard themselves as worthy of honor above all else, but of an honor that they deserve. A small-minded man falls short both in view of his own deserts and in relation to the claims of a high-minded person, while a vain man exceeds his own deserts but does not exceed the high-minded.

This means that the high-minded man, inasmuch as he deserves what is greatest, is the best. For the deserts of the better man are always greater, and those of the best man the greatest. It follows that a truly high-minded man must be good. And what is great in each virtue would seem to be the mark of a high-minded person. It would be quite out of character for him to run away in battle with arms swinging or to do wrong to anyone. For what motive does he have to act basely, he to whom nothing is great? If we were to examine [his qualities] one by one, we should see the utter absurdity of thinking of a high-minded man as being anything but good. If he were base, he would not even deserve honor, for honor is the prize of excellence and virtue, and it is reserved as a tribute to the good. High-mindedness thus is the crown, as it were, of the virtues: it magnifies them and it cannot exist without them. Therefore, it is hard to be truly high-minded and, in fact, impossible without goodness and nobility.

A high-minded man is, then, primarily concerned with honor and dishonor. From great honors and those that good men confer upon him he will derive a moderate amount of pleasure, convinced that he is only getting what is properly his or even less. For no honor can be worthy of perfect virtue. Yet he will accept it, because they have no greater tribute to pay to him. But he will utterly despise honors conferred by ordinary people and on trivial grounds, for that is not what he deserves. Similarly, he will despise dishonor, for no dishonor can be justified in his case. A high-minded man, as we have stated, is concerned primarily with honors. But he will of course also have a moderate attitude toward wealth, power, and every manner of good or bad luck that may befall him. He will not be overjoyed when his luck is good, nor will bad luck be very painful to him. For even toward honor, his attitude is that it is not of the greatest moment. Power and wealth are desirable for the honor they bring; at any rate, those who have them wish to gain honor through them. But a person who attaches little importance even to honor will also attach little importance to power and wealth. As a result, he is regarded as haughty.

Gifts of fortune, it is believed, also contribute to high-mindedness. Men of noble birth, of power, or of wealth are regarded as worthy of honor, since they occupy a superior position, and whatever is superior in goodness is held in greater honor. That is why the gifts of fortune make men more high-minded, for they are honored by some people [for having them]. But in truth it is the good man alone that ought to be honored, though a man who has both excellence and good fortune is regarded as still more worthy of honor. Whoever possesses the goods of fortune without possessing excellence or virtue is not justified in claiming great deserts for himself, nor is it correct to call him high-minded, for

neither is possible without perfect virtue. Their good fortune notwithstanding, such people become haughty and arrogant, for without virtue it is not easy to bear the gifts of fortune gracefully. Unable to bear them and considering themselves superior, they look down upon others, while they themselves do whatever they please. They imitate the high-minded man wherever they can, but they are not really like him. Thus, they look down upon others, but they do not act in conformity with excellence. A high-minded person is justified in looking down upon others for he has the right opinion of them, but the common run of people do so without rhyme or reason. 30 1124^b 5

A high-minded man does not take small risks and, since there are only a few things which he honors, he is not even fond of risks. But he will face great risks, and in the midst of them he will not spare his life, aware that life at any cost is not worth having. He is the kind of man who will do good, but who is ashamed to accept a good turn, because the former marks a man as superior, the latter as inferior. Moreover, he will requite good with a greater good, for in this way he will not only repay the original benefactor but put him in his debt at the same time by making him the recipient of an added benefit. The high-minded also seem to remember the good turns they have done, but not those they have received. For the recipient is inferior to the benefactor, whereas a high-minded man wishes to be superior. They listen with pleasure to what good they have done, but with displeasure to what good they have received. That is apparently why Thetis does not mention the good turns she had done to Zeus,* and why the Spartans did not mention theirs to the Athenians, but only the good they had received. It is, further, typical of a high-minded man not to ask for any favors, or only reluctantly, but to offer aid readily. He will show his stature in his relations with men of eminence and fortune, but will be unassuming toward those of moderate means. For to be superior to the former is difficult and dignified, but superiority over the latter is easy. Furthermore, there is nothing ignoble in asserting one's dignity among the great, but to do so among the lower classes is just as crude as to assert one's strength against an invalid. He will not go in for pursuits that the common people value, nor for those in which the first place belongs to others. He is slow to act and procrastinates, except when some great honor or achievement is at stake. His actions are few, but they are great and distinguished. He must be open in hate and open in love, for to hide one's feelings and to care more for the opinion of others than for truth is a sign of timidity. He speaks and acts openly: since he looks down upon others his speech is free and truthful, except when he deliberately depreciates himself in addressing the common run of people. He cannot adjust his life to another, except a friend, for to do so is slavish. That is, [by the way,] why all flatterers are servile and people from the lower classes are flatterers. He is not given to admiration, for nothing is great to him. He bears no grudges, for it is not typical of a high-minded man to have a long memory, especially for wrongs, but rather to overlook them. He is not a gossip, for he will talk neither about himself nor about others, since he is not interested in hearing himself praised or others run down. Nor again is he given to praise; and for the same reason he does not speak evil of others, not even of his enemies, except to scorn them. When he encounters misfortunes that are unavoidable or insignificant, he will not lament and ask for help. That kind of attitude belongs to someone who takes such matters seriously. He is a person who will rather possess beautiful and profitless objects than objects which are profitable and useful, for they mark him more as self-sufficient. 10 1125^a 5 10 15

*The reference is to Thetis' intercession with Zeus to help avenge the wrong done her son Achilles by Agamemnon.

Alexander the Great, detail from ancient Roman mosaic of the Battle of Issus. Aristotle tutored the young Alexander and later benefitted from Alexander's patronage. (Corbis/Bettmann)

Further, we think of a slow gait as characteristic of a high-minded man, a deep voice, and a deliberate way of speaking. For a man who takes few things seriously is unlikely to be in a hurry, and a person who regards nothing as great is not one to be excitable. But a shrill voice and a swift gait are due to hurry and excitement.

- 20 Such, then, is the high-minded man. A man who falls short is small-minded, and one who exceeds is vain. Now here, too, these people are not considered to be bad—for they are not evildoers—but only mistaken. For a small-minded man deprives himself of the good he deserves. What seems to be bad about him is due to
- 25 the fact that he does not think he deserves good things and that he does not know himself; if he did, he would desire what he deserves, especially since it is good. It is not that such people are regarded as foolish, but rather [that they are looked upon] as retiring. However, a reputation of this sort seems to make them even worse. For while any given kind of man strives to get what he deserves, these people keep aloof even from noble actions and pursuits and from external goods as well, because they consider themselves undeserving.

- 30 Vain people, on the other hand, are fools and do not know themselves, and they show it openly. They take in hand honorable enterprises of which they are not worthy, and then they are found out. They deck themselves out with clothes and showy gear and that sort of thing, and wish to publicize what fortune has
- 35 given them. They talk about their good fortune in the belief that that will bring them honor.

Small-mindedness is more opposed to high-mindedness than vanity is, for it occurs more frequently and is worse. Thus, as we have said, high-mindedness is concerned with high honors.

BOOK VI

1. Moral and Intellectual Excellence; the Psychological Foundations of Intellectual Excellence: We stated earlier that we must choose the median, and not excess or deficiency, and that the median is what right reason dictates. Let us now analyze this second point. 1138^b 20

In all the characteristics we have discussed, as in all others, there is some target on which a rational man keeps his eye as he bends and relaxes his efforts to attain it. There is also a standard that determines the several means which, as we claim, lie between excess and deficiency, and which are fixed by right reason. But this statement, true though it is, lacks clarity. In all other fields of endeavor in which scientific knowledge is possible, it is indeed true to say that we must exert ourselves or relax neither too much nor too little, but to an intermediate extent and as right reason demands. But if this is the only thing a person knows, he will be none the wiser: he will, for example, not know what kind of medicines to apply to his body, if he is merely told to apply whatever medical science prescribes and in a manner in which a medical expert applies them. Accordingly, in discussing the characteristics of the soul, too, it is not enough that the statement we have made be true. We must also have a definition of what right reason is and what standard determines it. 25 30

In analyzing the virtues of the soul we said that some are virtues of character and others excellence of thought or understanding. We have now discussed the moral virtues, [i.e., the virtues of character]. In what follows, we will deal with the others, [i.e., the intellectual virtues,] beginning with some prefatory remarks about the soul. We said in our earlier discussion that the soul consists of two parts, one rational and one irrational. We must now make a similar distinction in regard to the rational part. Let it be assumed that there are two rational elements: with one of these we apprehend the realities whose fundamental principles do not admit of being other than they are, and with the other we apprehend things which do admit of being other. For if we grant that knowledge presupposes a certain likeness and kinship of subject and object, there will be a generically different part of the soul naturally corresponding to each of two different kinds of object. Let us call one the scientific and the other the calculative element. Deliberating and calculating are the same thing, and no one deliberates about objects that cannot be other than they are. This means that the calculative constitutes one element of the rational part of the soul. Accordingly, we must now take up the question which is the best characteristic of each element, since that constitutes the excellence or virtue of each. But the virtue of a thing is relative to its proper function. 35 1139^a 5 10 15

2. The Two Kinds of Intellectual Excellence and Their Objects: Now, there are three elements in the soul which control action and truth: sense perception, intelligence, and desire. Of these sense perception does not initiate any action. We can see this from the fact that animals have sense perception but have no share in 20

action.* What affirmation and negation are in the realm of thought, pursuit and avoidance are in the realm of desire. Therefore, since moral virtue is a characteristic involving choice, and since choice is a deliberate desire, it follows that, if the choice is to be good, the reasoning must be true and the desire correct; that is, reasoning must affirm what desire pursues. This then is the kind of thought and the kind of truth that is practical and concerned with action. On the other hand, in the kind of thought involved in theoretical knowledge and not in action or production, the good and the bad state are, respectively, truth and falsehood; in fact, the attainment of truth is the function of the intellectual faculty as a whole. But in intellectual activity concerned with action, the good state is truth in harmony with correct desire.

Choice is the starting point of action: it is the source of motion but not the end for the sake of which we act, i.e., the final cause. The starting point of choice, however, is desire and reasoning directed toward some end. That is why there cannot be choice either without intelligence and thought or without some moral characteristic; for good and bad action in human conduct are not possible without thought and character. Now thought alone moves nothing; only thought which is directed to some end and concerned with action can do so. And it is this kind of thought also which initiates production. For whoever produces something produces it for an end. The product he makes is not an end in an unqualified sense, but an end only in a particular relation and of a particular operation. Only the goal of action is an end in the unqualified sense: for the good life is an end, and desire is directed toward this. Therefore, choice is either intelligence motivated by desire or desire operating through thought, and it is as a combination of these two that man is a starting point of action.

(No object of choice belongs to the past: no one chooses to have sacked Troy. For deliberation does not refer to the past but only to the future and to what is possible; and it is not possible that what is past should not have happened. Therefore, Agathon is right when he says:

One thing alone is denied even to god:
to make undone the deeds which have been done.**)

As we have seen, truth is the function of both intellectual parts [of the soul]. Therefore, those characteristics which permit each part to be as truthful as possible will be the virtues of the two parts.

3. *The Qualities by Which Truth Is Attained: (a) Pure Science or Knowledge:* So let us make a fresh beginning and discuss these characteristics once again. Let us take for granted that the faculties by which the soul expresses truth by way of affirmation or denial are five in number: art, science, practical wisdom, theoretical wisdom, and intelligence. Conviction and opinion do not belong here, for they may be false.

What pure science or scientific knowledge is—in the precise sense of the word and not in any of its wider uses based on mere similarity—will become clear in the following. We are all convinced that what we *know* scientifically cannot be otherwise than it is; but of facts which can possibly be other than they are we do not know whether

*Throughout the *Ethics*, Aristotle uses *praxis* ("action") as equivalent to "moral action," "conduct," and assumes animals are not capable of this.

**Agathon is a tragic poet who flourished in the last quarter of the fifth century B.C. Plato's *Symposium* is set in his house.

or not they continue to be true when removed from our observation. Therefore, an object of scientific knowledge exists of necessity, and is, consequently, eternal. For everything that exists of necessity in an unqualified sense is eternal, and what is eternal is ungenerated and imperishable [and hence cannot be otherwise].

Moreover, all scientific knowledge is held to be teachable, and what is scientifically knowable is capable of being learned. All teaching is based on what is already known, as we have stated in the *Analytics*; some teaching proceeds by induction and some by syllogism. Now, induction is the starting point [for knowledge] of the universal as well [as the particular], while syllogism proceeds *from* universals. Consequently, there are starting points or principles from which a syllogism proceeds and which are themselves not arrived at by a syllogism. It is, therefore, induction that attains them. Accordingly, scientific knowledge is a capacity for demonstration and has, in addition, all the other qualities which we have specified in the *Analytics*. When a man believes something in the way there specified, and when the starting points or principles on which his beliefs rest are known to him, then he has scientific knowledge; unless he knows the starting points or principles better than the conclusion, he will have scientific knowledge only incidentally. So much for our definition of scientific knowledge or pure science.

4. (b) *Art or Applied Science*: Things which admit of being other than they are include both things made and things done. Production is different from action—for that point we can rely even on our less technical discussions. Hence, the characteristic of acting rationally is different from the characteristic of producing rationally. It also follows that one does not include the other, for action is not production nor production action. Now, building is an art or applied science, and it is essentially a characteristic or trained ability of rationally producing. In fact, there is no art that is not a characteristic or trained ability of rationally producing, nor is there a characteristic of rationally producing that is not an art. It follows that art is identical with the characteristic of producing under the guidance of true reason. All art is concerned with the realm of coming-to-be, i.e., with contriving and studying how something which is capable both of being and of not being may come into existence, a thing whose starting point or source is in the producer and not in the thing produced. For art is concerned neither with things which exist or come into being by necessity, nor with things produced by nature: these have their source of motion within themselves.

Since production and action are different, it follows that art deals with production and not with action. In a certain sense, fortune and art are concerned with the same things, as Agathon says: "Fortune loves art and art fortune." So, as we have said, art is a characteristic of producing under the guidance of true reason, and lack of art, on the contrary, is a characteristic of producing under the guidance of false reason; and both of them deal with what admits of being other than it is.

5. (c) *Practical Wisdom*: We may approach the subject of practical wisdom by studying the persons to whom we attribute it. Now, the capacity of deliberating well about what is good and advantageous for oneself is regarded as typical of a man of practical wisdom—not deliberating well about what is good and advantageous in a partial sense, for example, what contributes to health or strength, but what sort of thing contributes to the good life in general. This is shown by the fact that we speak of men as having practical wisdom in a particular respect, i.e., not in an unqualified sense, when they calculate well with respect to some worthwhile end, one that cannot be attained by

an applied science or art. It follows that, in general, a man of practical wisdom is he who has the ability to deliberate.

Now no one deliberates about things that cannot be other than they are or about actions that he cannot possibly perform. Since, as we saw, pure science involves demonstration, while things whose starting points or first causes can be other than they are do not admit of demonstration—for such things too and not merely their first causes can all be other than they are—and since it is impossible to deliberate about what exists by necessity, we may conclude that practical wisdom is neither a pure science nor an art. It is not a pure science, because matters of action admit of being other than they are, and it is not an applied science or art, because action and production are generically different.

What remains, then, is that it is a truthful characteristic of acting rationally in matters good and bad for man. For production has an end other than itself, but action does not: good action is itself an end. That is why we think that Pericles* and men like him have practical wisdom. They have the capacity of seeing what is good for themselves and for mankind, and these are, we believe, the qualities of men capable of managing households and states.

This also explains why we call “self-control” *sophrosyne*: it “preserves” our “practical wisdom.” What it preserves is the kind of conviction we have described. For the pleasant and the painful do not destroy and pervert every conviction we hold—not, for example, our conviction that a triangle has or does not have the sum of its angles equal to two right angles—but only the convictions we hold concerning how we should act. In matters of action, the principles or initiating motives are the ends at which our actions are aimed. But as soon as a man becomes corrupted by pleasure or pain, the goal no longer appears to him as a motivating principle: he no longer sees that he should choose and act in every case for the sake of and because of this end. For vice tends to destroy the principle or initiating motive of action.

Necessarily, then, practical wisdom is a truthful rational characteristic of acting in matters involving what is good for man. Furthermore, whereas there exists such a thing as excellence in art, it does not exist in practical wisdom.** Also, in art a man who makes a mistake voluntarily is preferable to one who makes it involuntarily; but in practical wisdom, as in every virtue or excellence, such a man is less desirable. Thus it is clear that practical wisdom is an excellence or virtue and not an art. Since there are two parts of the soul that contain a rational element, it must be the virtue of one of them, namely of the part that forms opinions.*** For opinion as well as practical wisdom deals with things that can be other than they are. However, it is not merely a rational characteristic or trained ability. An indication that it is something more may be seen in the fact that a trained ability of that kind can be forgotten, whereas practical wisdom cannot.

6. (d) *Intelligence*: Since pure science or scientific knowledge is a basic conviction concerning universal and necessary truths, and since everything demonstrable and all pure science begins from fundamental principles (for science proceeds rationally), the fundamental principle or starting point for scientific knowledge cannot itself be the

*The name of Pericles (ca. 495–429 B.C.) is almost synonymous with the Athenian democracy.

**Because practical wisdom is itself a complete virtue or excellence, while the excellence of art depends on the goodness or badness of its product.

***“Opinion” here corresponds to the “calculative element” in Chapter 1: both are defined by reference to contingent facts, those which may be otherwise than they are.

object either of science, of art, or of practical wisdom. For what is known scientifically is demonstrable, whereas art and practical wisdom are concerned with things that can be other than they are. Nor are these fundamental principles the objects of theoretical wisdom: for it is the task of a man of theoretical wisdom to have a demonstration for certain truths.* Now, if scientific knowledge, practical wisdom, theoretical wisdom, and intelligence are the faculties by which we attain truth and by which we are never deceived both in matters which can and in those matters which cannot be other than they are; and if three of these—I am referring to practical wisdom, scientific knowledge, and theoretical wisdom—cannot be the faculty in question, we are left with the conclusion that it is intelligence that apprehends fundamental principles.

7. (e) *Theoretical Wisdom*: We attribute “wisdom” in the arts to the most precise and perfect masters of their skills: we attribute it to Phidias as a sculptor in marble and to Polycletus as a sculptor in bronze. In this sense we signify by “wisdom” nothing but excellence of art or craftsmanship. However, we regard some men as being wise in general, not in any partial sense or in some other particular respect, as Homer says in the *Margites*:

The gods let him not be a digger or a ploughman nor wise at anything.

It is, therefore, clear, that wisdom must be the most precise and perfect form of knowledge. Consequently, a wise man must not only know what follows from fundamental principles, but he must also have true knowledge of the fundamental principles themselves. Accordingly, theoretical wisdom must comprise both intelligence and scientific knowledge. It is science in its consummation, as it were, the science of the things that are valued most highly.

For it would be strange to regard politics or practical wisdom as the highest kind of knowledge, when in fact man is not the best thing in the universe. Surely, if “healthy” and “good” mean one thing for men and another for fishes, whereas “white” and “straight” always mean the same, “wise” must mean the same for everyone, but “practically wise” will be different. For each particular being ascribes practical wisdom in matters relating to itself to that thing which observes its interests well, and it will entrust itself to that thing. That is the reason why people attribute practical wisdom even to some animals—to all those which display a capacity of forethought in matters relating to their own life.

It is also evident that theoretical wisdom is not the same as politics. If we are to call “theoretical wisdom” the knowledge of what is helpful to us, there will be many kinds of wisdom. There is no single science that deals with what is good for all living things any more than there is a single art of medicine dealing with everything that is, but a different science deals with each particular good. The argument that man is the best of living things makes no difference. There are other things whose nature is much more divine than man’s: to take the most visible example only, the constituent parts of the universe.

Our discussion has shown that theoretical wisdom comprises both scientific knowledge and [apprehension by the] intelligence of things which by their nature are valued most highly. That is why it is said that men like Anaxagoras and Thales have

*In other words, the undemonstrable first or fundamental principles cannot be the proper and complete object of theoretical wisdom: as the next chapter shows, they are included within its sphere.

- 5 theoretical but not practical wisdom: when we see that they do not know what is advantageous to them, we admit that they know extraordinary, wonderful, difficult, and super-human things, but call their knowledge useless because the good they are seeking is not human.

10 Practical wisdom, on the other hand, is concerned with human affairs and with matters about which deliberation is possible. As we have said, the most characteristic function of a man of practical wisdom is to deliberate well: no one deliberates about things that cannot be other than they are, nor about things that are not directed to some end, an end that is a good attainable by action. In an unqualified sense, that man is good at deliberating who, by reasoning, can aim at and hit the best thing attainable to man by action.

- 15 Nor does practical wisdom deal only with universals. It must also be familiar with particulars, since it is concerned with action and action has to do with particulars. This explains why some men who have no scientific knowledge are more adept in practical matters, especially if they have experience, than those who do have scientific knowledge. For if a person were to know that light meat is easily digested, and hence wholesome, but did not know what sort of meat is light, he will not produce health, 20 whereas someone who knows that poultry is light and wholesome is more likely to produce health.*

Now, practical wisdom is concerned with action. That means that a person should have both [knowledge of universals and knowledge of particulars] or knowledge of particulars rather [than knowledge of universals]. But here, too, it seems, there is a supreme and comprehensive science involved, [i.e., politics].

8. *Practical Wisdom and Politics*: Political wisdom and practical wisdom are both the same characteristic, but their essential aspect is not the same. There are two kinds of 25 wisdom concerning the state: the one, which acts as practical wisdom supreme and comprehensive, is the art of legislation; the other, which is practical wisdom as dealing with particular facts, bears the name which, [in everyday speech,] is common to both kinds, politics, and it is concerned with action and deliberation. For a decree, [unlike a law, which lays down general principles,] is a matter for action, inasmuch as it is the last step [in the deliberative process]. That is why only those who make decrees are said to engage in politics, for they alone, like workmen, “do” things.**

- 30 It is also commonly held that practical wisdom is primarily concerned with one’s own person, i.e., with the individual, and it is this kind that bears the name “practical wisdom,” which properly belongs to others as well. The other kinds are called household management, legislation, and politics, the last of which is subdivided into deliberative and judicial.***

1142^a Now, knowing what is good for oneself is, to be sure, one kind of knowledge; but it is very different from the other kinds. A man who knows and concerns himself with

*The point here is that, in practical matters, a man who knows by experience that poultry is wholesome is likely to be more successful than a man who only has the scientific knowledge that light meat is digestible and therefore wholesome, without knowing the particular fact that poultry is light meat.

**I.e., lawgivers and other men who are concerned with political wisdom in the supreme and comprehensive sense are not generally regarded as being engaged in politics. The analogy to workmen represents of course not Aristotle’s view, which vigorously distinguishes action from production, but rather reflects a widespread attitude toward politics.

***In Athens, “deliberative” politics referred to matters debated in the Council and the Popular Assembly, and “judicial” politics to matters argued in the lawcourts.

his own interests is regarded as a man of practical wisdom, while men whose concern is politics are looked upon as busybodies. Euripides' words are in this vein:

How can I be called "wise," who might have filled a common soldier's place, free
from all care, sharing an equal lot . . . ? For those who reach too high and are too
active. . . . 5

For people seek their own good and think that this is what they should do. This opinion has given rise to the view that it is such men who have practical wisdom. And yet, surely one's own good cannot exist without household management nor without a political system. Moreover, the problem of how to manage one's own affairs properly needs clarification and remains to be examined. 10

An indication that what we have said is correct is the following common observation. While young men do indeed become good geometricians and mathematicians and attain theoretical wisdom in such matters, they apparently do not attain practical wisdom. The reason is that practical wisdom is concerned with particulars as well [as with universals], and knowledge of particulars comes from experience. But a young man has no experience, for experience is the product of a long time. In fact, one might also raise the question why it is that a boy may become a mathematician but not a philosopher or a natural scientist. The answer may be that the objects of mathematics are the result of abstraction, whereas the fundamental principles of philosophy and natural science come from experience. Young men can assert philosophical and scientific principles but can have no genuine convictions about them, whereas there is no obscurity about the essential definitions in mathematics. 15 20

Moreover, in our deliberations error is possible as regards either the universal principle or the particular fact: we may be unaware either that all heavy water is bad, or that the particular water we are faced with is heavy.

That practical wisdom is not scientific knowledge is [therefore] evident. As we stated, it is concerned with ultimate particulars, since the actions to be performed are ultimate particulars. This means that it is at the opposite pole from intelligence. For the intelligence grasps limiting terms and definitions that cannot be attained by reasoning, while practical wisdom has as its object the ultimate particular fact, of which there is perception but no scientific knowledge. This perception is not the kind with which [each of our five senses apprehends] its proper object, but the kind with which we perceive that in mathematics the triangle is the ultimate figure. For in this direction, too, we shall have to reach a stop. But this [type of mathematical cognition] is more truly perception than practical wisdom, and it is different in kind from the other [type of perception which deals with the objects proper to the various senses]. 25 30

9. Practical Wisdom and Excellence in Deliberation: There is a difference between investigating and deliberating: to deliberate is to investigate a particular kind of object. We must also try to grasp what excellence in deliberation is: whether it is some sort of scientific knowledge, opinion, shrewd guessing, or something generically different from any of these.

Now, scientific knowledge it is certainly not:* people do not investigate matters they already know. But good deliberation is a kind of deliberation, and when a person 1142^b

*Here, as in most of the following paragraph, Aristotle seems to be taking issue with Plato, who had identified the two, e.g., in *Republic*, Book IV, 428b.

deliberates he is engaged in investigating and calculating [things not yet decided]. Nor yet is it shrewd guessing. For shrewd guessing involves no reasoning and proceeds quickly, whereas deliberation takes a long time. As the saying goes, the action which follows deliberation should be quick, but deliberation itself should be slow. Furthermore, quickness of mind is not the same as excellence in deliberation: quickness of mind is a kind of shrewd guessing. Nor again is excellence in deliberation any form of opinion at all. But since a person who deliberates badly makes mistakes, while he who deliberates well deliberates correctly, it clearly follows that excellence in deliberation is some kind of correctness. But it is correctness neither of scientific knowledge nor of opinion. There cannot be correctness of scientific knowledge any more than there can be error of scientific knowledge; and correctness of opinion is truth. Moreover, anything that is an object of opinion is already fixed and determined, while deliberation deals with objects which remain to be determined. Still, excellence in deliberation does involve reasoning, and we are, consequently, left with the alternative that it is correctness of a process of thought; for thinking is not yet an affirmation. For while opinion is no longer a process of investigation but has reached the point of affirmation, a person who deliberates, whether he does so well or badly, is still engaged in investigating and calculating something [not yet determined].

Good deliberation is a kind of correctness of deliberation. We must, therefore, first investigate what deliberation is and with what objects it is concerned. Since the term "correctness" is used in several different senses, it is clear that not every kind of correctness in deliberation [is excellence in deliberation]. For (1) a morally weak or a bad man will, as a result of calculation, attain the goal which he has proposed to himself as the right goal to attain. He will, therefore, have deliberated correctly, but what he will get out of it will be a very bad thing. But the result of good deliberation is generally regarded as a good thing. It is this kind of correctness of deliberation which is good deliberation, a correctness that attains what is good.

But (2) it is also possible to attain something good by a false syllogism, i.e., to arrive at the right action, but to arrive at it by the wrong means when the middle term is false. Accordingly, this process, which makes us attain the right goal but not by the right means, is still not good deliberation.

Moreover, (3) it is possible that one man attains his goal by deliberating for a long time, while another does so quickly. Now, long deliberation, too, is not as such good deliberation: excellence in deliberation is correctness in assessing what is beneficial, i.e., correctness in assessing the goal, the manner, and the time.

Again, (4) it is possible for a person to have deliberated well either in general, in an unqualified sense, or in relation to some particular end. Good deliberation in the unqualified sense of course brings success in relation to what is, in an unqualified sense, the end, [i.e., in relation to the good life]. Excellence in deliberation as directed toward some particular end, however, brings success in the attainment of some particular end.

Thus we may conclude that, since it is a mark of men of practical wisdom to have deliberated well, excellence in deliberation will be correctness in assessing what is conducive to the end, concerning which practical wisdom gives a true conviction.

1143^a 10. *Practical Wisdom and Understanding*: Understanding, i.e., excellence in understanding, the quality which makes us call certain people "men of understanding" and "men of good understanding," is in general not identical with scientific knowledge or with opinion. For [if it were opinion,] everyone would be a man of understanding, [since everyone forms opinions]. Nor is it one of the particular branches of science, in the sense in which

medicine, for example, is the science of matters pertaining to health, or geometry the science which deals with magnitudes. For understanding is concerned neither with eternal and unchangeable truth nor with anything and everything that comes into being [and passes away again]. It deals with matters concerning which doubt and deliberation are possible. 5
Accordingly, though its sphere is the same as that of practical wisdom, understanding and practical wisdom are not the same. Practical wisdom issues commands: its end is to tell us what we ought to do and what we ought not to do. Understanding, on the other hand, only passes judgment. [There is no difference between understanding and excellence in understanding:] for excellence in understanding is the same as understanding, and men of 10
understanding are men of good understanding.

Thus understanding is neither possession nor acquisition of practical wisdom. Just as learning is called “understanding” when a man makes use of his faculty of knowledge, so [we speak of “understanding”] when it implies the use of one’s faculty of opinion in judging statements made by another person about matters which belong to the realm of practical wisdom—and in judging such statements rightly, for *good* understanding means 15
that the judgment is right. It is from this act of learning or understanding [what someone else says] that the term “understanding” as predicated of “men of good understanding” is derived. For we frequently use the words “learning” and “understanding” synonymously.

11. Practical Wisdom and Good Sense: As for what is called “good sense,” the quality which makes us say of a person that he has the sense to forgive others, [i.e., sympathetic understanding], and that he has good sense, this is a correct judgment of what is fair 20
or equitable. This is indicated by the fact that we attribute to an equitable man especially sympathetic understanding and that we say that it is fair, in certain cases, to have the sense to forgive. Sympathetic understanding is a correct critical sense or judgment of what is fair; and a correct judgment is a true one.

All these characteristics, as one would expect, tend toward the same goal. We 25
attribute good sense, understanding, practical wisdom, and intelligence to the same persons, and in saying that they have good sense, we imply at the same time that they have a mature intelligence and that they are men of practical wisdom and understanding. For what these capacities [have in common is that they are] all concerned with ultimate particular facts. To say that a person has good judgment in matters of practical wisdom 30
implies that he is understanding and has good sense or that he has sympathetic understanding; for equitable acts are common to all good men in their relation with someone else. Now, all matters of action are in the sphere of the particulars and ultimates. Not only must a man of practical wisdom take cognizance of particulars, but understanding and good sense, too, deal with matters of action, and matters of action are ultimates. As for intelligence, it deals with ultimates at both ends of the scale. It is intelligence, not reasoning, that has as its objects primary terms and definitions as well as ultimate particulars. Intelligence grasps, on the one hand, the unchangeable, primary terms and concepts 1143^b
for demonstrations; on the other hand, in questions of action, it grasps the ultimate, contingent fact and the minor premise. For it is particular facts that form the starting points or principles for [our knowledge of] the goal of action: universals arise out of particulars. Hence one must have perception of particular facts, and this perception is intelligence.* 5
Intelligence is, therefore, both starting point and end; for demonstrations start with ultimate terms and have ultimate facts as their objects.

*I.e., we can attain the end—happiness—only by discovering the general rules of moral conduct, and these, in turn, rest on the immediate apprehension by intelligence of particular moral facts.

That is why these characteristics are regarded as natural endowments and, although no one is provided with theoretical wisdom by nature, we do think that men have good sense, understanding, and intelligence by nature. An indication of this is that we think of these characteristics as depending on different stages of life, and that at a given stage of life a person acquires intelligence and good sense: the implication is that [human] nature is the cause. Therefore, we ought to pay as much attention to the sayings and opinions, undemonstrated though they are, of wise and experienced older men as we do to demonstrated truths. For experience has given such men an eye with which they can see correctly.*

We have now completed our discussion of what practical and theoretical wisdom are; we have described the sphere in which each operates, and we have shown that each is the excellence of a different part of the soul.

12. The Use of Theoretical and Practical Wisdom: One might raise some questions about the usefulness of these two virtues. Theoretical wisdom, [as we have described it,] will study none of the things that make a man happy, for it is not at all concerned with the sphere of coming-to-be [but only with unchanging realities]. Practical wisdom, on the other hand, *is* concerned with this sphere, but for what purpose do we need it? (1) It is true that practical wisdom deals with what is just, noble, and good for man; and it is doing such things that characterizes a man as good. But our ability to perform such actions is in no way enhanced by knowing them, since the virtues are characteristics, [that is to say, fixed capacities for action, acquired by habit]. The same also applies, after all, to matters of health and well-being (not in the sense of “producing health and well-being” but in the sense of “being healthy and well” as the manifestation of a physical condition or a characteristic): our ability to perform actions [which show that we are healthy and well] is in no way enhanced by a mastery of the science of medicine or of physical training.

(2) But if we are to say that the purpose of practical wisdom is not to *know* what is just, noble, and good, but to *become* just, noble, and good, it would be of no use at all to a man who is already good. Moreover, it is of no use to those who do not have virtue, for it makes no difference whether they have practical wisdom themselves or listen to others who have it. It is quite sufficient to take the same attitude as we take toward health: we want to be healthy, yet we do not study medicine.

(3) In addition, it would seem strange if practical wisdom, though [intrinsically] inferior to theoretical wisdom, should surpass it in authority, because that which produces a thing rules and directs it.

These, then, are the questions we must discuss: so far we have only stated them as problems.

First of all, then, we should insist that both theoretical and practical wisdom are necessarily desirable in themselves, even if neither of them produces anything. For each one of them is the virtue of a different part of the soul.

Secondly, they do in fact produce something: theoretical wisdom produces happiness, not as medicine produces health, but as health itself makes a person healthy. For since theoretical wisdom is one portion of virtue in its entirety, possessing and actualizing it makes a man happy. [For happiness, as we have seen (Book I, 7) consists in the activity of virtue.]

In the third place, a man fulfills his proper function only by way of practical wisdom and moral excellence or virtue: virtue makes us aim at the right target, and

*The “eye given by experience” is of course *nous*, “intelligence.”

practical wisdom makes us use the right means. The fourth part of the soul, the nutritive, does not have a virtue [which makes man fulfill his proper function,] since it does not play any role in the decision to act or not to act. 10

Finally, the argument has to be met that our ability to perform noble and just acts is in no way enhanced by practical wisdom. We have to begin a little further back and take the following as our starting point. It is our contention that people may perform just acts without actually being just men, as in the case of people who do what has been laid down by the laws but do so either involuntarily or through ignorance or for an ulterior motive, and not for the sake of performing just acts. [Such persons are not just men] despite the fact that they act the way they should, and perform all the actions which a morally good man ought to perform. On the other hand, it seems that it is possible for a man to be of such a character that he performs each particular act in such a way as to make him a good man—I mean that his acts are due to choice and are performed for the sake of the acts themselves. Now, it is virtue which makes our choice right. It is not virtue, however, but a different capacity, which determines the steps which, in the nature of the case, must be taken to implement this choice. 15 20

We must stop for a moment to make this point clearer. There exists a capacity called “cleverness,” which is the power to perform those steps which are conducive to a goal we have set for ourselves and to attain that goal. If the goal is noble, cleverness deserves praise; if the goal is base, cleverness is knavery. That is why men of practical wisdom are often described as “clever” and “knaveish.” But in fact this capacity [alone] is not practical wisdom, although practical wisdom does not exist without it. Without virtue or excellence, this eye of the soul, [intelligence,] does not acquire the characteristic of practical wisdom: that is what we have just stated and it is obvious. For the syllogisms which express the principles initiating action run: “Since the end, or the highest good, is such-and-such . . .”—whatever it may be; what it really is does not matter for our present argument. But whatever the true end may be, only a good man can judge it correctly. For wickedness distorts and causes us to be completely mistaken about the fundamental principles of action. Hence it is clear that a man cannot have practical wisdom unless he is good. 25 30 35

13. Practical Wisdom and Moral Virtue: Accordingly, we must also re-examine virtue or excellence. Virtue offers a close analogy to the relation that exists between practical wisdom and cleverness. Just as these two qualities are not identical but similar, so we find the same relation between natural virtue and virtue in the full sense. It seems that the various kinds of character inhere in all of us, somehow or other, by nature. We tend to be just, capable of self-control, and to show all our other character traits from the time of our birth. Yet we still seek something more, the good in a fuller sense, and the possession of these traits in another way. For it is true that children and beasts are endowed with natural qualities or characteristics, but it is evident that without intelligence these are harmful. This much, to be sure, we do seem to notice: as in the case of a mighty body which, when it moves without vision, comes down with a mighty fall because it cannot see, so it is in the matter under discussion. If a man acts blindly, i.e., using his natural virtue alone, he will fail; but once he acquires intelligence, it makes a great difference in his action. At that point, the natural characteristic will become that virtue in the full sense which it previously resembled. 1144^b 5 10

Consequently, just as there exist two kinds of quality, cleverness and practical wisdom, in that part of us which forms opinions, [i.e., in the calculative element,] so also there are two kinds of quality in the moral part of us, natural virtue and virtue in the full sense. Now virtue in the full sense cannot be attained without practical wisdom. 15

That is why some people maintain that all the virtues are forms of practical wisdom, and why Socrates' approach to the subject was partly right and partly wrong. He was
 20 wrong in believing that all the virtues are forms of wisdom, but right in saying that there is no virtue without wisdom. This is indicated by the fact that all the current definitions of virtue,* after naming the characteristic and its objects, add that it is a characteristic "guided by right reason." Now right reason is that which is determined by practical wisdom. So we see that these thinkers all have some inkling that virtue is a characteris-
 25 tic of this kind, namely, a characteristic guided by practical wisdom.

But we must go a little beyond that. Virtue or excellence is not only a characteristic which is guided by right reason, but also a characteristic which is united with right reason; and right reason in moral matters is practical wisdom.** In other words, while Socrates believed that the virtues *are* rational principles—he said that all of them are forms of
 30 knowledge—we, on the other hand, think that they are *united with* a rational principle.

Our discussion, then, has made it clear that it is impossible to be good in the full sense of the word without practical wisdom or to be a man of practical wisdom without moral excellence or virtue. Moreover, in this way we can also refute the dialectical argument which might be used to prove that the virtues exist independently of one another. The same indi-
 35 vidual, it might be argued, is not equally well-endowed by nature for all the virtues, with the result that at a given point he will have acquired one virtue but not yet another. In the case of
 1145^a the natural virtues this may be true, but it cannot happen in the case of those virtues which entitle a man to be called good in an unqualified sense. For in the latter case, as soon as he possesses this single virtue of practical wisdom, he will also possess all the rest.

It is now clear that we should still need practical wisdom, even if it had no bearing on action, because it is the virtue of a part of our soul. But it is also clear that [it does have an important bearing on action, since] no choice will be right without practical
 5 wisdom and virtue. For virtue determines the end, and practical wisdom makes us do what is conducive to the end.

Still, practical wisdom has no authority over theoretical wisdom or the better part of our soul*** any more than the art of medicine has authority over health. [Just as medicine does not use health but makes the provisions to secure it, so] practical wisdom does not use theoretical wisdom but makes the provisions to secure it. It issues commands to
 10 attain it, but it does not issue them to wisdom itself. To say the contrary would be like asserting that politics governs the gods, because it issues commands about everything in the state, [including public worship].

BOOK VII

1. Moral Strength and Moral Weakness: Their Relation to Virtue and Vice and Current
 15 *Beliefs about Them:* We have to make a fresh start now by pointing out that the qualities of character to be avoided are three in kind: vice, moral weakness, and brutishness. The oppo-

*The reference is to the doctrines of Plato's successors in the Academy.

**I.e., right reason is not only an external standard of action, but it also lives in us and makes us virtuous.

***That is, the scientific or cognitive part in the soul, the rational element which grasps necessary and permanent truths.

sites of two of these are obvious: one is called virtue or excellence and the other moral strength. The most fitting description of the opposite of brutishness would be to say that it is superhuman virtue, a kind of heroic and divine excellence; just as Homer has Priam say about Hector that he was of surpassing excellence: 20

for he did not seem like one who was child of a mortal man, but of god.

Therefore, if, as is said, an excess of virtue can change a man into a god, the characteristic opposed to brutishness must evidently be something of this sort. For just as vice and virtue do not exist in brute beasts, no more can they exist in a god. The quality of gods is something more worthy of honor than [human] virtue or excellence, and the quality of a brute is generically different from [human] vice. 25

If it is rare to find a man who is divine—as the Spartans, for example, customarily use the attribute “divine man” to express an exceptionally high degree of admiration for a person—it is just as rare that a brute is found among men. It does happen, particularly among barbarians, but in some cases disease and physical disability can make a man brutish. “Brutishness” is also used as a term of opprobrium for those who exceed all other men in vice. 30

But we must defer until later some mention of this kind of disposition, and vice has already been discussed. We must now discuss moral weakness, softness, and effeminacy, also moral strength and tenacity. We will do so on the assumption that each of these two sets of characteristics is neither identical with virtue or with wickedness nor generically different from it, but different species respectively of the covering genera, [namely, qualities to be sought and qualities to be avoided]. 35 1145^b

The proper procedure will be the one we have followed in our treatment of other subjects: we must present phenomena, [that is, the observed facts of moral life and the current beliefs about them,] and, after first stating the problems inherent in these, we must, if possible, demonstrate the validity of all the beliefs about these matters,* and, if not, the validity of most of them or of the most authoritative. For if the difficulties are resolved and current beliefs are left intact, we shall have proved their validity sufficiently. 5

Now the current beliefs are as follows: (1) Moral strength and tenacity are qualities of great moral value and deserve praise, while moral weakness and softness are base and deserve blame. (2) A man who is morally strong tends to abide by the results of his calculation, and a morally weak man tends to abandon them. (3) A morally weak man does, on the basis of emotion, what he knows to be base, whereas a morally strong man, knowing that certain appetites are base, refuses to follow them and accepts the guidance of reason. (4) Though a self-controlled man is called morally strong and tenacious, some people affirm and others deny [the converse, namely,] that a morally strong person is self-controlled in every respect; likewise, some people call a self-indulgent person “morally weak” and a morally weak person “self-indulgent” without discriminating between the two, while others say that they are different. (5) Sometimes it is said that a man of practical wisdom cannot possibly be morally weak, and sometimes people who have practical wisdom and who are clever are said to be morally weak. (6) Finally, it is said that moral weakness is shown even in anger and in the pursuit of honor and profit. These, then, are the opinions commonly heard. 10 15 20

*“Matters” here translates the Greek word *pathos*, which we usually render as “emotion” or “affect.” Here, however, it is used in a loose and general sense to include the whole class of moral phenomena. In other words, Aristotle does not mean to deny here that the qualities enumerated above are lasting characteristics.

2. Problems in the Current Beliefs About Moral Strength and Moral Weakness:

The problems we might raise are these. [As to (3):] how can a man be morally weak in his actions, when his basic assumption is correct [as to what he should do]? Some people claim that it is impossible for him to be morally weak if he has knowledge [of what he ought to do]. Socrates, for example, believed that it would be strange if, when a man
 25 possesses knowledge, something else should overpower it and drag it about like a slave. In fact, Socrates was completely opposed to the view [that a man may know what is right but do what is wrong], and did not believe that moral weakness exists. He claimed that no one acts contrary to what is best in the conviction [that what he is doing is bad], but through [ignorance of the fact that it is bad].

Now this theory is plainly at variance with the observed facts, and one ought to investigate the emotion [involved in the acts of a morally weak man]: if it comes about through ignorance, what manner of ignorance is it? For evidently a man who is morally weak in his actions does not think [that he ought to act the way he does] before he is in
 30 the grip of emotion.

There are some people* who accept only certain points of Socrates' theory, but reject others. They agree that nothing is better or more powerful than *knowledge*, but they do not agree that no one acts contrary to what he *thought* was the better thing to do. Therefore, they say, a [morally weak person] does not have knowledge but opinion
 35 when he is overpowered by pleasures.

However, if it really is opinion and not knowledge, if, in other words, the basic
 1146^a conviction which resists [the emotion] is not strong but weak, as it is when people are in doubt, we can forgive a man for not sticking to his opinions in the face of strong appetites. But we do not forgive wickedness or anything else that deserves blame [as moral weakness does. Hence it must be something stronger than opinion which is overpowered]. But does that mean that it is practical wisdom** which resists [the appetite]? This, after all, is the strongest [kind of conviction]. But that would be absurd: for it
 5 would mean that the same man will have practical wisdom and be morally weak at the same time, and there is no one who would assert that it is the mark of a man of practical wisdom to perform voluntarily the basest actions. In addition, it has been shown before that a man of practical wisdom is a man of action he is concerned with ultimate particulars that he possesses the other virtues.

Furthermore, [as regards (4)]: if being a morally strong person involves having
 10 strong and base appetites, a self-controlled man will not be morally strong nor a morally strong man self-controlled. It is out of character for a self-controlled person to have excessive or base appetites. Yet a morally strong man certainly must have such appetites: for if the appetites are good, the characteristic which prevents him from following them is bad, and that would mean that moral strength is not always morally
 15 good. If, on the other hand, our appetites are weak and not base, there is nothing extraordinary in resisting them, nor is it a great achievement if they are base and weak.

Again, [to take (1) and (2),] if moral strength makes a person abide by any and every opinion, it is a bad thing; for example, if it makes him persist in a false opinion. And if moral weakness makes a man abandon any and every opinion, moral weakness
 20 will occasionally be morally good, as, for example, in the case of Neoptolemus in Sophocles' *Philoctetes*. Neoptolemus deserves praise when he does not abide by the

*I.e., Plato's followers in the Academy.

**The point is this: if the kind of conviction a morally weak man has is neither knowledge nor a weak conviction, it must be a strong conviction, and practical wisdom is such a conviction.

resolution which Odysseus had persuaded him to adopt, because it gives him pain to tell a lie.

Further, [concerning (1) and (3),] the sophistic argument presents a problem. The Sophists want to refute their opponents by leading them to conclusions which contradict generally accepted facts. Their purpose is to have success bring them the reputation of being clever, and the syllogism which results only becomes a problem or quandary [for their opponents]. For the mind is in chains when, because it is dissatisfied with the conclusion it has reached, it wishes not to stand still, while on the other hand its inability to resolve the argument makes forward movement impossible. Now, they have one argument which leads to the conclusion that folly combined with moral weakness is virtue. This is the way it runs: [if a man is both foolish and morally weak,] he acts contrary to his conviction because of his moral weakness; but [because of his folly,] his conviction is that good things are bad and that he ought not to do them. Therefore, [acting contrary to his conviction,] he will do what is good and not what is bad. 25 30

A further problem [arises from (2) and (4)]. A person who, in his actions, pursues, and prefers what is pleasant, convinced or persuaded [that it is good],* would seem to be better than one who acts the same way not on the basis of calculation, but because of moral weakness. For since he may be persuaded to change his mind, he can be cured more easily. To a morally weak man, on the other hand, applies the proverb, "When water chokes you, what can you wash it down with?" For if he had been persuaded to act the way he does, he would have stopped acting that way when persuaded to change his mind. But as it is, though persuaded that he ought to do one thing, he nevertheless does another. 35 1146^b

Finally, if everything is the province of moral weakness and moral strength, who would be morally weak in the unqualified sense of the word? No one has every form of moral weakness, but we do say of some people that they are morally weak in an unqualified sense. 5

These are the sort of problems that arise. Some of the conflicting opinions must be removed and others must be left intact. For the solution of a problem is the discovery [of truth].

3. Some Problems Solved: Moral Weakness and Knowledge: Our first step is, then, to examine (1) whether morally weak people act knowingly or not, and, if knowingly, in what sense. Secondly, (2) we must establish the kind of questions with which a morally weak and a morally strong man are concerned. I mean, are they concerned with all pleasure and pain or only with certain distinct kinds of them? Is a morally strong person the same as a tenacious person or are they different? Similar questions must also be asked about all other matters germane to this study. 10

The starting point of our investigation is the question (*a*) whether the morally strong man and the morally weak man have their distinguishing features in the situations with which they are concerned or in their manner [of reacting to the situation]. What I mean is this: does a morally weak person owe his character to certain situations to [which he reacts], or to the manner [in which he reacts], or to both? Our second question (*b*) is whether or not moral weakness and moral strength are concerned with all [situations and feelings. The answer to both these questions is that] a man who is morally weak in the unqualified sense is not [so described because of his reaction] to every situation, but only to those situations in which also a self-indulgent man may get 15 20

*I.e., a self-indulgent person.

involved. Nor is he morally weak because of the mere fact of his relationship to these situations, [namely, that he yields to temptation]. In that case moral weakness would be the same as self-indulgence. Instead, his moral weakness is defined by the manner [in which he yields]. For a self-indulgent person is led on by his own choice, since he believes that he should always pursue the pleasure of the moment. A morally weak man, on the other hand, does not think he should, but pursues it, nonetheless.

- (1) The contention that it is true opinion rather than knowledge which a morally weak man violates in his actions has no bearing on our argument. For some people have
 25 no doubts when they hold an opinion, and think they have exact knowledge. Accordingly, if we are going to say that the weakness of their belief is the reason why those who hold opinion will be more liable to act against their conviction than those who have knowledge, we shall find that there is no difference between knowledge and opinion. For some people
 30 are no less firmly convinced of what they believe than others are of what they know: Heraclitus is a case in point.* (*a*) But the verb “to know” has two meanings: a man is said to “know” both when he does not use the knowledge he has and when he does use it. Accordingly, when a man does wrong it will make a difference whether he is not exercising the knowledge he has, [viz., that it is wrong to do what he is doing,] or whether he is exercising it. In the latter case, we would be baffled, but not if he acted without exercising
 35 his knowledge.

Moreover, (*b*) since there are two kinds of premise,** [namely, universal and
 1147^a particular,] it may well happen that a man knows both [major and minor premise of a practical syllogism] and yet acts against his knowledge, because the [minor] premise which he uses is universal rather than particular. [In that case, he cannot apply his knowledge to his action,] for the actions to be performed are particulars. Also, there are
 5 two kinds of universal term to be distinguished: one applies to (*i*) the agent, and the other (*ii*) to the thing. For example, when a person knows that dry food is good for all men, [he may also know] (*i*) that he is a man, or (*ii*) that this kind of food is dry. But whether the particular food before him is of this kind is something of which a morally weak man either does not have the knowledge or does not exercise it. So we see that there will be a tremendous difference between these two ways of knowing. We do not regard it as at all strange that a morally weak person “knows” in the latter sense [with one term nonspecific], but it would be surprising if he “knew” in the other sense, [namely with both terms apprehended as concrete particulars].

- 10 There is (*c*) another way besides those we have so far described, in which it is possible for men to have knowledge. When a person has knowledge but does not use it, we see that “having” a characteristic has different meanings. There is a sense in which a person both has and does not have knowledge, for example, when he is asleep, mad, or

*The reference is not to any specific utterance of Heraclitus, but to the tone of intense conviction with which he asserted all his doctrines, some of which Aristotle finds patently false, and hence examples of opinion rather than knowledge.

**What is involved in this paragraph is the practical syllogism. However, a refinement is added here, which requires further explanation. A major premise, Aristotle says, may contain two kinds of universal, e.g., the premise that “dry food is good for all men” makes a universal statement about (*i*) men and (*ii*) about dry food. Accordingly, two kinds of syllogism can be developed from this major premise. The first: “dry food is good for all men”; “I am a man”; therefore, “dry food is good for me” is here neglected by Aristotle, because the agent is obviously always aware of being a person. But the second possible syllogism: “dry food is good for all men”; “this kind of food is dry”; therefore, “this kind of food is good for me,” leaves the agent only with the general knowledge that, for example, cereals are good, but the individual will not yet know whether this barley is a cereal. “Knowledge” of this sort will obviously not serve to check a healthy appetite faced with an attractive bowl of porridge.

drunk. But this is precisely the condition of people who are in the grip of the emotions. Fits of passion, sexual appetites, and some other such passions actually cause palpable changes in the body, and in some cases even produce madness. Now it is clear that we must attribute to the morally weak a condition similar to that of men who are asleep, mad, or drunk. That the words they utter spring from knowledge [as to what is good] is no evidence to the contrary. People can repeat geometrical demonstrations and verses of Empedocles even when affected by sleep, madness, and drink; and beginning students can reel off the words they have heard, but they do not yet know the subject. The subject must grow to be part of them, and that takes time. We must, therefore, assume that a man who displays moral weakness repeats the formulae [of moral knowledge] in the same way as an actor speaks his lines. 15 20

Further, (*d*) we may also look at the cause [of moral weakness] from the viewpoint of the science of human nature, in the following way. [In the practical syllogism,] one of the premises, the universal, is a current belief, while the other involves particular facts which fall within the domain of sense perception. When two premises are combined into one, [i.e., when the universal rule is realized in a particular case,] the soul is thereupon bound to affirm the conclusion, and if the premises involve action, the soul is bound to perform this act at once. For example, if [the premises are]: “Everything sweet ought to be tasted” and “This thing before me is sweet” (“this thing” perceived as an individual particular object), a man who is able [to taste] and is not prevented is bound to act accordingly at once. 25 30

Now, suppose that there is within us one universal opinion forbidding us to taste [things of this kind], and another [universal] opinion which tells us that everything sweet is pleasant, and also [a concrete perception], determining our activity, that the particular thing before us is sweet; and suppose further that the appetite [for pleasure] happens to be present. [The result is that] one opinion tells us to avoid that thing, while appetite, capable as it is of setting in motion each part of our body, drives us to it. [This is the case we have been looking for, the defeat of reason in moral weakness.] Thus it turns out that a morally weak man acts under the influence of some kind of reasoning and opinion, an opinion which is not intrinsically but only incidentally opposed to right reason; for it is not opinion but appetite that is opposed to right reason.* And this explains why animals cannot be morally weak: they do not have conceptions of universals, but have only the power to form mental images and memory of particulars. 35 1147^b 5

How is the [temporary] ignorance of a morally weak person dispelled and how does he regain his [active] knowledge [of what is good]? The explanation is the same as it is for drunkenness and sleep, and it is not peculiar to the affect of moral weakness. To get it we have to go to the students of natural science.

The final premise, consisting as it does in an opinion about an object perceived by the senses, determines our action. When in the grip of emotion, a morally weak man either does not have this premise, or he has it not in the sense of knowing it, but in the sense of uttering it as a drunken man may utter verses of Empedocles. [Because he is not in active possession of this premise,] and because the final [concrete] term of his 10

*The point is this: there is a kind of reasoning involved in the actions of a morally weak person: such a person starts out with the opinion that everything sweet is pleasant, finds a particular sweet thing, and knows that the thing is pleasant. But this person also has right reason, which warns not to taste everything sweet. However, the appetite for pleasure, taking hold of the opinion that everything sweet is pleasant, transforms this opinion into the action of tasting. What is contrary to right reason (i.e., contrary to the knowledge that not everything sweet should be tasted) is not the person's opinion (that sweet things are pleasant) but rather the person's appetite for pleasure.

reasoning is not a universal and does not seem to be an object of scientific knowledge in the same way that a universal is, [for both these reasons] we seem to be led to the conclusion which Socrates sought to establish. Moral weakness does not occur in the presence of knowledge in the strict sense, and it is sensory knowledge, not science, which is dragged about by emotion.

This completes our discussion of the question whether a morally weak person acts with knowledge or without knowledge, and in what sense it is possible for him to act knowingly.

4. *More Problems Solved: The Sphere in Which Moral Weakness Operates:*

(2) The next point we have to discuss is whether it is possible for a man to be morally weak in the unqualified sense, or whether the moral weakness of all who have it is concerned with particular situations. If the former is the case, we shall have to see with what kind of situations he is concerned.

Now, it is clearly in their attitude to pleasures and pains that men are morally strong and tenacious and morally weak and soft. There are two sources of pleasure: some are necessary, and others are desirable in themselves but admit of excess. The necessary kind are those concerned with the body: I mean sources of pleasure such as food and drink and sexual intercourse, in short, the kind of bodily pleasures which we assigned to the sphere of self-indulgence and self-control.* By sources of pleasure which are not necessary but desirable in themselves, I mean, for example, victory, honor, wealth, and similar good and pleasant things. Now, (a) those who violate the right reason that they possess by excessive indulgence in the second type of pleasures, are not called morally weak in the unqualified sense, but only with a qualification: we call them "morally weak in regard to material goods," or profit, or honor, or anger, but not "morally weak" pure and simple. They are different from the morally weak in the unqualified sense and share the same name only by analogy, as in our example of the man called Man, who won an Olympic victory. In his case there is not much difference between the general definition of man and the definition proper to him alone, and yet there was a difference. [That there is similarly a difference between the two senses of morally weak] is shown by the fact that we blame moral weakness—regardless of whether it is moral weakness in the unqualified sense or moral weakness concerning some particular bodily pleasure—not only as an error, but also as a kind of vice. But we do not blame as vicious those [who are morally weak in matters of material goods, profit, ambition, anger, and so forth].

(b) We now come to those bodily enjoyments which, we say, are the sphere of the self-controlled and the self-indulgent. Here a man who pursues the excesses of things pleasant and avoids excesses of things painful (of hunger, thirst, heat, cold, and of anything we feel by touch or taste), and does so not by choice but against his choice and thinking, is called "morally weak" without the addition of "in regard to such-and-such," e.g., "in regard to feelings of anger," but simply morally weak without qualification. The truth of this is proved by the fact that persons who indulge in bodily pleasures are called "soft," but not persons who indulge in feelings of anger and so forth. For this reason, we class the morally weak man with the self-indulgent, and the morally strong with the self-controlled. But we do not include [in the same category] those who indulge in feelings of anger, because moral weakness and self-indulgence are, in a way, concerned with the same pleasures and pains. That is, they are concerned with the same pleasures

*I.e., the sensual pleasures of taste and touch.

and pains but not in the same way. Self-indulgent men pursue the excess by choice, but the morally weak do not exercise choice.

That is why we are probably more justified in calling a person self-indulgent who shows little or no appetite in pursuing an excess of pleasures and in avoiding moderate pains, than a person who is driven by strong appetite [to pursue pleasure and to avoid pain]. For what would the former do, if, in addition, he had the vigorous appetite of youth and felt strong pain at lacking the objects necessary for his pleasure? 20

Some appetites and desires are generically noble and worth while—[let us remember] our earlier distinction of pleasant things into those which are by nature desirable, the opposite of these, and those which are intermediate between the two—for example, material goods, profit, victory, and honor. Now, people are not blamed for being affected by all these and similar objects of pleasure and by those of the intermediate kind, nor are they blamed for having an appetite or a liking for them; they are blamed only for the manner in which they do so, if they do so to excess. This, by the way, is why [we do not regard as wicked] all those who, contrary to right reason, are overpowered by something that is noble and good by nature, or who pursue it—those, for example, who devote themselves to the pursuit of honor or to their children and parents more than they should. All these things are good, and those who devote themselves to them are praised. And yet even here there is an element of excess, if, like Niobe, one were to fight against the gods [for the sake of one's children], or if one showed the same excessively foolish devotion to his father as did Satyros, nicknamed “the filial.”* So we see that there cannot be any wickedness in this area, because, as we stated, each of these things is in itself naturally desirable. But excess in one's attachment to them is base and must be avoided. 30 1148^b

Similarly, there cannot be moral weakness in this area [of things naturally desirable]. Moral weakness is not only something to be avoided, but it is also something that deserves blame. Still, because there is a similarity in the affect, people do call it “moral weakness,” but they add “in regard to [such-and-such],” in the same way as they speak of a “bad” doctor or a “bad” actor without meaning to imply that the person is bad in the unqualified sense. So just as in the case of the doctor and the actor [we do not speak of “badness” in the unqualified sense], because their badness is not vice but only something similar to vice by analogy, so it is clear that, in the other case, we must understand by “moral weakness” and “moral strength” only that which operates in the same sphere as self-control and self-indulgence. When we use these terms of anger, we do so only in an analogous sense. Therefore, we add a qualification and say “morally weak in regard to anger,” just as we say “morally weak in regard to honor or profit.” 5 10

5. *Moral Weakness and Brutishness*: (1) Some things are pleasant by nature, partly (a) without qualification, and partly (b) pleasant for different classes of animals and humans. Then (2) there are things which are not pleasant by nature, but which come to be pleasant (a) through physical disability, (b) through habit, or (c) through an [innate] depravity of nature. We can observe characteristics corresponding to each of the latter group (2), just as [we did in discussing (1), things pleasant by nature]. I mean (2c) characteristics of brutishness, for instance, the female who is said to rip open pregnant women and devour the infants; or what is related about some of the savage tribes 15 20

*Niobe boasted that, with her six (or in some versions, seven) sons and an equal number of daughters, she was at least equal to the goddess Leto, who only had two children, the twins Apollo and Artemis. Apollo and Artemis thereupon killed all her children, and Niobe was turned into stone. Who exactly Satyros was, we do not know. Ancient commentators tell us that he committed suicide when his father died, or that he called his father a god.

Lapith and Centaur, Metope from Parthenon, 477–438 B.C. According to a Greek myth, the Lapiths invited the Centaurs to the wedding feast of their king, Peirthon, as a gesture of goodwill. Upon seeing the beauty of the Lapith bride, the Centaurs succumbed to their animal instincts of lust and drunkenness and turned the feast into an abduction attempt and brawl. The Lapith warriors, under the cool wisdom of Apollo, brought a sense of calm to the chaos. The image is a symbolic lesson in its appeal for human reason and order over the lower animal instinct of passion and brutishness—a lesson also taught by Aristotle in the *Nicomachean Ethics*.
(© SEF/Art Resource, NY)

near the Black Sea, that they delight in eating raw meat or human flesh, and that some of them lend each other their children for a feast; or the story told about Phalaris.*

- These are characteristics of brutishness. Another set of characteristics (2a) develop through disease and occasionally through insanity, as, for example, in the case of the man who offered his mother as a sacrifice to the gods and ate of her, or the case of the slave who ate the liver of his fellow slave. Other characteristics are the result of disease or (2b) of habit, e.g., plucking out one's hair, gnawing one's fingernails, or even chewing coal or earth, and also sexual relations between males. These practices are, in some cases, due to nature, but in other cases they are the result of habit, when, for example, someone has been sexually abused from childhood.

When nature is responsible, no one would call the persons affected morally weak any more than one would call women morally weak, because they are passive and not

*Phalaris, tyrant of Acragas in the second quarter of the sixth century B.C., was said to have built a hollow brazen bull, in which he roasted his victims alive, presumably to eat them afterwards. There were several other stories current in antiquity about his brutality.

active in sexual intercourse. Nor would we apply the term to persons in a morbid condition as a result of habit. To have one of these characteristics means to be outside the limits of vice, just as brutishness, too, lies outside the limits of vice. To have such characteristics and to master them or be mastered by them does not constitute moral [strength or] weakness in an unqualified sense but only by analogy, just as a person is not to be called morally weak without qualification when he cannot master his anger, but only morally weak in regard to the emotion involved. 1149^a

For all excessive folly, cowardice, self-indulgence, and ill-temper is either brutish or morbid. When someone is by nature the kind of person who fears everything, even the rustling of a mouse, his cowardice is brutish, while the man's fear of the weasel was due to disease. In the case of folly, those who are irrational by nature and live only by their senses, as do some distant barbarian tribes, are brutish, whereas those whose irrationality is due to a disease, such as epilepsy, or to insanity, are morbid. 5 10

Sometimes it happens that a person merely possesses one of these characteristics without being mastered by it—I mean, for example, if a Phalaris had restrained his appetite so as not to eat the flesh of a child or so as not to indulge in some perverse form of sexual pleasure. But it also happens that a man not only has the characteristic but is mastered by it. Thus, just as the term “wickedness” refers in its unqualified sense to man alone, while in another sense it is qualified by the addition of “brutish” or “morbid,” in precisely the same way it is plain that there is a brutish and a morbid kind of moral weakness [i.e., being mastered by brutishness or disease], but in its unqualified sense the term “moral weakness” refers only to human self-indulgence. 15 20

It is, accordingly, clear that moral weakness and moral strength operate only in the same sphere as do self-indulgence and self-control, and that the moral weakness which operates in any other sphere is different in kind, and is called “moral weakness” only by extension, not in an unqualified sense.

6. *Moral Weakness in Anger*: At this point we may observe that moral weakness in anger is less base than moral weakness in regard to the appetites. For (1) in a way, anger seems to listen to reason, but to hear wrong, like hasty servants, who run off before they have heard everything their master tells them, and fail to do what they were ordered, or like dogs, which bark as soon as there is a knock without waiting to see if the visitor is a friend. In the same way, the heat and swiftness of its nature make anger hear but not listen to an order, before rushing off to take revenge. For reason and imagination indicate that an insult or a slight has been received, and anger, drawing the conclusion, as it were, that it must fight against this sort of thing, simply flares up at once. Appetite, on the other hand, is no sooner told by reason and perception that something is pleasant than it rushes off to enjoy it. Consequently, while anger somehow follows reason, appetite does not. Hence appetite is baser [than anger]. For when a person is morally weak in anger, he is in a sense overcome by reason, but the other is not overcome by reason but by appetite. 25 30 35 1149^b

Further, (2) it is more excusable to follow one's natural desires, inasmuch as we are also more inclined to pardon such appetites as are common to all men and to the extent that they are common to all. Now anger and ill temper are more natural than are the appetites which make us strive for excess and for what is not necessary. Take the example of the man who was defending himself against the charge of beating his father with the words: “Yes, I did it: my father, too, used to beat his father, and he beat his, and”—pointing to his little boy—“he will beat me when he grows up to be a man. It runs in the family.” And the story goes that the man who was being dragged out of the 5 10

house by his son asked him to stop at the door, on the grounds that he himself had not dragged his father any further than that.

Moreover, (3) the more underhanded a person is, the more unjust he is. Now, a hot-tempered man is not underhanded; nor is anger: it is open. But appetite has the same attribute as Aphrodite, who is called “weaver of guile on Cyprus born,” and as her “pattern-pierced zone,” of which Homer says: “endearment that steals the heart away even from the thoughtful.” Therefore, since moral weakness of this type [which involves the appetite] is more unjust and baser than moral weakness concerning anger, it is this type which constitutes moral weakness in the unqualified sense and is even a kind of vice.*

Again, (4) no one feels pain when insulting another without provocation, whereas everyone who acts in a fit of anger acts with pain. On the contrary, whoever unprovoked insults another, feels pleasure. If, then, acts which justify outbursts of anger are more unjust than others, it follows that moral weakness caused by appetite [is more unjust than moral weakness caused by anger], for anger does not involve unprovoked insult.

It is now clear that moral weakness in regard to the appetites is more disgraceful than moral weakness displayed in anger, and also that moral strength and weakness operate in the sphere of the bodily appetites and pleasures. But we must still grasp the distinctions to be made within bodily appetites and pleasures. For, as we stated at the beginning, some pleasures are human, i.e., natural in kind as well as in degree, while others are brutish, and others again are due to physical disability and disease. It is only with the first group of these, [i.e., the human pleasures,] that self-control and self-indulgence are concerned. For that reason, we do not call beasts either self-controlled or self-indulgent; if we do so, we do it only metaphorically, in cases where a general distinction can be drawn between one class of animals and another on the basis of wantonness, destructiveness, and indiscriminate voracity. [This use is only metaphorical] because beasts are incapable of choice and calculation, but [animals of this type] stand outside the pale of their nature, just as madmen do among humans.

Brutishness is a lesser evil than vice, but it is more horrifying. For [in a beast] the better element cannot be perverted, as it can be in man, since it is lacking. [To compare a brute beast and a brutish man] is like comparing an inanimate with an animate being to see which is more evil. For the depravity of a being which does not possess the source that initiates its own motion is always less destructive [than the depravity of a being that possesses this source], and intelligence is such a source. A similar comparison can be made between injustice [as such] and an unjust man: each is in some sense worse than the other, for a bad man can do ten thousand times as much harm as a beast.

7. Moral Strength and Moral Weakness: Tenacity and Softness: As regards the pleasures, pains, appetites, and aversions that come to us through touch and taste, and which we defined earlier as the sphere of self-indulgence and self-control, it is possible to be the kind of person who is overcome even by those which most people master; but it is also possible to master those by which most people are overcome. Those who are overcome by pleasure or master it are, respectively, morally weak and morally strong; and in the case of pain, they are, respectively, soft and tenacious. The disposition which characterizes the majority of men lies between these two, although they tend more to the inferior characteristics.

Some pleasures are necessary, up to a certain point, and others are not, whereas neither excesses nor deficiencies of pleasure are necessary. The same is also true of

*But it is not vice in the unqualified sense, for that would involve choice.

appetites and pains. From all this it follows that a man is self-indulgent when he pursues excesses of pleasant things, or when he [pursues necessary pleasures] to excess, by choice, for their own sakes, and not for an ulterior result. A man of this kind inevitably feels no regret, and is as a result incorrigible. For a person who feels no regret is incorrigible. A person deficient [in his pursuit of the necessary pleasures] is the opposite [of self-indulgent], and the man who occupies the middle position is self-controlled. In the same way, a man who avoids bodily pain [is self-indulgent], provided he does so by choice and not because he is overcome by them. 20

A choice is not exercised either by a person who is driven by pleasure, or by a person who is avoiding the pain of [unsatisfied] appetite. There is, accordingly, a difference between indulging by choice and not by choice. Everyone would think worse of a man who would perform some disgraceful act actuated only slightly or not at all by appetite, than of a person who was actuated by a strong appetite. And we would regard as worse a man who feels no anger as he beats another man, than someone who does so in anger. For what would he do, if he were in the grip of emotion when acting? Hence a self-indulgent man is worse than one who is morally weak. 25

So we see that one of the characteristics described, [viz., the deliberate avoidance of pain,] constitutes rather a kind of softness, while a person possessing the other, [viz., the deliberate pursuit of excessive pleasures,] is self-indulgent.

A morally strong is opposed to a morally weak man, and a tenacious to a soft man. For being tenacious consists in offering resistance, while moral strength consists in mastering. Resistance and mastery are two different things, just as not being defeated differs from winning a victory. Hence, moral strength is more desirable than tenacity. A man who is deficient [in his resistance to pains] which most people withstand successfully is soft and effeminate. For effeminacy is a form of softness. A man of this kind lets his cloak trail, in order to save himself the pain of lifting it up, and plays the invalid without believing himself to be involved in the misery which a true invalid suffers. 30 35 1150^b 5

The situation is similar in the case of moral strength and moral weakness. If a person is overcome by powerful and excessive pleasures or pains, we are not surprised. In fact, we find it pardonable if he is overcome while offering resistance, as, for example, Theodectes' Philoctetes* does when bitten by the snake, or as Cercyon in Carcinus' *Alope*,** or as people who try to restrain their laughter burst out in one great guffaw, as actually happened to Xenophantus.*** But we are surprised if a man is overcome by and unable to withstand those [pleasures and pains] which most people resist successfully, unless his disposition is congenital or caused by disease, as among the kings of Scythia, for example, in whom softness is congenital,[†] and as softness distinguishes the female from the male. 10 15

*Theodectes (ca. 375–334 B.C.) spent most of his life at Athens. He studied under Plato, Isocrates, and Aristotle, and in addition to writing tragedies, won a considerable reputation as an orator. An ancient note on this passage tells us that, in Theodectes' tragedy, Philoctetes, after repressing his pain for a long time, finally bursts out: "Cut off my hand!"

**Carcinus was a fourth-century B.C. Athenian tragic poet. According to an ancient commentator, "Cercyon had a daughter Alope. Upon learning that his daughter Alope had committed adultery, he asked her who had perpetrated the deed, and said: 'If you tell me, I will not be grieved at all.' When Alope told him who the adulterer was, Cercyon was so overcome with grief that he could no longer stand life and renounced living."

***The occasion is not known. Xenophantus is said to have been a musician at the court of Alexander the Great (356–323 B.C.). Seneca tells us that when Xenophantus sang, Alexander was so stirred that he seized his weapons in his hands.

[†]According to the Hippocratic treatise *On Airs, Waters, and Places* 22, horseback riding caused softness among the Scythian aristocracy.

A man who loves amusement is also commonly regarded as being self-indulgent, but he is actually soft. For amusement is relaxation, inasmuch as it is respite from work, and a lover of amusement is a person who goes in for relaxation to excess.

- One kind of moral weakness is impetuosity and another is a lack of strength. People of the latter kind deliberate but do not abide by the results of their deliberation, because they are overcome by emotion, while the impetuous are driven on by emotion, because they do not deliberate. [If they deliberated, they would not be driven on so easily,] for as those who have just been tickled are immune to being tickled again, so some people are not overcome by emotion, whether pleasant or painful, when they feel and see it coming and have roused themselves and their power of reasoning in good time. Keen and excitable persons are the most prone to the impetuous kind of moral weakness. Swift ness prevents the keen and vehemence the excitable from waiting for reason to guide them, since they tend to be led by their imagination.

8. *Moral Weakness and Self-Indulgence*: A self-indulgent man, as we stated, is one who feels no regret, since he abides by the choice he has made. A morally weak person, on the other hand, always feels regret. Therefore, the formulation of the problem, as we posed it above, does not correspond to the facts: it is a self-indulgent man who cannot be cured, but a morally weak man is curable. For wickedness is like a disease such as dropsy or consumption, while moral weakness resembles epilepsy: the former is chronic, the latter intermittent. All in all, moral weakness and vice are generically different from each other. A vicious man is not aware of his vice, but a morally weak man knows his weakness.

- Among the morally weak, those who lose themselves in [emotion, i.e., the impetuous,] are better than those who have a rational principle but do not abide by it, [i.e., those who lack strength]. For they are overcome by a lesser emotion and do not yield without previous deliberation, as the impetuous do. A man who has this kind of moral weakness resembles those who get drunk quickly and on little wine, or on less wine than most people do.

- That moral weakness is not a vice [in the strict sense] is now evident, though in a certain sense it is perhaps one. For moral weakness violates choice, whereas vice is in accordance with choice. Nevertheless, they are similar in the actions to which they lead, just as Demodocus said of the Milesians:

The Milesians are no stupid crew, except that they do what the stupid do.*

- Similarly, the morally weak are not unjust, but they will act like unjust men.

- A morally weak man is the kind of person who pursues bodily pleasures to excess and contrary to right reason, though he is not persuaded [that he ought to do so]; the self-indulgent, on the other hand, is persuaded to pursue them because he is the kind of man who does so. This means that it is the former who is easily persuaded to change his mind, but the latter is not. For virtue or excellence preserves and wickedness destroys the initiating motive or first cause [of action], and in actions the initiating motive or first cause is the end at which we aim, as the hypotheses are in mathematics. For neither in mathematics nor in moral matters does reasoning teach us the principles or starting points; it is virtue, whether natural or habitual, that inculcates right opinion about the

*Demodocus wrote lampooning epigrams in the sixth century B.C.

principle or first premise. A man who has this right opinion is self-controlled, and his opposite is self-indulgent. 20

But there exists a kind of person who loses himself under the impact of emotion and violates right reason, a person whom emotion so overpowers that he does not act according to the dictates of right reason, but not sufficiently to make him the kind of man who is persuaded that he must abandon himself completely to the pursuit of such pleasures. This is the morally weak man: he is better than the self-indulgent, and he is not bad in the unqualified sense of the word. For the best thing in him is saved: the principle or premise [as to how he should act]. Opposed to him is another kind of man, who remains steadfast and does not lose himself, at least not under the impact of emotion. These considerations make it clear that moral strength is a characteristic of great moral worth, while moral weakness is bad. 25

9. *Steadfastness in Moral Strength and Moral Weakness*: Is a man morally strong when he abides by any and every dictate of reason and choice, or only when he abides by the right choice? And is a man morally weak when he does not abide by every choice and dictate of reason, or only when he fails to abide by the rational dictate which is not false and the choice which is right? This is the problem we stated earlier. Or is it true reason and right choice as such, but any other kind of choice incidentally, to which the one remains steadfast and the other does not? [This seems to be the correct answer,] for if a person chooses and pursues the attainment of *a* by means of *b*, his pursuit and choice are for *a* as such but for *b* incidentally. And by “as such” we mean “in the unqualified sense.” Therefore, there is a sense in which the one abides by and the other abandons any and every kind of opinion, but in the unqualified sense, only true opinion. 30 35 1151^b

There are those who remain steadfast to their opinion and are called “obstinate.” They are hard to convince and are not easily persuaded to change their mind. They bear a certain resemblance to a morally strong person, just as an extravagant man resembles one who is generous, and a reckless man resembles one who is confident. But they are, in fact, different in many respects. The one, the morally strong, will be a person who does not change under the influence of emotion and appetite, but on occasion he will be persuaded [by argument]. Obstinate men, on the other hand, are not easily persuaded by rational argument; but to appetites they are amenable, and in many cases are driven on by pleasures. The various kinds of obstinate people are the opinionated, the ignorant, and the boorish. The opinionated let themselves be influenced by pleasure and pain: they feel the joy of victory, when someone fails to persuade them to change their mind, and they feel pain when their views are overruled, like decrees that are declared null and void. As a result, they bear a greater resemblance to the morally weak than to the morally strong. 5 10 15

Then there are those who do not abide by their decisions for reasons other than moral weakness, as, for example, Neoptolemus in Sophocles’ *Philoctetes*. Granted it was under the influence of pleasure that he did not remain steadfast, but it was a noble pleasure: it was noble in his eyes to be truthful, but he was persuaded by Odysseus to tell a lie. For not anybody who acts under the influence of pleasure is self-indulgent, bad, or morally weak, but only those who do so under the influence of a base pleasure. 20

There is also a type who feels less joy than he should at the things of the body and, therefore, does not abide by the dictates of reason. The median between this type and the morally weak man is the man of moral strength. For a morally weak person does not abide by the dictates of reason, because he feels more joy than he should [in bodily things], but the man under discussion feels less joy than he should. But a morally strong 25

man remains steadfast and does not change on either account. Since moral strength is good, it follows that both characteristics opposed to it are bad, as they in fact turn out to be. But since one of the two opposites is in evidence only in a few people and on few occasions, moral strength is generally regarded as being the only opposite of moral weakness, just as self-control is thought to be opposed only to self-indulgence.

Since many terms are used in an analogical sense, we have come to speak analogically of the "moral strength" of a self-controlled man. [There is a resemblance between the two] since a morally strong man is the kind of person who does nothing contrary to the dictates of reason under the influence of bodily pleasures, and the same is true of a self-controlled man. But while a morally strong man has base appetites, a self-controlled man does not and is, moreover, a person who finds no pleasure in anything that violates the dictates of reason. A morally strong man, on the other hand, does find pleasure in such things, but he is not driven by them. There is also a similarity between the morally weak and the self-indulgent in that both pursue things pleasant to the body; but they are different in that a self-indulgent man thinks he ought to pursue them, while the morally weak thinks he should not.

10. Moral Weakness and Practical Wisdom: It is not possible for the same person to have practical wisdom and be morally weak at the same time, for it has been shown that a man of practical wisdom is *ipso facto* a man of good character. Moreover, to be a man of practical wisdom, one must not only know [what one ought to do], but he must also be able to act accordingly. But a morally weak man is not able so to act. However, there is no reason why a clever man could not be morally weak. That is why occasionally people are regarded as possessing practical wisdom, but as being morally weak at the same time; it is because cleverness differs from practical wisdom in the way we have described in our first discussion of the subject. They are closely related in that both follow the guidance of reason, but they differ in that [practical wisdom alone] involves moral choice.

Furthermore, a morally weak man does not act like a man who has knowledge and exercises it, but like a man asleep or drunk. Also, even though he acts voluntarily—for he knows in a sense what he is doing and what end he is aiming at—he is not wicked, because his moral choice is good,* and that makes him only half-wicked. He is not unjust, either, for he is no underhanded plotter. [For plotting implies deliberation,] whereas one type of morally weak man does not abide by the results of his deliberation, while the other, the excitable type, does not even deliberate. So we see that a morally weak person is like a state which enacts all the right decrees and has laws of a high moral standard, but does not apply them, a situation which Anaxandrides made fun of: "Thus wills the state, that cares not for its laws."** A wicked man, on the other hand, resembles a state which does apply its laws, but the laws are bad.

In relation to the characteristics possessed by most people, moral weakness and moral strength lie at the extremes. For a morally strong person remains more steadfast and a morally weak person less steadfast than the capacity of most men permits.

The kind of moral weakness displayed by excitable people is more easily cured than the moral weakness of those who deliberate but do not abide by their decisions; and those who are morally weak through habituation are more curable than those who

*I.e., his basic moral purpose is good, even though it is eventually vitiated by appetite.

**Anaxandrides (fl. 382–349 B.C.) migrated from his native Rhodes (or Colophon) to Athens, where he gained fame as a poet of the Middle Comedy.

are morally weak by nature. For it is easier to change habit than to change nature. Even habit is hard to change, precisely because it resembles nature, as Euenus says: 30

A habit, friend, is of long practice born,
and practice ends in fashioning man's nature.*

We have now completed our definitions of moral strength, moral weakness, tenacity, and softness, and stated how these characteristics are related to one another. 35

11. Pleasure: Some Current Views: It is the role of a political philosopher to study pleasure and pain. For he is the supreme craftsman of the end to which we look when we call one particular thing bad and another good in the unqualified sense. Moreover, an examination of this subject is one of the tasks we must logically undertake, since we established that virtue and vice of character are concerned with pains and pleasures, and most people claim that happiness involves pleasure. That is why the word "blessed" is derived from the word "enjoy." 1152^b 5

Now, (1) some people believe that no pleasure is good, either in itself or incidentally, since the good and pleasure are not the same thing.** (2) Others hold that, though some pleasures are good, most of them are bad.*** (3) Then there is a third view, according to which it is impossible for pleasure to be the highest good, even if all pleasures are good.† 10

[The following arguments are advanced to support (1) the contention that] pleasure is not a good at all: (a) All pleasure is a process or coming-to-be leading to the natural state [of the subject] and perceived [by the subject]; but no process is of the same order as its ends, e.g., the building process is not of the same order as a house. Further, (b) a self-controlled man avoids pleasures. Again, (c) a man of practical wisdom does not pursue the pleasant, but what is free from pain.†† Moreover, (d) pleasures are an obstacle to good sense: the greater the joy one feels, e.g., in sexual intercourse, the greater the obstacle; for no one is capable of rational insight while enjoying sexual relations.††† Also, (e) there is no art of pleasure; yet every good is the result of an art. Finally, (f) children and beasts pursue pleasures, whereas they do not know what is good. 15

[The arguments for the view (2) that] not all pleasures are good are: (a) Some pleasures are disgraceful and cause for reproach; and (b) some pleasures are harmful, for there are pleasant things that may cause disease. 20

[And the argument in favor of (3), the contention that] pleasure is not the highest good, is that it is not an end but a process or coming-to-be. These are roughly the views put forward.

12. The Views Discussed: (1) Is Pleasure a Good Thing?: But the following considerations will show that the arguments we have enumerated do not lead us to the conclusion 25

*Euenus of Paros was a famous Sophist, who lived in the late fifth century B.C.

**This view seems to have been propounded by Speusippus, Plato's nephew and disciple, who succeeded him as head of the Academy from 347–339 B.C. A similar view had been espoused by Antisthenes (ca. 455–ca. 360 B.C.), the friend of Socrates and precursor of the Cynic School.

***This is probably a reference to the view stated by Plato in *Philebus* 13b.

†No particular proponents of this view can be identified, but they are also discussed in Plato's *Philebus* 53c–55c.

††Arguments (b) and (c) had probably been used by Speusippus and before him perhaps by Antisthenes.

†††This argument may come from Archytas, a Pythagorean philosopher, mathematician, ruler of Tarentum, and friend of Plato, in the first half of the fourth century B.C.

that (1) pleasure is not a good, or (3) that it is not the highest good. In the first place, [to answer argument (1*a*) and (3),] we use the word “good” in two senses: a thing may be good in the unqualified sense, or “good” for a particular person. Hence the term has also two meanings when applied to natural states and characteristics [of persons], and consequently also when applied to their motions and processes. This means that motions and processes which are generally held to be bad are partly bad without qualification, but not bad for a particular person, and even desirable for him; and partly not even desirable for a particular person except on occasion and for a short time, though they are not desirable in an unqualified sense. Others again are not even pleasures, but only appear to be, for example, all processes accompanied by pain and undergone for remedial purposes, such as the processes to which the sick are subjected.

Secondly, the good has two aspects: it is both an activity and a characteristic. Now, the processes which restore us to our natural characteristic condition are only incidentally pleasant; but the activity which is at work when our appetites [want to see us restored] is the activity of that part of our characteristic condition and natural state which has been left unimpaired. For that matter, there are pleasures which do not involve pain and appetite (e.g., the activity of studying) and we experience them when there is nothing deficient in our natural state. [That processes of restoration are only incidentally pleasant] is shown by the fact that the pleasant things which give us joy while our natural state is being replenished are not the same as those which give us joy once it has been restored. Once restored, we feel joy at what is pleasant in the unqualified sense, but while the replenishment goes on, we enjoy even its opposite: for instance, we enjoy sharp and bitter things, none of which are pleasant either by nature or in the unqualified sense. Consequently, the pleasures [derived from them, too, are not pleasant either by nature or in the unqualified sense], for the difference that exists between various pleasant things is the same as that which is found between the pleasures derived from them.

In the third place, there is no need to believe that there exists something better than pleasure which is different from it, just as, according to some, the end is better than the process which leads to it. For pleasures are not processes, nor do all pleasures involve processes: they are activities and an end, and they result not from the process of development we undergo, but from the use we make of the powers we have. Nor do all pleasures have an end other than themselves; that is only true of the pleasures of those who are being led to the perfection of their natural states. For that reason, it is not correct, either, to say that pleasure is a process perceived [by the subject]: one should rather call it an “activity of our characteristic condition as determined by our natural state,” and instead of “perceived” we should call it “unobstructed.” (There are some who believe pleasure to be process on the ground that it is good in the true sense of the word, for they think that activity is process, but it is, as a matter of fact, different.)

The argument (2*b*) that pleasures [are bad, because] some pleasant things may cause disease, is like arguing that wholesome things are bad, because some of them are bad for making money. Both pleasant and wholesome things are bad in the relative senses mentioned, but that does not make them bad in themselves: even studying is occasionally harmful to health.

Also, (1*d*) neither practical wisdom nor any characteristic is obstructed by the pleasure arising from it, but only by alien pleasures extraneous to it. The pleasures arising from study and learning will only intensify study and learning, [but they will never obstruct it].

The argument (1*e*) that no pleasure is the result of an art makes good sense. For art never produces any activity at all: it produces the capacity for the activity.

Nevertheless, the arts of perfume-making as well as of cooking are generally regarded as arts of pleasure.

The arguments (1*b*) that a self-controlled person avoids pleasure, (1*c*) that a man of practical wisdom pursues a life free from pain, and (1*f*) that children and beasts pursue pleasure, are all refuted by the same consideration. We have stated in what sense pleasures are good without qualification and in what sense not all pleasures are good. These last mentioned are the pleasures which beasts and children pursue, while a man of practical wisdom wants to be free from the pain which they imply. They are the pleasures that involve appetite and pain, i.e., the bodily pleasures—for they are of this sort—and their excesses, in terms of which a self-indulgent man is self-indulgent. That is why a self-controlled man avoids these pleasures. But there are pleasures even for the self-controlled.

13. The Views Discussed: (3) Is Pleasure the Highest Good?: To continue: there is general agreement that pain is bad and must be avoided. One kind of pain is bad in the unqualified sense, and another kind is bad, because in some way or other it obstructs us. Now, the opposite of a thing to be avoided—in the sense that it must be avoided and is bad—is good. It follows, therefore, necessarily that pleasure is a good. Speusippus tried to solve the question by saying that, just as the greater is opposed both to the less and to the equal, [so pleasure is opposed both to pain and to the good]. But this solution does not come out correctly: surely, he would not say that pleasure is essentially a species of evil.

But (2*a*) even if some pleasures are bad, it does not mean that the highest good cannot be some sort of pleasure, just as the highest good may be some sort of knowledge, even though some kinds of knowledge are bad. Perhaps we must even draw the necessary conclusion that it is; for since each characteristic has its unobstructed activities, the activity of all characteristics or of one of them—depending on whether the former or the latter constitutes happiness—if unobstructed, must be the most desirable of all. And this activity is pleasure. Therefore, the highest good is some sort of pleasure, despite the fact that most pleasures are bad and, if you like, bad in the unqualified sense of the word. It is for this reason that everyone thinks that the happy life is a pleasant life, and links pleasure with happiness. And it makes good sense this way: for no activity is complete and perfect as long as it is obstructed, and happiness is a complete and perfect thing. This is why a happy man also needs the goods of the body, external goods, and the goods of fortune, in order not to be obstructed by their absence.

But those who assert* that a man is happy even on the rack and even when great misfortunes befall him, provided that he is good, are talking nonsense, whether they know it or not. Since happiness also needs fortune, some people regard good fortune as identical with happiness. But that is not true, for even good fortune, if excessive, can be an obstruction; perhaps we are, in that case, no longer justified in calling it “good fortune,” for its definition is determined by its relation to happiness.

Also, the fact that all beasts and all men pursue pleasure is some indication that it is, in a sense, the highest good:

There is no talk that ever quite dies down,
if spread by many men. . . .

But since no single nature and no single characteristic condition is, or is regarded, as the best [for all], people do not all pursue the same pleasure, yet all pursue pleasure. Perhaps

*The Cynics are probably meant.

they do not even pursue the pleasure which they think or would say they pursue, but they all pursue the same [thing], pleasure. For everything has by nature something divine about it. But the bodily pleasures have arrogated the name “pleasure” unto themselves as their own private possession, because everyone tends to follow them and participates in them more frequently than in any others. Accordingly, since these are the only pleasures with which they are familiar, people think they are the only ones that exist.

1154^a It is also evident that if pleasure, i.e., the activity [of our faculties], is not good, it will be impossible for a happy man to live pleasantly. For to what purpose would he need pleasure, if it were not a good and if it is possible that a happy man’s life is one of pain? For if pain is neither good nor bad, pleasure is not, either: so why should he avoid it? Surely, the life of a morally good man is no pleasanter [than that of anyone else], if his activities are not more pleasant.

14. *The Views Discussed: (2) Are Most Pleasures Bad?*: The subject of the pleasures of the body demands the attention of the proponents of the view that, though some pleasures—for instance, the noble pleasures—are highly desirable, the pleasures of the body—that is, the pleasures which are the concern of the self-indulgent man—are not. If that is true, why then are the pains opposed to them bad? For bad has good as its opposite. Is it that the necessary pleasures are good in the sense in which anything not bad is good? Or are they good up to a certain point? For all characteristics and motions which cannot have an excess of good cannot have an excess of pleasure, either; but those which can have an excess of good can also have an excess of pleasure. Now, excess is possible in the case of the goods of the body, and it is the pursuit of excess, but not the pursuit of necessary pleasures, that makes a man bad. For all men get some kind of enjoyment from good food, wine, and sexual relations, but not everyone enjoys these things in the proper way. The reverse is true of pain: a bad person does not avoid an excess of it, but he avoids it altogether. For the opposite of an excess is pain only for the man who pursues the excess.

It is our task not only to say what is true, but also to state what causes error, since that helps carry conviction. For when we can give a reasoned explanation why something which appears to be true is, in fact, not true, it makes us give greater credence to what is true. Accordingly, we must now explain why the pleasures of the body appear to be more desirable.

The first reason, then, is that pleasure drives out pain. When men experience an excess of pain, they pursue excessive pleasure and bodily pleasure in general, in the belief that it will remedy the pain. These remedial [pleasures] become very intense—and that is the very reason why they are pursued—because they are experienced in contrast with their opposite.

As a matter of fact, these two reasons which we have stated also explain why pleasure is not regarded as having any moral value: some pleasures are the actions that spring from a bad natural state—either congenitally bad, as in the case of a beast, or bad by habit, as in the case of a bad man—while other pleasures are remedial and indicate a deficient natural state, and to be in one’s natural state is better than to be moving toward it. But since the remedial pleasures only arise in the process of reaching the perfected state, they are morally good only incidentally.

The second reason is that the pleasures of the body are pursued because of their intensity by those incapable of enjoying other pleasures. Take, for example, those who induce themselves to be thirsty. There is no objection to this practice, if the pleasures are harmless; but if they are harmful, it is bad. For many people have nothing else to

give them joy, and because of their nature, it is painful for them to feel neither [pleasure nor pain]. Actually, animal nature is under a constant strain, as the students of natural science attest when they say that seeing and hearing are painful, but [we do not feel the pain because,] as they assert, we have become accustomed to it. Similarly, whereas the growing process [we go through] in our youth puts us into the same [exhilarated] state as that of a drunken man, and [makes] youth the age of pleasure, excitable natures, on the other hand, always need remedial action: as a result of [the excess of black bile in their] constitutional blend, their bodies are exposed to constant gnawing sensations, and they are always in a state of vehement desire. Now, since pain is driven out by the pleasure opposed to it or by any strong pleasure at all, excitable people become self-indulgent and bad. 5 10 15

Pleasures unattended by pain do not admit of excess. The objects of these pleasures are what is pleasant by nature and not what is incidentally pleasant. By “things incidentally pleasant” I mean those that act as remedies. For since it is through some action of that part of us which has remained sound that a cure is effected, the remedy is regarded as being pleasant. But [pleasant by nature it is not]: pleasant by nature are those things which produce the action of an unimpaired natural state. 20

There is no single object that continues to be pleasant forever, because our nature is not simple but contains another natural element, which makes us subject to decay. Consequently, whenever one element does something, it runs counter to the nature of the other; and whenever the two elements are in a state of equilibrium, the act performed seems neither painful nor pleasant. If there is a being with a simple nature, the same action will always be the most pleasant to him. That is why the divinity always enjoys one single and simple pleasure: for there is not only an activity of motion but also an activity of immobility, and pleasure consists in rest rather than in motion. But “change in all things is pleasant,” as the poet has it, because of some evil in us. For just as a man who changes easily is bad, so also is a nature that needs to change. The reason is that such a nature is not simple and not [entirely] good. 25 30

This completes our discussion of moral strength and moral weakness, and of pleasure and pain. We have stated what each of them is and in what sense some of them are good and some bad. It now remains to talk about friendship.

* * *

BOOK X

* * *

6. *Happiness and Activity*: Now that we have completed our discussion of the virtues, and of the different kinds of friendship and pleasure, it remains to sketch an outline of happiness, since, as we assert, it is the end or goal of human [aspirations]. Our account will be more concise if we recapitulate what we have said so far. 1176^a 30

We stated, then, that happiness is not a characteristic; if it were, a person who passes his whole life in sleep, vegetating like a plant, or someone who experiences the greatest misfortunes could possess it. If, then, such a conclusion is unacceptable, we must, in accordance with our earlier discussion, classify happiness as some sort of activity. Now, some activities are necessary and desirable only for the sake of something else, while others are desirable in themselves. Obviously, happiness must be classed as an activity desirable in itself and not for the sake of something else. For happiness lacks 35 1176^b 5

nothing and is self-sufficient. Activities desirable in themselves are those from which we seek to derive nothing beyond the actual exercise of the activity. Actions in conformity with virtue evidently constitute such activities; for to perform noble and good deeds is something desirable for its own sake.

Pleasant amusements, too, [are desirable for their own sake]. We do not choose
 10 them for the sake of something else, since they lead to harm rather than good when we become neglectful of our bodies and our property. But most of those who are considered happy find an escape in pastimes of this sort, and this is why people who are well versed in such pastimes find favor at the courts of tyrants; they make themselves pleasant by
 15 providing what the tyrants are after, and what they want is amusement. Accordingly, such amusements are regarded as being conducive to happiness, because men who are in positions of power devote their leisure to them. But perhaps such persons cannot be [regarded as] evidence. For virtue and intelligence, which are the sources of morally good activities, do not consist in wielding power. Also, if these men, who have never
 20 tasted pure and generous pleasure, find an escape in the pleasures of the body, this is no sufficient reason for thinking that such pleasures are in fact more desirable. For children, too, think that what they value is actually the best. It is, therefore, not surprising that as children apparently do not attach value to the same things as do adults, so bad men do not attach value to the same things as do good men. Accordingly, as we
 25 have stated repeatedly, what is valuable and pleasant to a morally good man actually is valuable and pleasant. Each individual considers that activity most desirable which corresponds to his own proper characteristic condition, and a morally good man, of course, so considers activity in conformity with virtue.

Consequently, happiness does not consist in amusement. In fact, it would be strange if our end were amusement, and if we were to labor and suffer hardships all our life long
 30 merely to amuse ourselves. For, one might say, we choose everything for the sake of something else—except happiness; for happiness is an end. Obviously, it is foolish and all too childish to exert serious efforts and toil for purposes of amusement. Anacharsis* seems to be right when he advises to play in order to be serious; for amusement is a form
 35 of rest, and since we cannot work continuously we need rest. Thus rest is not an end, for
 1177^a we take it for the sake of [further] activity. The happy life is regarded as a life in conformity with virtue. It is a life which involves effort and is not spent in amusement.

Moreover, we say that what is morally good is better than what is ridiculous and brings amusement, and the better the organ or man—whichever may be involved in a
 5 particular case—the greater the moral value of the activity. But the activity of the better organ or the better man is in itself superior and more conducive to happiness.

Furthermore, any person at all, even a slave, can enjoy bodily pleasures no less than the best of men. But no one would grant that a slave has a share in happiness any more than that he lives a life of his own. For happiness does not consist in pastimes of
 10 this sort, but in activities that conform with virtue, as we have stated earlier.

7. Happiness, Intelligence, and the Contemplative Life: Now, if happiness is activity in conformity with virtue, it is to be expected that it should conform with the highest virtue, and that is the virtue of the best part of us. Whether this is intelligence or something else which, it is thought, by its very nature rules and guides us and which

*Anacharsis, who is said to have lived early in the sixth century B.C., was a Scythian whose travels all over the Greek world brought him a reputation for wisdom. He allegedly met Solon at Athens and was numbered in some ancient traditions among the Seven Wise Men.

gives us our notions of what is noble and divine; whether it is itself divine or the most divine thing in us; it is the activity of this part [when operating] in conformity with the excellence or virtue proper to it that will be complete happiness. That it is an activity concerned with theoretical knowledge or contemplation has already been stated. 15

This would seem to be consistent with our earlier statements as well as the truth. For this activity is not only the highest—for intelligence is the highest possession we have in us, and the objects which are the concern of intelligence are the highest objects of knowledge—but also the most continuous: we are able to study continuously more easily than to perform any kind of action. Furthermore, we think of pleasure as a necessary ingredient in happiness. Now everyone agrees that of all the activities that conform with virtue activity in conformity with theoretical wisdom is the most pleasant. At any rate, it seems that [the pursuit of wisdom or] philosophy holds pleasures marvelous in purity and certainty, and it is not surprising that time spent in knowledge is more pleasant than time spent in research. Moreover, what is usually called “selfsufficiency” will be found in the highest degree in the activity which is concerned with theoretical knowledge. Like a just man and any other virtuous man, a wise man requires the necessities of life; once these have been adequately provided, a just man still needs people toward whom and in company with whom to act justly, and the same is true of a self-controlled man, a courageous man, and all the rest. But a wise man is able to study even by himself, and the wiser he is the more is he able to do it. Perhaps he could do it better if he had colleagues to work with him, but he still is the most self-sufficient of all. Again, study seems to be the only activity which is loved 1177^b for its own sake. For while we derive a greater or a smaller advantage from practical pursuits beyond the action itself, from study we derive nothing beyond the activity of studying. Also, we regard happiness as depending on leisure; for our purpose in being busy is to have leisure, and we wage war in order to have peace. Now, the practical virtues are activated in political and military pursuits, but the actions involved in these pursuits seem to be unlesirely. This is completely true of military pursuits, since no one chooses to wage war or foments war for the sake of war; he would have to be utterly bloodthirsty if he were to make enemies of his friends simply in order to have battle and slaughter. But the activity of the statesman, too, has no leisure. It attempts to gain advantages beyond political action, advantages such as political power, prestige, or at least happiness for the statesman himself and his fellow citizens, and that is something other than political activity: after all, the very fact that we investigate politics shows that it is not the same [as happiness]. Therefore, if we take as established (1) that political and military actions surpass all other actions that conform with virtue in nobility and grandeur; (2) that they are unlesirely, aim at an end, and are not chosen for their own sake; (3) that the activity of our intelligence, inasmuch as it is an activity concerned with theoretical knowledge, is thought to be of greater value than the others, aims at no end beyond itself, and has a pleasure proper to itself—and pleasure increases activity; and (4) that the qualities of this activity evidently are self-sufficiency, leisure, as much freedom from fatigue as a human being can have, and whatever else falls to the lot of a supremely happy man; it follows that the activity of our intelligence constitutes the complete happiness of man, provided that it encompasses a complete span of life; 25 for nothing connected with happiness must be incomplete.

However, such a life would be more than human. A man who would live it would do so not insofar as he is human, but because there is a divine element within him. This divine element is as far above our composite nature* as its activity is above the active

*Human beings, consisting of soul and body, i.e., of form and matter, are composite beings, whereas the divine, being all intelligence, is not.

exercise of the other, [i.e., practical,] kind of virtue. So if it is true that intelligence is
 30 divine in comparison with man, then a life guided by intelligence is divine in comparison
 with human life. We must not follow those who advise us to have human thoughts,
 since we are [only] men, and mortal thoughts, as mortals should; on the contrary, we
 1178^a should try to become immortal as far as that is possible and do our utmost to live in
 accordance with what is highest in us. For though this is a small portion [of our nature],
 it far surpasses everything else in power and value. One might even regard it as each
 man's true self, since it is the controlling and better part. It would, therefore, be strange
 if a man chose not to live his own life but someone else's.

Moreover, what we stated before will apply here, too: what is by nature proper to
 5 each thing will be at once the best and the most pleasant for it. In other words, a life
 guided by intelligence is the best and most pleasant for man, inasmuch as intelligence,
 above all else, is man. Consequently, this kind of life is the happiest.

8. *The Advantages of the Contemplative Life*: A life guided by the other kind of
 virtue, [the practical,] is happy in a secondary sense, since its active exercise is confined
 10 to man. It is in our dealings with one another that we perform just, courageous, and other
 virtuous acts, when we observe the proper kind of behavior toward each man in private
 transactions, in meeting his needs, in all manner of actions, and in our emotions, and all
 of these are, as we see, peculiarly human. Moreover, some moral acts seem to be deter-
 mined by our bodily condition, and virtue or excellence of character seems in many ways
 closely related to the emotions. There is also a close mutual connection between practi-
 cal wisdom and excellence of character, since the fundamental principles of practical
 20 wisdom are determined by the virtues of character, while practical wisdom determines
 the right standard for the moral virtues. The fact that these virtues are also bound up with
 the emotions indicates that they belong to our composite nature, and the virtues of our
 composite nature are human virtues; consequently, a life guided by these virtues and the
 happiness [that goes with it] are likewise human. The happiness of the intelligence,
 25 however, is quite separate [from that kind of happiness]. That is all we shall say about it
 here, for a more detailed treatment lies beyond the scope of our present task.

It also seems that such happiness has little need of external trimmings, or less
 need than moral virtue has. Even if we grant that both stand in equal need of the neces-
 sities of life, and even if the labors of a statesman are more concerned with the needs
 30 of our body and things of that sort—in that respect the difference between them may
 be small—yet, in what they need for the exercise of their activities, their difference
 will be great. A generous man will need money to perform generous acts, and a just
 man will need it to meet his obligations. For the mere wish to perform such acts is
 35 inscrutable, and even an unjust man can pretend that he wishes to act justly. And a
 courageous man will need strength if he is to accomplish an act that conforms with his
 1178^b virtue, and a man of self-control the possibility of indulgence. How else can he or any
 other virtuous man make manifest his excellence? Also, it is debatable whether the
 moral purpose or the action is the more decisive element in virtue, since virtue depends
 on both. It is clear of course that completeness depends on both. But many things
 5 are needed for the performance of actions, and the greater and nobler the actions the
 more is needed. But a man engaged in study has no need of any of these things, at least
 not for the active exercise of studying; in fact one might even go so far as to say
 that they are a hindrance to study. But insofar as he is human and lives in the society of
 his fellow men, he chooses to act as virtue demands, and accordingly, he will need
 10 externals for living as a human being.

A further indication that complete happiness consists in some kind of contemplative activity is this. We assume that the gods are in the highest degree blessed and happy. But what kind of actions are we to attribute to them? Acts of justice? Will they not look ridiculous making contracts with one another, returning deposits, and so forth? Perhaps acts of courage—withstanding terror and taking risks, because it is noble to do so? Or generous actions? But to whom will they give? It would be strange to think that they actually have currency or something of the sort. Acts of self-control? What would they be? Surely, it would be in poor taste to praise them for not having bad appetites. If we went through the whole list we would see that a concern with actions is petty and unworthy of the gods. Nevertheless, we all assume that the gods exist and, consequently, that they are active; for surely we do not assume them to be always asleep like Endymion.* Now, if we take away action from a living being, to say nothing of production, what is left except contemplation? Therefore, the activity of the divinity which surpasses all others in bliss must be a contemplative activity, and the human activity which is most closely akin to it is, therefore, most conducive to happiness.

This is further shown by the fact that no other living being has a share in happiness, since they all are completely denied this kind of activity. The gods enjoy a life blessed in its entirety; men enjoy it to the extent that they attain something resembling the divine activity; but none of the other living beings can be happy, because they have no share at all in contemplation or study. So happiness is coextensive with study, and the greater the opportunity for studying, the greater the happiness, not as an incidental effect but as inherent in study; for study is in itself worthy of honor. Consequently, happiness is some kind of study or contemplation.

But we shall also need external well-being, since we are only human. Our nature is not self-sufficient for engaging in study: our body must be healthy and we must have food and generally be cared for. Nevertheless, if it is not possible for a man to be supremely happy without external goods, we must not think that his needs will be great and many in order to be happy; for self-sufficiency and moral action do not consist in an excess [of possessions]. It is possible to perform noble actions even without being ruler of land and sea; a man's actions can be guided by virtue also if his means are moderate. That this is so can be clearly seen in the fact that private individuals evidently do not act less honorably but even more honorably than powerful rulers. It is enough to have moderate means at one's disposal, for the life of a man whose activity is guided by virtue will be happy.

Solon certainly gave a good description of a happy man, when he said that he is a man moderately supplied with external goods, who had performed what he, Solon, thought were the noblest actions, and who had lived with self-control. For it is possible to do what one should even with moderate possessions. Also Anaxagoras, it seems, did not assume that a happy man had to be rich and powerful. He said that he would not be surprised if a happy man would strike the common run of people as strange, since they judge by externals and perceive nothing but externals. So it seems that our account is in harmony with the opinion of the wise.

Now, though such considerations carry some conviction, in the field of moral action truth is judged by the actual facts of life, for it is in them that the decisive element lies. So we must examine the conclusions we have reached so far by applying them to the actual facts of life: if they are in harmony with the facts we must accept them, and if they clash we must assume that they are mere words.

*Supposedly the most beautiful of men, Endymion was loved by the Moon, who cast him into a perpetual sleep that she might descend and embrace him each night.

A man whose activity is guided by intelligence, who cultivates his intelligence and keeps it in the best condition, seems to be most beloved by the gods. For if the gods have any concern for human affairs—and they seem to have—it is to be expected that they rejoice in what is best and most akin to them, and that is our intelligence; it is also to be expected that they requite with good those who most love and honor intelligence, as being men who care for what is dear to the gods and who act rightly and nobly. That a wise man, more than any other, has all these qualities is perfectly clear. Consequently, he is the most beloved by the gods, and as such he is, presumably, also the happiest. Therefore, we have here a further indication that a wise man attains a higher degree of happiness than anyone.

HELLENISTIC AND ROMAN PHILOSOPHY

Following the death of Alexander the Great in 323 B.C., three of his generals, Ptolemy, Seleucus, and Antigonus, carved up the empire he had created. For the next three centuries the descendants of these three men ruled the eastern Mediterranean world. By 30 B.C., with the Roman Emperor Octavian's defeat of Anthony and Cleopatra and the annexation of Egypt, the period of Greek rule was over. Real power in the area had shifted westward to emerging Rome.

This shift from Greek to Roman authority did not happen without social and political turmoil, and the philosophies that developed during this period reflect that turmoil. The emphasis now was not on complete systems of thought, such as those proposed by Plato and Aristotle. In their place were theories focusing on the practical questions of the good life for individuals. In a world that seemed more and more chaotic and uncontrollable, philosophers began to seek personal salvation more than comprehensive theories. Even the Platonic Academy and the Aristotelian Lyceum, which continued for centuries, moved from the constructive doctrines of their founders to more narrowly defined critical issues.

The roots of the Epicurean school can be traced back to an early Socratic school, the Cyrenaics. The Cyrenaic school was founded by one of Socrates' associates and admirers, Aristippus of Cyrene, from Libya, in northern Africa. The Cyrenaics disparaged speculative philosophy and extolled the pleasure of the moment. But, following Aristippus, they maintained that the purest pleasure derives from self-mastery and the philosophic life. Only philosophy can protect human beings from passion, which inevitably brings suffering. While despising popular opinion, the Cyrenaics did believe that custom, law, and

altruism contributed to long-range pleasure. The Cyrenaic philosophy, with its understanding of the good life as enjoyment of stable pleasures, led to the development of the Epicurean school as expressed by Epicurus.

The history of the Stoic school begins with the thought of Socrates' follower Antisthenes. Antisthenes, a rhetorician with an Athenian father and a Phrygian, non-Greek mother, had been a teacher before he met Socrates, who made a profound impression on him. It seems to have been Socrates' character—his self-control and self-sufficiency, his indifference to winter cold, his serenely ironic superiority in every experience, and the opinions of others (see the *Apology*)—that struck Antisthenes with the force of revelation. What he learned from Socrates was neither a metaphysic nor even a philosophic method but, as he put it, "to live with myself." When he disposed of his possessions, keeping only a ragged old coat, Socrates is said to have taunted him: "I see your vanity through the holes of your coat." Antisthenes founded a school whose members acquired the nickname of "Cynics" <*kynikos*>, Greek for "doglike." The Cynics slept on the ground, neglected their clothes, let their beards grow to unusual lengths, and despised the conventions of society, insisting that virtue and happiness consist of self-control and independence. They believed that human dignity was independent of human laws and customs.

Of Antisthenes' Cynic disciples, none was more famous than Diogenes, who went about carrying a lantern in daylight and, when asked why, would reply, "I am looking for an honest man." He made his home in a tub. His eccentric behavior

Laocoön, second century B.C., by Hagesandros, Polydoros, and Athenodoros, all of Rhodes. The Trojan priest Laocoön protested against bringing the Greeks' wooden horse into the city. According to one version of the legend, he was punished for his interference when Apollo sent two serpents to kill him and his sons. The Hellenistic 2nd Roman philosophers sought relief from tortured emotions such as this work depicts. (Hirmer Fotoarchiv)

attracted the attention of even Alexander the Great, who, on visiting him, asked whether there was anything at all that he could do to please him. Diogenes replied: "Yes, get out of my sunlight."

Emphasizing self-control and independence, and locating human dignity outside law and convention, the Cynicism of Antisthenes and Diogenes flowed like a tributary into Stoicism. Stoicism, in turn, became the dominant philosophy of the Roman Empire.

A third Hellenistic school of philosophy, Skepticism, also had its roots in Socrates' teachings: specifically, in Socrates' repeated claim that he did not know anything. Based on the work of Pyrrho of Elis (ca. 360–270 B.C.), this movement stressed the contradictory nature of knowledge and advocated suspending judgment and achieving an attitude of detachment.

The last great movement of ancient philosophy was Neoplatonism. The leader of this return to Platonic concepts, Plotinus (A.D. 204–270), did not lack enthusiasm, but he was, nevertheless, more remote from classical Greek attitudes than were the Hellenistic philosophers. He extolled the spirit to the point of saying he was ashamed to have a body; his fervor was entirely mystical, and he longed, to cite his famous words, to attain "the flight of the Alone to the Alone." Thus he perfected the less classical tendencies of Plato's thought, merging those tendencies with Neopythagoreanism and with Oriental notions such as the emanations from the One.

In A.D. 529, Plato's Academy was closed by Emperor Justinian, bringing to an end a millennium of Greek and Roman philosophy.

For clear, concise introductions to the Hellenistic and Roman philosophers, see Frederick Copleston, "Post-Aristotelian Philosophy," in his *A History of Philosophy: Volume I, Greece & Rome, Part II* (Garden City, NY: Image Books, 1962), and D.W. Hamlyn, "Greek Philosophy after Aristotle," in D.J. O'Connor, ed., *A Critical History of Western Philosophy* (New York: The Free Press, 1964). Eduard Zeller, *The Stoics, Epicureans, and Sceptics*, translated by Oswald J. Reichel (New York: Russell & Russell, 1962); Émile Bréhier, *The Hellenistic and Roman Age*, translated by Wade Baskin (Chicago: University of Chicago Press, 1965); A.A. Long, *Hellenistic Philosophy: Stoics, Epicureans, Sceptics* (New York: Scribners, 1974); R.W. Sharples, *Stoics, Epicureans and Sceptics* (Oxford: Routledge, 1996); John Dillon, *The Middle Platonists, 80 B.C. to A.D. 220* (Ithaca, NY: Cornell University Press, 1996); and Mark Morford, *Roman Philosophers* (London: Routledge, 2002), are all solid histories of the period. A.A. Long and D.N. Sedley, eds., *The Hellenistic Philosophers*, two vols. (Cambridge: Cambridge University Press, 1987) and Keimpe Algra, et al., eds., *The Cambridge History of Hellenistic Philosophy* (Cambridge: Cambridge University Press, 1999) provide source material and discussions, while Jacques Brunschwig, *Papers in Hellenistic Philosophy*, translated by Janet Lloyd (Cambridge: Cambridge University Press, 1994) and Terence Irwin, ed., *Hellenistic Philosophy* (Hamden, CT: Garland Publishing, 1995) give technical expositions of a number of important issues. For an interesting comparative approach to the Hellenistic thinkers, see Martha C. Nussbaum, *The Therapy of Desire: Theory and Practice in Hellenistic Ethics* (Princeton: Princeton University Press, 1994).

EPICURUS

341–270 B.C.

Like Pythagoras, Epicurus was born on the Greek island of Samos. At eighteen he went to Athens for a year, then joined his father in Colophon, the city where Xenophanes had been born. He studied the writings of Democritus and eventually set up his own school on the island of Lesbos. From there he moved to the Hellespont and, finally, to Athens in 307 B.C. As he moved from place to place, many of his students followed him. In Athens he established a community known as the “Garden,” where he spent the rest of his life teaching and writing.

Epicurus’s community welcomed people of all classes and of both sexes. The school required no fee from students, accepting what each individual was able and willing to pay. Epicurus himself was almost worshiped by his disciples, and members of his group had to swear an oath: “I will be faithful to Epicurus in accordance with whom I have made it my choice to live.”* Among the later followers of Epicurus’s thought, the Roman poet Lucretius (98–55 B.C.) considered him to be a god. Yet Epicurus was not overbearing or authoritarian. According to all accounts, he was kind and generous, treating his followers as friends, not subordinates. While dying in agony from a urinary obstruction, Epicurus wrote a letter that illustrates his gracious spirit. The extant portion includes these words to his friend Idomeneus: “I have a bulwark against all this pain from the joy in my soul at the memory of our conversations together.”**

Epicurus wrote over three hundred volumes, but all that has survived are some fragments, three complete letters, and a short treatise summarizing his views. These surviving works provide an understanding of Epicurus’s physics and ethics

*From Introduction To Greek Philosophy by J.V. Luce (C) 1992. Reprinted by kind permission of Thames & Hudson Ltd., London.

**Ibid.

and give some sense of his psychology and theory of knowledge. Epicurus's first letter, *To Herodotus*, explains his atomistic theory. Like Democritus, Epicurus asserts that reality is composed of atoms and the void. But unlike Democritus, whose atomism is deterministic, Epicurus broaches the notion that atoms sometimes inexplicably "swerve." As atoms "fell downward" through the void, some of them swerved from their paths and collided with other atoms, setting off a chain reaction that eventually led to the world as we know it. Epicurus goes on to explore the implications of this theory for perception and knowledge.

The second letter, *To Pythocles*, on astronomy and meteorology, is of questionable origin and adds little to our understanding of Epicurus's thought. But the third letter, *To Menoeceus*, together with the short work *Principle Doctrines* explains his central ethical theory. Epicurus declares that pleasure is the highest good, though some pleasures are unnatural and unnecessary. In contrast to the modern understanding of the word "epicurean," Epicurus opposed exotic meals and profuse consumption. Such indulgences never bring permanent pleasure and frequently lead to its opposite: pain. Instead Epicurus advocates enjoying only the "natural" pleasures—those most likely to lead to contentment and repose. Epicurus's ethical works are reprinted here, complete, in the Russel M. Geer translations.

* * *

The classic secondary work on Epicurus is Cyril Bailey, *The Greek Atomists and Epicurus* (Oxford: Clarendon Press, 1928). Norman Wentworth De Witt, *Epicurus and His Philosophy* (Minneapolis: University of Minnesota Press, 1954), provides an interesting interpretation—one which John M. Rist, *Epicurus: An Introduction* (Cambridge: Cambridge University Press, 1972), contests. A.E. Taylor, *Epicurus* (1911; reprinted New York: Books for Libraries Press, 1969); G.K. Stradach, *The Philosophy of Epicurus* (Evanston, IL: Northwestern University Press, 1963); and Diskin Clay, *Lucretius and Epicurus* (Ithaca, NY: Cornell University Press, 1983), give helpful overviews. A.J. Festugière, *Epicurus and His Gods*, translated by C.W. Chilton (1955; reprinted London: Russell, 1969); James H. Nichols, Jr., *Epicurean Political Philosophy* (Ithaca, NY: Cornell University Press, 1976); and Tim O'Keefe, *Epicurus on Freedom* (Cambridge: Cambridge University Press, 2005), deal with specific topics.

LETTER TO MENOECEUS

I. INTRODUCTION

Epicurus to Menoeceus, greeting.

Let no young man delay the study of philosophy, and let no old man become weary of it; for it is never too early nor too late to care for the well-being of the soul. The man who says that the season for this study has not yet come or is already past is like the man who says it is too early or too late for happiness. Therefore, both the young and the old should study philosophy, the former so that as he grows old he may still retain the happiness of youth in his pleasant memories of the past, the latter so that although he is old he may at the same time be young by virtue of his fearlessness of the future. We must therefore study the means of securing happiness, since if we have it we have everything, but if we lack it we do everything in order to gain it.

II. BASIC TEACHINGS

A. THE GODS

The gods exist; but it is impious to accept the common beliefs about them. They have no concern with men.

Practice and study without ceasing that which I was always teaching you, being assured that these are the first principles of the good life. After accepting god as the immortal and blessed being depicted by popular opinion, do not ascribe to him anything in addition that is alien to immortality or foreign to blessedness, but rather believe about him whatever can uphold his blessed immortality. The gods do indeed exist, for our perception of them is clear; but they are not such as the crowd imagines them to be, for most men do not retain the picture of the gods that they first receive. It is not the man who destroys the gods of popular belief who is impious, but he who describes the gods in the terms accepted by the many. For the opinions of the many about the gods are not perceptions but false suppositions. According to these popular suppositions, the gods send great evils to the wicked, great blessings to the righteous, for they, being always well disposed to their own virtues, approve those who are like themselves, regarding as foreign all that is different.*

B. DEATH

Philosophy, showing that death is the end of all consciousness, relieves us of all fear of death. A life that is happy is better than one that is merely long.

*The ambiguous rendition of the last part of this sentence is intentional. "They" may be the gods, who approve men like themselves, or men, who approve gods.

Epicurus, *Letters, Principal Doctrines, and Vatican Sayings*, translated by Russel M. Geer (Pearson/ Library of the Liberal Arts, 1964).

Accustom yourself to the belief that death is of no concern to us, since all good and evil lie in sensation and sensation ends with death. Therefore the true belief that death is nothing to us makes a mortal life happy, not by adding to it an infinite time, but by taking away the desire for immortality. For there is no reason why the man who is thoroughly assured that there is nothing to fear in death should find anything to fear in life. So, too, he is foolish who says that he fears death, not because it will be painful when it comes, but because the anticipation of it is painful; for that which is no burden when it is present gives pain to no purpose when it is anticipated. Death, the most dreaded of evils, is therefore of no concern to us; for while we exist death is not present, and when death is present we no longer exist. It is therefore nothing either to the living or to the dead since it is not present to the living, and the dead no longer are.

But men in general sometimes flee death as the greatest of evils, sometimes long for it as a relief from the evils of life.

The wise man neither renounces life nor fears its end; for living does not offend him, nor does he suppose that not to live is in any way an evil. As he does not choose the food that is most in quantity but that which is most pleasant, so he does not seek the enjoyment of the longest life but of the happiest.

He who advises the young man to live well, the old man to die well, is foolish, not only because life is desirable, but also because the art of living well and the art of dying well are one. Yet much worse is he who says that it is well not to have been born, but once born, be swift to pass through Hades' gates.

If a man says this and really believes it, why does he not depart from life? Certainly the means are at hand for doing so if this really be his firm conviction. If he says it in mockery, he is regarded as a fool among those who do not accept his teaching.

Remember that the future is neither ours nor wholly not ours, so that we may neither count on it as sure to come nor abandon hope of it as certain not to be.

III. THE MORAL THEORY

A. PLEASURE AS THE MOTIVE

The necessary desires are for health of body and peace of mind; if these are satisfied, that is enough for the happy life.

You must consider that of the desires some are natural, some are vain, and of those that are natural, some are necessary, others only natural. Of the necessary desires, some are necessary for happiness, some for the ease of the body, some for life itself. The man who has a perfect knowledge of this will know how to make his every choice or rejection tend toward gaining health of body and peace of mind, since this is the final end of the blessed life. For to gain this end, namely freedom from pain and fear, we do everything. When once this condition is reached, all the storm of the soul is stilled, since the creature need make no move in search of anything that is lacking, nor seek after anything else to make complete the welfare of the soul and the body. For we only feel the lack of pleasure when from its absence we suffer pain; but when we do not suffer pain, we no longer are in need of pleasure. For this reason we say that pleasure is the

beginning and the end of the blessed life. We recognize pleasure as the first and natural good; starting from pleasure we accept or reject; and we return to this as we judge every good thing, trusting this feeling of pleasure as our guide.

B. PLEASURES AND PAINS

Pleasure is the greatest good; but some pleasures bring pain, and in choosing, we must consider this.

For the very reason that pleasure is the chief and the natural good, we do not choose every pleasure, but there are times when we pass by pleasures if they are outweighed by the hardships that follow; and many pains we think better than pleasures when a greater pleasure will come to us once we have undergone the long-continued pains. Every pleasure is a good since it has a nature akin to ours; nevertheless, not every pleasure is to be chosen. Just so, every pain is an evil, yet not every pain is of a nature to be avoided on all occasions. By measuring and by looking at advantages and disadvantages, it is proper to decide all these things; for under certain circumstances we treat the good as evil, and again, the evil as good.

C. SELF-SUFFICIENCY

The truly wise man is the one who can be happy with a little.

We regard self-sufficiency as a great good, not so that we may enjoy only a few things, but so that, if we do not have many, we may be satisfied with the few, being firmly persuaded that they take the greatest pleasure in luxury who regard it as least needed, and that everything that is natural is easily provided, while vain pleasures are hard to obtain. Indeed, simple sauces bring a pleasure equal to that of lavish banquets if once the pain due to need is removed; and bread and water give the greatest pleasure when one who is in need consumes them. To be accustomed to simple and plain living is conducive to health and makes a man ready for the necessary tasks of life. It also makes us more ready for the enjoyment of luxury if at intervals we chance to meet with it, and it renders us fearless against fortune.

D. TRUE PLEASURE

The truest happiness does not come from enjoyment of physical pleasures but from a simple life, free from anxiety, with the normal physical needs satisfied.

When we say that pleasure is the end, we do not mean the pleasure of the profligate or that which depends on physical enjoyment—as some think who do not understand our teachings, disagree with them, or give them an evil interpretation—but by pleasure we mean the state wherein the body is free from pain and the mind from anxiety. Neither continual drinking and dancing, nor sexual love, nor the enjoyment of fish and whatever else the luxurious table offers brings about the pleasant life; rather, it is produced by the reason which is sober, which examines the motive for every choice and rejection, and which drives away all those opinions through which the greatest tumult lays hold of the mind.

E. PRUDENCE

Prudence or practical wisdom should be our guide.

Of all this the beginning and the chief good is prudence. For this reason prudence is more precious than philosophy itself. All the other virtues spring from it. It teaches that it is not possible to live pleasantly without at the same time living prudently, nobly, and justly, nor to live prudently, nobly, and justly without living pleasantly; for the virtues have grown up in close union with the pleasant life, and the pleasant life cannot be separated from the virtues.

IV. CONCLUSION

A. PANEGRIC* ON THE PRUDENT MAN

Whom then do you believe to be superior to the prudent man: he who has reverent opinions about the gods, who is wholly without fear of death, who has discovered what is the highest good in life and understands that the highest point in what is good is easy to reach and hold and that the extreme of evil is limited either in time or in suffering, and who laughs at that which some have set up as the ruler of all things, Necessity? He thinks that the chief power of decision lies within us, although some things come about by necessity, some by chance, and some by our own wills; for he sees that necessity is irresponsible and chance uncertain, but that our actions are subject to no power. It is for this reason that our actions merit praise or blame. It would be better to accept the myth about the gods than to be a slave to the determinism of the physicists; for the myth hints at a hope for grace through honors paid to the gods, but the necessity of determinism is inescapable. Since the prudent man does not, as do many, regard chance as a god for the gods do nothing in disorderly fashion or as an unstable cause of all things, he believes that chance does not give man good and evil to make his life happy or miserable, but that it does provide opportunities for great good or evil. Finally, he thinks it better to meet misfortune while acting with reason than to happen upon good fortune while acting senselessly; for it is better that what has been well-planned in our actions should fail than that what has been ill-planned should gain success by chance.

B. FINAL WORDS TO MENOCEUS

Meditate on these and like precepts, by day and by night, alone or with a like-minded friend. Then never, either awake or asleep, will you be dismayed; but you will live like a god among men; for life amid immortal blessings is in no way like the life of a mere mortal.

*[Formal praise for a festival]

PRINCIPAL DOCTRINES

I. That which is blessed and immortal is not troubled itself, nor does it cause trouble to another. As a result, it is not affected by anger or favor, for these belong to weakness.

II. Death is nothing to us; for what has been dissolved has no sensation, and what has no sensation is nothing to us.

III. The removal of all that causes pain marks the boundary of pleasure. Wherever pleasure is present and as long as it continues, there is neither suffering nor grieving nor both together.

IV. Continuous bodily suffering does not last long. Intense pain is very brief, and even pain that barely outweighs physical pleasure does not last many days. Long illnesses permit physical pleasures that are greater than the pain.

V. It is impossible to live pleasantly without living prudently, well, and justly, and to live prudently, well, and justly without living pleasantly. Even though a man live well and justly, it is not possible for him to live pleasantly if he lacks that from which stems the prudent life.

VI. Any device whatever by which one frees himself from the fear of others is a natural good.

VII. Some, thinking thus to make themselves safe from men, wished to become famous and renowned. They won a natural good if they made their lives secure; but if their lives were not secure, they did not have that for which, following the rule of nature, they first sought.

VIII. No pleasure is evil in itself; but the means by which certain pleasures are gained bring pains many times greater than the pleasures.

IX. If every pleasure were cumulative, and if this were the case both in time and in regard to the whole or the most important parts of our nature, then pleasures would not differ from each other.

X. If the things that produce the pleasures of the dissolute were able to drive away from their minds their fears about what is above them and about death and pain, and to teach them the limit of desires, we would have no reason to find fault with the dissolute; for they would fill themselves with pleasure from every source and would be free from pain and sorrow, which are evil.

XI. If our dread of the phenomena above us, our fear lest death concern us, and our inability to discern the limits of pains and desires were not vexatious to us, we would have no need of the natural sciences.

XII. It is not possible for one to rid himself of his fears about the most important things if he does not understand the nature of the universe but dreads some of the things he has learned in the myths. Therefore, it is not possible to gain unmixed happiness without natural science.

XIII. It is of no avail to prepare security against other men while things above us and beneath the earth and in the whole infinite universe in general are still dreaded.

XIV. When reasonable security from men has been attained, then the security that comes from peace of mind and withdrawal from the crowd is present, sufficient in strength and most unmixed in well-being.

XV. Natural wealth is limited and easily obtained; the wealth defined by vain fancies is always beyond reach.

XVI. Fortune seldom troubles the wise man. Reason has controlled his greatest and most important affairs, controls them throughout his life, and will continue to control them.

XVII. The just man is least disturbed; the unjust man is filled with the greatest turmoil.

XVIII. When once the pain caused by need has been removed, bodily pleasure will not be increased in amount but only varied in quality. The mind attains its utmost pleasure in reflecting on the very things that used to cause the greatest mental fears and on things like them.

XIX. Time that is unlimited and time that is limited afford equal pleasure if one measures pleasure's extent by reason.

XX. The flesh believes that pleasure is limitless and that it requires unlimited time; but the mind, understanding the end and limit of the flesh and ridding itself of fears of the future, secures a complete life and has no longer any need for unlimited time. It does not, however, avoid pleasure; and when circumstances bring on the end of life, it does not depart as if it still lacked any portion of the good life.

XXI. The man who understands the limits of living knows that it is easy to obtain that which removes the pain caused by want and that which perfects the whole life. Therefore, he has no need of things that involve struggle.

XXII. It is necessary to take into account the real purpose of knowledge and all the evidence of that clear perception to which we refer our opinions. If we do not, all will be full of bad judgment and confusion.

XXIII. If you struggle against all your sensations, you will have no standard of comparison by which to measure even the sensations you judge false.

XXIV. If you reject any sensation, and if you fail to distinguish between conjecture based upon that which awaits confirmation and evidence given by the senses, by the feelings, and by the mental examinations of confirmed concepts, you will confuse the other sensations with unfounded conjecture and thus destroy the whole basis for judgment. If among all opinions you accept as equally valid both those that await confirmation and those that have been confirmed, you will not free yourself from error, since you will have preserved all the uncertainty about every judgment of what is true and what is not true.

XXV. If you do not at all times refer each of your actions to the natural end,* but fall short of this and turn aside to something else in choosing and avoiding, your deeds will not agree with your words.

XXVI. Those desires that do not bring pain if they are not satisfied are not necessary; and they are easily thrust aside whenever to satisfy them appears difficult or likely to cause injury.

XXVII. Of the things that wisdom prepares for insuring lifelong happiness, by far the greatest is the possession of friends.

*That is, to pleasure.

XXVIII. The same wisdom that permits us to be confident that no evil is eternal or even of long duration also recognizes that in our limited state the security that can be most perfectly gained is that of friendship.

XXIX. Of the desires, some are natural and necessary; some are natural but not necessary; and others are neither natural nor necessary but arise from empty opinion.

XXX. Among the bodily desires, those rest on empty opinion that are eagerly pursued although if unsatisfied they bring no pain. That they are not got rid of is because of man's empty opinion, not because of their own nature.

XXXI. Natural justice is a compact resulting from expediency by which men seek to prevent one man from injuring others and to protect him from being injured by them.

XXXII. There is no such thing as justice or injustice among those beasts that cannot make agreements not to injure or be injured. This is also true of those tribes that are unable or unwilling to make agreements not to injure or be injured.

XXXIII. There is no such thing as justice in the abstract; it is merely a compact between men in their various relations with each other, in whatever circumstances they may be, that they will neither injure nor be injured.

XXXIV. Injustice is not evil in itself, but only in the fear and apprehension that one will not escape those who have been set up to punish the offense.

XXXV. If a man has secretly violated any of the terms of the mutual compact not to injure or be injured, he cannot feel confident that he will be undetected in the future even if he has escaped ten thousand times in the past; for until his death it will remain uncertain whether he will escape.

XXXVI. In general, justice is the same for all, a thing found useful by men in their relations with each other; but it does not follow that it is the same for all in each individual place and circumstance.

XXXVII. Among the things commonly held just, that which has proved itself useful in men's mutual relationships has the stamp of justice whether or not it be the same for all; if anyone makes a law and it does not prove useful in men's relationships with each other, it is no longer just in its essence. If, however, the law's usefulness in the matter of justice should change and it should meet men's expectations only for a short time, nonetheless during that short time it was just in the eyes of those who look simply at facts and do not confuse themselves with empty words.

XXXVIII. If, although no new circumstances have arisen, those things that were commonly held just in these matters did not in their actual effects correspond with that conception, they were not just. Whenever, as a result of new circumstances, the same things that had been regarded as just were no longer useful, they were just at the time when they were useful for the relations of citizens to each other; but afterwards, when they were no longer useful, they were no longer just.

XXXIX. He who has best controlled his lack of confidence in the face of external forces has, as far as possible, treated these externals as akin to himself or, when that was impossible, at least as not alien. Where he was not able to do even this, he kept to himself and avoided whatever it was best to avoid.

XL. Those who were best able to prepare security for themselves in relation to their neighbors* lived most pleasantly with their neighbors since they had the most perfect assurance; and enjoying the most complete intimacy, they did not lament the death of one who died before his time as if it were an occasion for sorrow.

*That is, those who were most self-sufficient and least dependent upon others

EPICETETUS

ca. A.D. 50—ca. A.D. 130

Epictetus was born a slave in Hierapolis, a small town in Phrygia, Asia Minor (in present-day Turkey). His master was Epaphroditus, a member of Emperor Nero's personal staff in Rome. As was often done at that time, Epaphroditus saw to it that Epictetus had a good education, sending him to study with the Roman Stoic, Rufus. Epictetus gained his freedom sometime after the death of the emperor in A.D. 68 and began to teach philosophy in Rome. In A.D. 89 or 93 Emperor Domitian expelled all philosophers from Rome. Domitian seems to have been especially angry with the Stoics for teaching that sovereignty comes from God and is for the benefit of the people. (Epictetus's reported claim that he had the same regard for the emperor as for his water-pot could not have helped.) Epictetus moved to Nicropolis in Epirus (northwestern Greece), where he established a thriving Stoic school and lived a simple life with few material goods. As an old man, he married so that he could adopt a child who otherwise would have been "exposed," that is, left to die. Those whom he taught described him as a humble, charitable man of great moral and religious devotion.

Epictetus never wrote anything, but one of his admiring students, Arrian, composed eight *Discourses* based on Epictetus's lectures, along with a summary of the great man's thought, the *Handbook* (*Enchiridion*). The *Handbook*, given here complete in the outstanding new Keith Seddon translation, builds on the early Stoa's concept of *Logos*. Since the *Logos* or natural law permeates everything, it provides us with moral intuition, so all persons have the capacity for virtue. But in order to live the moral life, one must apply these intuitions to specific cases. Education is necessary if we are to learn how to properly connect moral insights with life. We must begin by recognizing the fact that we cannot change events that happen to us, but we can change our attitude toward those events. To accomplish this and achieve

the good life, we must go through three stages. First, we must order our desires and overcome our fears. Next, we must perform our duties—in whatever role fate has given us. Finally, we must think clearly and judge accurately. Only then will we gain inner tranquility.

Despite Emperor Domitian's condemnation, Stoicism had a special appeal to the Roman mind. The Romans were not much interested in the speculative and theoretical content of Zeno's early Stoa. Instead, in the austere moral emphasis of Epictetus, with his concomitant stress on self-control and superiority to pain, the Romans found an ideal for the wise man, whereas the Stoic description of natural law provided a basis for Roman law. One might say that the pillars of republican Rome tended to be Stoical, even if some Romans had never heard of Stoicism.

Edelstein, *The Meaning of Stoicism* (Cambridge, MA: Harvard University Press, 1966); John M. Rist, *Stoic Philosophy* (Cambridge: Cambridge University Press, 1969); F.H. Sandbach, *The Stoics* (New York: Norton, 1975); Margaret E. Reiser, *The Nature of Man in Early Stoic Philosophy* (New York: St. Martin's Press, 1989); and Brad Inwood, ed., *The Cambridge Companion to the Stoics* (Cambridge: Cambridge University Press, 2003). For comparisons between Stoicism and other Hellenistic schools, see R.M. Wenley, *Stoicism and Its Influence* (1924; reprinted New York: Cooper Square, 1963); Edwin R. Bevan, *Stoics and Sceptics* (Oxford: Clarendon Press, 1913); and R.D. Hicks, *Stoic and Epicurean* (1910; reprinted New York: Russell, 1962). For collections of essays consult A.A. Long, ed., *Problems in Stoicism* (London: Athlone Press, 1971); J.M. Rist, ed., *The Stoics* (Berkeley: University of California Press, 1978); A.A. Long, ed., *Stoic Studies* (Cambridge: Cambridge University Press, 1996); and Steven K. Strange and Jack Zupko, eds., *Stoicism: Traditions and Transformations* (Cambridge: Cambridge University Press, 2004).

For volumes specifically on Epictetus, see John Bonforte, *The Philosophy of Epictetus* (New York: Philosophical Library, 1955) and William O. Stephens, *Stoic Ethics: Epictetus and Happiness as Freedom* (London: Continuum, 2007). Iason Xenakis, *Epictetus: Philosopher-Therapist* (The Hague, Netherlands: Martinus Nijhoff, 1969), makes an interesting application of Epictetus; while W.A. Oldfather, *Contributions Towards a Bibliography of Epictetus* (Urbana: University of Illinois Press, 1927; supplement, 1952), furnishes a bibliography. For a study of Epictetus' star pupil, see Philip A. Stadter, *Arrian of Nicomedia* (Chapel Hill: University of North Carolina Press, 1980).

HANDBOOK (ENCHIRIDION)

Chapter 1: [1] On the one hand, there are things that are in our power, whereas other things are not in our power. In our power are opinion, impulse, desire, aversion, and, in a word, whatever is our own doing. Things not in our power include our body, our possessions, our reputations, our status, and, in a word, whatever is not our own doing.

[2] Now, things that are in our power are by nature free, unhindered, unimpeded; but things not in our power are weak, slavish, hindered, and belong to others. [3] Remember, therefore, that whenever you suppose those things that are by nature slavish to be free, or those things that belong to others to be your own, you will be hindered, miserable and distressed, and you will find fault with both gods and men. If, however, you suppose to be yours only what is yours, and what belongs to another to belong to another (as indeed it does), no one will ever compel you, no one will hinder you; you will find fault with no one, reproach no one, nor act against your own will; you will have no enemies and no one will harm you, for no harm can touch you.

[4] Thus, when aiming at such great things remember that securing them requires more than a modest effort: some things you will have to give up altogether, and others you will have to put aside for the time being. If you want such great things but at the same time strive for status and wealth, you may well not even obtain these latter things because you are seeking the former; at any rate, you will certainly fail to secure those former great things which alone bring freedom and happiness.

[5] Straightaway then, train yourself to say to every unpleasant impression, “You are an impression, and by no means what you appear to be.” Then examine it and test it by the rules that you have, first (in this way especially) by asking whether it concerns things that are in our power or things that are not in our power: and if it concerns something not in our power, have ready to hand the answer, “This is nothing to me.”

Chapter 2: [1] Remember that, on the one hand, desires command you to obtain what you long for and, on the other, aversions command you to avoid what you dislike. Those who fail to gain what they desire are unfortunate, whilst those who fall into what they seek to avoid are miserable. So if you seek to avoid only those things contrary to nature amongst the things that are in your power, you will accordingly fall into nothing to which you are averse; but if you seek to avoid sickness, or death, or poverty, you will be miserable. [2] Therefore, remove altogether your aversion for anything that is not in our power, and transfer it to those things contrary to nature that *are* in our power. For the time being, completely restrain your desires, for if you desire any of those things not in our power you are bound to suffer misfortune. For of those things in our power, which it would be proper to desire, none is yet within your grasp. Use only impulse and repulsion, but use even these lightly, with reservation, and without straining.

Chapter 3: With respect to any of those things you find attractive or useful or have a fondness for, recall to mind what kind of thing it is, beginning with the most trifling. So if you are fond of an earthenware pot, say, “I am fond of an earthenware pot.” Then you will not be upset if it gets broken. When you kiss your child or wife, say that you are kissing a human being; then, should they die, you will not be distressed.

Chapter 4: When you are about to undertake some task, remind yourself what sort of business it is. If you are going out to bathe, bring to mind what happens at the baths: there will be those who splash you, those who will jostle you, some will be abusive to

you, and others will steal from you. And thus you will undertake the affair more securely if you say to yourself from the start, "I wish to take a bath, but also to keep my moral character in accordance with nature." Do likewise with every undertaking. For thus, if anything should happen that interferes with your bathing, be ready to say, "Oh well, it was not only this that I wanted, but also to keep my moral character in accordance with nature, and I cannot do that if I am irritated by things that happen."

Chapter 5: It is not circumstances themselves that trouble people, but their judgments about those circumstances. For example, death is nothing terrible, for if it were, it would have appeared so to Socrates; but having the opinion that death is terrible, *this* is what is terrible. Therefore, whenever we are hindered or troubled or distressed, let us never blame others, but ourselves, that is, our own judgments. The uneducated person blames others for their failures; those who have just begun to be instructed blame themselves; those whose learning is complete blame neither others nor themselves.

Chapter 6: Do not take pride in any excellence that is not your own. If a horse were to say proudly, "I am beautiful," one could put up with that. But when you say proudly, "I have a beautiful horse," remember that you are boasting about something good that belongs to the horse. What, then, belongs to *you*? The use of impressions. Whenever you are in accordance with nature regarding the way you use impressions, then be proud, for then you will be proud of a good that is your own.

Chapter 7: Just as on a voyage, when the ship has anchored, if you go ashore to get water you may also pick up a shell-fish or a vegetable from the path, but you should keep your thoughts fixed on the ship, and you should look back frequently in case the captain calls, and, if he should call, you must give up all these other things to avoid being bound and thrown on board like a sheep; so in life also, if instead of a vegetable and a shell-fish you are given a wife and a child, nothing will prevent you from taking them—but if the captain calls, give up all these things and run to the ship without even turning to look back. And if you are old, do not even go far from the ship, lest you are missing when the call comes.

Chapter 8: Do not demand that things should happen just as you wish, but wish them to happen just as they do, and all will be well.

Chapter 9: Illness interferes with one's body, but not with one's moral character, unless one so wishes. Lameness interferes with one's leg, but not with one's moral character. Say this to yourself regarding everything that happens to you, for you will find that what happens interferes with something else, but not with you.

Chapter 10: On every occasion when something happens to you, remember to turn to yourself to see what capacity you have for dealing with it. If you are attracted to a beautiful boy or woman, you will find that self-control is the capacity to use for that. If hardship befalls you, you will find endurance; if abuse, you will find patience. Make this your habit and you will not be carried away by impressions.

Chapter 11: Never say of anything, "I have lost it," but rather "I have given it back." Has your child died? It has been given back. Has your wife died? She has been given back. Has your land been taken from you? Well, that too has been given back. "But the one who took it from me is a bad man!" What concern is it of yours by whose hand the Giver asks for its return? For the time that these things are given to you, take care of them as things that belong to another, just as travelers do an inn.

Chapter 12: [1] If you want to make progress, set aside all considerations like these: "If I neglect my affairs, I will have nothing to live on"; "If I do not punish my slave-boy, he will be bad." For it is better to die of hunger, free from distress and fear, than to live perturbed amidst plenty. It is better for your slave-boy to be bad than for you to be wretched. [2] Begin therefore with little things. The olive oil is spilled. The wine is stolen. Say to yourself, "This is the price for peace of mind, and this is the price for

being free of troubles. Nothing can be had without paying the price.” And when you call your slave-boy, bear in mind that it is quite possible he won’t heed you, or even if he does heed you it is quite possible that he won’t do the things you tell him to. But he is not in so fine a position that your peace of mind depends upon him.

Chapter 13: If you want to make progress, submit to appearing foolish and stupid with regard to external things. Do not wish to appear knowledgeable about anything and, if others think you amount to something, distrust yourself. For you should know that it is not easy both to keep your moral character in accordance with nature and to keep secure external things, for in attending to one, you will inevitably neglect the other.

Chapter 14: [1] It is foolish to wish that your children and your wife and your friends should live forever, for you are wishing for things to be in your power which are not, and wishing for what belongs to others to be your own. It is foolish in the same way, too, to wish that your slave-boy should never do wrong, for now you want badness not to be badness, but something else. However, if you wish not to fail in what you desire, this you are able to do. Exercise yourself, therefore, in what you *are* able to do. [2] A person’s master is the one who has power over that which is wished for or not wished for, so as to secure it or take it away. Therefore, anyone who wishes to be free should neither wish for anything nor avoid anything that depends on others; those who do not observe this rule will of necessity be the slaves of others.

Chapter 15: Remember, you ought to behave in life as you would at a banquet. Something is carried round and comes to you: reach out and take a modest portion. It passes by? Do not stop it. It has not yet arrived? Do not stretch your desire towards it, but wait until it comes to you. So it should be concerning your children, your wife, your status, your wealth, and one day you will be worthy to share a banquet with the gods. If, however, you do not take these things even when they are put before you, but have no regard for them, not only will you share a banquet with the gods, but also rule with them. By acting in this way, Diogenes and Heraclitus, and people like them, were deservedly gods and were deservedly called so.

Chapter 16: When you see someone weeping in grief because their child has gone abroad or because they have lost their property, take care not to be carried away by the impression that these external things involve them in anything bad, but be ready to say immediately, “This person is not distressed by what has happened (for it does not distress anyone else), but by the judgement they make of it.” Do not hesitate, however, to sympathise with words, or if it so happens, to weep with them; but take care not to weep inwardly.

Chapter 17: Remember that you are an actor in a play of such a kind as the playwright chooses: short, if he wants it short, long if he wants it long. If he wants you to play the part of a beggar, play even this part well; and so also for the parts of a disabled person, an administrator, or a private individual. For this is your business, to play well the part you are given; but choosing it belongs to another.

Chapter 18: When a raven croaks inauspiciously, do not be carried away by the impression, but straightaway draw a distinction and say to yourself, “This portent signifies nothing with respect to me, but only with regard to my body, my possessions, my reputation, my children or my wife. To me, however, all portents are auspicious, if I wish them so. For however the affair turns out, it is in my power to benefit from it.”

Chapter 19: [1] You can be invincible if you never enter a contest in which it is not in your power to win. [2] Beware that, when you see someone honoured before others, enjoying great power, or otherwise highly esteemed, you do not get carried away by the impression and think them happy. For if the essence of good lies in what is in our power, it is wrong to feel envy or jealousy, and you yourself will not wish to be praetor, senator

Theater at Hieropolis, Phrygia, Asia Minor (present-day Turkey). Built during Epictetus's lifetime—in his hometown—this theater had a capacity for more than twelve thousand spectators. All-day festivals of drama on every phase of life from the tragic to the comic were presented here. It is not surprising that Epictetus uses the image of the play and the playwright to make his point. (Forrest E. Baird)

or consul, but someone who is free. There is only one way to attain this end, and this is to have no concern for the things that are not in our power.

Chapter 20: Remember that the insult does not come from the person who abuses you or hits you, but from your judgement that such people are insulting you. Therefore, whenever someone provokes you, be aware that it is your own opinion that provokes you. Try, therefore, in the first place, not to be carried away by your impressions, for if you can gain time and delay, you will more easily control yourself.

Chapter 21: Let death and exile, and all other things that seem terrible, appear daily before your eyes, but especially death—and you will never entertain any abject thought, nor long for anything excessively.

Chapter 22: If you set your heart on philosophy, be prepared from the very start to be ridiculed and jeered at by many people who will say, “Suddenly he’s come back to us a philosopher!” and “Where do you suppose he got that supercilious look?” Now, for your part, do not show a supercilious look, but hold to the things that seem best to you, as someone who has been assigned to this post by God. And remember that if you persist in your principles, those who at first ridiculed you will later admire you. But if, on the other hand, you are defeated by such people, you will be doubly ridiculed.

Chapter 23: If at any time it should happen that you turn to external things with the aim of pleasing someone, understand that you have ruined your life’s plan. Be content, then, in everything, with being a philosopher; and if you wish also to be regarded as such, appear so to yourself, and that will be sufficient.

Chapter 24: [1] Do not be troubled by thoughts such as these: "I will be valued by no one my whole life long, a nobody everywhere!" For if lacking value is something bad (which it is), you cannot be involved in anything bad through other people any more than you can be involved in anything disgraceful. Is it any business of yours, then, to acquire status or to be invited to a banquet? Certainly not! How, then, can this be regarded as lacking value? And how will you be a nobody everywhere, when all you have to be is a somebody concerning those things that are in your power, with respect to which you can be someone of the greatest value?

[2] "But my friends," you say, "will lack support."

What do you mean, "lack support"? Certainly they won't get much cash from you, neither will you make them Roman citizens! Who told you, then, that these things are amongst those that are in our power, and not the business of other people? And who can give to others things they do not have themselves?

[3] "Get some money, then," someone says, "so that we can have some too!"

If I can get it whilst also preserving my self-respect, my trustworthiness, my magnanimity, show me how, and I will get it. But if you ask me to forsake those things that are good and my own, in order that you may acquire those things that are not good, see for yourself how unfair and thoughtless you are. Besides, what would you rather have, money, or a friend who is trustworthy and has self-respect? Therefore help me towards this end, and do not ask me to do anything by which I will lose those very qualities.

[4] "But my country," you say, "as far as it depends on me, will be without my help."

I ask again, what help do you mean? It will not have colonnades and bathhouses on your account. But what does that mean? For neither is it provided with shoes by a smith, nor weapons by a shoemaker: it is enough if everyone properly attends to their own business. But if you were to provide it with another trustworthy citizen who has self-respect, would that not be of use to your country?

"Yes."

Well, then, you also cannot be useless to it.

[5] "What place, then," you ask, "will I have in the community?"

That which you may have whilst also preserving your trustworthiness and self-respect. But if, by wishing to be useful, you throw away these qualities, of what use can you be to your community if you become shameless and untrustworthy?

Chapter 25: [1] Has someone been honoured above you at a banquet, or in a greeting, or in being called in to give advice? If these things are good, you should be pleased for the person who has received them. If, on the other hand, they are bad, do not be upset that you did not receive them yourself. Remember, with respect to acquiring things that are not in our power, you cannot expect an equal share if you do not behave in the same way as other people. [2] How is it possible, if you do not hang around someone's door, accompany them or praise them, to have an equal share with people who do these things? You will be unjust, therefore, and insatiable, if you refuse to pay the price for which these things are sold, but wish instead to obtain them for nothing. [3] For what price are lettuces sold? An obol, let's say. When someone else, then, pays an obol and takes the lettuce, whilst you, not paying it go without, do not imagine that this person has gained an advantage over you. Whereas they have the lettuce, you still have the obol that you did not pay.

[4] So, in the present case, if you have not been invited to someone's banquet, that is because you have not paid them the price for which a banquet is sold. They sell it for praise; they sell it for flattery. Pay the price, then, for which it is sold, if you think this will be to your advantage. But if at the same time you do not want to pay the one, yet wish to receive the other, you are insatiable and foolish.

[5] Do you have nothing, then, in place of the banquet? You have this—you have not had to praise the person you did not want to praise, and you have not had to bear the insolence of their doorkeepers.

Chapter 26: We can understand the will of nature from those things in which we do not differ from one another. For example, when our neighbour's slave has broken a cup, we are immediately ready to say, "Well, such things happen." Understand, then, that when your own cup gets broken you should react in just the same way as when someone else's cup gets broken. Apply the same principle to matters of greater importance. Has someone else's child or wife died? There is no one who would not say, "Such is the way of things." But when someone's own child dies they immediately cry, "Woe is me! How wretched I am!" But we should remember how we feel when we hear of the same thing happening to other people.

Chapter 27: Just as a target is not set up in order to be missed, so neither does the nature of evil exist in the world.

Chapter 28: How angry you would be if someone handed over your body to just any person who happened to meet you! Are you not ashamed, then, when you hand over your mind to just any person you happen to meet, such that when they abuse you, you are upset and troubled?

Chapter 29: [1] In every undertaking, consider what comes first and what comes after, then proceed to the action itself. Otherwise you will begin with a rush of enthusiasm having failed to think through the consequences, only to find that later, when difficulties appear, you will give up in disgrace. [2] Do you want to win at the Olympic Games? So do I, by the gods! For that is a fine achievement. But consider what comes first and what comes after, and only then begin the task. You must be well-disciplined, submit to a diet, abstain from sweet things, follow a training schedule at the set times, in the heat, in the cold—no longer having cold drinks or wine just when you like. In a word, you must hand yourself over to your trainer, just as you would to a doctor. And then, when the contest comes, you may strain your wrist, twist your ankle, swallow lots of sand, sometimes be whipped, and after all that, suffer defeat. [3] Think about all this, and if you still want to, then train for the games, otherwise you will behave like children, who first play at being wrestlers, then at being gladiators, then they blow trumpets, then act in a play. In the same way, you will first be an athlete, then a gladiator, then an orator, then a philosopher, but you will do none of these things wholeheartedly—but like a monkey, you will mimic whatever you see, as first one thing, then another, takes your fancy. All this because you do not undertake anything after properly considering it from all sides, but randomly and half-heartedly. [4] So it is when some people go to see a philosopher and hear someone speak such as Euphrates (and who can speak like him?)—they too want to be philosophers. [5] But first consider what sort of undertaking this is, then examine your own capacities to see if you can bear it. So you want to be a pentathlete or a wrestler? Look at your arms, your thighs, examine your back. Different people are naturally suited to different tasks. [6] Do you think that if you do these things you can still eat in the same way, drink in the same way, give way to anger and irritation, just as you do now? You must go without sleep, endure hardship, live away from home, be looked down on by a slave-boy, be laughed at by those whom you meet, and in everything get the worst of it: in honours, in status, in the law courts, and in every little affair. [7] Consider carefully whether you are willing to pay such a price for peace of mind, freedom and serenity, for if you are not, do not approach philosophy, and do not behave like children, being first a philosopher, next a tax-collector, then an orator, and later a procurator of the Emperor. These things are not compatible. You must be one person, either good or bad. You must cultivate either your

ruling principle or external things, seek to improve things inside or things outside. That is, you must play the role either of a philosopher or an uneducated person.

Chapter 30: The actions that are appropriate for us can generally be determined by our relationships. He is your father. This tells you to take care of him, to yield to him in all things, to put up with him when he abuses you or beats you.

“But he is a bad father.”

Nature did not provide for you a good father, but a father. Your brother wrongs you? Well then, maintain your relationship to him. Do not think about what he is doing, but about what you will have to do if you want to keep your moral character in accordance with nature. For no one can harm you unless you wish it. You will be harmed only when you think you are harmed. If you get into the habit of looking at the relationships implied by “neighbour,” “citizen,” “commander,” you will discover what is proper to expect from each.

Chapter 31: [1] Know that the most important thing regarding devotion to the gods is to have the right opinions about them—that they exist and administer the universe well and justly—to stand ready to obey them, to submit to everything that happens, and to follow it willingly as something being accomplished by the most perfect intelligence. Do this and you will never blame the gods nor accuse them of neglecting you. [2] But you will not be able to do this unless you remove the notions of good and bad from things that are *not* in our power, and apply them only to those things that *are* in our power. For if you believe that anything not in our power is good or bad, then when you fail to get what you want or get what you do not want, it is inevitable that you will blame and hate those responsible. [3] For every living thing naturally flees and avoids things that appear harmful (and their causes), and pursues and admires things that are beneficial (and their causes). It is impossible, then, for someone who thinks they are being harmed to take delight in what they suppose is causing the harm, just as it is impossible for them to take delight in the harm itself. [4] This is why even a father is reproached by his son when he does not give him a share of those things the son regards as good. Thus, in thinking a king’s throne to be something good, Eteocles and Polynices became enemies. This is why the farmer reproaches the gods, and so too the sailor, the merchant, and those who lose their wives and children. For people are devoted to what they find advantageous. Therefore, whoever takes proper care of their desires and aversions, at the same time also cares properly for their devotion. [5] But it is everyone’s duty to offer libations, sacrifices and first-fruits according to tradition, with a pure disposition, not slovenly or carelessly, neither too meanly nor beyond our means.

Chapter 32: [1] When you make use of divination, remember that you do not know how events will turn out (this is what you have come to learn from the diviner), but if you really are a philosopher you know before you come what sort of thing it is. For if it is one of the things that are not in our power, then necessarily what will happen will be neither good nor bad. [2] Therefore do not bring desire and aversion to the diviner (for, if you do, you will be fearful of what you may hear), but go with the understanding that everything that happens will be indifferent and of no concern to you, for whatever it may be it is in your power to make good use of it, and in this no one can hinder you. Go with confidence to the gods as your counselors, and afterwards, when some advice has been given, remember from whom you have received it and whose counsel you will be disregarding if you disobey. [3] Approach the diviner in the way Socrates thought appropriate, that is, only in those cases when the whole question turns upon the outcome of events, and when there are no means afforded by reason or any other art for discovering what is going to happen. Therefore, when it is necessary to share a danger with a friend or with your country, do not ask the diviner whether you should share the danger. For even if the

diviner should happen to tell you that the omens are unfavourable, that death is foretold, or mutilation to some part of the body, or exile—even at this risk, reason requires you to stand by your friend or share the danger with your country. Pay attention, therefore, to the greater diviner, Pythian Apollo, who threw from the temple the man who did not help his friend when he was being murdered.

Chapter 33: [1] From the outset, establish for yourself a certain character and disposition that you will maintain both when you are by yourself and with other people. [2] For the most part, keep silent, or say only what is required in few words. On rare occasions, when circumstances call for it, we will speak, but not about ordinary things: not about gladiators, nor horse-racing, not about athletes, nor about food and drink (which are the usual topics); and especially do not talk about people, blaming or praising or comparing them. [3] If at all possible, turn the conversation of the company by what you say to more suitable topics; and if you happen to be alone amidst strangers, keep silent. [4] Do not laugh a great deal, nor at many things, nor without restraint. [5] Avoid swearing oaths altogether, if possible; otherwise refuse to do so as far as circumstances allow. [6] Avoid banquets given by strangers and uneducated people. But if there is ever an occasion to join in them, take every care never to slip into the ways of the uneducated; be assured that if your companion is dirty it is inevitable that in their company you will become dirty yourself, even if you happen to start out clean. [7] As to things concerning the body, take only what bare necessity requires with respect to such things as food, drink, clothing, shelter and household slaves: exclude everything that is for outward show or luxury. [8] As for sex, you should stay pure before marriage as far as you can, but if you have to indulge, do only what is lawful. However, do not be angry with those who do indulge, or criticise them, and do not boast of the fact that you do not yourself indulge. [9] If you are told that someone is saying bad things about you, do not defend yourself against what is said, but answer, “Obviously this person is ignorant of my other faults, otherwise they would not have mentioned only these ones.” [10] It is not necessary for the most part to go to public games; but if it is ever appropriate for you to go, show that your first concern is for no one other than yourself—that is, wish only to happen what does happen, and wish only those to win who do win, and in this way you will meet with no hindrance. Refrain entirely from shouting or laughing at anyone, or getting greatly excited. And after you have left, do not talk a great deal about what happened (except in so far as it contributes to your own improvement), for doing so would make it clear that you have been impressed by the spectacle. [11] Do not go randomly or thoughtlessly to public readings; but when you do go, maintain your own dignity and equanimity, and guard against offending anyone. [12] When you are about to meet someone, especially someone who enjoys high esteem, ask yourself what Socrates or Zeno would have done in such circumstances, and you will have no difficulty in making proper use of the occasion. [13] When you go to see someone who has great power, propose to yourself that you will not find them at home, that you will be shut out, that the doors will be slammed in your face, that this person will pay no attention to you. And if in spite of all this it is your duty to go, then go, and bear what happens, and never say to yourself, “It wasn’t worth the trouble!” For that is the way of the uneducated person, someone who is bewildered by external things. [14] In conversations, avoid talking at great length or excessively about your own affairs and adventures; however pleasant it may be for you to talk about the risks you have run, it is not equally pleasant for other people to hear about your adventures. [15] Avoid also trying to excite laughter, for this is the sort of behaviour that slips easily into vulgarity and at the same time is liable to diminish the respect your neighbours have for you. [16] There is danger also in lapsing into foul language. So whenever anything like this happens, if the opportunity arises, go so far as to rebuke those who behave in this way; otherwise, by keeping silent and blushing and frowning, make it clear that you disapprove of such language.

Chapter 34: When you get an impression of some pleasure, as in the case of other impressions, guard against being carried away by it, but let the matter wait for you, and delay a little. Now consider these two periods of time, that during which you will enjoy the pleasure, and that when the pleasure has passed during which you will regret it and reproach yourself. Next set against these how pleased you will be if you refrain, and how you will commend yourself. When, however, the time comes to act, take care that the attraction, allure and seductiveness of the pleasure do not overcome you, but set against all this the thought of how much better it is to be conscious of having won this victory over it.

Chapter 35: When you do something from a clear judgement that it ought to be done, never try to avoid being seen doing it, even if you expect most people to disapprove. If, however, it would not be right to do it, avoid the deed itself. But if it *is* right, why be afraid of anyone who wrongly disapproves?

Chapter 36: Just as the propositions “It is day” and “It is night” can be used meaningfully in a disjunctive proposition, but make no sense in a conjunctive proposition, so at a banquet, to choose the largest share may make sense with respect to nourishing the body, but makes no sense for maintaining the proper kind of social feeling. Therefore, when you are eating with someone else, bear in mind not merely the value to your body of what is set before you, but also the value of maintaining the proper respect for your host.

Chapter 37: If you undertake a role that is beyond your capacities, you both disgrace yourself in that one and also fail in the role that you might have filled successfully.

Chapter 38: Just as in walking about you take care not to step on a nail or twist your ankle, so also you should take care not to harm your ruling principle. If we guard against this in every action, we will engage in affairs with greater security.

Chapter 39: Everyone’s body is the measure for their possessions, as the foot is a measure for the shoe. If then you hold to this principle you will maintain the proper measure, but if you go beyond it, you will inevitably be carried over a cliff. Thus, in the case of the shoe, if you go beyond the foot, first you will get a gilded shoe, then a purple one, and then an embroidered one. For once you have gone beyond the measure, there is no limit.

Chapter 40: Once they reach the age of fourteen years, women are addressed by men as “madam.” Accordingly, when they see that there is nothing else but pleasing men with sex, they begin to use cosmetics and dress up, and to place all their hopes in that. It is worth our while, then, to make sure they understand that they are valued for nothing other than their good behaviour and self-respect.

Chapter 41: It is a sign of foolishness to spend a lot of time on things that concern the body, such as exercising a great deal, eating and drinking a lot, defecating and having sex. These are things that should be done in passing. Instead, you should turn your whole attention to the care of your mind.

Chapter 42: When someone treats you badly or says bad things about you, remember that they do or say these things because they think it is appropriate. This is because it is not possible for someone to act on how things appear *to you*, but on how things appear *to them*. Accordingly, if someone holds a false opinion, because *this* is the person who has been deceived, it is *they* who suffer the harm. In the same way, if someone supposes that a true conjunction is false, it is not the conjunction that is harmed, but the person who has been deceived. If you proceed, then, from these principles, you will be gentle with the person who abuses you, saying on all such occasions, “To them, this is how it seemed.”

Chapter 43: Every circumstance has two handles. Use one, and it may be carried; but use the other, and it cannot be carried. Therefore, whenever your brother treats you unjustly, do not take hold of the matter by the handle that he has wronged you (for this is the handle by which the matter cannot be carried), but rather by the other handle, that

he is your brother, that you were raised up together, and you will take hold of it using the handle by which it may be carried.

Chapter 44: These inferences are invalid: "I am richer than you, therefore I am better than you"; "I am more eloquent than you, therefore I am better than you." But these are better argued: "I am richer than you, therefore my property is greater than yours;" "I am more eloquent than you, therefore my speech is superior to yours." For *you*, of course, are neither property nor speech.

Chapter 45: Does someone bathe hastily? Do not say that they do so badly, but hastily. Does someone drink a great deal of wine? Do not say that they do this badly, but that they drink a great deal. For until you understand their motives, how do you know that what they do is bad? Understand this and you will never receive convincing impressions but assent to quite different ones.

Chapter 46: [1] On no occasion call yourself a philosopher, and do not talk a great deal amongst uneducated people about philosophical principles, but do what follows from those principles. For example, at a banquet do not talk about how people ought to eat, but eat as someone should. Remember how Socrates had so completely eliminated ostentation that people would come to him wanting him to introduce them to philosophers, and he would take them off to other philosophers: so little did he care about being overlooked. [2] And if a discussion about philosophical principles should arise in uneducated people, keep silent for the most part, for there is great danger that you will immediately vomit up what you have not yet digested. And when someone says to you that you know nothing, and you are not offended, then know that you have begun your work. For sheep do not show the shepherd how much they have eaten by vomiting up their fodder, but they digest their food within to produce wool and milk on the outside. So do not display your philosophical principles to uneducated people, but show them the actions that result from the principles when you digest them.

Chapter 47: Once you have adapted your body to plain simple living, do not make a show of it. When you drink water, do not declare on every occasion that you are drinking water. If you want to train yourself to endure hardships, do it by yourself, away from other people. Do not embrace statues, but if you are ever thirsty, take a mouthful of cold water and spit it out without telling anyone.

Chapter 48: [1] The condition and character of the uneducated person is this: they never look for benefit or harm to come from themselves, but from external things. The condition and character of the philosopher is this: they look for every benefit and harm to come from themselves. [2] The signs that someone is making progress are these: they blame no one, they praise no one, they find fault with no one, they accuse no one, they never say anything of themselves as though they amount to something or know anything. When they are impeded or hindered, they blame themselves. If someone praises them, they laugh inwardly at the person who praises them, and if anyone censures them, they make no defence. They go about as if they were sick, cautious not to disturb what is healing before they are fully recovered. [3] They have rid themselves of all desires, and have transferred their aversion to only those things contrary to nature that are in our power. They have no strong preferences in regard to anything. If they appear foolish or ignorant, they do not care. In a word, they keep guard over themselves as though they are their own enemy lying in wait.

Chapter 49: When someone prides themselves on being able to understand and explain Chrysippus, say to yourself, "If Chrysippus had not written obscurely, this person would have nothing on which to pride themselves." But what do I want? To understand nature, and to follow her. Therefore I seek someone who can explain this to me, and when I hear that Chrysippus can do so, I go to him. But I do not understand his writings; so I seek someone who can explain them to me. Now, up to this point there is nothing to be proud of.

When I find someone to explain them, what remains is my putting his principles into practice; this is the only thing to be proud of. But if I am impressed merely by the act of explaining, what else have I accomplished but become a philologist instead of a philosopher, except only that I can explain Chrysippus instead of Homer? No, when someone says to me, “Explain Chrysippus to me,” rather than feel proud, I would blush when I am unable to manifest actions that agree and harmonise with Chrysippus’ teaching.

Chapter 50: Hold fast to the things herein proposed as if they were laws, as if it would be sacrilegious to transgress them. Pay no attention to what people say about you, for this is no longer yours.

Chapter 51: [1] For how long will you put off demanding of yourself the best, and never to transgress the dictates of reason? You have received the philosophical principles to which you ought to agree, and you have accepted them. What sort of teacher are you waiting for, that you put off improving yourself until they come? You are no longer a child, but a grown adult. If you remain negligent and lazy, always piling up delay upon delay, fixing first one day then another after which you will attend to yourself, you will fail to make progress without even realising, but will continue to live as someone uneducated until you die. [2] From this moment commit yourself to living as an adult, as someone who is making progress, and let everything that appears best to you be a law that you cannot transgress. And if you are presented with anything laborious, or something pleasant, with anything reputable or disreputable, remember that the contest is *now*, that the Olympic Games are *now*, that it is no longer possible to put them off, and that progress is won or lost as the result of just once giving in. [3] This is how Socrates attained perfection, by paying attention to nothing but reason in everything that he encountered. But even if you are not yet Socrates, you should live as someone who wishes to be Socrates.

Chapter 52: [1] The first and most necessary topic in philosophy concerns putting principles to practical use, such as, “We ought not to lie.” The second is concerned with demonstrations, such as, “Why is it that we ought not to lie?” And the third is concerned with confirming and articulating the first two: for example, “Why is this a demonstration?” For what is a demonstration, what is entailment, what is contradiction, what is truth, and what is falsehood? [2] Thus the third topic of study is necessary for the second, and the second is necessary for the first. But the most necessary, the one where we ought to rest, is the first. But we do the opposite—we spend our time on the third topic, upon this we expend all our efforts, whilst entirely neglecting the first topic. Thus, whilst at the same time as lying, we are more than ready to explain why it is wrong to lie.

Chapter 53: [1] We must always have these thoughts at hand:

“Lead me, Zeus, and you too, Destiny,
Wherever you have assigned me to go,
and I’ll follow without hesitating; but if I am not willing,
because I am bad, I’ll follow all the same.”

—Cleanthes

[2] “Whosoever properly with necessity complies
we say is wise, and understands things divine.”

—Euripides

[3] “Well, Crito, if this pleases the gods, let it happen this way.”

—Socrates [*Crito*, 43D]

[4] “Certainly, Anytus and Meletus may put me to death, but they cannot harm me.”

—Socrates [*Apology*, 30C]

PYRRHO

ca. 360—ca. 270 B.C.

SEXTUS EMPIRICUS

A.D. third century

Pyrrho was born in the town of Elis on the Greek Peloponnesus. He joined the expedition of Alexander the Great to India and there met several of the learned magi of the East. Following Alexander's death in 323 B.C., Pyrrho returned to Elis and spent the rest of his life teaching there.

Pyrrho was greatly influenced by the Democritean notion that the world is not as our sense perceptions would lead us to believe. According to Pyrrho, we can know only appearances relative to each person—there is no way we can know things as they really are. This means that any statement we might make about reality can be opposed by an equally valid statement that contradicts it. Given this inability to know which assertion is true, Pyrrho said we should develop an attitude of “suspended judgment” <*epoche*> and thus gradually attain “unperturbedness” or “quietude” <*ataraxia*>. This claimed inability to know came to be called “Skepticism.”

Pyrrho left no writings, but his philosophy is well represented by the works of the third-century A.D. author Sextus Empiricus. Little is known about this writer other than that he was apparently a Greek physician, that he was the head of a Skeptical school in some major city, and that he wrote the *Outlines of Pyrrhonism*. The selection reprinted here, in the R.G. Bury translation, begins by dividing philosophers into three categories: “Dogmatists,” who claim to know the truth; those inheritors of Plato's Academy, such as Carneades, who made the opposite dogmatic claim that no truth is possible; and the Pyrrhoist skeptics, who suspend judgment while looking for the truth. Sextus Empiricus goes on to explain the nature of such a suspension of judgment and concludes with a discussion of how this suspension leads to “quietude.” In the process of his explication, Sextus avoids self-refutation by explaining that he is not describing what is really true (which would be dogmatism), but only how things *appear* to him to be.

As for its impact, elements of Pyrrhoist skepticism are echoed in Hegel's concept of the dialectic (with the claim that every statement can be contradicted by its opposite) and in Husserl's use of *<epochē>*. Thinkers such as Montaigne, Hume, and Santayana have used skepticism to attack the dogmatic philosophies of their day. While it has rarely been an established school of thought, skepticism has raised questions for all systematic philosophers since the time of Pyrrho.

OUTLINES OF PYRRHONISM (in part)

BOOK I

1. *Of the Main Difference Between Philosophic Systems.* The natural result of any investigation is that the investigators either discover the object of their search or deny that it is discoverable and confess it to be inapprehensible or persist in their search. So, too, with regard to the objects investigated by philosophy, this is probably why some have claimed to have discovered the truth, others have asserted that it cannot be apprehended, while others again go on inquiring. Those who believe they have discovered it are the "Dogmatists," specially so called—Aristotle, for example, and Epicurus

and the Stoics and certain others; Cleitomachus and Carneades and other Academics treat it as inapprehensible; the Sceptics keep on searching. Hence it seems reasonable to hold that the main types of philosophy are three—the Dogmatic, the Academic, and the Sceptic. Of the other systems it will best become others to speak: our task at present is to describe in outline the Sceptic doctrine, first premising that of none of our future statements do we positively affirm that the fact is exactly as we state it, but we simply record each fact, like a chronicler, as it appears to us at the moment.

2. *Of the Arguments of Scepticism.* Of the Sceptic philosophy one argument (or branch of exposition) is called “general,” the other “special.” In the general argument we set forth the distinctive features of Scepticism, stating its purport and principles, its logical methods, criterion, and end or aim; the “Tropes,” also, or “Modes,” which lead to suspension of judgment, and in what sense we adopt the Sceptic formulae, and the distinction between Scepticism and the philosophies which stand next to it. In the special argument we state our objections regarding the several divisions of so-called philosophy. Let us, then, deal first with the general argument, beginning our description with the names given to the Sceptic School.

3. *Of the Nomenclature of Scepticism.* The Sceptic School, then, is also called “Zetetic” from its activity in investigation and inquiry, and “Ephectic” or Suspensive from the state of mind produced in the inquirer after his search, and “Aporetic” or Dubitative either from its habit of doubting and seeking, as some say, or from its indecision as regards assent and denial, and “Pyrrhonian” from the fact that Pyrrho appears to us to have applied himself to Scepticism more thoroughly and more conspicuously than his predecessors.

4. *What Scepticism Is.* Scepticism is an ability, or mental attitude, which opposes appearances to judgements in any way whatsoever, with the result that, owing to the equipollence of the objects and reasons thus opposed, we are brought firstly to a state of mental suspense and next to a state of “unperturbedness” or quietude. Now we call it an “ability” not in any subtle sense, but simply in respect of its “being able.” By “appearances” we now mean the objects of sense-perception, whence we contrast them with the objects of thought or “judgements.” The phrase “in any way whatsoever” can be connected either with the word “ability,” to make us take the word “ability,” as we said, in its simple sense, or with the phrase “opposing appearances to judgements”; for inasmuch as we oppose these in a variety of ways—appearances to appearances, or judgements to judgements, or *alternando* appearances to judgements,—in order to ensure the inclusion of all these antitheses we employ the phrase “in any way whatsoever.” Or, again, we join “in any way whatsoever” to “appearances and judgements” in order that we may not have to inquire how the appearances appear or how the thought-objects are judged, but may take these terms in the simple sense. The phrase “opposed judgements” we do not employ in the sense of negations and affirmations only but simply as equivalent to “conflicting judgements.” “Equipollence” we use of equality in respect of probability and improbability, to indicate that no one of the conflicting judgements takes precedence of any other as being more probable. “Suspense” is a state of mental rest owing to which we neither deny nor affirm anything. “Quietude” is an untroubled and tranquil condition of soul. And how quietude enters the soul along with suspension of judgement we shall explain in our chapter [12] “What Is the End of Scepticism.”

5. *Of the Sceptic.* In the definition of the Sceptic system there is also implicitly included that of the Pyrrhonian philosopher: he is the man who participates in this “ability.”

6. *Of the Principles of Scepticism.* The originating cause of Scepticism is, we say, the hope of attaining quietude. Men of talent, who were perturbed by the contradictions in things and in doubt as to which of the alternatives they ought to accept, were led on to inquire what is true in things and what false, hoping by the settlement of the question to attain quietude. The main basic principle of the Sceptic system is that of opposing to every proposition an equal proposition; for we believe that as a consequence of this we end by ceasing to dogmatize.

7. *Does the Sceptic Dogmatize?* When we say that the Sceptic refrains from dogmatizing we do not use the term "dogma," as some do, in the broader sense of "approval of a thing" (for the Sceptic gives assent to the feelings which are the necessary results of sense-impressions, and he would not, for example, say when feeling hot or cold "I believe that I am not hot or cold"); but we say that "he does not dogmatize" using "dogma" in the sense, which some give it, of "assent to one of the non-evident objects of scientific inquiry"; for the Pyrrhonian philosopher assents to nothing that is non-evident. Moreover, even in the act of enunciating the Sceptic formulae concerning things non-evident—such as the formula "No more (one thing than another)," or the formula "I determine nothing," or any of the others which we shall presently mention,—he does not dogmatize. For whereas the dogmatizer posits the things about which he is said to be dogmatizing as really existent, the Sceptic does not posit these formulae in any absolute sense; for he conceives that, just as the formula "All things are false" asserts the falsity of itself as well as of everything else, as does the formula "Nothing is true," so also the formula "No more" asserts that itself like all the rest, is "No more this than that," and thus cancels itself along with the rest. And of the other formulae we say the same. If then, while the dogmatizer posits the matter of his dogma as substantial truth, the Sceptic enunciates his formulae so that they are virtually canceled by themselves, he should not be said to dogmatize in his enunciation of them. And, most important of all, in his enunciation of these formulae he states what appears to himself and announces his own impression in an undogmatic way, without making any positive assertion regarding the external realities.

8. *Has the Sceptic a Doctrinal Rule?* We follow the same lines in replying to the question "Has the Sceptic a doctrinal rule?" For if one defines a "doctrinal rule" as "adherence to a number of dogmas which are dependent both on one another and on appearances," and defines "dogma" as "assent to a non-evident proposition," then we shall say that he has not a doctrinal rule. But if one defines "doctrinal rule" as "procedure which, in accordance with appearance, follows a certain line of reasoning, that reasoning indicating how it is possible to seem to live rightly (the word 'rightly' being taken, not as referring to virtue only, but in a wider sense) and tending to enable one to suspend judgement," then we say that he has a doctrinal rule. For we follow a line of reasoning which, in accordance with appearances, points us to a life conformable to the customs of our country and its laws and institutions, and to our own instinctive feelings.

9. *Does the Sceptic Deal with Physics?* We make a similar reply also to the question "Should the Sceptic deal with physical problems?" For while, on the one hand, so far as regards making firm and positive assertions about any of the matters dogmatically treated in physical theory, we do not deal with physics; yet, on the other hand, in respect of our mode of opposing to every proposition an equal proposition and of our theory of quietude we do treat of physics. This, too, is the way in which we approach the logical and ethical branches of so-called "philosophy."

10. *Do the Sceptics Abolish Appearances?* Those who say that "the Sceptics abolish appearances," or phenomena, seem to me to be unacquainted with the statements of

our School. For, as we said above, we do not overthrow the affective sense-impressions which induce our assent involuntarily; and these impressions are “the appearances.” And when we question whether the underlying object is such as it appears, we grant the fact that it appears, and our doubt does not concern the appearance itself but the account given of the appearance,—and that is a different thing from questioning the appearance itself. For example, honey appears to us to be sweet (and this we grant, for we perceive sweetness through the senses), but whether it is also sweet in its essence is for us a matter of doubt, since this is not an appearance but a judgement regarding the appearance. And even if we do actually argue against the appearances, we do not propound such arguments with the intention of abolishing appearances, but by way of pointing out the rashness of the Dogmatists; for if reason is such a trickster as to all but snatch away the appearances from under our very eyes, surely we should view it with suspicion in the case of things non-evident so as not to display rashness by following it.

11. *Of the Criterion of Scepticism.* That we adhere to appearances is plain from what we say about the Criterion of the Sceptic School. The word “Criterion” is used in two senses: in the one it means “the standard regulating belief in reality or unreality,” (and this we shall discuss in our refutation); in the other it denotes the standard of action by conforming to which in the conduct of life we perform some actions and abstain from others; and it is of the latter that we are now speaking. The criterion, then, of the Sceptic School is, we say, the appearance, giving this name to what is virtually the sense-presentation. For since this lies in feeling and involuntary affection, it is not open to question. Consequently, no one, I suppose, disputes that the underlying object has this or that appearance; the point in dispute is whether the object is in reality such as it appears to be.

Adhering, then, to appearances we live in accordance with the normal rules of life, undogmatically, seeing that we cannot remain wholly inactive. And it would seem that this regulation of life is fourfold, and that one part of it lies in the guidance of Nature, another in the constraint of the passions, another in the tradition of laws and customs, another in the instruction of the arts. Nature’s guidance is that by which we are naturally capable of sensation and thought; constraint of the passions is that whereby hunger drives us to food and thirst to drink; tradition of customs and laws, that whereby we regard piety in the conduct of life as good, but impiety as evil; instruction of the arts, that whereby we are not inactive in such arts as we adopt. But we make all these statements undogmatically.

12. *What Is the End of Scepticism?* Our next subject will be the End of the Sceptic system. Now an “End” is “that for which all actions or reasonings are undertaken, while it exists for the sake of none”; or, otherwise, “the ultimate object of appetency.” We assert still that the Sceptic’s End is quietude in respect of matters of opinion and moderate feeling in respect of things unavoidable. For the Sceptic, having set out to philosophize with the object of passing judgement on the sense-impressions and ascertaining which of them are true and which false, so as to attain quietude thereby, found himself involved in contradictions of equal weight, and being unable to decide between them suspended judgement; and as he was thus in suspense there followed, as it happened, the state of quietude in respect of matters of opinion. For the man who opines that anything is by nature good or bad is forever being disquieted: when he is without the things which he deems good he believes himself to be tormented by things naturally bad and he pursues after the things which are, as he thinks, good; which when he has obtained he keeps falling into still more perturbations because of his irrational and immoderate elation, and in his dread of a change of fortune he uses every endeavour to

avoid losing the things which he deems good. On the other hand, the man who determines nothing as to what is naturally good or bad neither shuns nor pursues anything eagerly; and, in consequence, he is unperturbed.

The Sceptic, in fact, had the same experience which is said to have befallen the painter Apelles. Once, they say, when he was painting a horse and wished to represent in the painting the horse's foam, he was so unsuccessful that he gave up the attempt and flung at the picture the sponge on which he used to wipe the paints off his brush, and the mark of the sponge produced the effect of a horse's foam. So, too, the Sceptics were in hopes of gaining quietude by means of a decision regarding the disparity of the objects of sense and of thought, and being unable to effect this they suspended judgement; and they found that quietude, as if by chance, followed upon their suspense, even as a shadow follows its substance. We do not, however, suppose that the Sceptic is wholly untroubled; but we say that he is troubled by things unavoidable; for we grant that he is old at times and thirsty, and suffers various affections of that kind. But even in these cases, whereas ordinary people are afflicted by two circumstances,—namely, by the affections themselves and in no less a degree, by the belief that these conditions are evil by nature,—the Sceptic, by his rejection of the added belief in the natural badness of all these conditions, escapes here too with less discomfort. Hence we say that, while in regard to matters of opinion the Sceptic's End is quietude, in regard to things unavoidable it is "moderate affection." But some notable Sceptics have added the further definition "suspension of judgement in investigations."

13. *Of the General Modes Leading to Suspension of Judgement.* Now that we have been saying that tranquility follows on suspension of judgement, it will be our next task to explain how we arrive at this suspension. Speaking generally, one may say that it is the result of setting things in opposition. We oppose either appearances to appearances or objects of thought to objects of thought or *alternando*. For instance, we oppose appearances when we say "The same tower appears round from a distance, but square from close at hand"; and thoughts to thoughts, when in answer to him who argues the existence of Providence from the order of the heavenly bodies we oppose the fact that often the good fare ill and the bad fare well, and draw from this the inference that Providence does not exist. And thoughts we oppose to appearances, as when Anaxagoras countered the notion that snow is white with the argument, "Snow is frozen water, and water is black; therefore snow also is black." With a different idea we oppose things present sometimes to things present, as in the foregoing examples, and sometimes to things past or future, as, for instance, when someone propounds to us a theory which we are unable to refute, we say to him in reply, "Just as, before the birth of the founder of the School to which you belong, the theory it holds was not as yet apparent as a sound theory, although it was really in existence, so likewise it is possible that the opposite theory to that which you now propound is already really existent, though not yet apparent to us, so that we ought not as yet to yield assent to this theory which at the moment seems to be valid."

PLOTINUS

ca. A.D. 204–270

Plotinus was the most influential of the Neoplatonists. Born in Lykopolis, Egypt, in A.D. 204, he moved in his late twenties to Alexandria. There he studied with Ammonius Saccas, an unknown figure who was also the teacher of Origen. After eleven years with Ammonius, Plotinus joined an expedition to Persia to gain knowledge of Persian and Indian wisdom. The trek proved unsuccessful, and Plotinus moved on to Rome. There he established a school of philosophy and became friends with the emperor Gallienus. At one point, he sought permission to found a city based on Plato's *Republic*, but the plan came to naught. He stayed in Rome, teaching and writing, until the death of the emperor in A.D. 268. He then moved to the home of a friend where he died in A.D. 270, apparently from leprosy.

Developing Plato's dualistic understanding of reality, Plotinus taught that true reality lies "beyond" the physical world. This "reality beyond reality" has no limits and so cannot be described by words since words invariably have limits. Plotinus, again borrowing from Plato, calls it the "Good" or the "One." The One/Good has no limits and is so supremely rich that it overflows or "emanates" to produce "Intellectual-Principle" or "Divine Mind" (*Nous*). This Intellectual-Principle, in turn, overflows and "Divine-Soul" emanates from it. This process continues as Divine-Soul generates the material world. The lowest level of emanation, at the furthest extreme from the One/Good, is the utter formlessness and unreality of matter.

The goal of philosophy is to awaken individuals to recognize reality beyond the material world. But philosophy alone cannot take a person to the highest reality of the One/Good. Only in a mystical experience can an individual unite with the One/Good. Plotinus himself claimed to have achieved such a union, a "flight of the Alone to the Alone" to cite his famous words, four times during his

life. His experiences of nonmaterial reality were so powerful that he said he was ashamed to have a body.

Plotinus' writings were edited by one of his pupils, Porphyry, in the form of six groups of nine "Tractates" (treatises), published as the so-called *Enneads* (from the Greek word for "nine"). The selection given here, in the A.H. Armstrong translation, is Plotinus' "Treatise on Beauty." This tractate explains how the ascent of the soul to the One/Good depends on beauty of soul, a godlike disposition.

Neoplatonism, with its emphasis on the otherworldly and the need for escape from the physical world, was the perfect philosophy for the chaotic final days of the Roman Empire. St. Augustine, in particular, was strongly influenced by Neoplatonic thought. Indeed, if St. Thomas is considered an Aristotelian, St. Augustine may be called a Neoplatonist. Many later thinkers, such as Meister Eckhart, Nicholas Cusanus, John Comenius, Jacob Boehme, G.W.F. Hegel, and Friedrich Schelling, also had their philosophy molded by Neoplatonist doctrines.

Joseph Katz, *Plotinus' Search for the Good* (New York: King's Crown Press, 1950); Émile Bréhier, *The Philosophy of Plotinus*, translated by Joseph Thomas (Chicago: University of Chicago Press, 1958); and Lloyd P. Gerson, *Plotinus* (Oxford: Routledge, 1994) are good introductions to the study of Plotinus. For more advanced studies, see A.H. Armstrong, *The Architecture of the Intelligible Universe in the Philosophy of Plotinus* (Cambridge: Cambridge University Press, 1940); J.M. Rist, *Plotinus: The Road to Reality* (Cambridge: Cambridge University Press, 1967); Lloyd P. Gerson, ed., *The Cambridge Companion to Plotinus* (Cambridge: Cambridge University Press, 1996); and Margaret R. Miles, *Plotinus on Body and Beauty* (Oxford: Basil Blackwell, 1999). E.R. Dodds, *Select Passages Illustrating Neoplatonism*, translated by E.R. Dodds (New York: Macmillan, 1923), and Dominic J. O'Meara, *Plotinus: An Introduction to the Enneads* (Oxford: Oxford University Press, 1993), provide anthologies of the *Enneads* with discussions of important passages. For discussions of Neoplatonism as a school, see Thomas Whittaker, *The Neoplatonists* (Cambridge: Cambridge University Press, 1918); Arthur O. Lovejoy's influential book, *The Great Chain of Being* (Cambridge, MA: Harvard University Press, 1936); R.T. Wallis, *Neoplatonism* (London: Duckworth, 1972); and the collection of essays, R. Baine Harris, ed., *The Structure of Being: A Neoplatonic Approach* (Norfolk, VA: International Society for Neoplatonic Studies, 1982).

ENNEADS (in part)

ENNEAD I, TRACTATE 6: BEAUTY

1. Beauty is mostly in sight, but it is to be found too in things we hear, in combinations of words and also in music, and in all music [not only in songs]; for tunes and rhythms are certainly beautiful: and for those who are advancing upwards from sense-perception ways of life and actions and characters and intellectual activities are beautiful, and there is the beauty of virtue. If there is any beauty prior to these, this discussion will reveal it.

Very well then, what is it which makes us imagine that bodies are beautiful and attracts our hearing to sounds because of their beauty? And how are all the things which depend on soul beautiful? Are they all made beautiful by one and the same beauty or is there one beautifulness in bodies and a different one in other things? And what are they, or what is it? Some things, bodies for instance, are not beautiful from the nature of the objects themselves, but by participation, others are beauties themselves, like the nature of virtue. The same bodies appear sometimes beautiful, sometimes not beautiful, so that their being bodies is one thing, their being beautiful another. What is this principle, then, which is present in bodies? We ought to consider this first. What is it that attracts the gaze of those who look at something, and turns and draws them to it and makes them enjoy the sight? If we find this perhaps we can use it as a stepping-stone and get a sight of the rest. Nearly everyone says that it is good proportion of the parts to each other and to the whole, with the addition of good colour, which produces visible beauty, and that with the objects of sight and generally with everything else, being beautiful is being well-proportioned and measured. On this theory nothing single and simple but only a composite thing will have any beauty. It will be the whole which is beautiful, and the parts will not have the property of beauty by themselves, but will contribute to the beauty of the whole. But if the whole is beautiful the parts must be beautiful too; a beautiful whole can certainly not be composed of ugly parts; all the parts must have beauty. For these people, too, beautiful colours, and the light of the sun as well, since they are simple and do not derive their beautifulness from good proportion, will be excluded from beauty. And how do they think gold manages to be beautiful? And what makes lightning in the night and stars beautiful to see? And in sounds in the same way the simple will be banished, though often in a composition which is beautiful as a whole each separate sound is beautiful. And when, though the same good proportion is there all the time, the same face sometimes appears beautiful and sometimes does not, surely we must say that being beautiful is something else over and above good proportion, and good proportion is beautiful because of something else? But if when these people pass on to ways of life and beautiful expressions of thought they allege good proportion as the cause of beauty in these too, what can be meant by good proportion in beautiful ways of life or laws or studies or branches of knowledge? How can speculations be

well-proportioned in relation to each other? If it is because they agree, there can be concord and agreement between bad ideas. The statement that “righteousness is a fine sort of silliness” agrees with and is in tune with the saying that “morality is stupidity”; the two fit perfectly. Again, every sort of virtue is a beauty of the soul, a truer beauty than those mentioned before; but how is virtue well-proportioned? Not like magnitudes or a number. We grant that the soul has several parts, but what is the formula for the composition or mixture in the soul of parts or speculations? And what [on this theory], will the beauty of the intellect alone by itself be?

2. So let us go back to the beginning and state what the primary beauty in bodies really is. It is something which we become aware of even at the first glance; the soul speaks of it as if it understood it, recognises and welcomes it and as it were adapts itself to it. But when it encounters the ugly it shrinks back and rejects it and turns away from it and is out of tune and alienated from it. Our explanation of this is that the soul, since it is by nature what it is and is related to the higher kind of reality in the realm of being, when it sees something akin to it or a trace of its kindred reality, is delighted and thrilled and returns to itself and remembers itself and its own possessions. What likeness, then, is there between beautiful things here and There? If there is a likeness, let us agree that they are alike. But how are both the things in that world and the things in this beautiful? We maintain that the things in this world are beautiful by participating in form; for every shapeless thing which is naturally capable of receiving shape and form is ugly and outside the divine formative power as long as it has no share in formative power and form. This is absolute ugliness. But a thing is also ugly when it is not completely dominated by shape and formative power, since its matter has not submitted to be completely shaped according to the form. The form, then, approaches and composes that which is to come into being from many parts into a single ordered whole; it brings it into a completed unity and makes it one by agreement of its parts; for since it is one itself, that which is shaped by it must also be one as far as a thing can be which is composed of many parts. So beauty rests upon the material thing when it has been brought into unity, and gives itself to parts and wholes alike. When it comes upon something that is one and composed of like parts it gives the same gift to the whole; as sometimes art gives beauty to a whole house with its parts, and sometimes nature gives beauty to a single stone. So then the beautiful body comes into being by sharing in a formative power, *(logos)* which comes from the divine forms.

3. The power ordained for the purpose recognises this, and there is nothing more effective for judging its own subject-matter, when the rest of the soul judges along with it; or perhaps the rest of the soul too pronounces the judgment by fitting the beautiful body to the form in itself and using this for judging beauty as we use a ruler for judging straightness. But how does the bodily agree with that which is before body? How does the architect declare the house outside beautiful by fitting it to the form of house within him? The reason is that the house outside, apart from the stones, is the inner form divided by the external mass of matter, without parts but appearing in many parts. When sense-perception, then, sees the form in bodies binding and mastering the nature opposed to it, which is shapeless, and shape riding gloriously upon other shapes, it gathers into one that which appears dispersed and brings it back and takes it in, now without parts, to the soul's interior and presents it to that which is within as something in tune with it and fitting it and dear to it; just as when a good man sees a trace of virtue in the young, which is in tune with his own inner truth, the sight delights him. And the

simple beauty of colour comes about by shape and the mastery of the darkness in matter by the presence of light which is incorporeal and formative power and form. This is why fire itself is more beautiful than all other bodies, because it has the rank of form in relation to the other elements; it is above them in place and is the finest and subtlest of all bodies, being close to the incorporeal. It alone does not admit the others; but the others admit it for it warms them but is not cooled itself; it has colour primarily and all other things take the form of colour from it. So it shines and glitters as if it was a form. The inferior thing which becomes faint and dull by the fire's light, is not beautiful any more, as not participating in the whole form of colour. The melodies in sounds, too, the imperceptible ones which make the perceptible ones, make the soul conscious of beauty in the same way, showing the same thing in another medium. It is proper to sensible melodies to be measured by numbers, not according to any and every sort of formula but one which serves for the production of form so that it may dominate. So much, then, for the beauties in the realm of sense, images and shadows which, so to speak, sally out and come into matter and adorn it and excite us when they appear.

4. But about the beauties beyond, which it is no more the part of sense to see, but the soul sees them and speaks of them without instruments—we must go up to them and contemplate them and leave sense to stay down below. Just as in the case of the beauties of sense it is impossible for those who have not seen them or grasped their beauty—those born blind, for instance,—to speak about them, in the same way only those can speak about the beauty of ways of life who have accepted the beauty of ways of life and kinds of knowledge and everything else of the sort; and people cannot speak about the splendour of virtue who have never even imagined how fair is the face of justice and moral order; “neither the evening nor the morning star are as fair.” But there must be those who see this beauty by that with which the soul sees things of this sort, and when they see it they must be delighted and overwhelmed and excited much more than by those beauties we spoke of before, since now it is true beauty they are grasping. These experiences must occur whenever there is contact with any sort of beautiful thing, wonder and a shock of delight and longing and passion and a happy excitement. One can have these experiences by contact with invisible beauties, and souls do have them, practically all, but particularly those who are more passionately in love with the invisible, just as with bodies all see them, but all are not stung as sharply, but some, who are called lovers, are most of all.

5. Then we must ask the lovers of that which is outside sense “What do you feel about beautiful ways of life, as we call them, and beautiful habits and well-ordered characters and in general about virtuous activities and dispositions and the beauty of souls? What do you feel when you see your own inward beauty? How are you stirred to wild exultation, and long to be with yourselves, gathering your selves together away from your bodies?” For this is what true lovers feel. But what is it which makes them feel like this? Not shape or colour or any size, but soul, without colour itself and possessing a moral order without colour and possessing all the other light of the virtues; you feel like this when you see, in yourself or in someone else, greatness of soul, a righteous life, a pure morality, courage with its noble look, and dignity and modesty advancing in a fearless, calm and unperturbed disposition, and the godlike light of intellect shining upon all this. We love and delight in these qualities, but why do we call them beautiful? They exist and appear to us and he who sees them cannot possibly say anything else except that they are what really exists. What does “really exists” mean?

That they exist as beauties. But the argument still requires us to explain why real beings make the soul lovable. What is this kind of glorifying light on all the virtues? Would you like to take the opposites, the uglinesses in soul, and contrast them with the beauties? Perhaps a consideration of what ugliness is and why it appears so will help us to find what we are looking for. Suppose, then, an ugly soul, dissolute and unjust, full of all lusts, and all disturbance, sunk in fears by its cowardice and jealousies by its pettiness, thinking mean and mortal thoughts as far as it thinks at all, altogether distorted, loving impure pleasures, living a life which consists of bodily sensations and finding delight in its ugliness. Shall we not say that its ugliness came to it as a "beauty" brought in from outside, injuring it and making it impure and "mixed with a great deal of evil," with its life and perceptions no longer pure, but by the admixture of evil living a dim life and diluted with a great deal of death, no longer seeing what a soul ought to see, no longer left in peace in itself because it keeps on being dragged out, and down, and to the dark? Impure, I think, and dragged in every direction towards the objects of sense, with a great deal of bodily stuff mixed into it, consorting much with matter and receiving a form other than its own it has changed by a mixture which makes it worse; just as if anyone gets into mud or filth he does not show any more the beauty which he had what is seen is what he wiped off on himself from the mud and filth; his ugliness has come from an addition of alien matter, and his business, if he is to be beautiful again, is to wash and clean himself and so be again what he was before. So we shall be right in saying that the soul becomes ugly by mixture and dilution and inclination towards the body and matter. This is the soul's ugliness, not being pure and unmixed, like gold, but full of earthiness; if anyone takes the earthy stuff away the gold is left, and is beautiful, when it is singled out from other things and is alone by itself. In the same way the soul too, when it is separated from the lusts which it has through the body with which it consorted too much, and freed from its other affections, purged of what it gets from being embodied, when it abides alone has put away all the ugliness which came from the other nature.

6. For, as was said in old times, self-control, and courage and every virtue, is a purification, and so is even wisdom itself. This is why the mysteries are right when they say riddlingly that the man who has not been purified will lie in mud when he goes to Hades, because the impure is fond of mud by reason of its badness; just as pigs, with their unclean bodies, like that sort of thing. For what can true self-control be except not keeping company with bodily pleasures, but avoiding them as impure and belonging to something impure? Courage, too, is not being afraid of death. And death is the separation of body and soul; and a man does not fear this if he welcomes the prospect of being alone. Again, greatness of soul is despising the things here and wisdom is an intellectual activity which turns away from the things below and leads the soul to those above. So the soul when it is purified becomes form and formative power, altogether bodiless and intellectual and entirely belonging to the divine, whence beauty springs and all that is akin to it. Soul, then, when it is raised to the level of intellect increases in beauty. Intellect and the things of intellect are its beauty, its own beauty and not another's, since only then [when it is perfectly conformed to intellect] is it truly soul. For this reason it is right to say that the soul's becoming something good and beautiful is its being made like to God, because from Him come beauty and all else which falls to the lot of real beings. Or rather, beautifulness is reality, and the other kind of thing is the ugly, and this same is the primary evil; so for God the qualities of goodness and beauty are the same, or the realities, the good and the beautiful. So we must follow the same line of enquiry to discover beauty and

The School of Plato, Roman mosaic, n.d. The Platonism of late antiquity (and the Middle Ages) was strongly influenced by Plotinus' development and modification of Plato's thought. (Scala/Art Resource, NY)

goodness, and ugliness and evil. And first we must posit beauty which is also the good; from this immediately comes intellect, which is beauty; and soul is given beauty by intellect. Everything else is beautiful by the shaping of soul, the beauties in actions and in ways of life. And soul makes beautiful the bodies which are spoken of as beautiful; for since it is a divine thing and a kind of part of beauty, it makes everything it grasps and masters beautiful, as far as they are capable of participation.

7. So we must ascend again to the good, which every soul desires. Anyone who has seen it knows what I mean when I say that it is beautiful. It is desired as good, and the desire for it is directed to good, and the attainment of it is for those who go up to the

higher world and are converted and strip off what we put on in our descent; (just as for those who go up to the celebrations of sacred rites there are purifications, and strippings off of the clothes they wore before, and going up naked) until, passing in the ascent all that is alien to the God, one sees with one's self alone That alone, simple, single and pure, from which all depends and to which all look and are and live and think for it is the cause of life and mind and being. If anyone sees it, what passion will he feel, what longing in his desire to be united with it, what a shock of delight! The man who has not seen it may desire it as good, but he who has seen it glories in its beauty and is full of wonder and delight, enduring a shock which causes no hurt, loving with true passion and piercing longing; he laughs at all other loves and despises what he thought beautiful before; it is like the experience of those who have met appearances of gods or spirits and do not any more appreciate as they did the beauty of other bodies. "What then are we to think, if anyone contemplates the absolute beauty which exists pure by itself, uncontaminated by flesh or body, not in earth or heaven, that it may keep its purity?" All these other things are external additions and mixtures and not primary, but derived from it. If then one sees That which provides for all and remains by itself and gives to all but receives nothing into itself, if he abides in the contemplation of this kind of beauty and rejoices in being made like it, how can he need any other beauty? For this, since it is beauty most of all, and primary beauty, makes its lovers beautiful and lovable. Here the greatest, the ultimate contest is set before our souls; all our toil and trouble is for this, not to be left without a share in the best of visions. The man who attains this is blessed in seeing that "blessed sight," and he who fails to attain it has failed utterly. A man has not failed if he fails to win beauty of colours or bodies, or power or office or kingship even, but if he fails to win this and only this. For this he should give up the attainment of kingship and of rule over all earth and sea and sky, if only by leaving and overlooking them he can turn to That and see.

8. But how shall we find the way? What method can we devise? How can one see the "inconceivable beauty" which stays within in the holy sanctuary and does not come out where the profane may see it? Let him who can, follow and come within, and leave outside the sight of his eyes and not turn back to the bodily splendours which he saw before. When he sees the beauty in bodies he must not run after them; we must know that they are images, traces, shadows, and hurry away to that which they image. For if a man runs to the image and wants to seize it as if it was the reality (like a beautiful reflection playing on the water, which some story somewhere, I think, said riddlingly a man wanted to catch and sank down into the stream and disappeared) then this man who clings to beautiful bodies and will not let them go, will, like the man in the story, but in soul, not in body, sink down into the dark depths where intellect has no delight, and stay blind in Hades, consorting with shadows there and here. This would be truer advice "Let us fly to our dear country." What then is our way of escape, and how are we to find it? We shall put out to sea, as Odysseus did, from the witch Circe or Calypso—as the poet says (I think with a hidden meaning)—and was not content to stay though he had delights of the eyes and lived among much beauty of sense. Our country from which we came is there, our Father is there. How shall we travel to it, where is our way of escape? We cannot get there on foot; for our feet only carry us everywhere in this world, from one country to another. You must not get ready a carriage, either, or a boat. Let all these things go, and do not look. Shut your eyes, and change to and wake another way of seeing, which everyone has but few use.

9. And what does this inner sight see? When it is just awakened it is not at all able to look at the brilliance before it. So that the soul must be trained, first of all to look at beautiful ways of life then at beautiful works, not those which the arts produce, but the works of men who have a name for goodness: then look at the souls of the people who produce the beautiful works. How then can you see the sort of beauty a good soul has? Go back into yourself and look; and if you do not yet see yourself beautiful, then, just as someone making a statue which has to be beautiful cuts away here and polishes there and makes one part smooth and clears another till he has given his statue a beautiful face, so you too must cut away excess and straighten the crooked and clear the dark and make it bright, and never stop "working on your statue" till the divine glory of virtue shines out on you, till you see "self-mastery enthroned upon its holy seat." If you have become this, and see it, and are at home with yourself in purity, with nothing hindering you from becoming in this way one, with no inward mixture of anything else, but wholly yourself, nothing but true light, not measured by dimensions, or bounded by shape into littleness, or expanded to size by unboundedness, but everywhere unmeasured, because greater than all measure and superior to all quantity; when you see that you have become this, then you have become sight; you can trust yourself then; you have already ascended and need no one to show you; concentrate your gaze and see. This alone is the eye that sees the great beauty. But if anyone comes to the sight bleary-eyed with wickedness, and unpurified, or weak and by his cowardice unable to look at what is very bright, he sees nothing, even if someone shows him what is there and possible to see. For one must come to the sight with a seeing power made akin and like to what is seen. No eye ever saw the sun without becoming sunlike, nor can a soul see beauty without becoming beautiful. You must become first all godlike and all beautiful if you intend to see God and beauty. First the soul will come in its ascent to intellect and there will know the Forms, all beautiful, and will affirm that these, the Ideas, are beauty; for all things are beautiful by these, by the products and essence of intellect. That which is beyond this we call the nature of the Good, which holds beauty as a screen before it. So in a loose and general way of speaking the Good is the primary beauty; but if one distinguishes the intelligibles [from the Good] one will say that the place of the Forms is the intelligible beauty, but the Good is That which is beyond, the "spring and origin" of beauty; or one will place the Good and the primal beauty on the same level. In any case, however, beauty is in the intelligible world.

CHRISTIANITY AND MEDIEVAL PHILOSOPHY

With only a few exceptions, European medieval thought was deeply imbued with Christian faith. As a result, it is not possible to understand medieval philosophy without at least a rudimentary understanding of Christian beliefs as presented in the Bible. Whether or not today's reader accepts the veracity of the claims put forth in these writings, most medievals did believe them, and that belief formed the foundation of their thought.

Beginning as a Jewish sect, Christianity continued to hold a number of beliefs in common with Judaism, including the following bedrock convictions: that the Hebrew Bible (called the "Old Testament" by Christians) is the revealed Word of God; that God is superior to and distinct from the created world; that the world was created by God at a specific point in time and that the world will come to an end; that God is personal and desires a special relationship with the human race; that humans have sinned against God's Law and need God's forgiveness; that God requires righteousness as a means of a right relationship with God and others; and that God would send the Anointed One ("Messiah" in Hebrew, "Christ" in Greek) to set the people of God free.

But while Christians accepted the foundational beliefs of their Jewish ancestors, they differed on one key point: the identity of the Messiah. Whereas the Jews anticipated a spiritual-political figure to save them from the oppression of their enemies, Christians believed the Christ saved his people mainly from the spiritual oppressors of sin and death. Whereas the Jews believed the Messiah would scrupulously follow the Law, favoring and associating only with those who did likewise, the Christ of the Christians seemed to enjoy a remarkable freedom in

relation to several of Israel's most venerable institutions—for example, Sabbath observances, the Temple, and ritual purity—while associating with the “lowlifes” of society. In short, whereas the Jewish people were (and still are) awaiting the Messiah, Christians believed (and still believe) Jesus of Nazareth was the Messiah.

Christians held that after his death by crucifixion, Jesus rose from the dead (the Resurrection) and taught his followers for forty days before ascending into heaven. As part of that teaching, Jesus promised that he would return again (the Second Coming (*parousia*)) and that in the meantime his followers should spread the Christian faith to all the world.

The basic Christian belief was (and still is) that Jesus is the Son of God who became a human (the Incarnation) to atone for human sin (Redemption). The severed relationship between the Holy God and sinful humanity could be restored only through the sacrifice of one who was consummate righteousness. As the Word (*Logos*) of God made flesh, Jesus was that righteousness, made that sacrifice, and offered that restoration. Through faith, Christians accept this work done on their behalf (Justification) and receive the power of God's spirit to overcome sin and to serve others (Sanctification).

As Christians spread this message throughout the Roman Empire, they encountered resistance and persecution from both Jewish and Roman authorities. Many Jewish leaders objected to the Christian identification of Jesus with God; Roman authorities objected to the Christians' unwillingness to participate in emperor worship. Jews, too, had refused to participate in state religion and had often been persecuted. But Christians posed a unique threat to the Romans because, unlike the Jews, Christians proclaimed a supranational, supraracial, universal Lord—one very much in competition with Caesar. And Christians indefatigably sought converts to their universal Savior. Accordingly, they were persecuted on and off for three centuries.

Despite persecution, Christianity grew steadily in the centuries after Christ. There have been many explanations for that growth. The eighteenth-century historian Edward Gibbon* listed five causes: (1) Christianity's inheritance of the zeal of the Jews; (2) its connection to the philosophical doctrine of the immortality of the soul; (3) its claim of miracles; (4) the virtue of the early Christians; and (5) the organization of the church. Recent historians have pointed to the moral exclusivity of Christians, who demanded deep commitment; the definite and absolute character of Christian belief in an age of uncertainty; and the social dimensions of Christianity, which made it attractive to women, the poor, and the oppressed.**

As Christianity grew, doctrinal disputes inevitably arose. What was true Christianity? The answers tended to reflect deep convictions about two essential issues: the nature of the person and work of Jesus Christ and the relationship between faith and reason. What was the relationship between Jesus and God? Did Jesus have two distinct natures: one divine and one human? Or were they merged into a single unique nature? Moreover, if there is only one God, how could God also be three (Father, Son, and Holy Spirit)? And how could reason resolve issues of faith?

**The Decline and Fall of the Roman Empire*, Chapter XV.

**Of course, Christians have always claimed that none of these reasons is entirely adequate and that the most acceptable explanation for the rise of Christianity is a supernatural one.

The first issue, the nature of Christ, was resolved at the Council of Nicea, convened and presided over by the first Christian emperor, Constantine, in A.D. 325. The Council determined that the Son was exactly the same substance, “consubstantial” (*homoousios*), and not just “of like substance” (*homoiousios*), with God the Father. (The single Greek letter “iota,” meant a great deal more than “one iota of difference” to the early church.) By the middle of the first millenium, the “Nicene Creed” was confessed by virtually all Christendom as the orthodox answer to the nature-of-Christ question. The Nicene Creed is still authoritative in Orthodox, Catholic, and Protestant churches.

Even though the Christological question was answered at Nicea, the question of the right relation between faith and reason continued to be argued throughout the medieval period. The early Christians had a simple faith in Jesus as Messiah (if they were Jewish Christians) and as Lord (if they were Gentile Christians), and they believed Jesus had lived, taught, died, and risen for them and all others. But almost immediately, that simple faith encountered sophisticated Hellenistic thought throughout the Roman Empire. How much should Christian faith concede to the competence of philosophic reason? What was the relation between sacred writings (i.e., the Bible) and secular writings (e.g., philosophy)? In Acts 17, the Apostle Paul, the early Christian convert, used reason and quoted pagan poets to help him preach the gospel to Epicurean and Stoic philosophers in Athens. Yet later, in Colossians 2:8, he warned, “See to it that no one takes you captive through philosophy and empty deceit. . . .” Some early Church Fathers, such as Justin Martyr, used philosophy to help interpret Christian faith. Other Church Fathers, such as Tertullian, argued that reason could be inimical to faith: “What has Jerusalem to do with Athens?” he asked.

Some in the early church even claimed to have special esoteric knowledge not available to the rabble either in the sacred Scriptures or secular reason. They were known as “Gnostics,” from the Greek word for knowledge (*gnosis*). These Gnostics emphasized the Platonic belief in the soul as good and the body as evil, and they sought to free the soul from the body by extreme ascetic practices. Some of the Gnostics taught that Jesus was not *really* a physical person (since the body is evil) and that the Old Testament God, Yahweh, who had created bodies and matter, was really the devil. Manicheaism, which rivaled Christianity in the third and fourth centuries, and for a time claimed Augustine as one of its believers, was based on Gnostic thought.

For the most part, the early medieval philosophers sought to resolve these theological issues within the broad framework of Platonic thought. Augustine (as either the last classical thinker or the first medieval one), Boethius, Anselm, and Hildegard of Bingen all used Neoplatonic concepts. In the early Middle Ages, most of Aristotle’s writings were not available in the West. But in the East, Islamic philosophers, such as Ibn-Sina and Ibn Rushd (or Averroës), and Jewish thinkers, such as Moses Maimonides, read and commented on a wide range of Aristotelian works. These works, along with the Muslim and Jewish commentaries on them, were reintroduced to Western Europe in the late-Middle Ages and became the basis for the monumental work of Thomas Aquinas.

While Thomas lived during a period of relative calm and well-being, the centuries following his death were filled with tumult and upheaval. As a part of the often vicious conflict between church and state, Philip IV of France captured Pope Boniface VIII in 1303 and soon thereafter moved the papal court to Avignon,

France—the so-called Babylonian Captivity of the Church. Beginning in 1347, the bubonic plague, or Black Death, struck Western Europe. Responses to the plague ranged from fanatical anti-intellectual apocalypticism to self-indulgent hedonism. Some even blamed the plague on intellectuals such as Thomas Aquinas, saying they provoked divine wrath by explaining God's ways rationally; others simply counseled, "Let us eat, drink, and be merry, for tomorrow we die." Many turned to superstition or to scapegoating Jews. At the same time, England and France were involved in the Hundred Years' War (1337–1453), which brought enormous casualties. Because of the plague and the war, in the years from 1300 to 1450, the population of Western Europe was reduced by half—perhaps by as much as two-thirds. In 1378, the Great Schism divided the Catholic Church as the Italians reinstituted the papacy in Rome, while a second pope reigned in Avignon. For over thirty years, rival popes condemned and excommunicated one another. In 1409, an attempt to end the schism with a compromise pope led only to a third pope and thus a third claimant to St. Peter's universal chair. Finally, in 1417, the church united around one pope ruling in Rome. But by now the power and prestige of the papacy had been severely diminished, and a hundred years later, in the Protestant Reformation, the Western church split decisively.

The philosophy of this later medieval period is commonly viewed in the light of these social upheavals, and, indeed, there does seem to be some connection. Thomas had harmonized philosophy and theology in a systematic way reflective of the relative peacefulness of the thirteenth century. Just as social stability—particularly in the relationship between church and state—deteriorated in the centuries following Thomas, so also the philosophies that developed during this period tended to separate reason and faith. William of Ockham, for example, held that philosophy and theology were separate realms with separate rules. The Renaissance thinker Pico della Mirandola developed a philosophy essentially excluding faith while using reason to draw from sources both within and outside Christendom. In Pico's philosophy, reason and faith were no longer systematically conjoined: Reason stood supremely alone. Clearly the coherent, rational Christian synthesis of Thomas had unraveled.

But as Frederick Copleston has pointed out, there are other ways of understanding this transition. Instead of seeing late-medieval–early-Renaissance philosophy as destructive to a grand synthesis or as reactive to societal chaos, "one can see . . . philosophy being reborn and growing up under the shadow and care of theology, reaching a more or less adult stage and then tending to go its own way and assert its independence" (*A History of Medieval Philosophy*, p. 314). While acknowledging the disintegration of the peculiarly Thomistic approach to synthesis, this view sees the late-medieval period as a natural development of Western European thought.

Petry, ed., *Late Medieval Mysticism* (Philadelphia: Westminster Press, 1957); Gordon Leff, *The Dissolution of the Medieval Outlook: An Essay on Intellectual and Spiritual Change in the Fourteenth Century* (New York: New York University Press, 1976); Norman Kretzmann et al., eds., *The Cambridge History of Later Medieval Philosophy: From the Rediscovery of Aristotle to the Disintegration of Scholasticism 1100–1600* (Cambridge: Cambridge University Press, 1982); and John Marenbon, *Later Medieval Philosophy (1150–1350): An Introduction* (London: Routledge & Kegan Paul, 1987).

AUGUSTINE

A.D. 354–430

Aurelius Augustinus, Saint Augustine, was born of a Christian mother and a pagan father in Thagaste, a small town in what is now Algeria, North Africa. In many ways, his family's mixed religious background represented the crumbling Roman Empire. Even though the influence of Christianity had grown since Emperor Constantine's edict of religious toleration in A.D. 313, there were still many rivals to his mother's faith.

As a boy, Augustine showed intellectual promise, and at 17 he was sent to Carthage to study rhetoric. While there, Augustine found philosophy, rejected Christianity, took a mistress (who bore him a son), and began to investigate some of the religions of the time. He turned first to the followers of the prophet Mani—the Manichaeans. Mani was a third-century prophet who called himself “the apostle of God.” He developed the ancient Persian teaching of Zoroaster (or Zarathustra), which said that there are two great forces in the world, one good and one evil, and that neither can overcome the other. Living a life of sensual indulgence, Augustine took comfort from the idea that God could no more overcome evil in the universe than Augustine could in his own life.

In 375, Augustine returned to Thagaste to begin teaching rhetoric. When his mother, Monica (later sainted for her perseverance in prayer for her son), discovered that he had become a Manichaean, she expelled him from her house. Finding Thagaste boring, and his mother difficult, Augustine returned to Carthage. Over the next seven years, he grew disenchanted with Manichaeism. In 384, he left Carthage for teaching positions in Rome and finally Milan. In Milan, Augustine encountered the writings of Plotinus and was converted to Neoplatonism. At the same time, he came into contact with a group of Christians led by the Bishop of Milan, Ambrose. Under the influence of this group, Augustine was forced to reconsider his earlier rejection of Christianity, yet he was still unwilling to give up

his life of self-gratification. In 386, while sitting in a friend's garden, he heard what he thought was a child's voice saying, "Pick it up and read, pick it up and read." Augustine later recounted what happened:

I returned to the place where Alypius was sitting, for on leaving it I had put down there the book of the apostle's letters. I snatched it up, opened it and read in silence the passage on which my eyes first lighted: "Not in dissipation and drunkenness, nor in debauchery and lewdness, nor in arguing and jealousy; but put on the Lord Jesus Christ, and make no provision for the flesh or the gratification of your desires." [Rom. 13:13–14] I had no wish to read further, nor was there need. No sooner had I reached the end of the verse than the light of certainty flooded my heart and all dark shades of doubt fled away.*

The following year, Augustine was baptized and returned to Africa to found a monastic community. Within two years he left the cloister, answering the church's call to priesthood. He served as a priest, and later as bishop, in the African town of Hippo for the rest of his life.

* * *

While at Hippo, Augustine wrote voluminously on a variety of theological and philosophical topics. Many of his works sought to define exactly what was and was not "Christian." His doctrinal works, such as *The Trinity*, established Christian essentials; whereas his polemical works, directed against "heresies" (positions unacceptable to the church), outlined what was not admissible. Augustine fought two major heresies: the Pelagian and the Donatist. The Pelagians held that sin had affected only Adam, that the will is free from sin, and that God's grace is given on the basis of human merit. The Donatists maintained that the sacraments were effective only when administered by a priest in a state of grace. Augustine argued passionately that both heresies put too much emphasis on human ability and not enough on God's grace.

Augustine's most famous work, the *Confessions*, invented the genre of introspective autobiography. The *Confessions* are full of both psychological and spiritual insight and so can be read as either devotional tract or philosophical essay. Books I through IX are Augustine's life story from the perspective of Christian conversion (detailed in our selection from Book VIII). As Augustine reflects on his life, he sees both his sinfulness and his intellectual aimlessness apart from God's grace. He also gives early glimpses of his mature epistemological position that God must illumine the mind in order for an individual to gain wisdom. Following his conversion, Augustine continued to seek understanding—though now firmly founded on faith. Books X to XII illustrate this "faith seeking understanding," as Augustine examines the questions of memory, time, and creation. Our selection from Book XI explores the nature of time and God's relation to it. Augustine argues that God must be "outside" time in an eternal present. This view of God as timelessly eternal was developed by Boethius and is still influential today (see the suggested readings that follow). I am pleased to offer this selection in the outstanding new translation by Maria Boulding.

*Saint Augustine, *Confessions*, Book VIII. See reading on p. 275.

Of Augustine's many other works, *The City of God* is by far the most influential. During the fourth century, Christianity had become the state religion of the Roman Empire; in 410, Rome fell to the Visigoths, and the eternal city was sacked for the first time. Naturally, many considered the sack of Rome a punishment for the betrayal of the old Roman religion. Augustine wrote *The City of God* to answer this charge and in so doing he developed yet another first: the first Western philosophy of history. Rather than a cycle of repeated events, Augustine described history as being linear—from creation to consummation and final judgment. As history moves from beginning to end, we can observe two cities: the City of God, consisting of those who love God; and the City of Man, those who love self rather than God. The first selection, from Book XI, presents Augustine's final argument against the skeptics. Augustine's insistence that he *knows* he exists anticipates Descartes's argument twelve centuries later.

The second selection, from Book XII, explains the origin of evil and of the City of Man. Augustine begins by insisting, against the Manichaeans, that there is no being capable of opposing God: God is all-powerful. But, despite the presence of evil, God is also all-good and everything God created is good. Evil arises when a moral agent (angel or human) wills to love a lesser good (self) rather than the highest good (God). There is no evil "thing" to choose—there is only evil choosing. This leads to the question of what caused the will to choose evilly—a question Augustine says cannot be answered. Both selections have been ably translated by Gerald G. Walsh, Daniel J. Honan, and Grace Monahan.

Augustine's impact has been enormous. Medieval Catholic philosophers, such as Anselm and Thomas Aquinas, as well as Protestant reformers, such as Martin Luther and John Calvin, wanted to be Augustine's heirs. Many contemporary Christian thinkers still appeal to Augustine's ideas, such as his defense of grace and his explanation of evil. But Augustine's influence has not been limited to theologians and philosophers of religion. Ludwig Wittgenstein began his *Philosophical Investigations* by examining Augustine's theory of language, and Bertrand Russell claimed Augustine's theory of time superior even to that of Kant. Echoes of Augustine's understanding of history as the unfolding of divine purpose can be heard in the writings of Hegel, whereas Augustine's idea that some kind of faith must precede fruitful understanding has been adapted by thinkers in such fields as the sociology of knowledge and philosophy of science.

* * *

The best general account of Augustine's philosophy remains Étienne Gilson, *The Christian Philosophy of Saint Augustine*, translated by L.E.M. Lynch (New York: Random House, 1960); Peter Brown, *Augustine of Hippo: A Biography* (Berkeley: University of California Press, 1967), provides an excellent biography. For brief introductions to Augustine's life and thought, see Henry Chadwick's pair of books, *Augustine* and *Augustine: A Very Short Introduction* (Oxford: Oxford University Press, 1986 and 2001). For more extensive discussions of Augustine's thought, see Robert E. Meagher, *An Introduction to Augustine* (New York: New York University Press, 1978); Christopher Kirwan, *Augustine* (London: Routledge, 1989); and Benedict J. Groeschel, *Augustine: Major Writings* (New York: Crossroads, 1995). J.N. Figgis, *The Political Aspects of St. Augustine's City of God* (London: Longmans, Green, 1921); Ronald H. Nash, *The Light of the Mind: St. Augustine's*

Theory of Knowledge (Lexington: University Press of Kentucky, 1969); R.A. Markus, *Saeculum: History and Society in the Theology of St. Augustine* (Cambridge: Cambridge University Press, 1970); Robert J. O'Connell's pair of books, *St. Augustine's Confessions* and *Images of Conversion in St. Augustine's Confessions* (New York: Fordham University Press, 1989 and 1996); Brian Stock, *Augustine the Reader* (Cambridge, MA: Harvard University Press, 1996); and Robert Dyson, *St. Augustine of Hippo: The Christian Transformation of Political Philosophy* (London: Continuum, 2005) deal with the specialized topics indicated by their respective titles. John M. Rist, *Augustine: Ancient Thought Baptized* (Cambridge: Cambridge University Press, 1994) explores the connections between Augustine and Platonic thought. For collections of essays, see M.C. D'Arcy et al., *Saint Augustine* (New York: Meridian, 1957), and R.A. Markus, ed., *Augustine: A Collection of Critical Essays* (Garden City, NY: Anchor, Doubleday, 1972).

CONFESSIONS (in part)

BOOK VIII—CONVERSION

5, 10. . . . It was no iron chain imposed by anyone else that fettered me, but the iron of my own will. The enemy had my power of willing in his clutches, and from it had forged a chain to bind me. The truth is that disordered lust springs from a perverted will; when lust is pandered to, a habit is formed; when habit is not checked, it hardens into compulsion. These were like interlinking rings forming what I have described as a chain, and my harsh servitude used it to keep me under duress.

A new will had begun to emerge in me, the will to worship you disinterestedly and enjoy you, O God, our only sure felicity; but it was not yet capable of surmounting that earlier will strengthened by inveterate custom. And so the two wills fought it out—the old and the new, the one carnal, the other spiritual—and in their struggle tore my soul apart.

* * *

8, 19. Within the house of my spirit the violent conflict raged on, the quarrel with my soul that I had so powerfully provoked in our secret dwelling, my heart, and at the height of it I rushed to Alypius with my mental anguish plain upon my face. “What is happening to us?” I exclaimed. “What does this mean? What did you make of it? The untaught are rising up and taking heaven by Storm, while we with all our dreary teachings are still groveling in this world of flesh and blood! Are we ashamed to follow, just

because they have taken the lead, yet not ashamed of lacking the courage even to follow?" Some such words as these I spoke, and then my frenzy tore me away from him, while he regarded me in silent bewilderment. Unusual, certainly, was my speech, but my brow, cheeks and eyes, my flushed countenance and the cadences of my voice expressed my mind more fully than the words I uttered.

Adjacent to our lodgings was a small garden. We were free to make use of it as well as of the house, for our host, who owned the house, did not live there. The tumult in my breast had swept me away to this place, where no one would interfere with the blazing dispute I had engaged in with myself until it should be resolved. What the outcome would be you knew, not I. All I knew was that I was going mad, but for the sake of my sanity, and dying that I might live, aware of the evil that I was but unaware of the good I was soon to become. So I went out into the garden and Alypius followed at my heels; my privacy was not infringed by his presence, and, in any case, how could he abandon me in that state? We sat down as far as possible from the house. I was groaning in spirit and shaken by violent anger because I could form no resolve to enter into a covenant with you, though in my bones I knew that this was what I ought to do, and everything in me lauded such a course to the skies. It was a journey not to be undertaken by ship or carriage or on foot, nor need it take me even that short distance I had walked from the house to the place where we were sitting; for to travel—and more, to reach journey's end—was nothing else but to want to go there, but to want it valiantly and with all my heart, not to whirl and toss this way and that a will half crippled by the struggle, as part of it rose up to walk while part sank down.

20. While this vacillation was at its most intense many of my bodily gestures were of the kind that people sometimes want to perform but cannot, either because the requisite limbs are missing, or because they are bound and restricted, or paralyzed through illness, or in some other way impeded. If I tore out my hair, battered my forehead, entwined my fingers and clasped them round my knee, I did so because I wanted to. I might have wanted to but found myself unable, if my limbs had not been mobile enough to obey. So then, there were plenty of actions that I performed where willing was not the same thing as being able; yet I was not doing the one thing that was incomparably more desirable to me, the thing that I would be able to do as soon as I willed, because as soon as I willed—why, then, I would be willing it! For in this sole instance the faculty to act and the will to act precisely coincide, and the willing is already the doing. Yet this was not happening. My body was more ready to obey the slightest whim of my soul in the matter of moving my limbs, than the soul was to obey its own command in carrying out this major volition, which was to be accomplished within the will alone.

9, 21. How did this bizarre situation arise, how develop? May your mercy shed light on my inquiry, so that perhaps an answer may be found in the mysterious punishments meted out to humankind, those utterly baffling pains that afflict the children of Adam. How then did this bizarre situation arise, how develop? The mind commands the body and is instantly obeyed; the mind commands itself, and meets with resistance. When the mind orders the hand to move, so smooth is the compliance that command can scarcely be distinguished from execution; yet the mind is mind, while the hand is body. When the mind issues its command that the mind itself should will something (and the mind so commanded is no other than itself), it fails to do so. How did this bizarre situation arise, how develop? As I say, the mind commands itself to will something: it would not be giving the order if it did not want this thing; yet it does not do what it commands.

Evidently, then, it does not want this thing with the whole of itself, and therefore the command does not proceed from an undivided mind. Inasmuch as it issues the command, it does will it, but inasmuch as the command is not carried out, it does not will it. What the will is ordering is that a certain volition should exist, and this volition is not some alien thing, but its very self. Hence it cannot be giving the order with its whole self. It cannot be identical with that thing which it is commanding to come into existence, for if it were whole and entire it would not command itself to be, since it would be already.

This partial willing and partial non-willing is thus not so bizarre, but a sickness of the mind, which cannot rise with its whole self on the wings of truth because it is heavily burdened by habit. There are two wills, then, and neither is the whole: what one has the other lacks.

10, 22. Some there are who on perceiving two wills engaged in deliberation assert that in us there are two natures, one good, the other evil, each with a mind of its own. Let them perish from your presence, O God, as perish all who talk wildly and lead our minds astray. They are evil themselves as long as they hold these opinions, yet these same people will be good if they embrace true opinions and assent to true teaching, and so merit the apostle's commendation, You were darkness once, but now you are light in the Lord. The trouble is that they want to be light not in the Lord but in themselves, with their notion that the soul is by nature divine, and so they have become denser darkness still, because by their appalling arrogance they have moved further away from you, the true Light, who enlighten everyone who comes into the world. I warn these people, Take stock of what you are saying, and let it shame you; but once draw near to him and be illumined, and your faces will not blush with shame.

When I was making up my mind to serve the Lord my God at last, as I had long since purposed, I was the one who wanted to follow that course, and I was the one who wanted not to. I was the only one involved. I neither wanted it wholeheartedly nor turned from it wholeheartedly. I was at odds with myself, and fragmenting myself. This disintegration was occurring without my consent, but what it indicated was not the presence in me of a mind belonging to some alien nature but the punishment undergone by my own. In this sense, and this sense only, it was not I who brought it about, but the sin that dwelt within me as penalty for that other sin committed with greater freedom;* for I was a son of Adam.

23. Moreover, if we were to take the number of conflicting urges to signify the number of natures present in us, we should have to assume that there are not two, but many. If someone is trying to make up his mind whether to go to a Manichean conventicle or to the theater, the Manichees declare, "There you are, there's the evidence for two natures: the good one is dragging him our way, the bad one is pulling him back in the other direction. How else explain this dithering between contradictory wills?" But I regard both as bad, the one that leads him to them and the one that lures him back to the theater. They, on the contrary, think that an inclination toward them can only be good.

But consider this: suppose one of our people is deliberating, and as two desires clash he is undecided whether to go to the theater or to our church, will not our opponents too be undecided what attitude to take? Either they will have to admit that it is

*[That is, by Adam. Augustine uses the comparative to suggest a relative freedom enjoyed by Adam, superior to our own but short of perfect freedom. He was to spell out the distinction later in *Correction and Grace* XII, 33 between *posse non peccare* (the ability not to sin, Adam's privilege), and *non posse peccare* (the perfection of freedom in heaven)].

good will that leads a person to our church, just as good as that which leads to theirs the people who are initiated into their sacred rites and trapped there—and this they are unwilling to admit; or they will conclude that two evil natures and two bad minds are pitted against each other within one person, in which case their habitual assertion of one good and one evil nature will be erroneous; or, finally, they will be brought round to the truth and no longer deny that when a person is deliberating there is but one soul, thrown into turmoil by divergent impulses.

24. When, therefore, they observe two conflicting impulses within one person, let them stop saying that two hostile minds are at war, one good, the other evil, and that these derive from two hostile substances and two hostile principles. For you are true, O God, and so you chide and rebuke them and prove them wrong. The choice may lie between two impulses that are both evil, as when a person is debating whether to murder someone with poison or a dagger; whether to annex this part of another man's property or that, assuming he cannot get both; whether to buy himself pleasure by extravagant spending or hoard his money out of avarice; whether to go to the circus or the theater if both performances are on the same day—and I would even add a third possibility: whether to go and steal from someone else's house while he has the chance, and a fourth as well: whether to commit adultery while he is about it. All these impulses may occur together, at exactly the same time, and all be equally tempting, but they cannot all be acted upon at once. The mind is then rent apart by the plethora of desirable objects as four inclinations, or even more, do battle among themselves; yet the Manichees do not claim that there are as many disparate substances in us as this.

The same holds true for good impulses. I would put these questions to them: Is it good to find delight in a reading from the apostle? To enjoy the serenity of a psalm? To discuss the gospel? To each point they will reply, "Yes, that is good." Where does that leave us? If all these things tug at our will with equal force, and all together at the same time, will not these divergent inclinations put a great strain on the human heart, as we deliberate which to select? All are good, but they compete among themselves until one is chosen, to which the will, hitherto distracted between many options, may move as a united whole. So too when the joys of eternity call us from above, and pleasure in temporal prosperity holds us fast below, our one soul is in no state to embrace either with its entire will. Claimed by truth for the one, to the other clamped by custom, the soul is torn apart in its distress.

11, 25. Such was the sickness in which I agonized, blaming myself more sharply than ever, turning and twisting in my chain as I strove to tear free from it completely, for slender indeed was the bond that still held me. But hold me it did. In my secret heart you stood by me, Lord, redoubling the lashes of fear and shame in the severity of your mercy, lest I give up the struggle and that slender, fragile bond that remained be not broken after all, but thicken again and constrict me more tightly. "Let it be now," I was saying to myself. "Now is the moment, let it be now," and merely by saying this I was moving toward the decision. I would almost achieve it, but then fall just short; yet I did not slip right down to my starting-point, but stood aside to get my breath back. Then I would make a fresh attempt, and now I was almost there, almost there . . . I was touching the goal, grasping it . . . and then I was not there, not touching, not grasping it. I shrank from dying to death and living to life, for ingrained evil was more powerful in me than new-grafted good. The nearer it came, that moment when I would be changed, the more it pierced me with terror. Dismayed, but not quite dislodged, I was left hanging.

26. The frivolity of frivolous aims, the futility of futile pursuits, these things that had been my cronies of long standing, still held me back, plucking softly at my garment

of flesh and murmuring in my ear, "Do you mean to get rid of us? Shall we never be your companions again after that moment . . . never . . . never again? From that time onward so-and-so will be forbidden to you, all your life long." And what was it that they were reminding me of by those words, "so-and-so," O my God, what were they bringing to my mind? May your mercy banish such memories far from me! What foul deeds were they not hinting at, what disgraceful exploits! But now their voices were less than half as loud, for they no longer confronted me directly to argue their case, but muttered behind my back and slyly tweaked me as I walked away, trying to make me look back. Yet they did slow me down, for I could not bring myself to tear free and shake them off and leap across to that place whither I was summoned, while aggressive habit still taunted me: "Do you imagine you will be able to live without these things?"

27. The taunts had begun to sound much less persuasive, however; for a revelation was coming to me from that country toward which I was facing, but into which I trembled to cross. There I beheld the chaste, dignified figure of Continence. Calm and cheerful was her manner, though modest, pure and honorable her charm as she coaxed me to come and hesitate no longer, stretching kindly hands to welcome and embrace me, hands filled with a wealth of heartening examples. A multitude of boys and girls were there, a great concourse of youth and persons of every age, venerable widows and women grown old in their virginity, and in all of them I saw this that this same Continence was by no means sterile, but the fruitful mother of children conceived in joy from you, her Bridegroom. She was smiling at me, but with a challenging smile, as though to say, "Can you not do what these men have done, these women? Could any of them achieve it by their own strength, without the Lord their God? He it was, the Lord their God, who granted me to them. Why try to stand by yourself, only to lose your footing? Cast yourself on him and do not be afraid: he will not step back and let you fall. Cast yourself upon him trustfully; he will support and heal you." And I was bitterly ashamed, because I could still hear the murmurs of those frivolities, and I was still in suspense, still hanging back. Again she appealed to me, as though urging, "Close your ears against those unclean parts of you which belong to the earth and let them be put to death. They tell you titillating tales, but have nothing to do with the law of the Lord your God."

All this argument in my heart raged only between myself and myself. Alypius stood fast at my side, silently awaiting the outcome of my unprecedented agitation.

12, 28. But as this deep meditation dredged all my wretchedness up from the secret profundity of my being and heaped it all together before the eyes of my heart, a huge storm blew up within me and brought on a heavy rain of tears. In order to pour them out unchecked with the sobs that accompanied them I arose and left Alypius, for solitude seemed to me more suitable for the business of weeping. I withdrew far enough to ensure that his presence—even his—would not be burdensome to me. This was my need, and he understood it, for I think I had risen to my feet and blurted out something, my voice already choked with tears. He accordingly remained, in stunned amazement, at the place where we had been sitting. I flung myself down somehow under a fig-tree and gave free rein to the tears that burst from my eyes like rivers, as an acceptable sacrifice to you. Many things I had to say to you, and the gist of them, though not the precise words, was: "O Lord, how long? How long? Will you be angry for ever? Do not remember our age-old sins." For by these I was conscious of being held prisoner. I uttered cries of misery: "Why must I go on saying, 'Tomorrow . . . tomorrow'? Why not now? Why not put an end to my depravity this very hour?"

29. I went on talking like this and weeping in the intense bitterness of my broken heart. Suddenly I heard a voice from a house nearby—perhaps a voice of some boy or girl, I do not know—singing over and over again, “Pick it up and read, pick it up and read.” My expression immediately altered and I began to think hard whether children ordinarily repeated a ditty like this in any sort of game, but I could not recall ever having heard it anywhere else. I stemmed the flood of tears and rose to my feet, believing that this could be nothing other than a divine command to open the Book and read the first passage I chanced upon; for I had heard the story of how Antony had been instructed by a gospel text. He happened to arrive while the gospel was being read, and took the words to be addressed to himself when he heard, “Go and sell all you possess and give the money to the poor: you will have treasure in heaven. Then come, follow me” [Matt. 19:21]. So he was promptly converted to you by this plainly divine message. Stung into action, I returned to the place where Alypius was sitting, for on leaving it I had put down there the book of the apostle’s letters. I snatched it up, opened it and read in silence the passage on which my eyes first lighted: “Not in dissipation and drunkenness, nor in debauchery and lewdness, nor in arguing and jealousy; but put on the Lord Jesus Christ, and make no provision for the flesh or the gratification of your desires” [Rom. 13:13–14]. I had no wish to read further, nor was there need. No sooner had I reached the end of the verse than the light of certainty flooded my heart and all dark shades of doubt fled away.

30. I closed the book, marking the place with a finger between the leaves or by some other means, and told Alypius what had happened. My face was peaceful now. He in return told me what had been happening to him without my knowledge. He asked to see what I had read: I showed him, but he looked further than my reading had taken me. I did not know what followed, but the next verse was, “Make room for the person who is weak in faith.” He referred this text to himself and interpreted it to me. Confirmed by this admonition he associated himself with my decision and good purpose without any upheaval or delay, for it was entirely in harmony with his own moral character, which for a long time now had been far, far better than mine.

We went indoors and told my mother, who was overjoyed. When we related to her how it had happened she was filled with triumphant delight and blessed you, who have power to do more than we ask or understand, for she saw that you had granted her much more in my regard than she had been wont to beg of you in her wretched, tearful groaning. Many years earlier you had shown her a vision of me standing on the rule of faith; and now indeed I stood there, no longer seeking a wife or entertaining any worldly hope, for you had converted me to yourself. In so doing you had also converted her grief into a joy far more abundant than she had desired, and much more tender and chaste than she could ever have looked to find in grandchildren from my flesh.

* * *

BOOK XI—TIME AND ETERNITY

14, 17. There was therefore never any time when you had not made anything, because you made time itself. And no phases of time are coeternal with you, for you abide, and if they likewise were to abide, they would not be time. For what is time? Who could find any quick or easy answer to that? Who could even grasp it in his thought

God in Act of Creation, from a thirteenth-century French Bible. In the *Confessions*, Augustine argues that God created the world *ex nihilo* (out of nothing) and that God is outside of time. (Corbis-Bettmann)

clearly enough to put the matter into words? Yet is there anything to which we refer in conversation with more familiarity, any matter of more common experience, than time? And we know perfectly well what we mean when we speak of it, and understand just as well when we hear someone else refer to it. What, then, is time? If no one asks me, I know; if I want to explain it to someone who asks me, I do not know. I can state with confidence, however, that this much I do know: if nothing passed away there would be no past time; if there was nothing still on its way there would be no future time; and if nothing existed, there would be no present time.

Now, what about those two times, past and future: in what sense do they have real being, if the past no longer exists and the future does not exist yet? As for present time, if that were always present and never slipped away into the past, it would not be time at all; it would be eternity. If, therefore, the present's only claim to be called "time" is that it is slipping away into the past, how can we assert that this thing *is*, when its only title to being is that it will soon cease to be? In other words, we cannot really say that time exists, except because it tends to non-being.*

15, 18. Nonetheless we speak of a long time or a short time, and we do so only of time past or time in the future. For example, we call a hundred years ago a long time in

*[This is the heart of the matter for Augustine. He pursues the argument relentlessly throughout the rest of this Book XI, revealing time as something elusive that slips the more swiftly through our fingers the more we try to analyze it or justify our habit of measuring it. The inexorable rush of time toward non-being reveals the fragility of time-bound, time-conditioned creatures, whose only refuge from their native nothingness is the eternity of God.]

the past, and likewise a hundred years hence a long time in the future; but we call—say—ten days ago a short time past, and ten days hence a short time in the future. But on what grounds can something that does not exist be called long or short? The past no longer exists and the future does not exist yet. We ought not, therefore, to say, “That is a long time,” but, when speaking of the past, we should say, “That was long,” and of the future, “That will be long.”

O my Lord, my light, will your truth not deride us humans for speaking so? This long time in the past: was it long when it was already past, or earlier than that, when it was still present? If the latter, yes, then it might have been long, because there was something to be long; but if it was already past it no longer existed, and therefore could not have been long, since it was not in existence at all. We ought not, therefore, to say, “That era in the past was a long one,” for we shall not find anything that was long, for since that point at which it became past time it has no longer had any being. Rather, we ought to say, “That era of time was long while present,” because while it was present it was long. It had not yet passed away and so passed out of existence, and so there was something there which could be long. But when it passed away it ceased to be long at that very point when it ceased to be at all.

19. Now, human mind, let us consider whether present time can be long, as you seem to think it can, since you have been granted the power to be aware of duration and to measure it. Answer my questions, then. Is the present century a long period of time? Before you say yes, reflect whether a hundred years can be present. If the first of them is running its course, that year is present, but ninety-nine others are future and therefore as yet have no being. If the second year is running its course, one year is already past, another is present, and the remainder are still to come. In the same fashion we may represent any one of the intervening years of the century as present, and always the years that preceded it will be past, and those that follow it future. Evidently, then, a hundred years cannot be present.

Well then, consider whether the one current year at least can be present. If we are in the first month of it, the other months are in the future; if we are in the second, the first month is already past and the rest do not yet exist. Even the current year, then, is not present in its totality, and if it is not present in its totality, the year is not present; for a year consists of twelve months, and while any one of them is current that one is present, but the others are either past or future.

But we must go further, and notice that the current month is not in fact present, because only one day of it is: if we are on the first day, the rest are future; if on the last, the others are past; if on any day in the middle, we shall be midway between past and future days.

20. Look where this leaves us. We saw earlier that present time was the only one of the three that might properly be called long, and now this present time has been pared down to the span of a bare day. But let us take the discussion further, because not even a single day is present all at once. It is made up of night hours and day hours, twenty-four in all. From the standpoint of the first hour all the rest are still future; the last hour looks to all those already past; and any one we pick in between has some before it, others to follow. Even a single hour runs its course through fleeing minutes: whatever portion of it has flown is now past, and what remains is future. If we can conceive of a moment in time which cannot be further divided into even the tiniest of minute particles, that alone can be rightly termed the present; yet even this flies by from the future into the past with such haste that it seems to last no time at all. Even if it has some duration, that too is divisible into past and future; hence the present is reduced to vanishing-point.

What kind of time, then, can be referred to as “a long time”? Future time, perhaps? Then we must not say, “That is a long time,” because there is as yet nothing to be long; we will have to say, “That will be long.” But when will it be so? If at the point of speaking that period is still in the future, it will not be long, because nothing yet exists to be long; if, however, at the moment when we speak it has begun to exist by emerging from the non-existent future, and so has become present, so that there is something in existence to be long, then this present time proclaims itself incapable of being long for the reasons already discussed.

16, 21. All the same, Lord, we are conscious of intervals of time, and we compare them with each other and pronounce some longer, others shorter. We also calculate by how much this period of time is longer or shorter than that other, and we report that the one is twice or three times as long as the other, or that it is the same length. But when we measure periods of time by our awareness of them, what we measure is passing time. Could anyone measure past periods that no longer exist, or future periods that do not yet exist? Only someone who is bold enough to claim that what has no being can be measured. So then, while time is passing it can be felt and measured, but once past it cannot, because it no longer exists.

17, 22. I am asking questions, Father, not making assertions: rule me, O my God, and shepherd me. For who would make so bold as to tell me that there are not really three tenses or times—past, present and future—as we learned as children and as we in our turn have taught our children, but that there is only present, since the other two do not exist? Or is the truth perhaps that they do exist, but that when a future thing becomes present it emerges from some hiding-place, and then retreats into another hiding-place when it moves from the present into the past? Where, otherwise, did soothsayers see future events, if they do not yet exist? What has no being cannot be seen. Nor would people who tell stories about the past be telling true tales if they had no vision of those past events in their minds; and if the events in question were non-existent they could not be seen. The future and the past must exist, then?

18, 23. Allow me, Lord, to press the question further: O my hope, do not let me lose the thread. If future and past things do exist, I want to know where they are. If this is not yet within my compass, I do know at any rate that, wherever they are, they are not there as future or past, but as present. For if in that place too future things are future, they are not there yet; and if there too past things are past, they are there no longer. Clearly, then, wherever they are and whatever they are, they can only be present. Nonetheless, when a true account is given of past events, what is brought forth from the memory is not the events themselves, which have passed away, but words formed from images of those events which as they happened and went on their way left some kind of traces in the mind through the medium of the senses. This is the case with my childhood, which no longer exists: it belongs to past time which exists no longer, but when I recall it and tell the story I contemplate the image of it which is still in my memory.

Whether something similar occurs in the prediction of future events, in that the seer has a presentiment of images which exist already, I confess, O my God, that I do not know. But this I undoubtedly do know, that we often plan our future actions beforehand, and that the plans in our mind are present to us, though the action we are planning has as yet no being, because it is future. When we set about it, and begin to do what we were planning, then the action will have real being, because then it will be not future but present.

24. However the mysterious presentiment of future events may be explained, only what exists can be seen. But what already exists is not future but present. Therefore

when it is claimed that future events are seen, it is not that these things are seen in themselves, because they have as yet no existence, being still future. It may be, however, that their causes, or signs of them, are seen, because these already exist; hence they are not future but present to the people who discern them, and from them future events may take shape in the mind and can be foretold. These ideas in the mind also exist already, and can be inwardly contemplated by people who predict the future.

Let me take an example from a wealth of such occurrences. I watch the dawn, and I give advance notice that the sun is about to rise. What I am looking at is present; what I foretell is future. Not that the sun is future, of course—no, that exists already, but its rising is future; it has not yet happened, yet unless I could imagine the sunrise in my mind, as I do now while I speak of it, I would be unable to forecast it. The dawn, which I am watching in the sky, is not the sunrise, but only precedes it; and similarly the picture I have in my mind is not the sunrise either. But these two realities are present and open to observation, so that the future event can be announced before its time.

We must conclude, then, that future events have no being as yet, and if they have no being yet they do not exist, and if they do not exist it is absolutely impossible for anyone to see them. But they can be predicted on the basis of other things which are already present and hence can be seen.

19, 25. You are the king of your creation; tell me, then: how do you instruct people's minds about the future? You did so teach the prophets. What method can you adopt for teaching what is future, when to you nothing is future at all? Would it be better to say that you teach what is present but has a bearing on the future? Yes, because what does not exist obviously cannot be taught. This method of yours is far above the reach of my mind; it is too much for me and of myself I cannot see it, but I will see it with your help, when you grant me this gift, O gracious light of my secret eyes.

20, 26. What is now clear and unmistakable is that neither things past nor things future have any existence, and that it is inaccurate to say, "There are three tenses or times: past, present and future," though it might properly be said, "There are three tenses or times: the present of past things, the present of present things, and the present of future things." These are three realities in the mind, but nowhere else as far as I can see, for the present of past things is memory, the present of present things is attention, and the present of future things is expectation. If we are allowed to put it that way, I do see three tenses or times, and admit that they are three. Very well, then, let the phrase pass: "There are three tenses or times: past, present and future," as common usage improperly has it: let people go on saying this. I do not mind, nor will I put up any opposition or offer correction, provided we understand what we are saying, and do not assert that either the future or the past exists now. There are few things, in fact, which we state accurately; far more we express loosely, but what we mean is understood.

21, 27. I said just now* that we measure periods of time as they pass, so as to declare this interval twice as long as that, or this equal to that, and report anything else about segments of time that our measurements have revealed. It follows, then, that we measure these intervals of time as they are passing by, as I remarked, and if anyone asks me, "How do you know that?" I must be allowed to reply, "I know it because we do in fact measure them; but what does not exist we cannot measure, and past and future do not exist." But how can we measure present time, when it has no extension? We can

*[That is, in XI, 16, 21.]

**[That is, the ideal present is a point, which has position but no magnitude.]

only hope to measure it as it passes by, because once it has passed by there will be no measuring; it will not exist to be measured.

But when it is measured, where does it come from, by what path does it pass, and whither go? Where from, if not from the future? By what path, if not the present? Whither, if not into the past? It comes, then, from what is not yet real, travels through what occupies no space, and is bound for what is no longer real. But what are we trying to measure, if not time that does have some extension? We speak of "half as long," "double the time," "three times as long," "equal in length," and make similar statements about time only in reference to extended time, or duration. Where then is this duration which will give us a chance to measure passing time? In the future, whence it has come to pass us by? But we do not measure what does not yet exist. In the present, perhaps, through which it passes on its way? But where there is no extension we cannot measure. In the past, then, to which it has gone? But we cannot measure what no longer exists.

22, 28. My mind is on fire to solve this most intricate enigma. O Lord, my God, my good Father, through Christ I beg you not to shut against me the door to these truths, so familiar yet so mysterious. Do not slam the door in the face of my desire, nor forbid me entrance to that place where I may watch these things grow luminous as your mercy sheds its light upon them, Lord. To whom should I put my questions about them? And to whom should I confess my stupidity with greater profit than to you, who do not weary of my intense, burning interest in your scriptures? Give me what I love; for I love indeed, and this love you have given me. Give this to me, Father, for you truly know how to give good gifts to your children; give me this gift, for I have only just begun to understand, and the labor is too much for me until you open the door. Through Christ I implore you, in the name of that holy of holies, let no noisy person stand in my way. I too have believed, and so I too speak. This is my hope, for this I live: to contemplate the delight of the Lord. See how old you have made my days; they are slipping away and I know not how.

We speak of one time and another time, of this period of time or that; we ask, "How long did that man speak?" or "How long did he take to do it?" We say, "What a long time it is since I saw so-and-so," and "This syllable has twice the length of that short one." We say these things and listen to them, we are understood and we understand. They are perfectly plain and fully familiar, yet at the same time deeply mysterious, and we still need to discover their meaning.

23, 29. I was once told by a certain learned man that the movements of the sun, moon and stars themselves constitute time. I did not agree with him. Why, in that case, should not the movements of all corporeal things constitute time? Suppose the luminaries of heaven were to halt, but a potter's wheel went on turning, would there not still be time by which we could measure those rotations, and say either that all of them took the same time, or (if the speed of the wheel varied) that some were of longer duration, others shorter? And when we said this, would we too not be speaking within time; and in the words we used, would there not be some long syllables and some short; and why could that be said of them, unless because some of them had taken a longer time to pronounce than others?

Through this small thing, O God, grant our human minds insight into the principles common to small things and great. The stars and the other luminaries in the sky are there to mark our times and days and years. Yes, granted; but as I would not assert that the revolution of that little wooden wheel itself constituted a day, so my learned informant on the other hand had no business to say that its gyrations did not occupy a space of time.

30. I want to know the essence and nature of time, whereby we measure the movement of bodies and say, for instance, that one movement lasts twice as long as another. Now I have a question to ask. Taking the word "day" to apply not only to the period of sunlight on earth—day as opposed to night, that is—but to the sun's whole course from the east and back to the east again, in the sense that we say, "So many days elapsed," meaning to include the nights, and not reckoning the nights as extra time over and above the days; taking it, then, that the movement of the sun in its circular course from the east back to the east completes a day, this is my question: is it the movement itself that constitutes a day? Or the time it takes? Or both? If the movement constitutes a day, then it would still be one day if the sun were to achieve its circuit in an interval of time equivalent to a single hour. If it is the time it takes, there would not be a day if the space between one sunrise and the next were as short as an hour; the sun would have to go round twenty-four times to make up a day. If both were required complete circuit of the sun and the customary duration of this—we could not call it a day if the sun traveled through its whole circuit in the space of an hour, nor could we if the sun stopped and as much time elapsed as it usually takes to run its whole course from morning to morning.

My question now is not, therefore, what is it that we call a day, but what is time itself, the time whereby we would be able to measure the sun's revolution and say that it had been completed in only half the usual time, if the circuit had occupied only that space of time represented by twelve hours? We could compare the two periods in terms of time and say that one was twice the length of the other, and this would still be possible even if the sun sometimes took the single period, and sometimes the double, to circle from the east and back to the east again. Let no one tell me, then, that time is simply the motion of the heavenly bodies. After all, at the prayer of a certain man the sun halted so that he could press home the battle to victory. The sun stood still, but time flowed on its way, and that fight had all the time it needed to be carried through to the finish.

I see, therefore, that time is a kind of strain or tension. But do I really see it? Or only seem to see? You will show me, O Light, O Truth.

24, 31. Are you commanding me to agree with someone who says that time is the motion of a body? You do not so command me. No corporeal object moves except within time: this is what I hear; this is what you tell me. But that a corporeal object's movement is itself time I do not hear; this you do not say. When a body moves, I measure in terms of time how long it is in motion, from the moment when it begins until its motion ceases. If I did not notice when it began, and it continues to move without my seeing when it stops, I cannot measure the time, except perhaps the interval between the moment when I began to watch and that when I ceased to observe it. If my observation is prolonged, I can only say that the process went on for a long time; I cannot say exactly how long, because when we add a definite indication of a length of time we do so by reference to some agreed standard. "This is as long as that," we say; or "This is twice as long as that other," or something similar. If, on the other hand, we have been able to note the position of some corporeal object when it moves (or when parts of it move, if, for example, it is being turned on a lathe), and we have observed its starting-point and its point of arrival, then we are able to state how much time has elapsed while the movement of the object was effected from the one place to the other, or how long it has taken to revolve on its axis.

Therefore if the motion of an object is one thing, and the standard by which we measure its duration another, is it not obvious which of the two has the stronger claim to be called time? Moreover, if the motion is irregular, so that the object is sometimes

moving and sometimes stationary, we measure not only its motion but also its static periods in terms of time, and say, "Its stationary periods were equivalent in length to its phases of motion," or "It was stationary for two or three times as long as it was in motion," or whatever else our calculation has ascertained or estimated roughly—more or less, as we customarily say. Clearly, then, time is not the movement of any corporeal object.

25, 32. I confess to you, Lord, that even today I am still ignorant of what time is; but I praise you, Lord, for the fact that I know I am making this avowal within time, and for my realization that within time I am talking about time at such length, and that I know this "length" itself is long only because time has been passing all the while. But how can I know that, when I do not know what time is? Or perhaps I simply do not know how to articulate what I know? Woe is me, for I do not even know what I do not know!

Behold me here before you, O my God; see that I do not lie. As I speak, this is the true state of my heart. You, you alone, will light my lamp, O Lord; O my God, you will illumine my darkness.

26, 33. Am I not making a truthful confession to you when I praise you for my ability to measure time? But this must mean, O my God, that though I can measure it, I do not know what I am measuring! I measure the movement of a body in terms of time, but surely I am by that same calculation measuring time itself? Would it be possible for me to measure a body's motion, to calculate how long it lasts and how long the object takes to travel from here to there, without also measuring the time within which the motion occurs? With what, then, do I measure time itself? Do we measure a longer time by the standard of a shorter, as we use the cubit to measure the span of a cross-beam? That indeed seems to be how we measure the quantity of a long syllable by that of a short syllable, and decide that the former is twice as long. Similarly we measure the length of poems by the length of their lines, and the length of the lines by the length of the feet, and the length of each foot by the length of its syllables, and the length of a long syllable by that of a short syllable. We do not reckon by the number of pages—that would be to impose a spatial, not a temporal standard—but by the pronunciation as voices recite them and die away. We declare, "That is a lengthy poem, for it consists of so many lines; the lines are long, since each is composed of so many feet; the feet are long, since each extends over so many syllables; and a syllable is long, when it is twice the quantity of a short one."

But the mensuration of time by these methods yields no result that is absolute, since it may happen that the sound of a shorter line, spoken with a drawl, actually lasts longer than that of a longer one hurried over. The same holds for the whole poem, a foot, and a syllable.

I have therefore come to the conclusion that time is nothing other than tension: but tension of what, I do not know, and I would be very surprised if it is not tension of consciousness itself. What am I measuring, I beg you to tell me, my God, when I say in imprecise terms, "This is longer than that," or even, precisely, "This is twice that"? That I am measuring time, I know; but I am not measuring future time, because it does not yet exist, not present time, which is a point without extension, nor past time, which exists no more. What, then, am I measuring? Time as it passes by, but not once it has passed? That was what I said earlier.

27, 34. Stick to it, now, my mind, and pay close attention. God is our ally; and he made us, not we ourselves. Mark where truth brightens to the dawn!

Suppose now that a physical voice begins to sound . . . and goes on sounding . . . and is still sounding . . . and now stops. Now there is silence, and that

voice is past and is a voice no longer. Before it sounded forth it was a future thing, so it could not be measured because it did not yet exist; neither can it be now, because it exists no more. Perhaps, then, it could be measured while it was sounding forth, because something did then exist that could be measured? But at that time it was not standing still; it was but a fleeting thing that was speeding on its way. Was it therefore any more measurable while sounding than before or after? Only as something transient was it extended over a period of time whereby it might be measured—only as transient, because the present moment has no duration. If it is argued that the sound could, nevertheless, be measured while it lasted, consider this: another voice begins to sound and is still sounding in a continuous, steady tone. Let us measure it, then, while it is sounding, for once it has fallen silent it will be a thing of the past, and nothing measurable will then exist. By all means let us measure it now, and state how long it lasts.

Ah, but it is still sounding, and there is no way of timing it except from its beginning, when the sound originated, to its end, when it ceases. Obviously we measure any interval of time from some inception to some ending. Hence the sound of a voice which has not yet finished cannot be measured in such a way that anyone can say how long or how short it is, nor can it be declared to be of the same length as something else, or half the length, or twice the length, or anything of the kind. But once finished, it will not exist. So by what criteria will it then be subject to measurement?

All the same we do measure periods of time, not periods which as yet have no being, nor those which have ceased to be, nor those which have no duration, nor those which have no terminus. We measure neither future nor past nor present nor passing time. Yet time we do measure.

35. Take the line, *Deus, creator omnium*.^{*} This line consists of eight syllables, short and long alternating. The four short ones—the first, third, fifth and seventh—are thus half the length of the four long ones—the second, fourth, sixth and eighth. Each of these latter lasts twice as long as each of the former; I have only to pronounce the line to report that this is the case, insofar as clear sense-perception can verify it. Relying on this unmistakable evidence of my ear I measure each long syllable by the criterion of a short one, and perceive that it is twice the quantity. But the syllables make themselves heard in succession; and if the first is short and the second long, how am I to hold on to the short one, how am I to apply it to the long one as a measuring-rod in order to discover that the long one has twice the quantity, when the long one does not begin to sound until the short one has ceased? Am I to measure the long one while it is present? Impossible, because I cannot measure something unfinished. But its completion is its passing away, so what now exists for me to measure? Where is the short syllable I was going to use as a standard? What has become of the long one I want to measure? Both have made their sound, and flown away, and passed by, and exist no more; yet I do my calculation and confidently assert that insofar as the testimony of my trained ear can be trusted, the short is half the long, the long twice the short; and obviously I am speaking about a space of time. I can only do this because the syllables have passed away and are completed. Evidently, then, what I am measuring is not the syllables themselves, which no longer exist, but something in my memory, something fixed and permanent there.

36. In you, my mind, I measure time. Do not interrupt me by clamoring that time has objective existence, nor hinder yourself with the hurly-burly of your impressions. In you, I say, do I measure time. What I measure is the impression which passing

^{*}[Ambrose's evening hymn: "God, Creator of all."]

phenomena leave in you, which abides after they have passed by: that is what I measure as a present reality, not the things that passed by so that the impression could be formed. The impression itself is what I measure when I measure intervals of time. Hence either time is this impression, or what I measure is not time.

What about when we measure silences, and say that this silent pause lasted as long as that sound? Do we not strain our thought to retain the feeling of a sound's duration, as though it were still audible, so as to be able to estimate the intervals of silence in relation to the whole space of time in question? Without any articulate word or even opening our mouths we go over in our minds poems, their lines, a speech, and we assess their developmental patterns and the time they occupied in relation to one another; and our estimate is no different from what it would have been if we had been reciting them aloud.

Suppose a person wishes to utter a fairly long sound, and has determined beforehand in his own mind how long it is to be. He must have first thought through that period of time in silence and committed the impression of it to memory; then he begins to utter the sound, which continues until it reaches the predetermined end. Or rather, it does not "continue," because the sound is evidently both something already heard and something still to be heard, for the part of it already completed is sound that has been, but the part that remains is sound still to be. Thus it is carried through as our present awareness drags what is future into the past. As the future dwindles the past grows, until the future is used up altogether and the whole thing is past.

28, 37. But how can a future which does not yet exist dwindle or be used up, and how can a past which no longer exists grow? Only because there are three realities in the mind which conducts this operation. The mind expects, and attends, and remembers, so that what it expects passes by way of what it attends to into what it remembers. No one, surely, would deny that the future is as yet non-existent? Yet an expectation of future events does exist in the mind. And would anyone deny that the past has ceased to be? Yet the memory of past events still lives on in the mind. And who would deny that the present has no duration, since it passes in an instant? Yet our attention does endure, and through our attention what is still to be makes its way into the state where it is no more. It is not, therefore, future time which is long, for it does not exist; a long future is simply an expectation of the future which represents it as long. Nor is the past along period of time, because it does not exist at all; a long past is simply a memory of the past which represents it as long.

38. Suppose I have to recite a poem I know by heart. Before I begin, my expectation is directed to the whole poem, but once I have begun, whatever I have plucked away from the domain of expectation and tossed behind me to the past becomes the business of my memory, and the vital energy of what I am doing is in tension between the two of them: it strains toward my memory because of the part I have already recited, and to my expectation on account of the part I still have to speak. But my attention is present all the while, for the future is being channeled through it to become the past. As the poem goes on and on, expectation is curtailed and memory prolonged, until expectation is entirely used up, when the whole completed action has passed into memory.

What is true of the poem as a whole is true equally of its individual stanzas and syllables. The same is true of the whole long performance, in which this poem may be a single item. The same thing happens in the entirety of a person's life, of which all his actions are parts; and the same in the entire sweep of human history, the parts of which are individual human lives.

CITY OF GOD (in part)

BOOK XI

CHAPTER 26

We ourselves can recognize in ourselves an image of God, in the sense of an image of the Trinity. Of course, it is merely an image and, in fact, a very remote one. There is no question of identity nor of co-eternity nor, in one word, of consubstantiality with Him. Nevertheless, it is an image which by nature is nearer to God than anything else in all creation, and one that by transforming grace can be perfected into a still closer resemblance.

For, we are, and we know that we are, and we love to be and to know that we are. And in this trinity of being, knowledge, and love there is not a shadow of illusion to disturb us. For, we do not reach these inner realities with our bodily senses as we do external objects, as, for example, color by seeing, sound by hearing, odor by smelling, flavor by tasting, hard or soft objects by touching. In the case of such sensible things, the best we can do is to form very close and immaterial images which help us to turn them over in our minds, to hold them in our memory, and thus to keep our love for them alive. But, without any illusion of image, fancy, or phantasm, I am certain that I am, that I know that I am, and that I love to be and to know.

In the face of these truths, the quibbles of the skeptics lose their force. If they say; “What if you are mistaken?”—well, if *I* am mistaken, I am. For, if one does not exist, he can by no means be mistaken. Therefore, I am, if I am mistaken. Because, therefore, I am, if I am mistaken, how can I be mistaken that I am, since it is certain that I am, if I am mistaken? And because, if I could be mistaken, I would have to be the one who is mistaken, therefore, I am most certainly not mistaken in knowing that I am. Nor, as a consequence, am I mistaken in knowing that I know. For, just as I know that I am, I also know that I know. And when I love both to be and to know, then I add to the things I know a third and equally important knowledge, the fact that I love.

Nor am I mistaken that I love, since I am not mistaken concerning the objects of my love. For, even though these objects were false, it would still be true that I loved illusions. For, if this were not true, how could I be reproved and prohibited from loving illusions? But, since these objects are true and certain, who can doubt that, when they are loved, the loving of them is also true and certain? Further, just as there is no one who does not wish to be happy, so there is no one who does not wish to exist. For, how can anyone be happy if he does not exist?

* * *

BOOK XII

CHAPTER I

In the previous book we saw something of the beginning of the two cities, so far as angels are concerned. In the same way, we must now proceed to the creation of men and see the beginning of the cities so far as it concerns the kind of rational creatures who are mortal. First, however, a few remarks about the angels must be made in order to make it as clear as I can how there is no real difficulty or impropriety in speaking of a single society composed of both men and angels; and why, therefore, it is right to say that there are not four cities or societies, namely, two of angels and two of men, but only two, one of them made up of the good—both angels and men—and the other of those who are evil.

There is no reason to doubt that the contrary dispositions which have developed among these good and bad angels are due, not to different natures and origins, for God the Author and Creator of all substances has created them both, but to the dissimilar choices and desires of these angels themselves. Some, remaining faithful to God, the common good of all, have lived in the enjoyment of His eternity, truth, and love, while others, preferring the enjoyment of their own power, as though they were their own good, departed from the higher good and common blessedness for all and turned to goods of their own choosing.

Preferring the pomp of pride to this sublimity of eternity, the craftiness of vanity to the certainty of truth, and the turmoil of dissension to the union of love, they became proud, deceitful, and envious.

Since the happiness of all angels consists in union with God, it follows that their unhappiness must be found in the very contrary, that is, in not adhering to God. To the question: "Why are the good angels happy?" the right answer is: "Because they adhere to God." To the question: "Why are the others unhappy?" the answer is: "Because they do not adhere to God." In fact, there is no other good which can make any rational or intellectual creature happy except God. Not every creature has the potentialities for happiness. Beasts, trees, stones, and such things neither acquire nor have the capacity for this gift. However, every creature which has this capacity receives it, not from itself, since it has been created out of nothing, but from its Creator. To possess Him is to be happy; to lose Him is to be in misery. And, of course, that One whose beatitude depends upon Himself as His own good and not on any other good can never be unhappy since He can never lose Himself.

Thus, there can be no unchangeable good except our one, true, and blessed God. All things which He has made are good because made by Him, but they are subject to change because they were made, not out of Him, but out of nothing. Although they are not supremely good, since God is a greater good than they, these mutable things are, none the less, highly good by reason of their capacity for union with and, therefore, beatitude in the Immutable Good which is so completely their good that, without this good, misery is inevitable.

But it does not follow that other creatures in the universe are better off merely because they are incapable of misery. That would be like saying that other members of the body are better than the eyes because they can never become blind. A sentient nature even in pain is better than a stone that cannot suffer. In the same way, a rational nature even in misery is higher than one which, because it lacks reason or sensation, cannot suffer misery.

This being the case, it is nothing less than a perversion of the nature of the angels if they do not adhere to God. For, remember, their nature is so high in the order of

creation that, mutable as it is, it can attain beatitude by adhering to the immutable and supreme Good, which is God, and that, unless it achieves beatitude, this nature fails to satisfy its inmost exigencies, and, finally, that nothing but God can satisfy these needs of the angelic nature.

Now, this perversion, like every imperfection in a nature, harms nature and, therefore, is contrary to the nature. It follows, therefore, that what makes the wicked angels differ from the good ones is not their nature but a perversion or imperfection; and this very blemish is a proof of how highly to be esteemed is the nature itself. Certainly, no blemish in a thing ought to be blamed unless we are praising the thing as a whole, for the whole point of blaming the blemish is that it mars the perfection of something we would like to see praised.

For example, when we say that blindness is a defect of the eyes, we imply that it is the very nature of the eyes to see, and when we say that deafness is a malady of the ears, we are supposing that it is their nature to hear. So, too, when we say that it is a failure in an angel not to attain union with God, we openly proclaim that they were meant by nature to be one with God.

Of course, no one can fully comprehend or properly express the ineffable union of being one with God in His life, in His wisdom, in His joy, and all this without a shadow of death or darkness or disturbance. One thing is certain. The very failure of the bad angels to cling to God—a desertion that damaged their nature like a disease—is itself proof enough that the nature God gave them was good—so good that not to be one with God was for them a disaster.

CHAPTER 2

This explanation just given seemed to me necessary to forestall the objection that the apostate spirits might have received from some principle other than God a nature different from that of the other angels. The malice of this mistake can be more easily and speedily removed the more clearly one grasps what God meant by the words, “I AM WHO AM” (Exod. 3:14), spoken through the medium of an angel at the time when Moses was being sent to the children of Israel.

Since God is supreme being, that is, since He supremely is and, therefore, is immutable, it follows that He gave “being” to all that He created out of nothing; not, however, absolute being. To some things He gave more of being and to others less and, in this way, arranged an order of natures in a hierarchy of being. (This noun, “being,” is derived from the verb “to be,” just as “wisdom” is from the verb “to be wise.” In Latin, *essentia*, “being,” is a new word, not used by the ancient writers, recently adopted in order to find an equivalent of the Greek, *ousía*), of which *essentia* is the exact translation.)

Consequently, no nature—except a non-existent one—can be contrary to the nature which is supreme and which created whatever other natures have being. In other words, nonentity stands in opposition to that which is. Therefore, there is no being opposed to God who is the Supreme Being and Source of all beings without exception.

CHAPTER 3

In Scripture, those who oppose God’s rule, not by nature but by sin, are called His enemies. They can do no damage to Him, but only to themselves; their enmity is not a

power to harm, but merely an inclination to oppose Him. In any case, God is immutable and completely invulnerable. Hence, the malice by which His so-called enemies oppose God is not a menace to Him, but merely bad for themselves—an evil because what is good in their nature is wounded. It is not their nature, but the wound in their nature, that is opposed to God—as evil is opposed to good.

No one will deny that God is supremely good. Thus, any lack of goodness is opposed to God as evil is opposed to good. At the same time, the nature itself is not less good because the lack of goodness is evil and, therefore, the evil of lacking some goodness is opposed to this good, which is the goodness of the nature. Note that in respect to God the contrast is merely that of evil to good, but in respect to the nature which suffers a lack of something good, the lack is not only evil but also harmful. No evils, of course, can be harmful to God, but only to mutable and corruptible natures—and, even then, the harm done bears witness to the goodness of the natures which suffer, for, unless they were good, they could not suffer the wounds of a lack of goodness.

Just consider the harm done by these wounds—the loss of integrity, of beauty, of health, of virtue, or of any other natural good which can be lost or lessened by sin or sickness. If a nature has nothing of goodness to lose, then there is no harm done by lacking this nothing and, consequently, there is nothing wrong. For, there is no such thing as something wrong that does no harm.

The conclusion is that, although no defect can damage an unchangeable good, no nature can be damaged by a defect unless that nature itself is good—for the simple reason that a defect exists only where harm is done. To put the matter in another way: a defect can never be found in the highest good, nor ever apart from some kind of good.

Thus, good things without defects can sometimes be found; absolutely bad things, never—for even those natures that were vitiated at the outset by an evil will are only evil in so far as they are defective, while they are good in so far as they are natural. And when a vitiated nature is being punished, in addition to the good of being what it is, it is a good for it not to go unpunished, since this is just and whatever is just is certainly good. No one is punished for natural defects, but only for deliberate faults. And even for a vice to develop, by force of habit and overindulgence, into a strong natural defect, the vice must have begun in the will. But here, of course, I am speaking of the vices of that nature which has a mind illumined by an immaterial light in virtue of which it can distinguish what is just from what is unjust.

CHAPTER 4

Of course, in the case of beasts, trees, and other mutable and mortal creatures which lack not merely an intellect, but even sensation or life itself, it would be ridiculous to condemn in them the defects which destroy their corruptible nature. For, it was by the will of the Creator that they received that measure of being whereby their comings and goings and fleeting existences should contribute to that special, if lowly, loveliness of our earthly seasons which chimes with the harmony of the universe. For, there was never any need for the things of earth either to rival those of heaven or to remain uncreated merely because the latter are better.

It is, in fact, the very law of transitory things that, here on earth where such things are at home, some should be born while others die, the weak should give way to the strong and the victims should nourish the life of the victors. If the beauty of this order fails to delight us, it is because we ourselves, by reason of our mortality, are so enmeshed in this

St. Matthew, from the Lindisfarne Gospels, before A.D. 698. (The British Library/SuperStock, Inc.)

corner of the cosmos that we fail to perceive the beauty of a total pattern in which the particular parts, which seem ugly to us, blend in so harmonious and beautiful a way. That is why, in those situations where it is beyond our power to understand the providence of God, we are rightly commanded to make an act of faith rather than allow the rashness of human vanity to criticize even a minute detail in the masterpiece of our Creator.

Although these defects in the things of earth are involuntary and unpunishable, yet, like voluntary ones, when properly contemplated, they reveal the excellence in the natures themselves, all of which have God for their Author and Creator. For, in both cases, what we dislike is the lack by defect of something which we like in the nature as a whole. Sometimes, of course, natures themselves are displeasing to men because they happen to be harmful. It is a case of regarding only their utility, not the things themselves, as with the plague of frogs and flies which scourged the pride of the Egyptians. But, with such reasoning, fault could be found even with the sun, since criminals and debtors have sometimes been judicially condemned to solar exposure. It is not by our comfort or inconvenience, but by the nature considered in itself, that glory is given to its Creator. So, even the nature of unquenchable fire is, without doubt, worthy of praise, although it is to serve as a punishment for the damned. Is there anything, in fact, more beautiful than a leaping, luminous flame of fire? Or anything more useful, when it warms us, heals us, cooks our food? Yet, nothing is more painful when it burns us. Thus, the same thing applied in one way is harmful, but when properly used is extremely beneficial. It is all but impossible to enumerate all the good uses to which fire is put throughout the world.

We should pay no attention to those who praise fire for its light but condemn its heat—on the principle that a thing should be judged not by its nature, but by our comfort or inconvenience. They like to see it, but hate to be burnt. What they forget is that the same light which they like is injurious and unsuitable for weak eyes, and that the heat which they hate is, for some animals, the proper condition for a healthy life.

CHAPTER 5

All natures, then, are good simply because they exist and, therefore, have each its own measure of being, its own beauty, even, in a way, its own peace. And when each is in the place assigned by the order of nature, it best preserves the full measure of being that was given to it. Beings not made for eternal life, changing for better or for worse according as they promote the good and improvement of things to which, by the law of the Creator, they serve as means, follow the direction of Divine Providence and tend toward the particular end which forms a part of the general plan for governing the universe. This means that the dissolution which brings mutable and mortal things to their death is not so much a process of annihilation as a progress toward something they were designed to become.

The conclusion from all this is that God is never to be blamed for any defects that offend us, but should ever be praised for all the perfection we see in the natures He has made. For God is Absolute Being and, therefore, all other being that is relative was made by Him. No being that was made from nothing could be on a par with God, nor could it even be at all, were it not made by Him.

CHAPTER 6

It follows that the true cause of the good angels' beatitude lies in their union with Absolute Being. And if we seek the cause of the bad angels' misery, we are right in finding it in this, that they abandoned Him whose Being is absolute and turned to themselves whose being is relative—a sin that can have no better name than pride. "For pride is the beginning of all sin" (Eccli. 10:15). They refused to reserve their strength for Him. They might have had more of being if they had adhered to Him whose Being is supreme, but, by preferring themselves to Him, they preferred what was less in the order of being.

Such was the first defect, the first lack, the first perversion of that nature which, being created, could not be absolute, and yet, being created for beatitude, might have rejoiced in Him who is Absolute Being; but which, having turned from Him, was doomed, not to be nothing but to have so much less of being that it was bound to be wretched.

If one seeks for the efficient cause of their evil will, none is to be found. For, what can make the will bad when it is the will itself which makes an action bad? Thus, an evil will is the efficient cause of a bad action, but there is no efficient cause of an evil will. If there is such a cause, it either has or has not a will. If it has, then that will is either good or bad. If good, one would have to be foolish enough to conclude that a good will makes a bad will. In that case, a good will becomes the cause of sin—which is utterly absurd. On the other hand, if the hypothetical cause of a bad will has itself a bad will, I would have to ask what made this will bad, and, to put an end to the inquiry: What made the

first bad will bad? Now, the fact is that there was no first bad will that was made bad by any other bad will—it was made bad by itself. For, if it were preceded by a cause that made it evil, that cause came first. But, if I am told that nothing made the will evil but that it always was so, then I ask whether or not it existed in some nature.

If this evil will existed in no nature, then it did not exist at all. If it existed in some nature, then it vitiated, corrupted, injured that nature and, therefore, deprived it of some good. An evil will could not exist in an evil nature but only in a good one, mutable enough to suffer harm from this deprivation. For, if no harm were done, then there was no deprivation and, consequently, no right to call the will evil. But, if harm was done, it was done by destroying or diminishing what was good. Thus, an evil will could not have existed from all eternity in a nature in which a previously existing good had to be eliminated before the evil will could harm the nature. But, if it did not exist from all eternity, who, then, caused this evil will?

The only remaining suggestion is that the cause of the evil will was something which had no will. My next question is whether this “something” was superior, inferior, or equal to the will. If superior, then it was better. So, then, how can it have had no will and not rather a good will? If equal, the case is the same: for, as long as two wills are equally good, one cannot produce an evil will in the other. The supposition remains, then, that it was an inferior thing without a will which produced the evil will of the angelic nature which first sinned.

But that thing itself, whatever it was, even though it was low to the lowest point of earthliness, was, without doubt good since it was a nature and a being having its own character and species in its own genus and order. How, then, can a good thing be the efficient cause of an evil will? How, I ask, can good be the cause of evil? For, when the will, abandoning what is above it, turns itself to something lower, it becomes evil because the very turning itself and not the thing to which it turns is evil. Therefore, an inferior being does not make the will evil but the will itself, because it is a created will, wickedly and inordinately seeks the inferior being.

Take the case of two men whose physical and mental make-up is exactly the same. They are both attracted by the exterior beauty of the same person. While gazing at this loveliness, the will of one man is moved with an illicit desire; the will of the other remains firm in its purity. Why did the will become evil in one case and not in the other? What produced the evil will in the man in whom it began to be evil? The physical beauty of the person could not have been the cause, since that was seen by both in exactly the same way and yet both wills did not become evil. Was the cause the flesh of one of those who looked? Then why not the flesh of the other, also? Or was the cause the mind of one of them? Again, why not the mind of both? For the supposition is that both are equally constituted in mind and body. Must we say, then, that one was tempted by a secret suggestion of the Devil, as if it were not rather by his own will that he consented to this suggestion or enticement or whatever it was?

If so, then what was it in him that was the cause of his consent, of the evil will to follow the evil suggestion? To settle this difficulty, let us suppose that the two men are tempted equally, that one yields and consents to the temptation, that the other remains as he was before. The obvious conclusion is that one was unwilling, the other willing, to fail in chastity. And what else could be the cause of their attitudes but their own wills, since both men have the same constitution and temperament? The beauty which attracted the eyes of both was the same; the secret suggestion by which both were tempted was the same. However carefully they examine the situation, eager to learn what it was that made one of the two evil, no cause is apparent.

For, suppose we say that the man himself made his will evil. Very well, but what was the man himself before he made his will evil? He was a good nature, created by God, the immutable God.

Take a person who says that the one who consents to the temptation and enticement made his own will evil although previously he had been entirely good. Recall the facts. The one consents, while the other does not, to a sinful desire concerning a beautiful person; the beauty was seen by both equally, and before the temptation both men were absolutely alike in mind and body. Now, the person who talks of a man making his own will evil must ask why the man made his will evil, whether because he is a nature or because he is nature made out of nothing? He will learn that the evil arises not from the fact that the man is a nature, but from the fact that the nature was made out of nothing.

For, if a nature is the cause of an evil will, then we are compelled to say that evil springs from good and that good is the cause of evil—since a bad will comes from a good nature. But how can it come about that a good, though mutable, nature, even before its will is evil, can produce something evil, namely, this evil will itself?

CHAPTER 7

No one, therefore, need seek for an efficient cause of an evil will. Since the “effect” is, in fact, a deficiency, the cause should be called “deficient.” The fault of an evil will begins when one falls from Supreme Being to some being which is less than absolute. Trying to discover causes of such deficiencies—causes which, as I have said, are not efficient but deficient—is like trying to see darkness or hear silence. True, we have some knowledge of both darkness and silence: of the former only by the eyes; of the latter only by the ears. Nevertheless, we have no sensation but only the privation of sensation.

So there is no point in anyone trying to learn from me what I know I do not know—unless, perhaps, he wants to know how not to know what, as he ought to know, no one can know. For, things we know, not by sensation, but by the absence of sensation, are known—if the word says or means anything—by some kind of “unknowing,” so that they are both known and not known at the same time. For example, when the vision of the eye passes from sensation to sensation, it sees darkness only when it begins not to see. So, too, no other sense but the ear can perceive silence, yet silence can only be heard by not being heard.

So, too, it is only the vision of the mind that discerns the species *intelligibilis* when it understands intelligible realities. But, when the realities are no longer intelligible, the mind, too, knows by “unknowing.” For “who can understand sins?” (Ps. 18:13).

CHAPTER 8

This I know, that the nature of God can never and nowhere be deficient in anything, while things made out of nothing can be deficient. In regard to these latter, the more they have of being and the more good things they do or make—for then they are doing or making something positive—the more their causes are efficient; but in so far as they fail or are defective and, in that sense, “do evil”—if a “defect” can be “done”—then their causes are “deficient.” I know, further, that when a will “is made” evil, what happens would not have happened if the will had not wanted it to happen. That is why the punishment which follows is just, since the defection was not necessary but voluntary.

The will does not fall “into sin”; it falls “sinfully.” Defects are not mere relations to natures that are evil; they are evil in themselves because, contrary to the order of natures, there is a defection from Being that is supreme to some lesser being.

Thus, greed is not a defect in the gold that is desired but in the man who loves it perversely by falling from justice which he ought to esteem as incomparably superior to gold; nor is lust a defect in bodies which are beautiful and pleasing: it is a sin in the soul of the one who loves corporal pleasures perversely, that is, by abandoning that temperance which joins us in spiritual and unblemishable union with realities far more beautiful and pleasing; nor is boastfulness a blemish in words of praise: it is a failing in the soul of one who is so perversely in love with other peoples’ applause that he despises the voice of his own conscience; nor is pride a vice in the one who delegates power, still less a flaw in the power itself: it is a passion in the soul of the one who loves his own power so perversely as to condemn the authority of one who is still more powerful.

In a word, anyone who loves perversely the good of any nature whatsoever and even, perhaps, acquires this good makes himself bad by gaining something good and sad by losing something better.

CHAPTER 9

There is, then, no natural efficient cause of an evil will or, if I may use the word, no essential cause. The reason for this is that it is the evil will itself that starts that evil in mutable spirits, which is nothing but a weakening and worsening of the good in their nature. What “makes” the will evil is, in reality, an “unmaking,” a desertion from God. The very defection is deficient—in the sense of having no cause. However, in saying that there is no efficient cause even of a good will, we must beware of believing that the good will of the good angels was uncreated and co-eternal with God. But, if good angels were created, how can we say that their good will was not created? The fact is, it was created; the only question is whether it was created simultaneously with the creation of the angels or whether they first existed without a good will. If simultaneously, then, undoubtedly, it was created by Him who created the angels, so that, as soon as they were created, they adhered to Him who created them by means of that love with which they were created. Thus, the reason why the bad were separated from the society of good angels was that the good persevered in the same good will, whereas the others changed themselves into bad angels by defection from good will. The only thing that “made” their will bad was that they fell away from a will which was good. Nor would they have fallen away, had they not chosen to fall away.

In the hypothesis, however, that the good angels, existing at first without a good will, produced it in themselves without the help of God, they must have made themselves better than what they were when God created them. This is nonsense. For, without a good will, what could they be but evil? Or, if we may not say evil, since their will was not yet evil—for they could hardly fall away from what they had not yet begun to have—at least, they certainly were not good angels—not as good as they were to become when they came to possess a good will.

So much for the hypothesis. Since they could not make themselves better than God made them—for no one can make anything better than God can—then it follows that, without the co-operation of their Creator, they could never have come into possession of that good will which made them better.

Now, it is true that their good will was not only the cause of their turning and adhering to Him, who is Perfect Being, rather than to themselves, whose being was less than perfect, but also the reason why they had more of being than before and could live wisely and happily in union with God. Nevertheless, this merely shows that any will, however good, would have been destitute and destined to remain in hopeless desire, did not He who had created their good nature out of nothing, and had given it a capacity for union with Himself, first awaken in the will a greater longing for this union and then fill the will with some of His very Being in order to make it better.

This raises another issue. For, if the good angels did something themselves to bring about their good will, did they do this with or without a will? If without, then, of course, they were not the agents. If with a will, was it an evil or a good one? If evil, how could it produce a good will? If good, well, then, they had a good will already. And who made this but God Himself who created them with a good will (that is, with the unblemished love by which they could adhere to Him) and who at the same time created their nature and enriched it with grace?

Thus, we are compelled to believe that the holy angels never existed without a good will, that is, without the love of God. But what of those angels who were created good and became evil by their own bad will for which their good nature is not responsible except in so far as there was a deliberate defection from good—for it is never good, but a defection from good, that is the cause of evil? These angels either received less grace of divine love than those who persevered in grace, or, if both were created equally good, then, while the former were falling by bad will, the latter were increasingly aided to reach that plenitude of beatitude which made them certain that they would never fall—a matter which I discussed in the preceding Book.

Thus with our praise to our Creator, we should all proclaim that, not only of holy men, but also of holy angels, it may be said that “the charity of God is poured forth” in them “by the Holy Spirit who has been given” to them (Rom. 5:5). Nor is it the good only of men, but first and foremost that of angels, which is referred to in the words: “It is good for me to adhere to my God” (Ps. 72:28).

And they who share this common good are in a holy communion both with Him to whom they adhere and one with another, and they form a single community, one City of God, which is also His living sacrifice and His living temple.

This ends the discussion of the origin of this City in so far as it concerns the angels. I must now turn to the rise of that part of the City which is made up of mortal men, created by the same God, who will one day be united to the immortal angels and who, at present, are either sojourning on earth or, if dead, are resting in the hidden sanctuaries where the souls of the departed have their abode.

It was from one man, the first whom God created, that the whole human race took its start. This is the faith revealed in Holy Scripture, a faith that has gained marvelous and merited authority throughout the world and among all peoples—as, along with other truths, Scripture itself divinely predicted would be the case.

BOETHIUS

ca. A.D. 480—ca. A.D. 524

Anicius Manlius Severinus Boethius was the son of a Roman high-government official. Possibly educated in Athens or Alexandria, Boethius had a special interest in the writings of Plato and Aristotle. His intention was to translate all their works into Latin and provide full commentary. He hoped to show the essential unity between Plato and Aristotle, but he finished only Aristotle's logical works. In 510, Boethius became consul and first minister to King Theodoric, the Ostrogothic ruler of Italy. Boethius served the next twelve years in government, wrote commentaries on Porphyry and Cicero, and began his work on Plato and Aristotle. Boethius's sons were named consuls in 522, and Boethius was made the important "master of the offices." But within a year, tragedy struck. Boethius was accused of treason, imprisoned, and executed sometime around 524. The specific charges are not known, but religious differences were probably involved. Theodoric followed the teachings of Arius (ca. A.D. 256–336) that Jesus Christ was neither coeternal with God the Father nor of the same substance. Boethius, as a Catholic, accepted the conclusions of the Council of Nicea (A.D. 325), which condemned Arian theology.

While in prison, Boethius wrote his most famous work, *The Consolation of Philosophy*. Written as a dialogue between Boethius and Lady Philosophy, it begins with Boethius protesting innocence and complaining of God's injustice and fortune's caprice. Using arguments rooted in both Stoic and Platonic thought, Philosophy replies that fortune is indeed fickle, but that the highest Good is found not in circumstances but in God. The selection given here, translated by Richard Green, is from the final book of the *Consolation* and examines how God's foreknowledge is compatible with free will. Boethius asks how one could be free to perform an action if God knew *beforehand* what one would do. Using a conception of time similar to Augustine's in Book XI of the *Confessions*, Lady Philosophy

explains that God is completely outside time. This means that God “sees all things in his eternal present as you see some things in your temporal present. . . . This divine foreknowledge does not change the nature and properties of things; it simply sees things present before it as they will later turn out to be in what we regard as the future.” For example, just as I know what my son is doing now even though his action is free, so God can know what I will do tomorrow though I act freely—because for God tomorrow *is* now.

It may seem odd that a devout Catholic presented his final thoughts in Neoplatonic and Stoic terms, without any specifically Christian references. Yet Boethius’s *magnum opus* was a source of great comfort to Christians in the Middle Ages for, as Étienne Gilson points out, “even when he is speaking only as a philosopher, Boethius thinks as a Christian.”

* * *

For background work on Boethius, see Howard Rollin Patch, *The Tradition of Boethius: A Study of His Importance in Medieval Culture* (New York: Oxford University Press, 1935) and Helen Marjorie Barrett, *Boethius: Some Aspects of His Times and Work* (Cambridge: Cambridge University Press, 1940). Henry Chadwick, *Boethius: The Consolations of Music, Logic, Theology, and Philosophy* (Oxford: Clarendon Press, 1981) and Edmund Reiss, *Boethius* (Boston: Twayne, 1982) study Boethius’s writings, whereas Ralph M. McInerny, *Boethius and Aquinas* (Washington, DC: Catholic University of America Press, 1990) shows his influence on Thomas Aquinas. For collections of essays, see Michael Masi, ed., *Boethius and the Liberal Arts: A Collection of Essays* (Las Vegas, NV: Peter Lang, 1981), and Margaret Gibson, ed., *Boethius, His Life, Thought, and Influence* (Oxford: Blackwell, 1981).

In recent years, there has been renewed interest in the problems posed by Boethius’s conception of God’s timelessness and foreknowledge. Paul Helm, *Eternal God: A Study of God Without Time* (Oxford: Clarendon Press, 1988), for example, argues in favor of Boethius’s position, whereas Richard Swinburne, *The Coherence of Theism* (Oxford: Clarendon Press, 1977) and Stephen T. Davis, *Logic and the Nature of God* (Grand Rapids, MI: Eerdmans, 1983) oppose it. For a summary of positions, see Gregory E. Ganssle, *God & Time: 4 Views* (Downers Grove, IL: InterVarsity Press, 2001). Much of the most interesting work in this area is found only in journals such as the *Journal of Philosophy* and *Faith and Philosophy*.

Boethius in Prison (from the 1385 manuscript of *On the Consolation of Philosophy*). Boethius was consul and first minister to King Theodoric, the Ostrogothic ruler of Italy. But in 522 Boethius was accused of treason, imprisoned, and executed sometime around 524. The specific charges are not known, but probably involved religious differences between the Catholic Boethius and the Arian Theodoric. (*Public Domain*)

THE CONSOLATION OF PHILOSOPHY (in part)

BOOK V

CHAPTER 6: PHILOSOPHY SOLVES THE PROBLEM OF PROVIDENCE AND FREE WILL BY DISTINGUISHING BETWEEN SIMPLE AND CONDITIONAL NECESSITY

“Since, as we have shown, whatever is known is known according to the nature of the knower, and not according to its own nature, let us now consider as far as is lawful the nature of the Divine Being, so that we may discover what its knowledge is. The common judgment of all rational creatures holds that God is eternal. Therefore let us consider what eternity is, for this will reveal both the divine nature and the divine knowledge.

“Eternity is the whole, perfect, and simultaneous possession of endless life. The meaning of this can be made clearer by comparison with temporal things. For whatever

Boethius, *The Consolation of Philosophy*, Book V, Chapters (prose) 2, 3, 6, translated by Richard Green (Pearson/Library of the Liberal Arts, 1962).

lives in time lives in the present, proceeding from past to future, and nothing is so constituted in time that it can embrace the whole span of its life at once. It has not yet arrived at tomorrow, and it has already lost yesterday; even the life of this day is lived only in each moving, passing moment. Therefore, whatever is subject to the condition of time, even that which—as Aristotle conceived the world to be—has no beginning and will have no end in a life coextensive with the infinity of time, is such that it cannot rightly be thought eternal. For it does not comprehend and include the whole of infinite life all at once, since it does not embrace the future which is yet to come. Therefore, only that which comprehends and possesses the whole plenitude of endless life together, from which no future thing nor any past thing is absent, can justly be called eternal. Moreover, it is necessary that such a being be in full possession of itself, always present to itself, and hold the infinity of moving time present before itself.

“Therefore, they are wrong who, having heard that Plato held that this world did not have a beginning in time and would never come to an end, suppose that the created world is coeternal with its Creator. For it is one thing to live an endless life, which is what Plato ascribed to the world, and another for the whole of unending life to be embraced all at once as present, which is clearly proper to the divine mind. Nor should God be thought of as older than His creation in extent of time, but rather as prior to it by virtue of the simplicity of His nature. For the infinite motion of temporal things imitates the immediate present of His changeless life and, since it cannot reproduce or equal life, it sinks from immobility to motion and declines from the simplicity of the present into the infinite duration of future and past. And, since it cannot possess the whole fullness of its life at once, it seems to imitate to some extent that which it cannot completely express, and it does this by somehow never ceasing to be. It binds itself to a kind of present in this short and transitory period which, because it has a certain likeness to that abiding, unchanging present, gives everything it touches a semblance of existence. But, since this imitation cannot remain still, it hastens along the infinite road of time, and so it extends by movement the life whose completeness it could not achieve by standing still. Therefore, if we wish to call things by their proper names, we should follow Plato in saying that God indeed is eternal, but the world is perpetual.

“Since, then, every judgment comprehends the subjects presented to it according to its own nature, and since God lives in the eternal present, His knowledge transcends all movement of time and abides in the simplicity of its immediate present. It encompasses the infinite sweep of past and future, and regards all things in its simple comprehension as if they were now taking place. Thus, if you will think about the foreknowledge by which God distinguishes all things, you will rightly consider it to be not a foreknowledge of future events, but knowledge of a never changing present. For this reason, divine knowledge is called providence, rather than prevision, because it resides above all inferior things and looks out on all things from their summit.

“Why then do you imagine that things are necessary which are illuminated by this divine light, since even men do not impose necessity on the things they see? Does your vision impose any necessity upon things which you see present before you?”

“Not at all,” I answered.

“Then,” Philosophy went on, “if we may aptly compare God’s present vision with man’s, He sees all things in his eternal present as you see some things in your temporal present. Therefore, this divine foreknowledge does not change the nature and properties of things; it simply sees things present before it as they will later turn out to be in what we regard as the future. His judgment is not confused; with a single intuition of his mind He knows all things that are to come, whether necessarily or not. Just as, when

you happen to see simultaneously a man walking on the street and the sun shining in the sky, even though you see both at once, you can distinguish between them and realize that one action is voluntary, the other necessary; so the divine mind, looking down on all things, does not disturb the nature of the things which are present before it but are future with respect to time. Therefore, when God knows that something will happen in the future, and at the same time knows that it will not happen through necessity, this is not opinion but knowledge based on truth.

“If you should reply that whatever God foresees as happening cannot help but happen, and that whatever must happen is bound by necessity—if you pin me down to this word ‘necessity’—I grant that you state a solid truth, but one which only a profound theologian can grasp. I would answer that the same future event is necessary with respect to God’s knowledge of it, but free and undetermined if considered in its own nature. For there are two kinds of necessity: one is simple, as the necessity by which all men are mortals; the other is conditional, as is the case when, if you know that someone is walking, he must necessarily be walking. For whatever is known, must be as it is known to be; but this condition does not involve that other, simple necessity. It is not caused by the peculiar nature of the person in question, but by an added condition. No necessity forces the man who is voluntarily walking to move forward; but as long as he is walking, he is necessarily moving forward. In the same way, if Providence sees anything as present, that thing must necessarily be, even though it may have no necessity by its nature. But God sees as present those future things which result from free will. Therefore, from the standpoint of divine knowledge these things are necessary because of the condition of their being known by God; but, considered only in themselves, they lose nothing of the absolute freedom of their own natures.

“There is no doubt, then, that all things will happen which God knows will happen; but some of them happen as a result of free will. And, although they happen, they do not, by their existence, lose their proper natures by which, before they happened, they were able not to happen. But, you may ask, what does it mean to say that these events are not necessary, since by reason of the condition of divine knowledge they happen just as if they were necessary? The meaning is the same as in the example I used a while ago of the sun rising and the man walking. At the time they are happening, they must necessarily be happening; but the sun’s rising is governed by necessity even before it happens, while the man’s walking is not. Similarly, all the things God sees as present will undoubtedly come to pass; but some will happen by the necessity of their natures, others by the power of those who make them happen. Therefore, we quite properly said that these things are necessary if viewed from the standpoint of divine knowledge, but if they are considered in themselves, they are free of the bonds of necessity. In somewhat the same way, whatever is known by the senses is singular in itself, but universal as far as the reason is concerned.

“But, you may say, if I can change my mind about doing something, I can frustrate Providence, since by chance I may change something which Providence foresaw. My answer is this: you can indeed alter what you propose to do, but, because the present truth of Providence sees that you can, and whether or not you will, you cannot frustrate the divine knowledge any more than you can escape the eye of someone who is present and watching you, even though you may, by your free will, vary your actions. You may still wonder, however, whether God’s knowledge is changed by your decisions, so that when you wish now one thing, now another, the divine knowledge undergoes corresponding changes. This is not the case. For divine Providence anticipates every future action and converts it to its own present knowledge. It does not change, as you imagine,

foreknowing this or that in succession, but in a single instant, without being changed itself, anticipates and grasps your changes. God has this present comprehension and immediate vision of all things not from the outcome of future events, but from the simplicity of his own nature. In this way, the problem you raised a moment ago is settled. You observed that it would be unworthy of God if our future acts were said to be the cause of divine knowledge. Now you see that this power of divine knowledge, comprehending all things as present before it, itself constitutes the measure of all things and is in no way dependent on things that happen later.

“Since this is true, the freedom of the human will remains inviolate, and laws are just since they provide rewards and punishments to human wills which are not controlled by necessity. God looks down from above, knowing all things, and the eternal present of his vision concurs with the future character of our actions, distributing rewards to the good and punishments to the evil. Our hopes and prayers are not directed to God in vain, for if they are just they cannot fail. Therefore, stand firm against vice and cultivate virtue. Lift up your soul to worthy hopes, and offer humble prayers to heaven. If you will face it, the necessity of virtuous action imposed upon you is very great, since all your actions are done in the sight of a Judge who sees all things.”

ANSELM (AND GAUNILLO)

1033–1109

Saint Anselm was born to a noble family in Aosta, in what is now Italy. Following a youth of travel and learning, Anselm joined the Benedictine monastery in the town of Bec, Normandy (in modern France). He remained in this monastery for the next thirty-three years, the last fifteen as abbot. During this time, he wrote a number of books on theological and philosophical topics. In 1093, Anselm was coerced into leaving the monastery to become Archbishop of Canterbury. Most of his sixteen years in Canterbury were spent skirmishing with the king of England for control of the church (a pattern that continued for five centuries until Henry VIII severed the English church from Rome entirely in 1534). Anselm died in 1109 and was canonized in 1494.

Anselm's thought can be summed up in the Augustinian phrase, "faith seeking understanding." Anselm was a deeply devoted Christian who began his thinking with the assumption that the doctrines of Christianity are true. And this faith drove him to seek understanding, to find rational explanations for the Christian teachings he already believed. His writings reflected this yearning to understand rationally particular problems in faith; he wrote a number of short treatises on such subjects as the Incarnation and the Trinity. He believed that he could demonstrate the truth of these revealed doctrines.

Anselm's most famous work is his attempt to prove the existence of God in the *Proslogion* (or *Discourse*) known now as the "ontological argument" (from Immanuel Kant's description). The ontological argument attempts to show that if one can conceive of "something greater than which we can conceive of nothing," one must also acknowledge that this being exists in reality as well as in the understanding. That is, if God is thought of, then God must exist. Recent scholars have pointed out that there are actually two arguments here: one, in Chapter II, that proves that God exists in reality; and another, in Chapters III to IV, that proves that God's existence is necessary.

Anselm's argument was attacked by a fellow monk named Gaunilo. Anselm's exchange with Gaunilo has been preserved and the key sections are reprinted here, along with selections from *Proslogion*, in the John F. Wippel and Allan B. Wolter translation.

Despite the fact that this argument has fascinated thinkers for more than nine hundred years, a student's first response to this passage is often one of confusion or simple denial: "He can't do that!" The student is not alone in being confused; the history of the argument is full of misrepresentations and misinterpretations. To be sure, careful thinkers such as Hume and Kant have attacked this argument. But it is notoriously difficult to say exactly what is wrong with Anselm's logic, and many purported refutations have actually been refutations of arguments quite different from Anselm's.

In recent years, there has been renewed interest in the argument, with Charles Hartshorne, Norman Malcom, and Alvin Plantinga claiming that it is successful. There has also been a tradition, beginning with the medieval thinker Bonaventure and continuing through Karl Barth in the twentieth century, that claims the *Proslogion*, Chapters II to IV, is not a philosophical argument at all. These theologians are convinced that Anselm is not "proving" anything, that he is simply showing the implications of God's self-revelation.

While the debate continues to rage, one fact is clear: Anselm raised some of the most basic questions in the history of philosophy. Questions about modes of existence, possible beings, necessity and contingency, as well as a range of issues in logic, all emerge in discussions of this provocative passage.

For a study of the complete *Proslogion*, see M.J. Charlesworth, *St. Anselm's Proslogion* (Oxford: Clarendon Press, 1965). For the rest of Anselm's major works see, Anselm of Canterbury, *The Major Works*, edited by Brian Davies and G.R. Evans, (Oxford: Oxford University Press, 1998). For a study of Anselm's life and times, see R.W. Southern's books *Saint Anselm and His Biographer* (Cambridge: Cambridge University Press, 1963) and *Saint Anselm: A Portrait in a Landscape* (Cambridge: Cambridge University Press, 1990); and William H. Shannon, *Anselm: The Joy of Faith* (New York: Crossroads, 1999). Jasper Hopkins, *A Companion to the Study of St. Anselm* (Minneapolis: University of Minnesota Press, 1972), provides a comprehensive discussion of Anselm and his work. For essays on Anselm's thought, see Brian Davies and Brian Leftow, eds., *The Cambridge Companion to Anselm* (Cambridge: Cambridge University Press, 2005).

For further reading on the ontological argument, the best source is John Hick and Arthur C. McGill, eds., *The Many-Faced Argument* (New York: Macmillan, 1967). Charles Hartshorne, *Anselm's Discovery: A Re-Examination of the Ontological Argument for God's Existence* (LaSalle, IL: Open Court, 1965); Alvin Plantinga, *The Nature of Necessity* (Oxford: Clarendon Press, 1974)—and his "simplified" version of this difficult work, Alvin Plantinga, *God, Freedom, and Evil* (Grand Rapids, MI: Eerdmans, 1977); and Richard Campbell, *From Belief to Understanding* (Canberra: Australian National University Press, 1976), all defend the argument. For theological interpretations, see Karl Barth, *Anselm: Fides Quaren Intellectum*, translated by Ian W. Robinson (London: SCM Press, 1960). (Key chapters from this work are included in Hick and McGill's *The Many-Faced Argument*.)

PROSLOGION [in part]

PREFACE

Some time ago at the pressing invitation of some brethren I did a small work* as a sample of meditation based on faith. The work was written in the person of one seeking to throw light on an area of ignorance by silently reasoning with himself. Reflecting that what I had woven together was really a chain of many arguments, I began to ask myself whether one might not be able to find a single argument, needing no proof beyond itself, which would suffice by itself to link together such conclusions as that God truly exists, that he is the highest good—needing no other but needed for the existence and well-being of all else—and whatever else we believe to be true of the divine being. Diligently and often did I pursue this quest. Sometimes the solution seemed almost at hand; at other times it simply eluded the grasp of my mind. Finally I decided in despair to cease the search for something so impossible to find. But when I tried to put the matter out of mind lest I waste time that might profitably be spent on other matters in such a fruitless quest, it continued to importune me despite my unwillingness and efforts at resistance. And so it was that one day when I was weary of struggling against this obsession the solution I had despaired of finding suddenly appeared amidst the welter of my conflicting thoughts and I eagerly seized the idea I had been so strenuously fending off.

Thinking that, if I put down in writing what I was so happy to find, others too would find pleasure reading it, I did the following little tract which takes up this and some allied matters from the viewpoint of one who tries to bring his mind to contemplate God and seeks to understand what he believes. . . .

CHAPTER 1

. . . It is not your sublimity, O Lord, I seek to penetrate, for my mind is no match for it, but I do desire to understand something of your truth which I believe and love in my heart. For I seek not to understand that I may believe, but I believe that I may understand. For this too I believe: “Unless I believe, I shall not understand!”

CHAPTER 2

O Lord, who grants understanding to faith, make me, so far as is good for me, to understand that you exist, as we believe, and that you are what we believe you to be. Now we believe you to be something greater than which we can conceive of nothing.** Could

*[*Monologion* (i.e., a soliloquy)]

**[This complicated formulation is difficult to understand, yet cannot be easily simplified without losing Anselm's meaning. Throughout this reading I have stayed with Wolter's wording. It might help the student to think of the phrase, “something greater than which we can conceive of nothing,” as a single entity. For a discussion of this complicated formulation, see M.J. Charlesworth, *St. Anselm's Proslogion* (Oxford: Oxford University Press, 1965).]

it be then that there is no such nature, since “the fool says in his heart, ‘There is no God’ ” [Ps. 13:1]? But surely this same fool, when he hears me say this, “something than which we can conceive of nothing greater,” understands what he hears and what he understands is in his understanding even if he does not understand it to exist. For it is one thing for something to be in the understanding and quite another to understand that the thing in question exists. When a painter thinks of the work he will make beforehand, he has it in his understanding, but he does not think that what he has yet to make exists. But once he has painted it, he not only has it in his understanding but he understands that what he has made exists. Even the fool then must be convinced that in his understanding at least there is something than which nothing greater can be conceived, for when he hears this, he understands it and whatever is understood is in the understanding. But surely if the thing be such that we cannot conceive of something greater, it does not exist solely in the understanding. For if it were there only, one could also think of it as existing in reality and this is something greater. If the thing than which none greater can be thought were in the mind alone, then this same thing would both be and not be something than which nothing greater can be conceived. But surely this cannot be. Without doubt then there exists both in the understanding and in reality a being greater than which nothing can be conceived.

CHAPTER 3

So truly does such a thing exist that it cannot be thought of as not existing. For we can think of something as existing which cannot be thought of as not existing, and such a thing is greater than what can be thought not to be. Wherefore, if the thing than which none greater can be thought could be conceived of as not existing, then this very thing than which none greater can be thought is not a thing than which none greater can be thought. But this is not possible. Hence, something greater than which nothing can be conceived so truly exists that it cannot be conceived not to be.

O Lord, our God, you are this being. So truly do you exist that you cannot even be thought of as nonexistent. And rightly so, for if some mind could think of something better than you, then the creature would rise above the Creator and would judge him, which is absurd. It is possible indeed to think of anything other than you as nonexistent. Of all beings then you alone have existence in the truest and highest sense, for nothing else so truly is or has existence in so great a measure. Why then does the fool “say in his heart, ‘There is no God,’” when it is so evident to a reasoning mind that of all things you exist in a supreme degree? Why indeed save that he is stupid and a fool!

CHAPTER 4

But how did he come to say in his heart what he could not think? Or why was it he could not think what he said in his heart? For after all, to say in one’s heart and to think are the same. And if it be true, or rather, since it is true that be thought it because he said it in his heart, and it is also true that he did not say it in his heart because he could not think it, it follows that there is not just one way to think of something or to say it in one’s heart. In one sense, we think of something when we think of the word that signifies that

something; in another sense, we think of it when we think of the thing itself. In the first sense, then, God can be thought of as not existing, but in the second sense, he cannot be thought of as not existing. For no one who really understands what God is can think that he does not exist, despite the fact that these words may be said in his heart either without any meaning whatsoever or with some peripheral sense. For God is that than which none greater can be thought, and whoever understands this correctly must understand that he so exists that he cannot even be thought of as nonexistent. Hence, he who understands that God exists in this way cannot think of him as nonexistent.

My thanks to you, good Lord, my thanks to you! For now I understand by your light what I once believed by your grace, so that even if I were to refuse to believe that you exist, I should be unable not to understand this to be true.

GAUNILLO AND ANSELM: DEBATE

GAUNILLO: [5.] Now the proof I am given that such a being exists not only in the understanding but also in reality is this. If such were not the case, then whatever really exists would be greater than this thing already proved to exist in the intellect. Hence the latter will not really be greater than everything else. To this I reply. Should one say that there is in the understanding something which cannot be conceived as actual, I would not deny it is in me in this way. But since this does not guarantee it any real existence, I shall not admit it has such until unquestionable proof be given. Now he who says: "This being which is greater than all exists, because otherwise it would not be greater than all" does not pay sufficient attention to what he is saying. For I would still not admit, indeed I would doubt or deny, that this [thing in the understanding] is greater than any real thing. Neither would I grant it any other existence (if it should be called "existence") than you have when the mind, on the basis of a word one only hears, tries to imagine something it has no knowledge of. But how do you prove to me this has any greater claim to real existence because it is assumed to be greater than all other things? For I deny or doubt that it is in my intellect or thought in any greater measure than are many dubious and uncertain things. For you must first assure me that it really exists somewhere and then, from the fact that it is greater than everything else, it will be clear that it also subsists of itself.

ANSELM: [II.] . . . I have said that if it is only in the understanding, it could be conceived to be also existing in reality, and this is greater. If it is only in the understanding, then one and the same thing is such that one both can and cannot conceive of anything greater. Which follows more logically, I ask: that it exists in the intellect alone, but cannot be thought to exist also in reality, or that it can be thought to exist in reality, and one who

I have followed the procedure of John Hick, *Classical and Contemporary Readings in the Philosophy of Religion* (Englewood Cliffs, NJ: Prentice Hall, 1964) and put the main points of Gaunilo's critique together with Anselm's replies. The numbers before each section refer to the paragraph numbers of Gaunilo's *A Reply to the Foregoing by a Certain Writer on Behalf of the Fool* (in Arabic numbers) and Anselm's *Reply to the Foregoing by the Author of the Book in Question* (in Roman numerals).

thinks this thinks of something greater than if it were only in the intellect? What follows more logically than this: if a being than which none greater is conceivable is only in the understanding, then it is not such that none greater can be conceived? But surely in no intellect will you find a thing with both these properties, viz. "greater than which something is conceivable" and "greater than which nothing is conceivable." Does it not follow then that if "a thing greater than which nothing is conceivable" is in any understanding, then such a thing is not only in the understanding? For if it were, it is "a thing greater than which something is conceivable," which is not consistent.

* * *

GAUNILLO: [6.] . . . They say that somewhere in the ocean there is an island, which because of the difficulty, or better, the impossibility of finding what does not exist, some call the lost island. And they say this island is inestimably wealthy, having all kinds of delights and riches in greater abundance even than the fabled "Fortunate Islands." And since it has no possessor or inhabitant, it excels all other inhabited countries in its possessions. Now should someone tell me that there is such an island, I could readily understand what he says, since there is no problem there. But suppose he adds, as though it were already implied: "You can't doubt any more that this island, which is more excellent than any land, really exists somewhere, since you don't doubt that it is in your understanding and that it is more excellent not to be in the understanding only. Hence it is necessary that it really exists, for if it did not, any land which does would excel it and consequently the island which you already understand to be more excellent would not be such." If one were to try to prove to me that this island in truth exists and its existence should no longer be questioned, either I would think he was joking or I would not know whether to consider him or me the greater fool, me for conceding his argument or him for supposing he had established with any certainty such an island's existence without first showing such excellence to be real and its existence indubitable rather than just a figment of my understanding, whose existence is uncertain.

ANSELM: [III.] But you claim our argument is on a par with the following. Someone imagines an island in the ocean which surpasses all lands in its fertility. Because of the difficulty, or rather impossibility, of finding what does not exist, he calls it "Lost Island." He might then say you cannot doubt that it really exists, because anyone can readily understand it from its verbal description. I assert confidently that if anyone finds something for me, besides that "than which none greater is conceivable," which exists either in reality or concept alone to which the logic of my argument can be applied, I will find and give him his "Lost Island," never to be lost again. . . .

GAUNILLO: [7.] This then is an answer the fool [in *Proslogion*, Ch. 3] could make to your arguments against him. When he is first assured that this being is so great that its nonexistence is inconceivable, and that this in turn is established for no other reason than that otherwise it would not excel all things, he could counter the same way and say: "When have I admitted there really is any such thing, i.e. something so much greater than everything else that one could prove to me it is so real, it could not even be conceived as unreal?" What we need at the outset is a very firm argument to show there is some superior being, bigger and better than all else that exists, so that we can go on from this to prove all the other attributes such a bigger and better being has to have.

The Romanesque Cathedral

a. *Exterior view of the Abbey Church of the Madeleine, Vezelay, France, built in the twelfth century. This church typifies the Romanesque style that flourished from about 1000 to 1200. The rounded arches above the portals are reminiscent of the arches of Roman construction. The thickness of the stone walls, together with the relatively simple facade, gives the structure the impression of solidity and solemnity.* (©Ivan Vdovin/Alamy Stock Photo)

b. *The nave. The rounded interior arches distribute the weight of the roof outward as well as downward, necessitating thick stone walls. As a result, only a few small windows are possible in a Romanesque church—adding to the fortress-like feel of the architecture.* (©Nat Farbman/The LIFE Picture Collection/Getty Images)

ANSELM: [III.] . . . It now seems obvious that a thing such that none greater can be conceived cannot be thought of as nonexistent since it exists on such firm grounds of truth. For otherwise it would not exist at all. If anyone says he thinks it does not exist, then I declare that when he thinks this he either thinks of something than which a greater is inconceivable, or else he does not think at all. If he does not think, then neither does he think that what he is not thinking of is nonexistent. But if he does think, then he thinks of something which cannot be thought of as not existing. For if it could be conceived as nonexistent, it could be conceived as having a beginning and an end. Now this is impossible. Hence if anyone thinks of it, he thinks of something that cannot even be conceived to be nonexistent. Now whoever conceives it thus doesn't think of it as nonexistent, for if he did he would conceive what can't be conceived. Nonexistence is inconceivable, then, of something greater than which nothing can be conceived.

GAUNILO: [7.] As for the statement that it is inconceivable that the highest thing of all should not exist, it might be better to say its nonexistence or even its possibility of nonexistence is unintelligible. For according to the true meaning of the word, unreal things are not intelligible, but their existence is conceivable in the way that the fool thinks that God does not exist. I most certainly know I exist, but for all that, I know my nonexistence is possible. As for that supreme being which God is, I understand without doubt both his existence and the impossibility of his nonexistence. But whether I can conceive of my nonexistence as long as I most certainly know I exist, I don't know. But if I am able to, why can I not conceive of the nonexistence of whatever else I know with the same certainty? But if I cannot, then such an inability will not be something peculiar to God [i.e., being such that He cannot be thought not to exist.]

ANSELM: [IV.] You claim moreover that when we say this supreme reality cannot be conceived of as nonexistent, it would be perhaps better to say that its nonexistence or even the possibility of its nonexistence is not understandable. But it is better to say it cannot be conceived. For had I said that the reality itself could not be understood not to exist, perhaps you, who insist that according to proper usage what is false cannot be understood, would object that nothing existing could be understood not to exist. For it is false to claim that what exists does not exist. Hence it would not be peculiar to God to be unable to be understood as nonexistent. If any one of the things that most certainly exist can be understood to be nonexistent, however, then other certain things can also be understood to be nonexistent. But this objection cannot be applied to "conceiving," if this is correctly understood. For though none of the things that exist can be understood not to exist, still they can all be conceived as nonexistent, except the greatest. For all—and only—those things can be conceived as nonexistent which have a beginning or end or consist of parts or do not exist in their entirety in any time or place, as I have said. Only that being which cannot be conceived to be nonexistent must be conceived as having no beginning or end or composition of parts but is whole and entire always and everywhere.

Consequently you must realize that you can conceive of yourself as nonexistent, though you most certainly know that you exist. You surprise me when you say you are not sure of this. For we conceive of many things as nonexistent which we know to exist and of many things as existent which we know do not exist. And we conceive them thus not by judging but by imagining them so. We can indeed conceive of something as existent even while we know it does not exist, because we are able to conceive the one at the same time that we know the other. But we cannot conceive nonexistence while knowing existence, because we cannot conceive existence and nonexistence at the same time. If anyone distinguishes between the two senses of the statement in this fashion, then, he will understand that nothing, as long as it is known to be, can be conceived not to be, and that whatever exists, with the exception of a thing such that no greater is conceivable, can be conceived of as nonexistent even when it is known to exist. This inability to be conceived of as nonexistent, then, is peculiar to God, even though there are many objects which cannot be conceived not to be while they are. As for the way in which God can still be said to be conceived as not existing, I believe this has been explained clearly enough in my little book itself.

HILDEGARD OF BINGEN

1098–1179

The monasteries and convents were as important to the intellectual life of twelfth-century Europe as were the developing universities. Those religious houses contained both scholars seeking the reconciliation of faith and reason and contemplatives who emphasized the nonrational and mystical elements of Christianity. For example, both the academic Peter Abelard and the mystic St. Bernard of Clairvaux, his adversary, were monks. The cloister was also one of the few places where women could get an education, write, and assume positions of intellectual leadership. Among the leading nuns who wrote during this period was the mystic, Hildegard of Bingen.

Hildegard was born in Bernmersheim, near Mainz, Germany. As their tenth and last child, her parents gave her as a “tithe” (literally a “tenth”) to the church when she was eight years old. She took the vows of the Order of St. Benedict at around fifteen and spent her next two decades as a devoted Benedictine nun at Disibodenberg. In 1137, Hildegard became the abbess of her convent and soon thereafter began her writing career. Over the next forty-two years, Hildegard not only wrote, she also founded two new convents, worked for social and church reform, and preached throughout the Rhine River basin. Sought out for advice by kings and popes as well as by common people, she wrote numerous letters of counsel and warning. Hildegard was fearlessly direct in these letters, as the opening lines of her letter to Pope Anastasius IV indicate:

So it is, O man, that you who sit in the chief seat of the Lord, hold him in contempt when you embrace evil, since you do not reject [evil] but kiss it, by silently tolerating

it in depraved men. . . . Beware, therefore, of wanting to associate yourself with the ways of the pagans, lest you fall.*

In addition to letters, Hildegard's works include an explication of the Rule of St. Benedict (a list of rules used to govern monastic life), commentaries on the Gospels, scientific and medical treatises, poetry, songs, and the earliest known morality play. But Hildegard is best known for her visionary trilogy, *Scivias*.

Perhaps from as early as age three, Hildegard had visions, and she continued to have them throughout her life. As she explained in her preface to the *Scivias*, these visions did not come to her while sleeping or in a trance, "but by God's will [I] beheld them wide awake and clearly, with the mind, eyes, and ears of the inner person." In the passage from this work, reprinted here as translated by Mother Columba Hart and Jane Bishop, Hildegard relates a vision of a fetus receiving a soul. She goes on to discuss the relation between the body and the soul, as well as the interrelations among the various parts of the soul: senses, intellect, will, reason. She ends this interesting discussion with a pictorial analogy that illustrates her visual style.

* * *

For an overview of mysticism, begin with the classic by Evelyn Underhill, *Mysticism: A Study in the Nature and Development of Man's Spiritual Consciousness*, 12th edition (London: Methuen, 1930). W.T. Stace, *Mysticism and Philosophy* (London: Macmillan, 1960); M.D. Knowles, *The Nature of Mysticism* (New York: Hawthorn Books, 1966); Georgia Harkness, *Mysticism: Its Meaning and Message* (Nashville, TN: Abingdon Press, 1973); and S.T. Katz, *Mysticism and Philosophical Analysis* (New York: Oxford University Press, 1978) also give good general introductions. Paul E. Szarmach, *An Introduction to the Medieval Mystics of Europe* (Albany, NY: SUNY Press, 1984) provides sketches of virtually every major medieval mystic.

For a study of Hildegard of Bingen's life and thought, see Sabina Flanagan, *Hildegard of Bingen, 1098–1179: A Visionary Life* (London: Routledge, 1989); and Renate Craine, *Hildegard: Prophet of the Cosmic Christ* (New York: Crossroads, 1997). Surveys with sections on Hildegard include Lina Eckenstein, *Women under Monasticism* (New York: Russell and Russell, 1963); Peter Dronke, *Women Writers of the Middle Ages* (Cambridge: Cambridge University Press, 1984); Margaret Alic, *Hypatia's Heritage: A History of Women in Science from Antiquity through the Nineteenth Century* (Boston: Beacon Press, 1986); and Elisabeth Gössmann, "Hildegard of Bingen" in Mary Ellen Waithe, *A History of Women Philosophers, Volume II: Medieval, Renaissance and Enlightenment Women Philosophers, 500–1600* (Dordrecht, The Netherlands: Kluwer Academic, 1989).

*Hildegard of Bingen, *Mystical Writings*, edited by Fiona Bowie and Oliver Davies, translated by Robert Carver (New York: Crossroads, 1990), p. 134. Portentously, Pope Anastasius IV died soon after this letter was sent.

SCIVIAS (in part)

BOOK I, VISION 4

16: AN INFANT IS VIVIFIED IN THE WOMB AND CONFIRMED BY A SOUL ON LEAVING IT

And you see the image of a woman who has a perfect human form in her womb. This means that after a woman has conceived by human semen, an infant with all its members whole is formed in the secret chamber of her womb. And behold! *By the secret design of the Supernal Creator that form moves with vital motion*; for, by God's secret and hidden command and will, fitly and rightly at the divinely appointed time the infant in the maternal womb receives a spirit, and shows by the movements of its body that it lives, just as the earth opens and brings forth the flowers of its use when the dew falls on it. *So that a fiery globe which has no human lineaments possesses the heart of that form*; that is, the soul, burning with a fire of profound knowledge, which discerns whatever is within the circle of its understanding, and, without the form of human members, since it is not corporeal or transitory like a human body, gives strength to the heart and rules the whole body as its foundation, as the firmament of Heaven contains the lower regions and touches the higher. *And it also touches the person's brain*; for in its powers it knows not only earthly but also heavenly things, since it wisely knows God; *and it spreads itself through all the person's members*; for it gives vitality to the marrow and veins and members of the whole body, as the tree from its root gives sap and greenness to all the branches. *But then this human form, in this way vivified, comes forth from the woman's womb, and changes its color according to the movement the globe makes in that form*; which is to say that after the person has received the vital spirit in the maternal womb and is born and begins his actions, his merits will be according to the works his soul does with the body, for he will put on brightness from the good ones and darkness from the evil ones.

17: HOW THE SOUL SHOWS ITS POWERS ACCORDING TO THE POWERS OF THE BODY

The soul now shows its powers according to the powers of the body, so that in a person's infancy it produces simplicity, in his youth strength, and in adulthood, when all the person's veins are full, it shows its strongest powers in wisdom; as the tree in its first shoots is tender and then shows that it can bear fruit, and finally, in its full utility, bears it. But then in human old age, when the marrow and veins start to incline to weakness, the soul's powers are gentler, as if from a weariness at human knowledge; as when winter approaches the sap of the tree diminishes in the branches and the leaves, and the tree in its old age begins to bend.

Body and Soul, from an early edition of *Scivias*. One of the souls in heaven (represented by the eyes) is entering the fetus in the womb. As Hildegard writes, "... at the divinely appointed time the infant in the maternal womb receives a spirit, and shows by the movements of its body that it lives." (Art from Hildegard of Bingen: *Scivias* (CWS), Translated by Mother Columba Hart and Jane Bishop; Introduced by Barbara J. Newman. 18: A PERSON HAS THREE PATHS WITHIN HIMSELF

But a person has within himself three paths. What are they? The soul, the body and the senses; and all human life is led in these. How? The soul vivifies the body and conveys the breath of life to the senses; the body draws the soul to itself and opens the senses; and the senses touch the soul and draw the body. For the soul gives life to the body as fire gives light to darkness, with two principal powers like two arms, intellect and will; the soul has arms not so as to move itself, but so as to show itself in these powers as the sun

shows itself by its brilliance. Therefore, O human, who are not just a bundle of marrow, pay attention to scriptural knowledge!

19: ON THE INTELLECT

The intellect is joined to the soul like an arm to the body. For as the arm, joined to the hand with its fingers, branches out from the body, so the intellect, working with the other powers of the soul, by which it understands human actions, most certainly proceeds from the soul. For before all the other powers of the soul it understands whatever is in human works, whether good or evil, so that through it, as through a teacher, everything is understood; for it sifts things as wheat is purified of any foreign matter, inquiring whether they are useful or useless, lovable or hateful, pertinent to life or death. Thus, as food without salt is tasteless, the other powers of the soul without intellect are insipid and undiscerning. But the intellect is also to the soul as the shoulder is to the body, the very core of the other powers of the soul; as the bodily shoulder is strong, so it understands the divinity and the humanity in God, which is the joint of the arm, and it has true faith in its work, which is the joint of the hand, with which it chooses among the various works wisely as if with fingers. But it does not work in the same way as the other powers of the soul. What does this mean?

20: ON THE WILL

The will activates the work, and the mind receives it, and the reason produces it. But the intellect understands the work, knowing good and evil, just as the angels, who have intellect, love good and despise evil. And where the heart is in the body, there the intellect is in the soul, exercising its power in that part of the soul as the will does in another part. How? Because the will has great power in the soul. How? The soul stands in a corner of the house, that is, by the prop of the heart, like a man who stands in a corner of his house, so that looking through the whole house he may command all its contents, lifting his right arm to point out what is useful in the house and turning to the East. Thus the soul should do, looking along the streets of the body toward the rising sun. Thus it puts its will, like a right arm, as the support of the veins and marrow and the movement of the whole body; for the will does every work, whether it be good or bad.

21: ANALOGY OF FIRE AND BREAD

For the will is like a fire, baking each deed as if in a furnace. Bread is baked so that people may be nourished by it and be able to live. So too the will is the strength of the whole work, for it starts by kneading it and when it is firm adds the yeast and pounds it severely; and, thus preparing the work in contemplation as if it were bread, it bakes it in perfection by the full action of its ardor, and so makes a greater food for humans in the work they do than in the bread they eat. A person stops eating from time to time, but the work of his will goes on in him till his soul leaves his body. And in whatever differing circumstances the work is performed, whether in infancy, youth, adulthood or bent old age, it always progresses in the will and in the will comes to perfection.

22: HOW IN THE WILL'S TABERNACLE ALL POWERS ARE ACTIVATED AND COME TOGETHER

But the will has in the human breast a tabernacle, the mind, upon which the intellect and that same will and a sort of force of the soul all breathe in strength. And all these are activated and come together in the same tabernacle. How? If anger arises, gall is produced and brings the anger to its height by filling the tabernacle with smoke. If wicked delight rises up, the flame of lust touches its structure, and so the wantonness that pertains to that sin is elevated and in that tabernacle united with it. But there is another, lovely kind of joy, which is kindled in that tabernacle by the Holy Spirit, and the rejoicing soul receives it faithfully and perfects good works in the desire of Heaven. And there is a kind of sadness that engenders in the tabernacle, out of those humors that surround the gall, the sloth which produces disdain, obduracy and stubbornness in people and depresses the soul, unless the grace of God comes quickly to rescue it.

But since in that tabernacle there occur contrary conditions, it is often disturbed by hatred and other deadly emotions, which kill the soul and try to lay it waste in perdition. But when the will wills, it can move the implements in the tabernacle and in its burning ardor dispose of them, whether they are good or evil. But if these implements please the will, it bakes its food there and offers it to people to enjoy. So in that tabernacle a great throng of good and evil things arises, like an army gathered in some place of assembly; when the commander of an army arrives, if the army pleases him he accepts it, but if it displeases him he orders it to disband. The will does the same. How? If good or evil arises in the breast, the will either carries it out or ignores it.

23: ON THE REASON

But both in the intellect and in the will reason stands forth as the loud sound of the soul, which makes known every work of God or Man. For sound carries words on high, as the wind lifts the eagle so that it can fly. Thus the soul utters the sound of reason in the hearing and the understanding of humanity, that its powers may be understood and its every work brought to perfection. But the body is the tabernacle and support of all the powers of the soul, since the soul resides in the body and works with the body, and the body with it, whether for good or for evil.

24: ON THE SENSES

It is the senses on which the interior powers of the soul depend, so that these powers are known through them by the fruits of each work. The senses are subject to these powers, since they guide them to the work, but the senses do not impose work on the powers, for they are their shadow and do what pleases them. The exterior human being awakens with senses in the womb of his mother before he is born, but the other powers of the soul still remain in hiding. What is this? The dawn announces the daylight; just so the human senses manifest the reason and all the powers of the soul. And as on the two commandments of God hang all the Law and the prophets, so also on the soul and its powers depend the human senses. What does this mean?

The Law is ordained for human salvation, and the prophets show forth the hidden things of God; so also human senses protect a person from harmful things and lay bare

the soul's interior. For the soul emanates the senses. How? It vivifies a person's face and glorifies him with sight, hearing, taste, smell and touch, so that by this touch he becomes watchful in all things. For the senses are the sign of all the powers of the soul, as the body is the vessel of the soul. What does this mean? A person is recognized by his face, sees with his eyes, hears with his ears, opens his mouth to speak, feels with his hands, walks with his feet; and so the senses are to a person as precious stones and as a rich treasure sealed in a vase. But as the treasure within is known when the vase is seen, so also the powers of the soul are inferred by the senses.

25: THAT THE SOUL IS THE MISTRESS AND THE FLESH THE HANDMAID

The soul is the mistress, the flesh the handmaid. How? The soul rules the body by vivifying it, and the body is ruled by this vivification, for if the soul did not vivify the body it would fall apart and decay. But when a person does an evil deed and the soul knows it, it is as bitter for the soul as poison is for the body when it knowingly takes it. But the soul rejoices in a sweet deed as the body delights in sweet food. And the soul flows through the body like sap through a tree. What does this mean? By the sap, the tree grows green and produces flowers and then fruit. And how is this fruit matured? By the air's tempering. How? The sun warms it, the rain waters it, and thus by the tempering of the air it is perfected. What does this mean? The mercy of God's grace, like the sun, will illumine the person, the breath of the Holy Spirit, like the rain, will water him, and so discernment, like the tempering of the air, will lead him to the perfection of good fruits.

26: ANALOGY OF A TREE TO THE SOUL

The soul in the body is like sap in a tree, and the soul's powers are like the form of the tree. How? The intellect in the soul is like the greenery of the tree's branches and leaves, the will like its flowers, the mind like its bursting firstfruits, the reason like the perfected mature fruit, and the senses like its size and shape. And so a person's body is strengthened and sustained by the soul. Hence, O human, understand what you are in your soul, you who lay aside your good intellect and try to liken yourself to the brutes.

MOSES MAIMONIDES

1135–1204

Moses ben Maimon, or Maimonides (referred to by Jewish scholars as “Rambam” for “Rabbi Moses ben Maimon”), was born at 1:00 P.M. on March 30, 1135, and died on December 13, 1204. The fact that we have such precise dates indicates the esteem with which he was held in his lifetime. As a boy in Córdoba, Spain, he was taught the Torah and the Talmud by his father, along with philosophy and science. At age 13, Maimonides and his family were forced to flee Spain after a time of peaceful coexistence between Jews and Muslims came to an end. Following a period of travel, which included a stay in Palestine, Maimonides and his family settled in Cairo, Egypt. There, Maimonides and his brother David became jewel merchants. Within a few years, Maimonides lost both his father and David, the latter killed in a shipwreck in the Indian Ocean during a business trip. Maimonides gave up the jewel business and turned to medicine. His expertise as a doctor eventually led to his appointment as a court physician for the ruler Saladin (the same Saladin who defeated Richard the Lionhearted in the Third Crusade). Maimonides’ spiritual insights led to his being named the head of the Egyptian Jewish community. While serving both his religion and the state, he still found time to write extensively. His death in 1204 was mourned by Jews throughout the Mediterranean region, and his remains were taken from Cairo to Tiberias, on the Sea of Galilee, where his tomb is still visited today.

Maimonides’ philosophical fame rests squarely on his major work, *The Guide for the Perplexed*. This work was written not for the majority of believers, but for those who knew both Jewish Law and Greek philosophy and were perplexed on how to harmonize the two. Though his religion was different, Maimonides faced questions similar to those of his neighboring Muslims and Christians: how to reconcile faith and reason. In the *Guide*, Maimonides asserts that there can be no conflict between faith and reason. Using Aristotle’s

philosophy (with some Neoplatonic spin), Maimonides believed he could answer a number of philosophical questions about the nature of God and of God's creation in a way that was consistent with sacred writings. Apparent disagreements between philosophy and theology frequently resulted from either taking figurative passages in Scripture literally or misunderstanding difficult philosophical arguments. Occasionally, philosophy is simply incapable of answering a given question and one must accept "the authority of Prophecy, which can teach things beyond the reach of human speculation." But even in such cases, philosophy can still provide general reasons for believing Scripture. For example, philosophy is inconclusive in determining whether or not the world is eternal. But whichever position we assume, says Maimonides, we can use that assumption to prove that God exists (when using arguments that Maimonides collected).

The selection from the *Guide* given here, in the M. Friedländer translation, presents Maimonides' arguments for God's existence. This passage greatly influenced Thomas Aquinas, and echoes of Maimonides' thought can be heard throughout Thomas's writings.

* * *

For selections from Maimonides' writings, see Jacob Samuel Minkin, *The World of Moses Maimonides, with Selections From His Writings* (New York: T. Yoseloff, 1957); Moses Maimonides, *The Guide for the Perplexed*, translated by Shlomo Pines (Chicago: Chicago University Press, 1963); and Moses Maimonides, *Rambam: Readings in the Philosophy of Moses Maimonides*, translated by Lenn Evan Goodman (New York: Viking Press, 1976).

Among the many general introductions to Maimonides' life and thought, more recent helpful studies include Abraham Joshua Heschel, *Maimonides: A Biography*, translated by Joachim Neugroschel (New York: Farrar, Straus & Giroux, 1982); Oliver Leaman, *Moses Maimonides* (London: Routledge, 1990); and Herbert A. Davidson, *Moses Maimonides* (Oxford: Oxford University Press, 2004). For more specialized studies, see Carol Klein, *The Credo of Maimonides: A Synthesis* (New York: Philosophical Library, 1958); Jehuda Melber, *The Universality of Maimonides* (New York: Jonathan David, 1968); Menachem Marc Kellner, *Dogma in Medieval Jewish Thought: From Maimonides to Abravanel* (Oxford: Oxford University Press, 1986); Raymond L. Weiss, *Maimonides' Ethics* (Chicago: University of Chicago Press, 1991); Howard Kreisel, *Maimonides' Political Thought* (Albany, NY: SUNY Press, 1999); David Hartman, *Maimonides' Torah and Philosophic Quest* (Philadelphia, PA: Jewish Publication Society, 2000); and James Arthur Diamond, *Maimonides and the Hermeneutics of Concealment: Deciphering Scripture and Midrash in The Guide of the Perplexed* (Albany, NY: SUNY Press, 2002). For collections of essays, see Salo Wittmayer Baron, ed., *Essays on Maimonides: An Octocentennial Volume* (New York: Columbia University Press, 1941); Joseph A. Buijs, ed., *Maimonides: A Collection of Critical Essays* (Notre Dame, IN: University of Notre Dame Press, 1988); Eric L. Ormsby, ed., *Moses Maimonides and His Time* (Washington, DC: Catholic University of America Press, 1989); and Kenneth Seeskin, ed., *The Cambridge Companion to Maimonides* (Cambridge: Cambridge University Press, 2005).

THE GUIDE FOR THE PERPLEXED (in part)

PART II

INTRODUCTION: Twenty-five of the propositions which are employed in the proof for the existence of God, or in the arguments demonstrating that God is neither corporeal nor a force connected with a material being, or that He is One, have been fully established, and their correctness is beyond doubt. Aristotle and the Peripatetics who followed him have proved each of these propositions. There is, however, one proposition which we do not accept—namely, the proposition which affirms the Eternity of the Universe, but we will admit it for the present, because by doing so we shall be enabled clearly to demonstrate our own theory.

PROPOSITION I: The existence of an infinite magnitude is impossible.

PROPOSITION II: The co-existence of an infinite number of finite magnitudes is impossible.

PROPOSITION III: The existence of an infinite number of causes and effects is impossible, even if these were not magnitudes; if, e.g., one Intelligence were the cause of a second, the second the cause of a third, the third the cause of a fourth, and so on, the series could not be continued ad infinitum.

PROPOSITION IV: Four categories are subject to change:—

- (a) *Substance*—Changes which affect the substance of a thing are called genesis and destruction.
- (b) *Quantity*—Changes in reference to quantity are increase and decrease.
- (c) *Quality*—Changes in the qualities of things are transformations.
- (d) *Place*—Change of place is called motion.

The term “motion” is properly applied to change of place, but is also used in a general sense of all kinds of changes.

PROPOSITION V: Motion implies change and transition from potentiality to actuality.

PROPOSITION VI: The motion of a thing is either essential or accidental; or it is due to an external force, or to the participation of the thing in the motion of another thing. This latter kind of motion is similar to the accidental one. An instance of essential motion may be found in the translation of a thing from one place to another. The accident of a thing, as, e.g., its black color, is said to move when the thing itself changes its place. The upward motion of a stone, owing to a force applied to it in that direction, is an instance of a motion due to an external force. The motion of a nail in a boat may serve to illustrate motion due to the participation of a thing in the motion of another thing; for when the boat moves, the nail is said to move likewise. The same is the case with everything composed of several parts: when the thing itself moves, every part of it is likewise said to move.

PROPOSITION VII: Things which are changeable are, at the same time, divisible. Hence everything that moves is divisible, and consequently corporeal; but that which is indivisible cannot move, and cannot therefore be corporeal.

PROPOSITION VIII: A thing that moves accidentally must come to rest, because it does not move of its own accord; hence accidental motion cannot continue for ever.

PROPOSITION IX: A corporeal thing that sets another corporeal thing in motion can only effect this by setting itself in motion at the time it causes the other thing to move.

PROPOSITION X: A thing which is said to be contained in a corporeal object must satisfy either of the two following conditions: it either exists through that object, as is the case with accidents, or it is the cause of the existence of that object; such is, e.g., its essential property. In both cases it is a force existing in a corporeal object.

PROPOSITION XI: Among the things which exist through a material object, there are some which participate in the division of that object, and are therefore accidentally divisible, as, e.g., its color, and all other qualities that spread throughout its parts. On the other hand, among the things which form the essential elements of an object, there are some which cannot be divided in any way, as, e.g., the soul and the intellect.

PROPOSITION XII: A force which occupies all parts of a corporeal object is finite, that object itself being finite.

PROPOSITION XIII: None of the several kinds of change can be continuous, except motion from place to place, provided it be circular.

PROPOSITION XIV: Locomotion is in the natural order of the several kinds of motion the first and foremost. For genesis and corruption are preceded by transformation, which, in its turn, is preceded by the approach of the transforming agent to the object which is to be transformed. Also, increase and decrease are impossible without previous genesis and corruption.

PROPOSITION XV: Time is an accident that is related and joined to motion in such a manner that the one is never found without the other. Motion is only possible in time, and the idea of time cannot be conceived otherwise than in connection with motion; things which do not move have no relation to time.

PROPOSITION XVI: Incorporeal bodies can only be numbered when they are forces situated in a body; the several forces must then be counted together with substances or objects in which they exist. Hence purely spiritual beings, which are neither corporeal nor forces situated in corporeal objects, cannot be counted, except when considered as causes and effects.

PROPOSITION XVII: When an object moves, there must be some agent that moves it, from without, as, e.g., in the case of a stone set in motion by the hand; or from within, e.g., when the body of a living being moves. Living beings include in themselves, at the same time, the moving agent and the thing moved; when, therefore, a living being dies, and the moving agent, the soul, has left the body, i.e., the thing moved, the body

remains for some time in the same condition as before, and yet cannot move in the manner it has moved previously. The moving agent, when included in the thing moved, is hidden from, and imperceptible to, the senses. This circumstance gave rise to the belief that the body of an animal moves without the aid of a moving agent. When we therefore affirm, concerning a thing in motion, that it is its own moving agent, or, as is generally said, that it moves of its own accord, we mean to say that the force which really sets the body in motion exists in that body itself.

PROPOSITION XVIII: Everything that passes over from a state of potentiality to that of actuality, is caused to do so by some external agent; because if that agent existed in the thing itself, and no obstacle prevented the transition, the thing would never be in a state of potentiality, but always in that of actuality. If, on the other hand, while the thing itself contained that agent, some obstacle existed, and at a certain time that obstacle was removed, the same cause which removed the obstacle would undoubtedly be described as the cause of the transition from potentiality to actuality [and not the force situated within the body]. Note this.

PROPOSITION XIX: A thing which owes its existence to certain causes has in itself merely the possibility of existence; for only if these causes exist, the thing likewise exists. It does not exist if the causes do not exist at all, or if they have ceased to exist, or if there has been a change in the relation which implies the existence of that thing as a necessary consequence of those causes.

PROPOSITION XX: A thing which has in itself the necessity of existence cannot have for its existence any cause whatever.

PROPOSITION XXI: A thing composed of two elements has necessarily their composition as the cause of its present existence. Its existence is therefore not necessitated by its own essence; it depends on the existence of its two component parts and their combination.

PROPOSITION XXII: Material objects are always composed of two elements [at least], and are without exception subject to accidents. The two component elements of all bodies are substance and form. The accidents attributed to material objects are quantity, geometrical form, and position.

PROPOSITION XXIII: Everything that exists potentially, and whose essence includes a certain state of possibility, may at some time be without actual existence.

PROPOSITION XXIV: That which is potentially a certain thing is necessarily material, for the state of possibility is always connected with matter.

PROPOSITION XXV: Each compound substance consists of matter and form, and requires an agent for its existence, viz., a force which sets the substance in motion, and thereby enables it to receive a certain form. The force which thus prepares the substance of a certain individual being, is called the immediate motor. Here the necessity arises of investigating into the properties of motion, the moving agent and the thing moved. But this has already been explained sufficiently; and the opinion of Aristotle may be expressed in the following proposition: Matter does not move of its own accord—an important proposition that led to the investigation of the Prime Motor (the first moving agent).

Of these foregoing twenty-five propositions some may be verified by means of a little reflection and the application of a few propositions capable of proof, or of axioms or theorems of almost the same force, such as have been explained by me. Others require many arguments and propositions, all of which, however, have been established by conclusive proofs partly in the *Physics* and its commentaries, and partly in the *Metaphysics* and its commentary. I have already stated that in this work it is not my intention to copy the books of the philosophers or to explain difficult problems, but simply to mention those propositions which are closely connected with our subject, and which we want for our purpose.

To the above propositions one must be added which enunciates that the universe is eternal, and which is held by Aristotle to be true, and even more acceptable than any other theory. For the present we admit it, as a hypothesis, only for the purpose of demonstrating our theory. It is the following proposition:—

PROPOSITION XXVI: Time and motion are eternal, constant, and in actual existence.

In accordance with this proposition, Aristotle is compelled to assume that there exists actually a body with constant motion, viz., the fifth element. He therefore says that the heavens are not subject to genesis or destruction, because motion cannot be generated nor destroyed. He also holds that every motion must necessarily be preceded by another motion, either of the same or of a different kind. The belief that the locomotion of an animal is not preceded by another motion, is not true; for the animal is caused to move, after it had been in rest, by the intention to obtain those very things which bring about that locomotion. A change in its state of health, or some image, or some new idea can produce a desire to seek that which is conducive to its welfare and to avoid that which is contrary. Each of these three causes sets the living being in motion, and each of them is produced by various kinds of motion. Aristotle likewise asserts that everything which is created must, before its actual creation, have existed in *potentiâ*. By inferences drawn from this assertion he seeks to establish his proposition, viz., the thing that moves is finite, and its path finite; but it repeats the motion in its path an infinite number of times. This can only take place when the motion is circular, as has been stated in Proposition XIII. Hence follows also the existence of an infinite number of things which do not co-exist but follow one after the other.

Aristotle frequently attempts to establish this proposition; but I believe that he did not consider his proofs to be conclusive. It appeared to him to be the most probable and acceptable proposition. His followers, however, and the commentators of his books, contend that it contains not only a probable but a demonstrative proof, and that it has, in fact, been fully established. On the other hand, the *Mutakallemim* try to prove that the proposition cannot be true, as, according to their opinion, it is impossible to conceive how an infinite number of things could even come into existence successively. They assume this impossibility as an axiom. I, however, think that this proposition is admissible, but neither demonstrative, as the commentators of Aristotle assert, nor, on the other hand, impossible, as the *Mutakallemim* say. We have no intention to explain here the proofs given by Aristotle, or to show our doubts concerning them, or to set forth our opinions on the creation of the universe. I here simply desire to mention those propositions which we shall require for the proof of the three principles stated above. Having thus quoted and admitted these propositions, I will now proceed to explain what may be inferred from them.

THOMAS AQUINAS

1225–1274

Saint Thomas Aquinas was indisputably the greatest of the medieval philosophers. He was born in his family's castle of Roccasecca near the town of Aquino, about halfway between Rome and Naples. The seventh son of the Count of Aquino, Landolfo, and his wife Teodora, at the age of 5 Thomas was sent to the Benedictine monastery of Monte Casino, where his uncle was the abbot. His parents hoped he would get a good education at the monastery and perhaps one day become abbot of Monte Casino. However, political struggles between the pope and the emperor made the monastery unsafe, and at age 14 Thomas moved to the Imperial University in Naples.

At this university, Thomas came under the influence of the Dominicans, a mendicant, or begging, order of friars. Even though the Dominicans were admired by many for their religious commitment, Thomas's family was appalled when in 1244 he announced his plans to join the order. They considered the Dominicans religious fanatics, virtually a cult, with none of the sophistication, prestige, or power of the long-established Benedictines. At his parents' instigation, Thomas's brothers kidnapped him and held him captive in the family castle. For a year they tried reasoning, shouting, intimidating—even tempting him with a prostitute—but Thomas would not be swayed. He eventually managed to escape and became a Dominican friar.

Thomas went to Paris, where he studied with Albertus Magnus (Albert the Great), an advocate of the newly rediscovered Aristotelian writings, and he even followed his teacher to Cologne to continue his study of Aristotle. As a student, Thomas was so stolid and methodical that many of his peers thought he was dull or downright stupid. Given his deliberate manner and his portly build, his classmates dubbed him "the Dumb Ox." But Albertus saw his potential and turned this cruel epithet into a prophecy, saying, "You call him a Dumb Ox; I tell you the Dumb Ox

will bellow so loud his bellowing will fill the world.” In 1252, Thomas returned to Paris for graduate studies, eventually receiving the magistrate (doctorate) in theology in 1256.

On concluding his studies, it seemed natural that Thomas would join the faculty of the University of Paris. However, scholars from the mendicant orders were held in suspicion by the regular faculty of the university. Along with the great Franciscan friar Bonaventure, Thomas was not allowed to teach in Paris until the pope himself intervened.

The rest of Thomas’s life was spent teaching in France and Italy and writing extensively on philosophical and theological subjects. His complete works in Latin comprise twenty-five volumes. Thomas was also called upon to intervene in several disputes. In addition to defending his Dominican order, he was forced to articulate a middle position between those who rejected Aristotelian philosophy as anti-Christian and those who accepted Aristotle (or, rather, a version of Averroës’ interpretation of Aristotle) too uncritically. Throughout his writings, Thomas negotiated a middle path of critical admiration for Aristotle.

Like other Christian thinkers, Thomas was concerned with the relation between reason and faith. Using basically Aristotelian categories, Thomas taught that natural reason could establish some of the truths of religion (such as the existence, unity, and goodness of God), but other truths were accessible only through faith. Contrary to some of the Latin Averroists, Thomas taught that there was no

The Benedictine Monastery of Monte Cassino. At the age of 5, St. Thomas Aquinas was sent here to study. His parents hoped that he might someday become abbot of the monastery, but he chose to join the Dominican order instead. (AP/Wide World Photos)

conflict between the teachings of philosophy and those of theology. To use a later analogy, Thomas believed that “the book of nature” (i.e., the created world) and the “Book of Scripture” were in perfect harmony.

In December 1273, Thomas suddenly stopped writing, apparently the result of a mystical experience. He reported to a friend that “all I have written seems like straw to me.” A few months later, he was called to a church council in Lyon, France. On the way there, his health forced him to stop at Fossanova (south of Rome) where he died on March 7, 1274, at the age of 49.

Three years after his death, several of Thomas’s teachings were condemned by the Bishop of Paris. However, the condemnation did not stand long, and in 1323, Saint Thomas Aquinas was canonized. In 1879, Pope Leo XII commended the study of Aquinas’s philosophy in an encyclical, *Aeterni Patris*. This papal proclamation did not launch a revival of Thomism, as is often said, but it did lend an enormous prestige to the study of Thomas and his work. The encyclical praises the saint in the highest terms: “As far as man is concerned, reason can now hardly rise higher than she rose, borne up in the flight of Thomas; and Faith can hardly gain more help from reason than those which Thomas gave her.” Despite the encouragement of Leo XII and others, not all Catholic philosophers are by any means Thomists; many twentieth-century Catholic thinkers have shown more interest in existentialism and phenomenology. Today Thomas is studied and admired as much by Protestants and non-Christians as he is by Catholics.

* * *

Thomas’s most famous work, the *Summa Theologica*, is one of the most comprehensive and systematic works of theology ever written. It has often been likened in its complexity and grandeur to a Gothic cathedral. This monumental classic is divided into four sections that, collectively, include 512 “Questions.” Each Question raises a topic or area of investigation and is, in turn, made up of several “Articles” that explore specific concerns. These Articles range from abstract philosophical issues, such as “Whether one can intend two things at the same time,” to such minutiae of theology as “Whether one angel can speak to another in such a way that others will not know what he is saying.” Each Article is examined in the same manner, beginning with a question, offering an answer that Thomas considers inadequate, then supporting this answer with several “objections.” At this point, a quotation or argument that contradicts the position taken thus far is introduced with the words “On the contrary (*sed contra*) . . .” The dramatic tension between two opposing positions is then resolved by the author’s concise and straightforward *Respondeo*, or “I answer that . . .,” which introduces his own view. In presenting his answer, Thomas tries to avoid directly denying the preceding objections, seeing them instead as limited truths that his *Respondeo* supersedes. Finally, Thomas moves on to answer, one by one, each of the initial objections. (The reader should keep in mind that the *first* things Thomas says about a subject are the *opposite* of the position he will subsequently defend.)

The selections from the *Summa Theologica* given here include readings from Thomas’s “Treatise on God” (including his famous “Five Ways” or five arguments for God’s existence); “Treatise on Man” (including a discussion of the nature of the soul); “Treatise on Human Acts” (including his definition of happiness); “Treatise on Law” (describing the kinds of law); and “Treatise on War” (describing

his arguments for a just war). The translation is that of the Fathers of the English Dominican Province.

* * *

The classic introductions to Thomas Aquinas are F.C. Copleston, *Aquinas* (Baltimore, MD: Penguin Books, 1955), and Étienne Gilson, *The Christian Philosophy of St. Thomas Aquinas* (New York: Random House, 1956). More recent helpful studies include Josef Pieper, *Guide to Thomas Aquinas* (New York: Pantheon, 1962); Ralph McInerny, *St. Thomas Aquinas* (Boston: Twayne, 1977); Anthony Kenny, *Aquinas* (New York: Hill and Wang, 1980); Brian Davies, *The Thought of Thomas Aquinas* (Oxford: Oxford University Press, 1992); Jean-Pierre Torrell, *Saint Thomas Aquinas, Volume I: The Person and His Work* (Washington, DC: Catholic University of America Press, 1996); and Thomas F. O'Meara, *Thomas Aquinas, Theologian* (Notre Dame, IN: Notre Dame University Press, 1997). James A. Weisheipl, *Friar Thomas D'Aquino: His Life, Thought, and Works* (Garden City, NY: Doubleday, 1974) offers a biography. G.K. Chesterton's impressionistic study entitled *St. Thomas Aquinas: The "Dumb Ox"* (1933; reprinted New York: Doubleday Image, 1956) is also a good place to become acquainted with Thomas. For a discussion of recent interpretation of Thomas Aquinas' work, see Fergus Karr, *Aquinas: Conflicting Versions of Thomism* (Oxford: Basil Blackwell, 2000). For collections of general essays, see Anthony Kenny, ed., *Aquinas: A Collection of Critical Essays* (Garden City, NY: Anchor Doubleday, 1969); Norman Kretzmann and Eleonore Stump, eds., *The Cambridge Companion to Aquinas* (Cambridge: Cambridge University Press, 1993); Scott MacDonald and Eleonore Stump, *Aquinas's Moral Theory* (Ithaca, NY: Cornell University Press, 1999); and Brian Davies, ed., *Aquinas's Summa Theologiae* (Lanham, MD: Rowman & Littlefield, 2005).

There are many studies on aspects of Thomas' thought. For example, a sampling of works on the "Five Ways" includes A.G.N. Flew, *God and Philosophy* (London: Hutchinson, 1966); Anthony Kenny, *The Five Ways: St. Thomas Aquinas' Proofs of God's Existence* (London: Routledge & Kegan Paul, 1969); Richard Swinburne, *The Existence of God* (Oxford: Clarendon Press, 1979); and J.L. Mackie, *The Miracle of Theism: Arguments for and against the Existence of God* (Oxford: Clarendon Press, 1982). Other recent studies of particular areas of Thomas' thought include John Milbank and Catherine Pickstock, *Truth in Aquinas* (London: Routledge, 2001); Anthony Kenny, *Aquinas on Being* (Oxford: Oxford University Press, 2002); Robert Pasnau, *Thomas Aquinas on Human Nature: A Philosophical Study of Summa Theologiae, 1a 75–89* (Cambridge: Cambridge University Press, 2002); and Alex Hall, *Thomas Aquinas & John Duns Scotus: Natural Theology in the High Middle Ages* (London: Continuum, 2007).

SUMMA THEOLOGICA (selections)

FIRST PART

TREATISE ON GOD

QUESTION 2: THE EXISTENCE OF GOD (IN THREE ARTICLES)

Because the chief aim of sacred doctrine is to teach the knowledge of God, not only as He is in Himself, but also as He is the beginning of things and their last end, and especially of rational creatures, as is clear from what has been already said, therefore, in our endeavor to expound this science, we shall treat: (1) Of God; (2) Of the rational creature's advance towards God; (3) Of Christ, Who as man, is our way to God.

In treating of God there will be a threefold division:—

For we shall consider (1) Whatever concerns the Divine Essence; (2) Whatever concerns the distinctions of Persons; (3) Whatever concerns the procession of creatures from Him.

Concerning the Divine Essence, we must consider:—

(1) Whether God exists? (2) The manner of His existence, or, rather, what is *not* the manner of His existence; (3) Whatever concerns His operations—namely, His knowledge, will, power.

Concerning the first, there are three points of inquiry:—

(1) Whether the proposition “God exists” is self-evident? (2) Whether it is demonstrable? (3) Whether God exists?

First Article

WHETHER THE EXISTENCE OF GOD IS SELF-EVIDENT?

We Proceed Thus to the First Article:—

Objection 1. It seems that the existence of God is self-evident. Now those things are said to be self-evident to us the knowledge of which is naturally implanted in us, as we can see in regard to first principles. But as Damascene says (*De Fid. Orth.* i. 1, 3), *the knowledge of God is naturally implanted in all*. Therefore the existence of God is self-evident.

Obj.2. Further, those things are said to be self-evident which are known as soon as the terms are known, which the Philosopher (1 *Poster.* iii) says is true of the first principles of demonstration. Thus, when the nature of a whole and of a part is known, it is at once recognized that every whole is greater than its part. But as soon as the signification of the word “God” is understood, it is at once seen that God exists. For by

From St. Thomas Aquinas, *Summa Theologica*, Treatise on God (Part I, Q. 2); Treatise on Man (Part I, Q. 75, a. 2; Q. 76, a. 1); Treatise on Human Acts (Part I–II, Q. 2, a. 8; Q. 3, a. 4, 8; Q. 5, a.5); Treatise on Law (Part I–II, Q. 94, a. 2, 4; Q. 95, a. 1, 2; Q. 96, a. 2); Treatise on War (Part II–II, q. 40, a. 1), translated by the Fathers of the English Dominican Province (New York: Benziger Brothers, 1947). Reprinted by permission.

this word is signified that thing than which nothing greater can be conceived. But that which exists actually and mentally is greater than that which exists only mentally. Therefore, since as soon as the word "God" is understood it exists mentally, it also follows that it exists actually. Therefore the proposition "God exists" is self-evident.

Obj. 3. Further, the existence of truth is self-evident. For whoever denies the existence of truth grants that truth does not exist: and if truth does not exist, then the proposition "Truth does not exist" is true: and if there is anything true, there must be truth. But God is truth itself: *I am the way, the truth, and the life* (John xiv. 6). Therefore "God exists" is self-evident.

On the contrary, No one can mentally admit the opposite of what is self-evident; as the Philosopher (*Metaph.* iv., lect. vi) states concerning the first principles of demonstration. But the opposite of the proposition "God is" can be mentally admitted: *The fool said in his heart, There is no God* (Ps. liii. 1). Therefore, that God exists is not self-evident.

I answer that, A thing can be self-evident in either of two ways; on the one hand, self-evident in itself, though not to us; on the other, self-evident in itself, and to us. A proposition is self-evident because the predicate is included in the essence of the subject, as "Man is an animal," for animal is contained in the essence of man. If, therefore the essence of the predicate and subject be known to all, the proposition will be self-evident to all; as is clear with regard to the first principles of demonstration, the terms of which are common things that no one is ignorant of, such as being and non-being, whole and part, and such like. If, however, there are some to whom the essence of the predicate and subject is unknown, the proposition will be self-evident in itself, but not to those who do not know the meaning of the predicate and subject of the proposition. Therefore, it happens, as Boethius says (*Hebdom., the title of which is: "Whether all that is, is good"*), "that there are some mental concepts self-evident only to the learned, as that incorporeal substances are not in space." Therefore I say that this proposition, "God exists," of itself is self-evident, for the predicate is the same as the subject; because God is His own existence as will be hereafter shown (Q. 3, A. 4). Now because we do not know the essence of God, the proposition is not self-evident to us; but needs to be demonstrated by things that are more known to us, though less known in their nature—namely, by effects.

Reply Obj. 1. To know that God exists in a general and confused way is implanted in us by nature, inasmuch as God is man's beatitude. For man naturally desires happiness, and what is naturally desired by man must be naturally known to him. This, however, is not to know absolutely that God exists; just as to know that someone is approaching is not the same as to know that Peter is approaching, even though it is Peter who is approaching; for many there are who imagine that man's perfect good which is happiness, consists in riches, and others in pleasures, and others in something else.

Reply Obj. 2. Perhaps not everyone who hears this word "God" understands it to signify something than which nothing greater can be thought, seeing that some have believed God to be a body. Yet, granted that everyone understands that by this word "God" is signified something than which nothing greater can be thought, nevertheless, it does not therefore follow that he understands that what the word signifies exists actually, but only that it exists mentally. Nor can it be argued that it actually exists, unless it be admitted that there actually exists something than which nothing greater can be thought; and this precisely is not admitted by those who hold that God does not exist.

Reply Obj. 3. The existence of truth in general is self-evident but the existence of a Primal Truth is not self-evident to us.

Second Article

WHETHER IT CAN BE DEMONSTRATED THAT GOD EXISTS?

We Proceed Thus to the Second Article:—

Objection 1. It seems that the existence of God cannot be demonstrated. For it is an article of faith that God exists. But what is of faith cannot be demonstrated, because a demonstration produces scientific knowledge; whereas faith is of the unseen (Heb. xi. 1). Therefore it cannot be demonstrated that God exists.

Obj.2. Further, the essence is the middle term of demonstration. But we cannot know in what God's essence consists, but solely in what it does not consist; as Damascene says (*De Fid. Orth.* i. 4). Therefore we cannot demonstrate that God exists.

Obj.3. Further, if the existence of God were demonstrated, this could only be from His effects. But His effects are not proportionate to Him, since He is infinite and His effects are finite; and between the finite and infinite there is no proportion. Therefore, since a cause cannot be demonstrated by an effect not proportionate to it, it seems that the existence of God cannot be demonstrated.

On the contrary, The Apostle says: *The invisible things of Him are clearly seen, being understood by the things that are made* (Rom. i. 20). But this would not be unless the existence of God could be demonstrated through the things that are made; for the first thing we must know of anything is, whether it exists.

I answer that, Demonstration can be made in two ways: One is through the cause, and is called *a priori*, and this is to argue from what is prior absolutely. The other is through the effect, and is called a demonstration *a posteriori*; this is to argue from what is prior relatively only to us. When an effect is better known to us than its cause, from the effect we proceed to the knowledge of the cause. And from every effect the existence of its proper cause can be demonstrated, so long as its effects are better known to us; because since every effect depends upon its cause, if the effect exists, the cause must pre-exist. Hence the existence of God, in so far as it is not self-evident to us, can be demonstrated from those of His effects which are known to us.

Reply Obj. 1. The existence of God and other like truths about God, which can be known by natural reason, are not articles of faith, but are preambles to the articles; for faith presupposes natural knowledge, even as grace presupposes nature, and perfection supposes something that can be perfected. Nevertheless, there is nothing to prevent a man, who cannot grasp a proof, accepting, as a matter of faith, something which in itself is capable of being scientifically known and demonstrated.

Reply Obj. 2. When the existence of a cause is demonstrated from an effect, this effect takes the place of the definition of the cause in proof of the cause's existence. This is especially the case in regard to God, because, in order to prove the existence of anything, it is necessary to accept as a middle term the meaning of the word, and not its essence, for the question of its essence follows on the question of its existence. Now the names given to God are derived from His effects; consequently, in demonstrating the existence of God from His effects, we may take for the middle term the meaning of the word "God."

Reply Obj. 3. From effects not proportionate to the cause no perfect knowledge of that cause can be obtained. Yet from every effect the existence of the cause can be clearly demonstrated, and so we can demonstrate the existence of God from His effects; though from them we cannot perfectly know God as He is in His essence.

Third Article

WHETHER GOD EXISTS?

We Proceed Thus to the Third Article:—

Objection 1. It seems that God does not exist; because if one of two contraries be infinite, the other would be altogether destroyed. But the word “God” means that He is infinite goodness. If, therefore, God existed, there would be no evil discoverable; but there is evil in the world. Therefore God does not exist.

Obj. 2. Further, it is superfluous to suppose that what can be accounted for by a few principles has been produced by many. But it seems that everything we see in the world can be accounted for by other principles, supposing God did not exist. For all natural things can be reduced to one principle, which is nature; and all voluntary things can be reduced to one principle, which is human reason, or will. Therefore there is no need to suppose God’s existence.

On the contrary, It is said in the person of God: *I am Who am* (Exod. iii. 14).

I answer that, The existence of God can be proved in five ways.

The first and more manifest way is the argument from motion. It is certain, and evident to our senses, that in the world some things are in motion. Now whatever is in motion is put in motion by another, for nothing can be in motion except it is in potentiality to that towards which it is in motion; whereas a thing moves inasmuch as it is in act. For motion is nothing else than the reduction of something from potentiality to actuality. But nothing can be reduced from potentiality to actuality, except by something in a state of actuality. Thus that which is actually hot, as fire, makes wood, which is potentially hot, to be actually hot, and thereby moves and changes it. Now it is not possible that the same thing should be at once in actuality and potentiality in the same respect, but only in different respects. For what is actually hot cannot simultaneously be potentially hot; but it is simultaneously potentially cold. It is therefore impossible that in the same respect and in the same way a thing should be both mover and moved, *i.e.*, that it should move itself. Therefore, whatever is in motion must be put in motion by another. If that by which it is put in motion be itself put in motion, then this also must needs be put in motion by another, and that by another again. But this cannot go on to infinity, because then there would be no first mover, and, consequently, no other mover; seeing that subsequent movers move only inasmuch as they are put in motion by the first mover; as the staff moves only because it is put in motion by the hand. Therefore it is necessary to arrive at a first mover, put in motion by no other; and this everyone understands to be God.

The second way is from the nature of the efficient cause. In the world of sense we find there is an order of efficient causes. There is no case known (neither is it, indeed, possible) in which a thing is found to be the efficient cause of itself; for so it would be prior to itself, which is impossible. Now in efficient causes it is not possible to go on to infinity, because in all efficient causes following in order, the first is the cause of the intermediate cause, and the intermediate is the cause of the ultimate cause, whether the intermediate cause be several, or one only. Now to take away the cause is to take away the effect. Therefore if there be no first cause among efficient causes, there will be no ultimate, nor any intermediate cause. But if in efficient causes it is possible to go on to infinity, there will be no first efficient cause, neither will there be an ultimate effect, nor any intermediate efficient causes; all of which is

plainly false. Therefore it is necessary to admit a first efficient cause, to which everyone gives the name of God.

The third way is taken from possibility and necessity, and runs thus. We find in nature things that are possible to be and not to be, since they are found to be generated, and to corrupt, and consequently, they are possible to be and not to be. But it is impossible for these always to exist, for that which is possible not to be at some time is not. Therefore, if everything is possible not to be, then at one time there could have been nothing in existence. Now if this were true, even now there would be nothing in existence, because that which does not exist only begins to exist by something already existing. Therefore, if at one time nothing was in existence, it would have been impossible for anything to have begun to exist; and thus even now nothing would be in existence—which is absurd. Therefore, not all beings are merely possible, but there must exist something the existence of which is necessary. But every necessary thing either has its necessity caused by another, or not. Now it is impossible to go on to infinity in necessary things which have their necessity caused by another, as has been already proved in regard to efficient causes. Therefore we cannot but postulate the existence of some being having of itself its own necessity, and not receiving it from another, but rather causing in others their necessity. This all men speak of as God.

The fourth way is taken from the gradation to be found in things. Among beings there are some more and some less good, true, noble, and the like. But “more” and “less” are predicated of different things, according as they resemble in their different ways something which is the maximum, as a thing is said to be hotter according as it more nearly resembles that which is hottest; so that there is something which is truest, something best, something noblest, and, consequently, something which is uttermost being; for those things that are greatest in truth are greatest in being, as it is written in *Metaph.* ii. Now the maximum in any genus is the cause of all in that genus; as fire, which is the maximum of heat, is the cause of all hot things. Therefore there must also be something which is to all beings the cause of their being, goodness, and every other perfection; and this we call God.

The fifth way is taken from the governance of the world. We see that things which lack intelligence, such as natural bodies, act for an end, and this is evident from their acting always, or nearly always, in the same way, so as to obtain the best result. Hence it is plain that not fortuitously, but designedly, do they achieve their end. Now whatever lacks intelligence cannot move towards an end, unless it be directed by some being endowed with knowledge and intelligence; as the arrow is shot to its mark by the archer. Therefore some intelligent being exists by whom all natural things are directed to their end; and this being we call God.

Reply Obj. 1. As Augustine says (*Enchir.* xi): *Since God is the highest good, He would not allow any evil to exist in His works, unless His omnipotence and goodness were such as to bring good even out of evil.* This is part of the infinite goodness of God, that He should allow evil to exist, and out of it produce good.

Reply Obj. 2. Since nature works for a determinate end under the direction of a higher agent, whatever is done by nature must needs be traced back to God, as to its first cause. So also whatever is done voluntarily must also be traced back to some higher cause other than human reason or will, since these can change and fail; for all things that are changeable and capable of defect must be traced back to an immovable and self-necessary first principle, as was shown in the body of the *Article*.

TREATISE ON MAN

**QUESTION 75: OF MAN WHO IS COMPOSED
OF A SPIRITUAL AND A CORPOREAL
SUBSTANCE: AND IN THE FIRST PLACE
CONCERNING WHAT BELONGS TO THE
ESSENCE OF THE SOUL**

* * *

Second Article

WHETHER THE HUMAN SOUL IS SOMETHING SUBSISTENT?

We Proceed Thus to the Second Article:—

Objection 1. It would seem that the human soul is not something subsistent. For that which subsists is said to be *this particular thing*. Now *this particular thing* is said not of the soul, but of that which is composed of soul and body. Therefore the soul is not something subsistent.

Obj. 2. Further, everything subsistent operates. But the soul does not operate; for, as the Philosopher says (*De Anima* i. 4), *to say that the soul feels or understands is like saying that the soul weaves or builds*. Therefore the soul is not subsistent.

Obj. 3. Further, if the soul were subsistent, it would have some operation apart from the body. But it has no operation apart from the body, not even that of understanding: for the act of understanding does not take place without a phantasm, which cannot exist apart from the body. Therefore the human soul is not something subsistent.

On the contrary, Augustine says (*de Trin.* x. 7): *Whoever understands that the nature of the soul is that of a substance and not that of a body, will see that those who maintain the corporeal nature of the soul, are led astray through associating with the soul those things without which they are unable to think of any nature—i.e., imaginary pictures of the corporal things*. Therefore the nature of the human intellect is not only incorporeal, but it is also a substance, that is, something subsistent.

I answer that, It must necessarily be allowed that the principle of intellectual operation which we call the soul, is a principle both incorporeal and subsistent. For it is clear that by means of the intellect man can have knowledge of all corporeal things. Now whatever knows certain things cannot have any of them in its own nature; because that which is in it naturally would impede the knowledge of anything else. Thus we observe that a sick man's tongue being vitiated by a feverish and bitter humor, is insensible to anything sweet and everything seems bitter to it. Therefore if the intellectual principle contained the nature of a body it would be unable to know all bodies. Now every body has its own determinate nature. Therefore it is impossible for the intellectual principle to be a body. It is likewise impossible for it to understand by means of a bodily organ; since the determinate nature of that organ would impede knowledge of all bodies; as when a certain determinate color is not only in the pupil of the eye, but also in a glass vase, the liquid in the vase seems to be of that same color.

Therefore the intellectual principle which we call the mind or the intellect has the operation *per se* apart from the body. Now only that which subsists can have an operation *per se*. For nothing can operate but what is actual: wherefore a thing operates according as it is; for which reason we do not say that heat imparts heat, but that what is hot gives heat. We must conclude, therefore, that the human soul, which is called the intellect or the mind, is something incorporeal and subsistent.

Reply Obj. 1. *This particular thing* can be taken in two senses. Firstly, for anything subsistent; secondly, for that which subsists, and is complete in a specific nature. The former sense excludes the inherence of an accident or of a material form; the latter excludes also the imperfection of the part, so that a hand can be called *this particular thing* in the first sense, but not in the second. Therefore as the human soul is a part of human nature, it can indeed be called *this particular thing*, in the first sense, as being something subsistent; but not in the second, for in this sense, what is composed of body and soul is said to be *this particular thing*.

Reply Obj. 2. Aristotle wrote those words as expressing not his own opinion, but the opinion of those who said that to understand is to be moved, as is clear from the context. Or we may reply that to operate *per se* belongs to what exists *per se*. But for a thing to exist *per se*, it suffices sometimes that it be not inherent, as an accident or a material form; even though it be part of something. Nevertheless, that is rightly said to subsist *per se*, which is neither inherent in the above sense nor part of anything else. In this sense, the eye or the hand cannot be said to subsist *per se*; nor can it for that reason be said to operate *per se*. Hence the operation of the parts is through each part attributed to the whole. For we say that the man sees with the eye, and feels with the hand and, and not in the same sense as when we say that what is hot gives heat by its heat; for heat, strictly speaking, does not give heat. We may therefore say that the soul understands, as the eye sees; but it is more correct to say that man understands through the soul.

Reply Obj. 3. The body is necessary for intellect, not as its origin of action, but on the part of the object; for the phantasm is to the intellect what color is to the sight. Neither does such a dependence on the body prove the intellect to be non-subsistent; otherwise it would follow that an animal is not subsistent, since it requires external objects of the senses in order to perform its act of perception.

* * *

QUESTION 76: OF THE UNION OF BODY AND SOUL

* * *

First Article

WHETHER THE INTELLECTUAL PRINCIPLE IS UNITED TO THE BODY AS ITS FORM?

We Proceed Thus to the First Article:—

Objection 1. It seems that the intellectual principle is not united to the body as its form. For the Philosopher says (*De Anima* iii. 4) that “the intellect is separate,” and that it is not the act of any body. Therefore it is not united to the body as its form.

Obj. 2. Further, every form is determined according to the nature of the matter of which it is the form; otherwise no proportion would be required between matter and form. Therefore if the intellect were united to the body as its form since every body has a determinate nature it would follow that the intellect has a determinate nature; and thus, it would not be capable of knowing all things, as is clear from what has been said (Q. 75, A. 2), which is contrary to the notion of intellect. Therefore the intellect is not united to the body as its form.

Obj. 3. Further, whatever receptive power is an act of a body receives a form materially and individually; for what is received must be received according to the mode of the receiver. But the form of the thing understood is not received into the intellect materially and individually, but rather immaterially and universally; otherwise the intellect would not be capable of the knowledge of immaterial and universal objects, but only of individuals, like the senses. Therefore the intellect is not united to the body as its form.

Obj. 4. Further, power and action have the same subject; for the same subject is what can, and does, act. But the intellectual action is not the action of a body, as appears from above (Q. 75, A. 2). Therefore neither is the intellectual power a power of the body. But virtue or power cannot be more abstract or more simple than the essence from which the virtue or power is derived. Therefore neither is the substance of the intellect the form of a body.

Obj. 5. Further, whatever has *per se* being is not united to the body as its form, because a form is that by which a thing is, so that the very being of a form does not belong to the form by itself. But the intellectual principle has *per se* being and is subsistent, as was said above (Q. 75, A. 2). Therefore it is not united to the body as its form.

Obj. 6. Further, whatever exists in a thing by reason of its nature exists in it always. But to be united to matter belongs to the form by reason of its nature. For form is the act of matter not by any accidental quality, but by its own essence; otherwise matter and form would not make a thing substantially one, but only accidentally one. Therefore a form cannot be without its own proper matter. But the intellectual principle, since it is incorruptible, as was shown above (Q. 75, A. 6), remains separate from the body after the dissolution of the body. Therefore the intellectual principle is not united to the body as its form.

On the contrary, According to the Philosopher (*Metaph.* vii. 2), difference is derived from the form. But the difference which constitutes man is *rational* which is applied to man on account of his intellectual principle. Therefore the intellectual principle is the form of man.

Answer that, We must assert that the intellect which is the principle of intellectual operation is the form of the human body. For that whereby primarily anything acts is a form of the thing to which the act is to be attributed; for instance, that whereby a body is primarily healed is health and that whereby the soul knows primarily is knowledge; hence health is a form of the body, and knowledge is a form of the soul. The reason is because nothing acts except so far as it is in act; hence a thing acts by that whereby it is in act. Now it is clear that the first thing by which the body lives is the soul. And as life appears through various operations in different degrees of living things, that whereby we primarily perform each of all these vital actions is the soul. For the soul is the primary principle of our nourishment, sensation, and local movement; and likewise of our understanding. Therefore this principle by which we primarily understand, whether it be called the intellect or the intellectual soul, is the form of the body. This is the demonstration used by Aristotle (*De Anima* ii. 2).

But if anyone say that the intellectual soul is not the form of the body he must first explain how it is that this action of understanding is the action of this particular man; for each one is conscious that it is himself who understands. Now an action may be attributed to anyone in three ways, as is clear from the Philosopher. "For a thing is said to move or act either by virtue of its whole self, for instance, as a physician heals; or by virtue of a part, as a man sees by his eye; or through an accidental quality, as when we say that something that is white build, because it is accidental to the builder to be white" (*Phys.* v. 1) So when we say that Socrates or Plato understands, it is clear that this is not attributed to him accidentally, since it is ascribed to him as man, which is predicated of him essentially. We must therefore say either that Socrates understands by virtue of his whole self, as Plato maintained, holding that man is an intellectual soul, or that the intellect is a part of Socrates. The first cannot stand, as was shown above (Q. 75, A. 4), for this reason, that it is one and the same man who is conscious both that he understands, and that he senses. But one cannot sense without a body; therefore the body must be some part of man. It remains therefore that the intellect by which Socrates understands is a part of Socrates, so that in some way it is united to the body of Socrates.

The Commentator [Averroës] held that this union is through the intelligible species, as having a double subject: in the possible intellect, and in the phantasms which are in the corporeal organs (*De Anima* iii, Comm. 5). Thus through the intelligible species the possible intellect is linked to the body of this or that particular man. But this link or union does not sufficiently explain the fact that the act of the intellect is the act of Socrates. This can be clearly seen from comparison with the sensitive power, from which Aristotle proceeds to consider things relating to the intellect. For the relation of phantasms to the intellect is like the relation of colours to the sense of sight, as he says in the book on the *Soul* (iii. 7). Therefore, as the species of colours are in the sight, so are the species of phantasms in the possible-intellect. Now it is clear that because the colours, the likenesses of which are in the sight, are on a wall, the action of seeing is not attributed to the wall, for we do not say that the wall sees, but rather that it is seen. Therefore, from the fact that the species of phantasms are in the possible intellect it does not follow that Socrates, in whom are the phantasms, understands, but that he or his phantasms are understood.

Some, however, tried to maintain that the intellect is united to the body as its mover, and hence that the intellect and body form one thing so that the act of the intellect could be attributed to the whole. This is groundless however, for many reasons. First, because the intellect does not move the body except through desire, the movement of which presupposes the operation of the intellect. The reason therefore why Socrates understands is not because he is moved by his intellect, but rather, contrariwise, he is moved by his intellect because he understands. Secondly, because, since Socrates is an individual in a nature of one essence composed of matter and form, if the intellect be not the form, it follows that it must be outside the essence, and then the intellect is to the whole Socrates as a mover to the thing moved. The act of intellect however remains in the agent, and does not pass into something else, as does the action of heating. Therefore the act of understanding cannot be attributed to Socrates for the reason that he is moved by his intellect. Thirdly, because the action of a mover is never attributed to the thing moved, except as to an instrument; as the action of a carpenter to a saw. Therefore if understanding is attributed to Socrates, as the action of what moves him, it follows that it is attributed to him as to an instrument. This is contrary to the teaching of the Philosopher, who holds that understanding is not possible through a corporeal instrument (*De Anima* iii. 4). Fourthly, because, although the action of a part

The Gothic Cathedral

a. *The Cathedral of Notre Dame de Chartres*, Chartres, France, begun in the 1140s. The word “Gothic” was originally a perjorative term coined by Renaissance thinkers who considered this style to be a barbaric break from classical tradition. The two towers shown here, for example, are not symmetrical. Even though the overall design of the cathedral may not be symmetrical, each of its elements was designed to reflect the harmony and beauty of God’s creation. (©LatitudeStock/Alamy Stock Photo)

b. *Interior, Chartres Cathedral*. By using pointed arches, it was possible to make soaring open spaces in the nave (main sanctuary) of the Gothic cathedral. The weight was shifted downward instead of outward. (©PATRICK KOVARIC/Getty)

c. *Flying Buttresses at Reims Cathedral*, ca. 1230–1235, by Villard De Honnecourt. To leave the interior unencumbered, the remaining outward stresses were often buttressed from outside the building. In some cathedrals exterior buttresses could not be built directly along the outside walls because of side aisles. Instead they were built outside the side aisles and connected to the pillars of the nave by stone ribs. These supporting ribs appear to “fly” over the side aisles. (©Scala/Art Resource, NY)

d. *The Rose Window*, Notre Dame Cathedral, Paris, thirteenth century. By using pointed arches and flying buttresses, the walls of a cathedral did not have to bear the weight of the roof. Instead they could be used as screens for stained glass ornamentation such as this. (©Bridgeman-Giraudon/Art Resource, NY)

be attributed to the whole, as the action of the eye is attributed to a man, yet it is never attributed to another part, except perhaps accidentally; for we do not say that the hand sees because the eye sees. Therefore if the intellect and Socrates are united in the above manner, the action of the intellect cannot be attributed to Socrates. If, however, Socrates be a whole composed of a union of the intellect with whatever else belongs to Socrates, while nevertheless the intellect is united to those other things only as a mover, it follows that Socrates is not one absolutely, and consequently neither a being absolutely, for a thing is a being according as it is one.

There remains, therefore, no other explanation than that given by Aristotle (*De Anima* ii. 2)—namely, that this particular man understands because the intellectual principle is his form. Thus from the very operation of the intellect it is made clear that the intellectual principle is united to the body as its form.

The same can be clearly shown from the nature of the human species. For the nature of each thing is shown by its operation. Now the proper operation of man as man is to understand, because he thereby surpasses all other animals. From this, too, Aristotle concludes (*Ethic.* x. 7) that the ultimate happiness of man must consist in this operation as properly belonging to him. Man must therefore derive his species from that which is the principle of this operation. But the species of anything is derived from its form. It follows therefore that the intellectual principle is the proper form of man.

But we must observe that the nobler a form is, the more it rises above corporeal matter, the less it is merged in matter, and the more it excels matter by its power and its operation; hence we find that the form of a mixed body has another operation not caused by its elemental qualities. And the higher we advance in the nobility of forms, the more we find that the power of the form excels the elementary matter; as the vegetative soul excels the form of the metal, and the sensitive soul excels the vegetative soul. Now the human soul is the highest and noblest of forms. Therefore it excels corporeal matter in its power by the fact that it has an operation and a power in which corporeal matter has no share whatever. This power is called the intellect.

It is well to remark that if anyone holds that the soul is composed of matter and form, it would follow that in no way could the soul be the form of the body. For since the form is an act, and matter is only a being in potency, that which is composed of matter and form cannot be the form of another by virtue of itself as a whole. But if it is a form by virtue of some part of itself, then that part which is the form we call the soul, and that of which it is the form we call the first thing animated, as was said above (Q. 75, A. 5).

Reply Obj. 1. As the Philosopher Says (*Phys.* ii. 2), the ultimate natural form to which the consideration of the natural philosopher is directed, namely, the human soul, is indeed separate; yet it exists in matter. He proves this from the fact that "man and the sun generate man from matter." It is separate indeed according to its intellectual power, because the intellectual power does not belong to a corporeal organ, as the power of seeing is the act of the eye; for understanding is an act which cannot be performed by a corporeal organ, like the act of seeing. But it exists in matter so far as the soul itself, to which this power belongs, is the form of the body, and the term of human generation. And so the Philosopher says (*De Anima* ii. 2) that "the intellect is separate" because it is not the power of a corporeal organ.

From this it is clear how to answer the *Second and Third objections*. For, in order that man may be able to understand all things by means of his intellect, and that his intellect may understand all things immaterial and universal, it is sufficient that the intellectual power be not the act of the body.

Reply Obj. 4. The human soul, by reason of its perfection, is not a form merged in matter, or entirely embraced by matter. Therefore there is nothing to prevent one of its powers not being the act of the body, although the soul is essentially the form of the body.

Reply Obj. 5. The soul communicates that being in which it subsists to the corporeal matter, out of which, combined with the intellectual soul, there results unity of being so that the being of the whole composite is also the being of the soul. This is not the case with other nonsubsistent forms. For this reason the human soul retains its own being after the dissolution of the body, though this is not so with other forms.

Reply Obj. 6. To be united to the body pertains to the soul by reason of itself, as it pertains to a light body by reason of itself to be raised up. And as a light body remains light when removed from its proper place, retaining meanwhile an aptitude and an inclination for its proper place, so the human soul retains its proper being when separated from the body, having an aptitude and a natural inclination to be united to the body.

FIRST PART OF THE SECOND PART(I–II)

TREATISE ON HUMAN ACTS

* * *

QUESTION 2: OF THOSE THINGS IN WHICH MAN 'S HAPPINESS CONSISTS

* * *

Eighth Article

WHETHER ANY CREATED GOOD CONSTITUTES MAN'S HAPPINESS?

We Proceed Thus to the Eighth Article:—

Objection 1. It would seem that some created good constitutes man's happiness. For Dionysius says (*Div. Nom.* vii) that Divine wisdom *unites the ends of first things to the beginnings of second things*, from which we may gather that the summit of a lower nature touches the base of the higher nature. But man's highest good is happiness. Since then the angel is above man in the order of nature, as stated in the First Part (Q. 111, A. 1), it seems that man's happiness consists in man somehow reaching the angel.

Obj. 2. Further, the last end of each thing is that which, in relation to it, is perfect: hence the part is for the whole, as for its end. But the universe of creatures which is called the macrocosm, is compared to man who is called the microcosm (*Phys.* viii. 2), as perfect to imperfect. Therefore man's happiness consists in the whole universe of creatures.

Obj. 3. Further, man is made happy by that which lulls his natural desire. But man's natural desire does not reach out to a good surpassing his capacity. Since then man's capacity does not include that good which surpasses the limits of all creation, it seems that man can be made happy by some created good. Consequently some created good constitutes man's happiness.

On the contrary, Augustine says (*De Civ. Dei* xix. 26): *As the soul is the life of the body, so God is man's life of happiness: of Whom it is written: "Happy is that people whose God is the Lord"* (Ps. cxliii. 15).

I answer that, It is impossible for any created good to constitute man's happiness. For happiness is the perfect good, which lulls the appetite altogether; else it would not be the last end, if something yet remained to be desired. Now the object of the will, *i.e.*, of man's appetite, is the universal good; just as the object of the intellect is the universal true. Hence it is evident that naught can lull man's will, save the universal good. This is to be found, not in any creature, but in God alone; because every creature has goodness by participation. Wherefore God alone can satisfy the will of man, according to the words of Ps. cii. 5: *Who satisfieth thy desire with good things.* Therefore God alone constitutes man's happiness.

Reply Obj. 1. The summit of man does indeed touch the base of the angelic nature, by a kind of likeness; but man does not rest there as in his last end, but reaches out to the universal fount itself of good, which is the common object of happiness of all the blessed, as being the infinite and perfect good.

Reply Obj. 2. If a whole be not the last end, but ordained to a further end, then the last end of a part thereof is not the whole itself, but something else. Now the universe of creatures, to which man is compared as part to whole, is not the last end, but is ordained to God, as to its last end. Therefore the last end of man is not the good of the universe, but God himself.

Reply Obj. 3. Created good is not less than that good of which man is capable, as of something intrinsic and inherent to him: but it is less than the good of which he is capable, as of an object, and which is infinite. And the participated good which is in an angel, and in the whole universe, is a finite and restricted good.

* * *

QUESTION 3: WHAT IS HAPPINESS?

* * *

Fourth Article

WHETHER, IF HAPPINESS IS IN THE INTELLECTIVE PART, IT IS AN OPERATION OF THE INTELLECT OR OF THE WILL?

We Proceed Thus to the Fourth Article:—

Objection 1. It would seem that happiness consists in an act of the will. For Augustine says (*De Civ. Dei* xix. 10, 11), that man's happiness consists in peace; wherefore it is written (Ps. cxlvii. 3): *Who hath placed peace in thy end.* But peace pertains to the will. Therefore man's happiness is in the will.

Obj. 2. Further, happiness is the supreme good. But good is the object of the will. Therefore happiness consists in an operation of the will.

Obj. 3. Further, the last end corresponds to the first mover: thus the last end of the whole army is victory, which is the end of the general, who moves all the men. But the first mover in regard to operations is the will: because it moves the other powers, as we shall state further on (Q. 9, AA. 1, 3). Therefore happiness regards the will.

Obj. 4. Further, if happiness be an operation, it must needs be man's most excellent operation. But the love of God, which is an act of the will, is a more excellent operation than knowledge, which is an operation of the intellect, as the Apostle declares (1 Cor. xiii). Therefore it seems that happiness consists in an act of the will.

Obj. 5. Further, Augustine says (*De Trin.* xiii. 5) that *happy is he who has whatever he desires, and desires nothing amiss*. And a little further on (6) he adds: *He is almost happy who desires well, whatever he desires: for good things make a man happy, and such a man already possesses some good—i.e., a good will*. Therefore happiness consists in an act of the will.

On the contrary, Our Lord said (Jo. xvii. 3): *This is eternal life: that they may know Thee, the only true God*. Now eternal life is the last end, as stated above (A. 2 ad 1). Therefore man's happiness consists in the knowledge of God, which is an act of the intellect.

I answer that, As stated above (Q. 2, A. 6) two things are needed for happiness: one, which is the essence of happiness: the other, that is, as it were, its proper accident, *i.e.*, the delight connected with it. I say, then, that as to the very essence of happiness, it is impossible for it to consist in an act of the will. For it is evident from what has been said (AA. 1, 2; Q. 2, A. 7) that happiness is the attainment of the last end. But the attainment of the end does not consist in the very act of the will. For the will is directed to the end, both absent, when it desires it; and present, when it is delighted by resting therein. Now it is evident that the desire itself of the end is not the attainment of the end, but is a movement towards the end: while delight comes to the will from the end being present; and not conversely, is a thing made present, by the fact that the will delights in it. Therefore, that the end be present to him who desires it, must be due to something else than an act of the will.

This is evidently the case in regard to sensible ends. For if the acquisition of money were through an act of the will, the covetous man would have it from the very moment that he wished for it. But at that moment it is far from him; and he attains it, by grasping it in his hand, or in some like manner; and then he delights in the money got. And so it is with an intelligible end. For at first we desire to attain an intelligible end; we attain it, through its being made present to us by an act of the intellect; and then the delighted will rests in the end when attained.

So, therefore, the essence of happiness consists in an act of the intellect: but the delight that results from happiness pertains to the will. In this sense Augustine says (*Conf.* x. 23) that happiness is *joy in truth*, because, to wit, joy itself is the consummation of happiness.

Reply Obj. 1. Peace pertains to man's last end, not as though it were the very essence of happiness; but because it is antecedent and consequent thereto: antecedent, in so far as all those things are removed which disturb and hinder man in attaining the last end: consequent, inasmuch as, when man has attained his last end, he remains at peace, his desire being at rest.

Reply Obj. 2. The will's first object is not its act: just as neither is the first object of the sight, vision, but a visible thing. Wherefore, from the very fact that happiness belongs to the will, as the will's first object, it follows that it does not belong to it as its act.

Reply Obj. 3. The intellect apprehends the end before the will does: yet motion towards the end begins in the will. And therefore to the will belongs that which last of all follows the attainment of the end, viz., delight or enjoyment.

Reply Obj. 4. Love ranks above knowledge in moving, but knowledge precedes love in attaining: *for naught is loved save what is known*, as Augustine says (*De Trin.* x. 1). Consequently we first attain an intelligible end by an act of the intellect; just as we first attain a sensible end by an act of sense.

Reply Obj. 5. He who has whatever he desires, is happy, because he has what he desires: and this indeed is by something other than the act of his will. But to desire nothing amiss is needed for happiness, as a necessary disposition thereto. And a good will is reckoned among the good things which make a man happy, forasmuch as it is an inclination of the will: just as a movement is reduced to the genus of its terminus, for instance, *alteration* to the genus *quality*.

Eighth Article

WHETHER MAN'S HAPPINESS CONSISTS IN THE VISION OF THE DIVINE ESSENCE?

We Proceed Thus to the Eighth Article:—

Objection 1. It would seem that man's happiness does not consist in the vision of the Divine Essence. For Dionysius says (*Myst. Theol.* i) that by that which is highest in his intellect, man is united to God as to something altogether unknown. But that which is seen in its essence is not altogether unknown. Therefore the final perfection of the intellect, namely, happiness, does not consist in God being seen in His Essence.

Obj. 2. Further, the higher perfection belongs to the higher nature. But to see His own Essence is the perfection proper to the Divine intellect. Therefore the final perfection of the human intellect does not reach to this, but consists in something less.

On the contrary, It is written (1 Jo. iii. 2): *When He shall appear, we shall be like to Him; and we shall see Him as He is.*

I answer that, Final and perfect happiness can consist in nothing else than the vision of the Divine Essence. To make this clear, two points must be observed. First, that man is not perfectly happy, so long as something remains for him to desire and seek: secondly, that the perfection of any power is determined by the nature of its object. Now the object of the intellect is *what a thing is*, i.e., the essence of a thing, according to *De Anima* iii. 6. Wherefore the intellect attains perfection, in so far as it knows the essence of a thing. If therefore an intellect know the essence of some effect, whereby it is not possible to know the essence of the cause, i.e. to know of the cause *what it is*; that intellect cannot be said to reach that cause simply, although it may be able to gather from the effect the knowledge that the cause is. Consequently, when man knows an effect, and knows that it has a cause, there naturally remains in man the desire to know about that cause, *what it is*. And this desire is one of wonder, and causes inquiry, as is stated in the beginning of the *Metaphysics* (i. 2). For instance, if a man, knowing the eclipse of the sun, consider that it must be due to some cause, and know not what that cause is, he wonders about it, and from wondering proceeds to inquire. Nor does this inquiry cease until he arrive at a knowledge of the essence of the cause.

If therefore the human intellect, knowing the essence of some created effect, knows no more of God than *that He is*; the perfection of that intellect does not yet reach simply the First Cause, but there remains in it the natural desire to seek the cause.

Wherefore it is not yet perfectly happy. Consequently, for perfect happiness the intellect needs to reach the very Essence of the First Cause. And thus it will have its perfection through union with God as with that object, in which alone man's happiness consists, as stated above (AA. 1, 7; Q. 2, A. 8).

Reply Obj. 1. Dionysius speaks of the knowledge of wayfarers journeying towards happiness.

Reply Obj. 2. As stated above (Q. 1, A. 8), the end has a twofold acceptance. First, as to the thing itself which is desired: and in this way, the same thing is the end of the higher and of the lower nature, and indeed of all things, as stated above (*ibid.*). Secondly, as to the attainment of this thing; and thus the end of the higher nature is different from that of the lower, according to their respective habitudes to that thing. So then the happiness of God, Who, in understanding his Essence, comprehends It, is higher than that of a man or angel who sees It indeed, but comprehends It not.

* * *

QUESTION 5: OF THE ATTAINMENT OF HAPPINESS

* * *

Fifth Article

WHETHER MAN CAN ATTAIN HAPPINESS BY HIS NATURAL POWERS?

We Proceed Thus to the Fifth Article:—

Objection 1. It would seem that man can attain Happiness by his natural powers. For nature does not fail in necessary things. But nothing is so necessary to man as that by which he attains the last end. Therefore this is not lacking to human nature. Therefore man can attain Happiness by his natural powers.

Obj. 2. Further, since man is more noble than irrational creatures, it seems that he must be better equipped than they. But irrational creatures can attain their end by their natural powers. Much more therefore can man attain Happiness by his natural powers.

Obj. 3. Further, Happiness is a *perfect operation*, according to the Philosopher (*Ethic.* vii. 13). Now the beginning of a thing belongs to the same principle as the perfecting thereof. Since, therefore, the imperfect operation, which is as the beginning in human operations, is subject to man's natural power, whereby he is master of his own actions; it seems that he can attain to perfect operation, *i.e.*, Happiness, by his natural powers.

On the contrary, Man is naturally the principle of his action, by his intellect and will. But final Happiness prepared for the saints, surpasses the intellect and will of man; for the Apostle says (1 Cor. ii. 9): *Eye hath not seen, nor ear heard, neither hath it entered into the heart of man, what things God hath prepared for them that love Him.* Therefore man cannot attain Happiness by his natural powers.

I answer that, Imperfect happiness that can be had in this life, can be acquired by man by his natural powers, in the same way as virtue, in whose operation it consists: on this point we shall speak further on (Q. 63). But man's perfect Happiness, as stated above (Q. 3, A. 8), consists in the vision of the Divine Essence. Now the vision of God's Essence surpasses the

nature not only of man, but also of every creature, as was shown in the First Part (Q. 12, A. 4). For the natural knowledge of every creature is in keeping with the mode of his substance: thus it is said of the intelligence (*De Causis*; Prop. viii.) that *it knows things that are above it, and things that are below it, according to the mode of its substance*. But every knowledge that is according to the mode of created substance, falls short of the vision of the Divine Essence, which infinitely surpasses all created substance. Consequently neither man, nor any creature, can attain final Happiness by his natural powers.

Reply Obj. 1. Just as nature does not fail man in necessities, although it has not provided him with weapons and clothing, as it provided other animals, because it gave him reason and hands, with which he is able to get these things for himself; so neither did it fail man in things necessary, although it gave him not the wherewithal to attain Happiness: since this it could not do. But it did give him freewill, with which he can turn to God, that He may make him happy. *For what we do by means of our friends, is done, in a sense, by ourselves* (*Ethic.* iii. 3).

Reply Obj. 2. The nature that can attain perfect good, although it needs help from without in order to attain it, is of more noble condition than a nature which cannot attain perfect good, but attains some imperfect good, although it need no help from without in order to attain it, as the Philosopher says (*De Caelo* ii. 12). Thus he is better disposed to health who can attain perfect health, albeit by means of medicine, than he who can attain but imperfect health, without the help of medicine. And therefore the rational creature, which can attain the perfect good of happiness, but needs the Divine assistance for the purpose, is more perfect than the irrational creature, which is not capable of attaining this good, but attains some imperfect good by its natural powers.

Reply Obj. 3. When imperfect and perfect are of the same species, they can be caused by the same power. But this does not follow of necessity, if they be of different species: for not everything, that can cause the disposition of matter, can produce the final perfection. Now the imperfect operation, which is subject to man's natural power, is not of the same species as that perfect operation which is man's happiness: since operation takes its species from its object. Consequently the argument does not prove.

* * *

TREATISE ON LAW

QUESTION 94: OF THE NATURAL LAW

* * *

Second Article

WHETHER THE NATURAL LAW CONTAINS SEVERAL PRECEPTS, OR ONE ONLY?

We Proceed Thus to the Second Article:—

Objection 1. It would seem that the natural law contains, not several precepts, but one only. For law is a kind of precept, as stated above (Q. 92, A. 2). If therefore there were many precepts of the natural law, it would follow that there are also many natural laws.

Obj. 2. Further, the natural law is consequent to human nature. But human nature, as a whole, is one; though, as to its parts, it is manifold. Therefore, either there is but one precept of the law of nature, on account of the unity of nature as a whole; or there are many, by reason of the number of parts of human nature. The result would be that even things relating to the inclination of the concupiscible faculty belong to the natural law.

Obj. 3. Further, law is something pertaining to reason, as stated above (Q. 90, A. 1). Now reason is but one in man. Therefore there is only one precept of the natural law.

On the contrary, The precepts of the natural law in man stand in relation to practical matters, as the first principles to matters of demonstration. But there are several first indemonstrable principles. Therefore there are also several precepts of the natural law.

I answer that, As stated above (Q. 91, A. 3), the precepts of the natural law are to the practical reason, what the first principles of demonstrations are to the speculative reason; because both are self-evident principles. Now a thing is said to be self-evident in two ways: first, in itself; secondly, in relation to us. Any proposition is said to be self-evident in itself, its predicate is contained in the notion of the subject: although, to one who knows not the definition of the subject, it happens that such a proposition is not self-evident. For instance, this proposition, *Man is a rational being*, is, in its very nature, self-evident, since who says *man*, says *a rational being*: and yet to one who knows not what a man is, this proposition is not self-evident. Hence it is that, as Boethius says (*De Hebdom.*), certain axioms or propositions are universally self-evident to all; and such are those propositions whose terms are known to all, as, *Every whole is greater than its part*, and, *Things equal to one and the same are equal to one another*. But some propositions are self-evident only to the wise, who understand the meaning of the terms of such propositions: thus to one who understands that an angel is not a body, it is self-evident that an angel is not circumscriptively in a place: but this is not evident to the unlearned, for they cannot grasp it.

Now a certain order is to be found in those things that are apprehended universally. For that which, before aught else, falls under apprehension, is *being*, the notion of which is included in all things whatsoever a man apprehends. Wherefore the first indemonstrable principle is that *the same thing cannot be affirmed and denied at the same time*, which is based on the notion of being and not-being: and on this principle all others are based, as is stated in *Metaph.* iv, text. 9. Now as being is the first thing that falls under the apprehension simply, so *good* is the first thing that falls under the apprehension of the practical reason, which is directed to action: since every agent acts for an end under the aspect of good. Consequently the first principle in the practical reason is one founded on the notion of good, viz., that *good is to be done and pursued, and evil is to be avoided*. All other precepts of the natural law are based upon this: so that whatever the practical reason naturally apprehends as man's good (or evil) belongs to the precepts of the natural law as something to be done or avoided.

Since, however, good has the nature of an end, and evil, the nature of a contrary, hence it is that all those things to which man has a natural inclination, are naturally apprehended by reason as being good, and consequently as objects of pursuit, and their contraries as evil, and objects of avoidance. Wherefore according to the order of natural inclinations, is the order of the precepts of the natural law. Because in man there is first of all an inclination to good in accordance with the nature which he has in common with all substances: inasmuch as every substance seeks the preservation of its own being, according to its nature: and by reason of this inclination, whatever is a means of preserving human life, and of warding off its obstacles, belongs to the natural law.

Secondly, there is in man an inclination to things that pertain to him more specially, according to that nature which he has in common with other animals: and in virtue of this inclination, those things are said to belong to the natural law, *which nature has taught to all animals*, such as sexual intercourse, education of offspring and so forth. Thirdly, there is in man an inclination to good, according to the nature of his reason, which nature is proper to him: thus man has a natural inclination to know the truth about God, and to live in society: and in this respect, whatever pertains to this inclination belongs to the natural law; for instance, to shun ignorance, to avoid offending those among whom one has to live, and other such things regarding the above inclination.

Reply Obj. 1. All these precepts of the law of nature have the character of one natural law, inasmuch as they flow from one first precept.

Reply Obj. 2. All the inclinations of any parts whatsoever of human nature, *e.g.*, of the concupiscible and irascible parts, in so far as they are ruled by reason, belong to the natural law, and are reduced to one first precept, as stated above: so that the precepts of the natural law are many in themselves, but are based on one common foundation.

Reply Obj. 3. Although reason is one in itself, yet it directs all things regarding man; so that whatever can be ruled by reason, is contained under the law of reason.

* * *

Fourth Article

WHETHER THE NATURAL LAW IS THE SAME IN ALL MEN?

We Proceed Thus to the Fourth Article:—

Objection 1. It would seem that the natural law is not the same in all. For it is stated in the Decretals (*Dist. i*) that *the natural law is that which is contained in the Law and the Gospel*. But this is not common to all men; because, as it is written (Rom. x. 16), *all do not obey the gospel*. Therefore the natural law is not the same in all men.

Obj. 2. Further, *Things which are accordingly to the law are said to be just*, as stated in *Ethic. v*. But it is stated in the same book that nothing is so universally just as not to be subject to change in regard to some men. Therefore even the natural law is not the same in all men.

Obj. 3. Further, as stated above (AA. 2, 3), to the natural law belongs everything to which a man is inclined according to his nature. Now different men are naturally inclined to different things; some to the desire of pleasures, others to the desire of honors, and other men to other things. Therefore there is not one natural law for all.

On the contrary, Isidore says (*Etym. v. 4*): *The natural law is common to all nations*.

I answer that, As stated above (AA. 2, 3), to the natural law belongs those things to which a man is inclined naturally: and among these it is proper to man to be inclined to act according to reason. Now the process of reason is from the common to the proper, as stated in *Phys. i*. The speculative reason, however, is differently situated in this matter, from the practical reason. For, since the speculative reason is busied chiefly with necessary things, which cannot be otherwise than they are, its proper conclusions, like the universal principles, contain the truth without fail. The practical reason, on the other hand, is busied with contingent matters, about which human actions are concerned: and consequently, although there is necessity in the general principles, the more we descend

to matters of detail, the more frequently we encounter defects. Accordingly then in speculative matters truth is the same in all men, both as to principles and as to conclusions: although the truth is not known to all as regards the conclusions, but only as regards the principles which are called *common notions*. But in matters of action, truth or practical rectitude is not the same for all, as to matters of detail, but only as to the general principles: and where there is the same rectitude in matters of detail, it is not equally known to all.

It is therefore evident that, as regards the general principles whether of speculative or of practical reason, truth or rectitude is the same for all, and is equally known by all. As to the proper conclusions of the speculative reason, the truth is the same for all, but is not equally known to all: thus it is true for all that the three angles of a triangle are together equal to two right angles, although it is not known to all. But as to the proper conclusions of the practical reason, neither is the truth or rectitude the same for all, nor, where it is the same, is it equally known by all. Thus it is right and true for all to act according to reason: and from this principle it follows as a proper conclusion, that goods entrusted to another should be restored to their owner. Now this is true for the majority of cases: but it may happen in a particular case that it would be injurious, and therefore unreasonable, to restore goods held in trust; for instance if they are claimed for the purpose of fighting against one's country. And this principle will be found to fail the more, according as we descend further into detail, e.g., if one were to say that goods held in trust should be restored with such and such a guarantee, or in such and such a way; because the greater the number of conditions added, the greater the number of ways in which the principle may fail, so that it be not right to restore or not to restore.

Consequently we must say that the natural law, as to general principles, is the same for all, both as to rectitude and as to knowledge. But as to certain matters of detail, which are conclusions, as it were, of those general principles, it is the same for all in the majority of cases, both as to rectitude and as to knowledge; and yet in some few cases it may fail, both as to rectitude, by reason of certain obstacles (just as natures subject to generation and corruption fail in some few cases on account of some obstacle), and as to knowledge, since in some the reason is perverted by passion, or evil habit, or an evil disposition of nature; thus formerly, theft, although it is expressly contrary to the natural law, was not considered wrong among the Germans, as Julius Caesar relates (*De Bello Gall.* vi).

Reply Obj. 1. The meaning of the sentence quoted is not that whatever is contained in the Law and the Gospel belongs to the natural law, since they contain many things that are above nature; but that whatever belongs to the natural law is fully contained in them. Wherefore Gratian, after saying that *the natural law is what is contained in the Law and the Gospel*, adds at once, by way of example, *by which everyone is commanded to do to others as he would be done by*.

Reply Obj. 2. The saying of the Philosopher is to be understood of things that are naturally just, not as general principles, but as conclusions drawn from them, having rectitude in the majority of cases, but failing in a few.

Reply Obj. 3. As, in man, reason rules and commands the other powers, so all the natural inclinations belonging to the other powers must needs be directed according to reason. Wherefore it is universally right for all men, that all their inclinations should be directed according to reason.

QUESTION 95: OF HUMAN LAW

* * *

First Article

WHETHER IT WAS USEFUL FOR LAWS TO BE FRAMED BY MEN?

We Proceed Thus to the First Article:—

Objection 1. It would seem that it was not useful for laws to be framed by men. Because the purpose of every law is that man be made good thereby, as stated above (Q. 92, A. 1). But men are more to be induced to be good willingly by means of admonitions, than against their will, by means of laws. Therefore there was no need to frame laws.

Obj. 2. Further, as the Philosopher says (*Ethic.* v. 4), *men have recourse to a judge as to animate justice.* But animate justice is better than inanimate justice, which is contained in laws. Therefore it would have been better for the execution of justice to be entrusted to the decision of judges, than to frame laws in addition.

Obj. 3. Further, every law is framed for the direction of human actions, as is evident from what has been stated above (Q. 90, AA. 1, 2). But since human actions are about singulars, which are infinite in number, matters pertaining to the direction of human actions cannot be taken into sufficient consideration except by a wise man, who looks into each one of them. Therefore it would have been better for human acts to be directed by the judgment of wise men, than by the framing of laws. Therefore there was no need of human laws.

On the contrary, Isidore says (*Etym.* v. 20): *Laws were made that in fear thereof human audacity might be held in check, that innocence might be safeguarded in the midst of wickedness, and that the dread of punishment might prevent the wicked from doing harm.* But these things are most necessary to mankind. Therefore it was necessary that human laws should be made.

I answer that, As stated above (Q. 63, A. 1; Q. 94, A. 3), man has a natural aptitude for virtue; but the perfection of virtue must be acquired by man by means of some kind of training. Thus we observe that man is helped by industry in his necessities, for instance, in food and clothing. Certain beginnings of these he has from nature, viz., his reason and his hands; but he has not the full complement, as other animals have, to whom nature has given sufficiency of clothing and food. Now it is difficult to see how man could suffice for himself in the matter of this training: since the perfection of virtue consists chiefly in withdrawing man from undue pleasures, to which above all man is inclined, and especially the young, who are more capable of being trained. Consequently a man needs to receive this training from another, whereby to arrive at the perfection of virtue. And as to those young people who are inclined to acts of virtue, by their good natural disposition, or by custom, or rather by the gift of God, paternal training suffices, which is by admonitions. But since some are found to be depraved, and prone to vice, and not easily amenable to words, it was necessary for such to be restrained from evil by force and fear, in order that, at least, they might

desist from evildoing, and leave others in peace, and that they themselves, by being habituated in this way, might be brought to do willingly what hitherto they did from fear, and thus become virtuous. Now this kind of training, which compels through fear of punishment, is the discipline of laws. Therefore, in order that man might have peace and virtue, it was necessary for laws to be framed: for, as the Philosopher says (*Polit.* i. 2), *as man is the most noble of animals if he be perfect in virtue, so is he the lowest of all, if he be severed from law and righteousness*; because man can use his reason to devise means of satisfying his lusts and evil passions, which other animals are unable to do.

Reply Obj. 1. Men who are well disposed are led willingly to virtue by being admonished better than by coercion: but men who are evilly disposed are not led to virtue unless they are compelled.

Reply Obj. 2. As the Philosopher says (*Rhet.* i. 1), *it is better that all things be regulated by law, than left to be decided by judges: and this for three reasons. First, because it is easier to find a few wise men competent to frame right laws, than to find the many who would be necessary to judge aright of each single case.—Secondly, because those who make laws consider long beforehand what laws to make; whereas judgment on each single case has to be pronounced as soon as it arises: and it is easier for man to see what is right, by taking many instances into consideration, than by considering one solitary fact.—Thirdly, because lawgivers judge in the abstract and of future events; whereas those who sit in judgment judge of things present, towards which they are affected by love, hatred, or some kind of cupidity; wherefore their judgment is perverted.*

Since then the animated justice of the judge is not found in every man, and since it can be deflected, therefore it was necessary, whenever possible, for the law to determine how to judge, and for very few matters to be left to the decision of men.

Reply Obj. 3. Certain individual facts which cannot be covered by the law *have necessarily to be committed to judges*, as the Philosopher says in the same passage: for instance, *concerning something that has happened or not happened*, and the like.

Second Article

WHETHER EVERY HUMAN LAW IS DERIVED FROM THE NATURAL LAW?

We Proceed Thus to the Second Article:—

Objection 1. It would seem that not every human law is derived from the natural law. For the Philosopher says (*Ethic.* v. 7) that *the legal just is that which originally was a matter of indifference*. But those things which arise from the natural law are not matters of indifference. Therefore the enactments of human laws are not all derived from the natural law.

Obj. 2. Further, positive law is contrasted with natural law, as stated by Isidore (*Etym.* v. 4) and the Philosopher (*Ethic.* v, *loc. cit.*). But those things which flow as conclusion from the general principles of the natural law belong to the natural law, as stated above (Q. 94, A. 4). Therefore that which is established by human law does not belong to the natural law.

Obj. 3. Further, the law of nature is the same for all; since the Philosopher says (*Ethic.* v. 7) that *the natural just is that which is equally valid everywhere*. If therefore

human laws were derived from the natural law, it would follow that they too are the same for all: which is clearly false.

Obj. 4. Further, it is possible to give a reason for things which are derived from the natural law. But it is not possible to give the reason for all the legal enactments of the lawgivers, as the jurist says. Therefore not all human laws are derived from the natural law.

On the contrary, Tully says (*Rhetor.* ii): *Things which emanated from nature and were approved by custom, were sanctioned by fear and reverence for the laws.*

I answer that, As Augustine says (*De Lib. Arb.* i. 5), *that which is not just seems to be no law at all: wherefore the force of a law depends on the extent of its justice. Now in human affairs a thing is said to be just, from being right, according to the rule of reason. But the first rule of reason is the law of nature, as is clear from what has been stated above (Q. 91, A. 2 ad 2).* Consequently every human law has just so much of the nature of law, as it is derived from the law of nature. But if in any point it deflects from the law of nature, it is no longer a law but a perversion of law.

But it must be noted that something may be derived from the natural law in two ways: first, as a conclusion from premises, secondly, by way of determination of certain generalities. The first way is like to that by which, in sciences, demonstrated conclusions are drawn from the principles: while the second mode is likened to that whereby, in the arts, general forms are particularized as to details: thus the craftsman needs to determine the general form of a house to some particular shape. Some things are therefore derived from the general principles of the natural law, by way of conclusions; *e.g.*, that *one must not kill* may be derived as a conclusion from the principle that one should do harm to no man: while some are derived therefrom by way of determination; *e.g.*, the law of nature has it that the evil-doer should be punished; but that he be punished in this or that way, is a determination of the law of nature.

Accordingly both modes of derivation are found in the human law. But those things which are derived in the first way, are contained in human law not as emanating therefrom exclusively, but have some force from the natural law also. But those things which are derived in the second way, have no other force than that of human law.

Reply Obj. 1. The Philosopher is speaking of those enactments which are by way of determination or specification of the precepts of the natural law.

Reply Obj. 2. This argument avails for those things that are derived from the natural law, by way of conclusions.

Reply Obj. 3. The general principles of the natural law cannot be applied to all men in the same way on account of the great variety of human affairs: and hence arises the diversity of positive laws among various people.

Reply Obj. 4. These words of the Jurist are to be understood as referring to decisions of rulers in determining particular points of the natural law: on which determinations the judgment of expert and prudent men is based as on its principles; in so far, to wit, as they see at once what is the best thing to decide.

Hence the Philosopher says (*Ethic.* vi. 11) that in such matters, *we ought to pay as much attention to the undemonstrated sayings and opinions of persons who surpass us in experience, age and prudence, as to their demonstrations.*

QUESTION 96: OF THE POWER OF HUMAN LAW

* * *

Second Article

WHETHER IT BELONGS TO THE HUMAN LAW TO REPRESS ALL VICES?

We Proceed Thus to the Second Article:—

Objection 1. It would seem that it belongs to human law to repress all vices. For Isidore says (*Etym.* v. 20) that *laws were made in order that, in fear thereof, man's audacity might be held in check*. But it would not be held in check sufficiently, unless all evils were repressed by law. Therefore human law should repress all evils.

Obj. 2. Further, the intention of the lawgiver is to make the citizens virtuous. But a man cannot be virtuous unless he forbear from all kinds of vice. Therefore it belongs to human law to repress all vices.

Obj. 3. Further, human law is derived from the natural law, as stated above (Q. 95, A. 2). But all vices are contrary to the law of nature. Therefore human law should repress all vices.

On the contrary, We read in *De Lib. Arb.* i. 5: *It seems to me that the law which is written for the governing of the people rightly permits these things, and that Divine providence punishes them*. But Divine providence punishes nothing but vices. Therefore human law rightly allows some vices, by not repressing them.

I answer that, As stated above (Q. 90, AA. I, 2), law is framed as a rule or measure of human acts. Now a measure should be homogeneous with that which it measures, as stated in *Metaph.* x, text. 3, 4, since different things are measured by different measures. Wherefore laws imposed on men should also be in keeping with their condition, for, as Isidore says (*Etym.* v. 21), law should be *possible both according to nature, and according to the customs of the country*. Now possibility or faculty of action is due to an interior habit or disposition: since the same thing is not possible to one who has not a virtuous habit, as is possible to one who has. Thus the same is not possible to a child as to a full-grown man: for which reason the law for children is not the same as for adults, since many things are permitted to children, which in an adult are punished by law or at any rate are open to blame. In like manner many things are permissible to men not perfect in virtue, which would be intolerable in a virtuous man.

Now human law is framed for a number of human beings, the majority of whom are not perfect in virtue. Wherefore human laws do not forbid all vices, from which the virtuous abstain, but only the more grievous vices, from which it is possible for the majority to abstain; and chiefly those that are to the hurt of others, without the prohibition of which human society could not be maintained: thus human law prohibits murder, theft and such like.

Reply Obj. 1. Audacity seems to refer to the assailing of others. Consequently it belongs to those sins chiefly whereby one's neighbor is injured: and these sins are forbidden by human law, as stated.

Reply Obj. 2. The purpose of human law is to lead men to virtue, not suddenly, but gradually. Wherefore it does not lay upon the multitude of imperfect men the burdens of those who are already virtuous, viz., that they should abstain from all evil. Otherwise

these imperfect ones, being unable to bear such precepts, would break out into yet greater evils: thus it is written (Prov. xxx. 33): *He that violently bloweth his nose, bringeth out blood*; and (Matth. ix. 17) that if *new wine*, i.e., precepts of a perfect life, *is put into old bottles*, i.e., into imperfect men, *the bottles break, and the wine runneth out*, i.e., the precepts are despised, and those men, from contempt, break out into evils worse still.

Reply Obj. 3. The natural law is a participation in us of the eternal law: while human law falls short of the eternal law. Now Augustine says (*De Lib. Arb.* i. 5): *The law which is framed for the government of states, allows and leaves unpunished many things that are punished by Divine providence. Nor, if this law does not attempt to do everything, is this a reason why it should be blamed for what it does.* Wherefore, too, human law does not prohibit everything that is forbidden by the natural law.

* * *

SECOND PART OF THE SECOND PART(II—II)

* * *

QUESTION 40: OF WAR

* * *

First Article

WHETHER IT IS ALWAYS SINFUL TO WAGE WAR?

We Proceed Thus to the First Article:—

Objection 1. It would seem that it is always sinful to wage war. Because punishment is not inflicted except for sin. Now those who wage war are threatened by Our Lord with punishment, according to Matth. xxvi. 52: *All that take the sword shall perish with the sword.* Therefore all wars are unlawful.

Obj. 2. Further, whatever is contrary to a Divine precept is a sin. But war is contrary to a Divine precept, for it is written (Matth. v. 39): *But I say to you not to resist evil*; and (Rom. xii. 19): *Not revenging yourselves, my dearly beloved, but give place unto wrath.* Therefore war is always sinful.

Obj. 3. Further, nothing, except sin, is contrary to an act of virtue. But war is contrary to peace. Therefore war is always a sin.

Obj. 4. Further, the exercise of a lawful thing is itself lawful, as is evident in scientific exercises. But warlike exercises which take place in tournaments are forbidden by the Church, since those who are slain in these trials are deprived of ecclesiastical burial. Therefore it seems that war is a sin in itself.

On the contrary, Augustine says in a sermon on the son of the centurion [*Ep. ad Marcel.*, cxxxviii.]: *If the Christian Religion forbade war altogether, those who sought*

salutary advice in the Gospel would rather have been counselled to cast aside their arms, and to give up soldiering altogether. On the contrary, they were told: "Do violence to no man; . . . and be content with your pay." [Luke iii. 14] If he commanded them to be content with their pay, he did not forbid soldiering.

I answer that, In order for a war to be just, three things are necessary. First, the authority of the sovereign by whose command the war is to be waged. For it is not the business of a private individual to declare war, because he can seek for redress of his rights from the tribunal of his superior. Moreover it is not the business of a private individual to summon together the people, which has to be done in wartime. And as the care of the common weal is committed to those who are in authority, it is their business to watch over the common weal of the city, kingdom or province subject to them. And just as it is lawful for them to have recourse to the sword in defending that common weal against internal disturbances, when they punish evil-doers, according to the words of the Apostle

Three Orders of Society, from L'image du monde, Franco-Flemish, late-thirteenth century. This detail from an illustrated manuscript page shows the hierarchy of medieval society with monk, knight, and peasant. (By permission of The British Museum © The British Library Board, Sloane 2435).

(Rom. xiii. 4): *He beareth not the sword in vain: for he is God's minister, an avenger to execute wrath upon him that doth evil*; so too, it is their business to have recourse to the sword of war in defending the common weal against external enemies. Hence it is said to those who are in authority (Ps. lxxxi. 4): *Rescue the poor: and deliver the needy out of the hand of the sinner*; and for this reason Augustine says (*Contra Faust.* xxii. 75): *The natural order conducive to peace among mortals demands that the power to declare and counsel war should be in the hands of those who hold the supreme authority.*

Secondly, a just cause is required, namely that those who are attacked, should be attacked because they deserve it on account of some fault. Wherefore Augustine says (QQ. in *Hept.*, qu. x, *super Jos.*): *A just war is wont to be described as one that avenges wrongs, when a nation or state has to be punished, for refusing to make amends for the wrongs inflicted by its subjects, or to restore what it has seized unjustly.*

Thirdly, it is necessary that the belligerents should have a rightful intention, so that they intend the advancement of good, or the avoidance of evil. Hence Augustine says *De Verb. Dom.*: *True religion looks upon as peaceful those wars that are waged not for motives of aggrandizement or cruelty, but with the object of securing peace, of punishing evil-doers, and of uplifting the good.* For it may happen that the war is declared by the legitimate authority, and for a just cause, and yet be rendered unlawful through a wicked intention. Hence Augustine says (*Contra Faust.* xxii. 74): *The passion for inflicting harm, the cruel thirst for vengeance, an unpacific and relentless spirit, the fever of revolt, the lust of power, and such like things, all these are rightly condemned in war.*

Reply Obj. 1. As Augustine says (*Contra Faust.* xxii. 70): *To take the sword is to arm oneself in order to take the life of anyone, without the command or permission of superior or lawful authority.* On the other hand, to have recourse to the sword (as a private person) by the authority of the sovereign or judge, or (as a public person) through zeal for justice, and by the authority, so to speak, of God, is not to *take the sword*, but to use it as commissioned by another, wherefore it does not deserve punishment. And yet even those who make sinful use of the sword are not always slain with the sword, yet they always perish with their own sword, because, unless they repent, they are punished eternally for their sinful use of the sword.

Reply Obj. 2. Such like precepts, as Augustine observes (*De Serm. Dom. in Monte* i. 19), should always be borne in readiness of mind, so that we be ready to obey them, and, if necessary, to refrain from resistance or self-defense. Nevertheless it is necessary sometimes for a man to act otherwise for the common good, or for the good of those with whom he is fighting. Hence Augustine says (*Ep. ad Marcellin.* cxxxviii): *Those whom we have to punish with a kindly severity, it is necessary to handle in many ways against their will. For when we are stripping a man of the lawlessness of sin, it is good for him to be vanquished, since nothing is more hopeless than the happiness of sinners, whence arises a guilty impunity, and an evil will, like an internal enemy.*

Reply Obj. 3. Those who wage war justly aim at peace, and so they are not opposed to peace, except to the evil peace, which Our Lord *came not to send upon earth* (Matth. x. 34). Hence Augustine says (*Ep. ad Bonif.* clxxxix): *We do not seek peace in order to be at war, but we go to war that we may have peace. Be peaceful, therefore, in warring, so that you may vanquish those whom you war against, and bring them to the prosperity of peace.*

Reply Obj. 4. Manly exercises in warlike feats of arms are not all forbidden, but those which are inordinate and perilous, and end in slaying or plundering. In olden times warlike exercises presented no such danger, and hence they were called *exercises of arms* or bloodless wars, as Jerome states in an epistle.

WILLIAM OF OCKHAM

ca. 1285–1349

William was born in Ockham, Surrey, near London, between 1280 and 1290. He joined the Franciscan order as a young man. In 1309 or 1310, he went to Oxford, where his studies included the work of Duns Scotus. Despite his success as a student and, later, as a student lecturer, Ockham was denied a license to teach. The chancellor of the university accused him of heresy, even going to the papal court in Avignon, France, in 1323 to press charges. The following year Ockham was summoned to Avignon by Pope John XXII. The affair dragged on for four years. Meanwhile, Ockham kept writing and came into conflict with the pope again when he joined the general of his Franciscan order in advocating apostolic poverty.

In 1328, Ockham was forced to flee Avignon when the pope was prepared to condemn the Franciscan position on poverty. He eventually found refuge in Munich under the protection of Emperor Ludwig of Bavaria, who was angry with the pope for not recognizing his crown. Ockham reportedly told the emperor, “Defend me with your sword, and I will defend you with my pen.”

Over the next twenty years, Ockham did indeed defend the emperor, arguing that imperial power flows from God through the people, not through the pope—a position that anticipated later political theories. Following Ludwig’s death in 1347, Ockham sought reconciliation with the pope (now Clement VI), and a document of submission was drawn up. We do not know whether Ockham ever signed the document, for he died in 1349, apparently from the plague.

Ockham’s philosophy reflects his times: He is much less optimistic than was Thomas Aquinas about the ability of human reason to understand the things of God. Ockham criticized the proofs for God’s existence, arguing that theological truth can be known only by revelation, not reason. In so arguing, he separated

philosophy from theology and reason from faith more completely than had any of his predecessors.

Ockham is probably best known for his “Law of Parsimony,” or “Ockham’s Razor.” This principle has often been formulated as *entia non sunt multiplicanda praeter necessitatem*, “entities are not to be multiplied beyond necessity,” though none of Ockham’s known works contains that exact phrase.* Essentially this principle holds that we should always seek the simplest explanation, a principle still used by philosophers and scientists. Ockham was not the first to enunciate this principle: It can be found earlier in the writings of Thomas Aquinas,** Duns Scotus, and even, in embryonic form, in Aristotle.*** But the skill with which Ockham wielded this “razor” ensured its association with his name.

Ockham was especially effective in using his razor on the question of universals. Contrary to the moderate realism dominant in his day, Ockham saw no need to posit universals as real entities beyond individual things. This critique is clear in the selections on universals given here. Following some defining of terms, Ockham argues against the realist position and, with great care, against the position of the “Subtle Doctor,” Duns Scotus. Ockham asserts that “in a particular substance there is nothing substantial except the particular form, the particular matter, or the composite of the two”—that is, there is no real universal apart from the particular thing.

* * *

Marilyn McCord Adams’s *William Ockham*, two volumes (Notre Dame, IN: University of Notre Dame Press, 1987) is the definitive introduction to Ockham, whereas Meyrick Heath Carré, *Realists and Nominalists* (London: Oxford University Press, 1946), and Sharon M. Kaye and Robert M. Martin, *On Ockham* (Belmont, CA: Wadsworth, 2001) provide helpful overviews. Specialized studies include E.A. Moody, *The Logic of William of Ockham* (1935; reprinted New York: Russell and Russell, 1965); Damascene Webering, *The Theory of Demonstration According to William Ockham* (St. Bonaventure, NY: Franciscan Institute, 1953); Herman Shapiro, *Motion, Time and Place According to William Ockham* (St. Bonaventure, NY: Franciscan Institute, 1957); Arthur Stephen McGrade, *The Political Thought of William of Ockham: Personal and Institutional Principles* (London: Cambridge University Press, 1974); and Rega Wood, *Ockham on the Virtues* (West Lafayette, IN: Purdue University Press, 1997). For collections of essays, see Philotheus Boehner, ed., *Collected Articles on Ockham* (St. Bonaventure, NY: Franciscan Institute, 1958) and Paul V. Spade, ed., *The Cambridge Companion to Ockham* (Cambridge: Cambridge University Press, 1999).

*Ockham’s extant writings do include the phrases *pluralitas non est ponenda sine necessitate*, “plurality is not to be posited without necessity,” and *frustra fit per plura quod potest fieri per pauciora*, “what can be explained by the assumption of fewer things is vainly explained by the assumption of more things.” Perhaps applying his principle to its own formulation, we should say, “Why use many if few will do?”

**See his *Summa Theologica*, Part I, Q. 2, a. 3, obj. 2—page 334 in this volume.

***See *Posterior Analytics* I.25, 86a33–35 and *Physics* I.4, 188a17–18; VIII.6, 259a8–12.

Plague Victim, from *Das Buch der Cirurgia*, 1497, by Hieronymus Brunschwig. Beginning in 1347 the Bubonic Plague, or “Black Death,” struck western Europe. Transmitted by flea bite, the disease was characterized by enormous swelling or “buboes” in the groin or armpits. The patient in this woodcut has a large bubo on his armpit—a sure sign that he will be dead within two or three days. Apparently William of Ockham met such a fate in 1349. (*Library of Congress*)

ON UNIVERSALS (in part)

SUMMA LOGICAE, PART I

CHAPTER 14: ON THE UNIVERSAL

It is not enough for the logician to have a merely general knowledge of terms; he needs a deep understanding of the concept of a term. Therefore, after discussing some general divisions among terms we should examine in detail the various headings under these divisions.

First, we should deal with terms of second intention and afterwards with terms of first intention. I have said that “universal,” “genus,” and “species” are examples of terms of second intention. We must discuss those terms of second intention which are called the five universals, but first we should consider the common term “universal.” It is predicated of every universal and is opposed to the notion of a particular.

First, it should be noted that the term “particular” has two senses. In the first sense a particular is that which is one and not many. Those who hold that a universal is a certain quality residing in the mind which is predicable of many (not suppositing for itself, of course, but for the many of which it is predicated) must grant that, in this sense of the word, every universal is a particular. Just as a word, even if convention makes it common, is a particular, the intention of the soul signifying many is numerically one thing a particular; for although it signifies many things it is nonetheless one thing and not many.

In another sense of the word we use “particular” to mean that which is one and not many and which cannot function as a sign of many. Taking “particular” in this sense no universal is a particular, since every universal is capable of signifying many and of being predicated of many. Thus, if we take the term “universal” to mean that which is not one in number, as many do, then, I want to say that nothing is a universal. One could, of course, abuse the expression and say that a population constitutes a single universal because it is not one but many. But that would be puerile.

Therefore, it ought to be said that every universal is one particular thing and that it is not a universal except in its signification, in its signifying many things. This is what Avicenna means to say in his commentary on the fifth book of the *Metaphysics*. He says, “One form in the intellect is related to many things, and in this respect it is a universal; for it is an intention of the intellect which has an invariant relationship to anything you choose.” He then continues, “Although this form is a universal in its relationship to individuals, it is a particular in its relationship to the particular soul in which it resides; for it is just one form among many in the intellect.” He means to say that a universal is an intention of a particular soul. Insofar as it can be predicated of many things not for itself but for these many, it is said to be a universal; but insofar as it is a particular form actually existing in the intellect, it is said to be a particular. Thus “particular” is predicated of a universal in the first sense but not in the second. In the same way we say that the sun is a universal cause and, nevertheless, that it is really and truly a particular or individual cause. For the sun is said to be a universal cause because it is the cause of many things (i.e., every object that is generable and corruptible), but it is said to be a particular cause

because it is one cause and not many. In the same way the intention of the soul is said to be a universal because it is a sign predicable of many things, but it is said to be a particular because it is one thing and not many.

But it should be noted that there are two kinds of universals. Some things are universal by nature; that is, by nature they are signs predicable of many in the same way that the smoke is by nature a sign of fire; weeping, a sign of grief; and laughter, a sign of internal joy. The intention of the soul, of course, is a universal by nature. Thus, no substance outside the soul, nor any accident outside the soul is a universal of this sort. It is of this kind of universal that I shall speak in the following chapters.

Other things are universals by convention. Thus, a spoken word, which is numerically one quality, is a universal; it is a sign conventionally appointed for the signification of many things. Thus, since the word is said to be common, it can be called a universal. But notice it is not by nature, but only by convention, that this label applies.

CHAPTER 15: THAT THE UNIVERSAL IS NOT A THING OUTSIDE THE MIND

But it is not enough just to state one's position; one must defend it by philosophical arguments. Therefore, I shall set forth some arguments for my view, and then corroborate it by an appeal to the authorities.

That no universal is a substance existing outside the mind can be proved in a number of ways:

No universal is a particular substance, numerically one; for if this were the case, then it would follow that Socrates is a universal; for there is no good reason why one substance should be a universal rather than another. Therefore no particular substance is a universal; every substance is numerically one and a particular. For every substance is either one thing and not many or it is many things. Now, if a substance is one thing and not many, then it is numerically one; for that is what we mean by "numerically one." But if, on the other hand, some substance is several things, it is either several particular things or several universal things. If the first alternative is chosen, then it follows that some substance would be several particular substances; and consequently that some substance would be several men. But although the universal would be distinguished from a single particular, it would not be distinguished from several particulars. If, however, some substance were to be several universal entities, I take one of those universal entities and ask, "Is it many things or is it one and not many?" If the second is the case then it follows that the thing is particular. If the first is the case then I ask, "Is it several particular things or several universal things?" Thus, either an infinite regress will follow or it will be granted that no substance is a universal in a way that would be incompatible with its also being a particular. From this it follows that no substance is a universal.

Again, if some universal were to be one substance existing in particular substances, yet distinct from them, it would follow that it could exist without them; for everything that is naturally prior to something else can, by God's power, exist without that thing; but the consequence is absurd.

Again, if the view in question were true, no individual would be able to be created. Something of the individual would pre-exist it, for the whole individual would not take its existence from nothing if the universal which is in it were already in something else. For the same reason it would follow that God could not annihilate an individual substance without destroying the other individuals of the same kind. If He were to annihilate some individual, he would destroy the whole which is essentially that individual

and, consequently, He would destroy the universal which is in that thing and in others of the same essence. Consequently, other things of the same essence would not remain, for they could not continue to exist without the universal which constitutes a part of them.

Again, such a universal could not be construed as something completely extrinsic to the essence of an individual; therefore, it would belong to the essence of the individual; and, consequently, an individual would be composed of universals, so that the individual would not be any more a particular than a universal.

Again, it follows that something of the essence of Christ would be miserable and damned, since that common nature really existing in Christ would be damned in the damned individual; for surely that essence is also in Judas. But this is absurd.

Many other arguments could be brought forth, but in the interests of brevity, I shall dispense with them. Instead, I shall corroborate my account by an appeal to authorities.

First, in the seventh book of the *Metaphysics*, Aristotle is treating the question of whether a universal is a substance. He shows that no universal is a substance. Thus, he says, "It is impossible that substance be something that can be predicated universally."

Again, in the tenth book of the *Metaphysics*, he says, "Thus, if, as we argued in the discussions on substance and being, no universal can be a substance, it is not possible that a universal be a substance in the sense of a one over and against the many."

From these remarks it is clear that, in Aristotle's view, although universals can supposit for substances, no universal is a substance.

Again, the Commentator in his forty-fourth comment on the seventh book of the *Metaphysics* says, "In the individual, the only substance is the particular form and matter out of which the individual is composed."

Again, in the forty-fifth comment, he says, "Let us say, therefore, that it is impossible that one of those things we call universals be the substance of anything, although they do express the substances of things."

And, again, in the forty-seventh comment, "It is impossible that they (universals) be parts of substances existing of and by themselves."

Again, in the second comment on the eighth book of the *Metaphysics*, he says, "No universal is either a substance or a genus."

Again, in the sixth comment on the tenth book, he says, "Since universals are not substances, it is clear that the common notion of being is not a substance existing outside the mind."

Using these and many other authorities, the general point emerges: no universal is a substance regardless of the viewpoint from which we consider the matter. Thus, the viewpoint from which we consider the matter is irrelevant to the question of whether something is a substance. Nevertheless, the meaning of a term is relevant to the question of whether the expression "substance" can be predicated of the term. Thus, if the term "dog" in the proposition "The dog is an animal" is used to stand for the barking animal, the proposition is true; but if it is used for the celestial body which goes by that name, the proposition is false. But it is impossible that one and the same thing should be a substance from one viewpoint and not a substance from another.

Therefore, it ought to be granted that no universal is a substance regardless of how it is considered. On the contrary, every universal is an intention of the mind which, on the most probable account, is identical with the act of understanding. Thus, it is said that the act of understanding by which I grasp men is a natural sign of men in the same way that weeping is a natural sign of grief. It is a natural sign such that it can stand for men in mental propositions in the same way that a spoken word can stand for things in spoken propositions.

That the universal is an intention of the soul is clearly expressed by Avicenna in the fifth book of the *Metaphysics*, in which he comments, "I say, therefore, that there are three senses of 'universal.' For we say that something is a universal if (like 'man') it is actually predicated of many things; and we also call an intention a universal if it could be predicated of many." Then follows the remark, "An intention is also called a universal if there is nothing inconceivable in its being predicated of many."

From these remarks it is clear that the universal is an intention of the soul capable of being predicated of many. The claim can be corroborated by argument. For every one agrees that a universal is something predicable of many, but only an intention of the soul or a conventional sign is predicated. No substance is ever predicated of anything. Therefore, only an intention of the soul or a conventional sign is a universal; but I am not here using the term "universal" for conventional signs, but only for signs that are universals by nature. That substance is not capable of functioning as predicate is clear; for if it were, it would follow that a proposition would be composed of particular substances; and, consequently, the subject would be in Rome and the predicate in England which is absurd.

Furthermore, propositions occur only in the mind, in speech, or in writing; therefore, their parts can exist only in the mind, in speech, and in writing. Particular substances, however, cannot themselves exist in the mind, in speech, or in writing. Thus, no proposition can be composed of particular substances. Propositions are, however, composed of universals; therefore, universals cannot conceivably be substances.

CHAPTER 16: AGAINST SCOTUS' ACCOUNT OF THE UNIVERSAL

It may be clear to many that a universal is not a substance outside the mind which exists in, but is distinct from, particulars. Nevertheless, some want to claim that the universal is, in some way, outside the soul and in particulars; and while they do not want to say that a universal is really distinct from particulars, they say that it is formally distinct from particulars. Thus, they say that in Socrates there is human nature which is contracted to Socrates by an individual difference which is not really, but only formally, distinct from that nature. Thus, while there are not two things, one is not formally the other.

I do not find this view tenable:

First, in creatures there can never be any distinction outside the mind unless there are distinct things; if, therefore, there is any distinction between the nature and the difference, it is necessary that they really be distinct things. I prove my premise by the following syllogism: the nature is not formally distinct from itself; this individual difference is formally distinct from this nature; therefore, this individual difference is not this nature.

Again, the same entity is not both common and proper, but in their view the individual difference is proper and the universal is common; therefore, no universal is identical with an individual difference.

Again, opposites cannot be attributed to one and the same created thing, but *common* and *proper* are opposites; therefore, the same thing is not both common and proper. Nevertheless, that conclusion would follow if an individual difference and a common nature were the same thing.

Again, if a common nature were the same thing as an individual difference, there would be as many common natures as there are individual differences; and, consequently, none of those natures would be common, but each would be peculiar to the difference with which it is identical.

Again, whenever one thing is distinct from another it is distinguished from that thing either of and by itself or by something intrinsic to itself. Now, the humanity of Socrates is something different from the humanity of Plato; therefore, they are distinguished of and by themselves and not by differences that are added to them.

Again, according to Aristotle things differing in species also differ in number, but the nature of a man and the nature of a donkey differ in species of and by themselves; therefore, they are numerically distinguished of and by themselves; therefore, each of them is numerically one of and by itself.

Again, that which cannot belong to many cannot be predicated of many; but such a nature, if it really is the same thing as the individual difference, cannot belong to many since it cannot belong to any other particular. Thus, it cannot be predicable of many; but, then, it cannot be a universal.

Again, take an individual difference and the nature which it contracts. Either the difference between these two things is greater or less than the difference between two particulars. It is not greater because they do not differ really; particulars, however, do differ really. But neither is it less because then they would admit of one and the same definition, since two particulars, can admit of the same definition. Consequently, if one of them is, by itself, one in number, the other will also be.

Again, either the nature is the individual difference or it is not. If it is the difference I argue as follows: this individual difference is proper and not common; this individual difference is this nature; therefore this nature is proper and not common, but that is what I set out to prove. Likewise, I argue as follows: the individual difference is not formally distinct from the individual difference; the individual difference is the nature; therefore, the nature is not formally distinct from the individual difference. But if it be said that the individual difference is not the nature, my point has been proved; for it follows that if the individual difference is not the nature, the individual difference is not really the nature; for from the opposite of the consequent follows the opposite of the antecedent. Thus, if it is true that the individual difference really is the nature, then the individual difference is the nature. The inference is valid, for from a determinable taken with its determination (where the determination does not detract from or diminish the determinable) one can infer the determinable taken by itself; but "really" does not express a determination that detracts or diminishes. Therefore, it follows that if the individual difference is really the nature, the individual difference is the nature.

Therefore, one should grant that in created things there is no such thing as a formal distinction. All things which are distinct in creatures are really distinct and, therefore, different things. In regard to creatures modes of argument like the following ought never be denied: this is *A*; this is *B*; therefore, *B* is *A*; and this is not *A*; this is *B*; therefore, *B* is not *A*. Likewise, one ought never deny that, as regards creatures, there are distinct things where contradictory notions hold. The only exception would be the case where contradictory notions hold true because of some syncategorematic element or similar determination, but in the same present case this is not so.

Therefore, we ought to say with the philosophers that in a particular substance there is nothing substantial except the particular form, the particular matter, or the composite of the two. And, therefore, no one ought to think that in Socrates there is a humanity or a human nature which is distinct from Socrates and to which there is added an individual difference which contracts that nature. The only thing in Socrates which can be construed as substantial is this particular matter, this particular form, or the composite of the two. And, therefore, every essence and quiddity and whatever belongs to substance, if it is really outside the soul, is just matter, form, or the composite of these or, following the doctrine of the Peripatetics, a separated and immaterial substance.

GIOVANNI PICO DELLA MIRANDOLA

1463–1494

In the late 1300s, some Italian thinkers began to talk about a rebirth or “renaissance.” They wrote disparagingly of the “Middle” or “Dark Ages,” depicting that time as a period of barbarian ignorance from which they had just emerged. They saw themselves as awakening to their classical past and continuing the civilizing work of the ancient Greeks and Romans.

Although few scholars today would accept this self-characterization, there was something different about the late-medieval/early-modern period. Whereas the medievals had access to some classical texts, the Renaissance thinkers had a wide, and often contradictory, variety of ancient Greek and Roman works. Whereas the philosophers of the Middle Ages tended to use ancient materials to reinforce their Christian beliefs, the early-modern thinkers found new uses for these ancient texts. But most important, whereas the Middle Ages tended to be vertically oriented, focusing on God and God’s Kingdom, the early-modern period became more and more horizontally oriented, examining the created world and celebrating its most important inhabitants, human beings.

The person who most typifies this use of ancient texts to express the importance and “dignity of man” is Count Giovanni Pico della Mirandola. Pico was born in Mirandola, near Ferrara, northern Italy. The son of a minor Italian prince, his education included a variety of subjects and a diversity of institutions. In 1477, he went to the University of Bologna to study canon (church) law. After two years, he moved to study philosophy at the universities of Ferrara and Padua. Finally in 1482, he concluded his studies by examining Hebrew and Arabic thought while in Florence and Paris.

Pico believed it was possible to reconcile the seeming contradictions among the various systems of thought he had studied. Drawing out what he considered the best in each thinker and system he encountered, he developed a philosophy

known as “syncretism.” Syncretism holds that all schools of philosophy have some truth and so should be examined and defended; but no system of thought has all the truth, and so one must also expose the errors in each scheme.

Applying his philosophy of syncretism, in 1486 Pico drew up a list of nine hundred true theses (or propositions), using various Greek, Arabic, Hebrew, and Roman thinkers who summarized his views. He invited scholars from all over Europe to come to Rome, where he would defend his positions against all challengers. However, the disputation never occurred. Pope Innocent VIII suspended the debate and appointed a commission to investigate the nine hundred theses. Seven of the propositions were subsequently declared unorthodox and six more held to be dangerous. Pico publicly protested the decision by publishing a defense of his positions. This succeeded only in infuriating the pope. The pope condemned all nine hundred propositions, reportedly commenting, “That young man wants someone to burn him.” Pico fled to France but was arrested there by papal envoys. Through the intervention of friends in Italy, Pico was released by the French king. He spent the rest of his short life in Florence under the protection of the powerful Medici family.

The *Oration on the Dignity of Man* was intended as an introductory speech for the proposed debate in Rome. In the selection reprinted here, translated by Charles Glenn Wallis, Pico exhibits his syncretistic willingness to draw from many different sources. Quoting from a wide variety of writings, he argues that God has given all creatures besides humans a unique, fixed nature. They have a certain kind of being that they cannot change. But we as human beings do not have a given being—we alone have the freedom to choose what we will become. Even though we can choose to become animals or “couch potatoes” or angelic philosophers, it is the ability to *choose* that gives us dignity.

* * *

Pico’s life was chronicled by his nephew in the difficult-to-find Giovanni Francesco Pico, *Giovanni Pico della Mirandola: His Life by His Nephew Giovanni Francesco Pico*, translated by Sir Thomas More, edited by J.M. Rigg (London: D. Nutt, 1890). For a general overview of Pico, see William G. Craven, *Giovanni Pico della Mirandola, Symbol of His Age: Modern Interpretations of a Renaissance Philosopher* (Geneve: Droz, 1981). For a collection of essays, see M.V. Dougherty, ed., *Pico della Mirandola: New Essays* (Cambridge: Cambridge University Press, 2008).

For collections of primary source readings in Renaissance philosophy, see Ernst Cassirer, Paul O. Kristeller, and John H. Randall, Jr., eds., *The Renaissance Philosophy of Man* (Chicago: University of Chicago Press, 1948), and Arturo B. Fallico and Herman Shapiro, eds., *Renaissance Philosophy*, two volumes (New York: Random House, 1967–1969). For general studies of Renaissance thought, see Ernst Cassirer, *The Individual and Cosmos in Renaissance Philosophy*, translated by Mario Domandi (New York: Harper & Row, 1963); Paul O. Kristeller, *Renaissance Thought and Its Sources* (New York: Columbia University Press, 1979); Charles B. Schmitt, Quentin Skinner, and Eckhard Kessler, eds., *The Cambridge History of Renaissance Philosophy* (Cambridge: Cambridge University Press, 1988); and Brian P. Copenhaver and Charles B. Schmitt, *Renaissance Philosophy*, Vol. 3 of *History of Western Philosophy* (Oxford: Oxford University Press, 1992).

ORATION ON THE DIGNITY OF MAN (in part)

Now the highest Father, God the master-builder, had, by the laws of his secret wisdom, fabricated this house, this world which we see, a very superb temple of divinity. He had adorned the super-celestial region with minds. He had animated the celestial globes with eternal souls; he had filled with a diverse throng of animals the cast-off and residual parts of the lower world. But, with the work finished, the Artisan desired that there be someone to reckon up the reason of such a big work, to love its beauty, and to wonder at its greatness. Accordingly, now that all things had been completed, as Moses and Timaeus testify, He lastly considered creating man. But there was nothing in the archetypes from which He could mold a new sprout, nor anything in His storehouses which He could bestow as a heritage upon a new son, nor was there an empty judiciary seat where this contemplator of the universe could sit. Everything was filled up; all things had been laid out in the highest, the lowest, and the middle orders. But it did not belong to the paternal power to have failed in the final parturition, as though exhausted by childbearing; it did not belong to wisdom, in a case of necessity, to have been tossed back and forth through want of a plan; it did not belong to the lovingkindness which was going to praise divine liberality in others to be forced to condemn itself. Finally, the best of workmen decided that that to which nothing of its very own could be given should be, in composite fashion, whatsoever had belonged individually to each and every thing. Therefore He took up man, a work of indeterminate form; and, placing him at the midpoint of the world, He spoke to him as follows:

“We have given to thee, Adam, no fixed seat, no form of thy very own, no gift peculiarly thine, that thou mayest feel as thine own, have as thine own, possess as thine own the seat, the form, the gifts which thou thyself shalt desire. A limited nature in other creatures is confined within the laws written down by Us. In conformity with thy free judgment, in whose hands I have placed thee, thou art confined by no bounds; and thou wilt fix limits of nature for thyself. I have placed thee at the center of the world, that from there thou mayest more conveniently look around and see whatsoever is in the world. Neither heavenly nor earthly, neither mortal nor immortal have We made thee. Thou, like a judge appointed for being honorable, art the molder and maker of thyself; thou mayest sculpt thyself into whatever shape thou dost prefer. Thou canst grow downward into the lower natures which are brutes. Thou canst again grow upward from thy soul’s reason into the higher natures which are divine.”

O great liberality of God the Father! O great and wonderful happiness of man! It is given him to have that which he chooses and to be that which he wills. As soon as brutes are born, they bring with them, “from their dam’s bag,” as Lucilius, says, what they are going to possess. Highest spirits have been, either from the beginning or soon after, that which they are going to be throughout everlasting eternity. At man’s birth the Father placed in him every sort of seed and sprouts of every kind of life. The seeds that each man cultivates will grow and bear their fruit in him. If he cultivates vegetable

Study of Human Proportions, by Leonardo da Vinci (1452–1519). Like Pico, Leonardo enjoyed the patronage of Lorenzo de Medici; and also like Pico, Leonardo celebrated the “dignity of man” and exuberantly exhibited his own ability. (© Alinari/Art Resource, NY)

seeds, he will become a plant. If the seeds of sensation, he will grow into brute. If rational, he will come out a heavenly animal. If intellectual, he will be an angel, and a son of God. And if he is not contented with the lot of any creature but takes himself up into the center of his own unity, then, made one spirit with God and settled in the solitary darkness of the Father, who is above all things, he will stand ahead of all things. Who does not wonder at this chameleon which we are? Or who at all feels more wonder at anything else whatsoever? It was not unfittingly that Asclepius the Athenian said that man was symbolized by Prometheus in the secret rites, by reason of our nature sloughing its skin and transforming itself; hence metamorphoses were popular among the Jews and the Pythagoreans. For the more secret Hebrew theology at one time reshapes holy Enoch into an angel of divinity, whom they call *malach hashechina*, and at other times reshapes other men into other divinities. According to the Pythagoreans, wicked men are deformed into brutes and, if you believe Empedocles, into plants too. And copying them, Mohammed often had it on his lips that he who draws back from divine law becomes a brute. And his saying so was reasonable: for it is not the rind which makes the plant, but a dull and non-sentient nature; not the hide which makes a beast of burden, but a brutal and sensual soul; not the spherical body which makes the heavens, but right reason; and not a separateness from the body but a spiritual intelligence which makes an angel. For example, if you see a man given over to his belly and crawling upon the ground, it is a bush not a man that you see. If you see anyone blinded by the illusions of his empty and Calypso-like imagination, seized by the desire of scratching, and delivered over to the senses, it is a brute not a man that you see. If you come upon a philosopher winnowing out all things by right reason, he is a heavenly not an earthly animal. If you come upon a pure contemplator, ignorant of the body, banished to the innermost places of the mind, he is not an earthly, not a heavenly animal; he more superbly is a divinity clothed with human flesh.

Who is there that does not wonder at man? And it is not unreasonable that in the Mosaic and Christian holy writ man is sometimes denoted by the name "all flesh" and at other times by that of "every creature"; and man fashions, fabricates, transforms himself into the shape of all flesh, into the character of every creature. Accordingly, where Evantes the Persian tells of the Chaldaean theology, he writes that man is not any inborn image of himself, but many images coming in from the outside: hence that saying of the Chaldaeans: *enosh hu shinuy vekamah tevaath baal chayim*, that is, man is an animal of diverse, multiform, and destructible nature.

But why all this? In order for us to understand that, after having been born in this state so that we may be what we will to be, then, since we are held in honor, we ought to take particular care that no one may say against us that we do not know that we are made similar to brutes and mindless beasts of burden. But rather, as Asaph the prophet says: "Ye are all gods, and sons of the most high," unless by abusing the very indulgent liberality of the Father, we make the free choice, which he gave to us, harmful to ourselves instead of helpful toward salvation. Let a certain holy ambition invade the mind, so that we may not be content with mean things but may aspire to the highest things and strive with all our forces to attain them: for if we will to, we can. Let us spurn earthly things; let us struggle toward the heavenly. Let us put in last place whatever is of the world; and let us fly beyond the chambers of the world to the chamber nearest the most lofty divinity. There, as the sacred mysteries reveal, the seraphim, cherubim, and thrones occupy the first places. Ignorant of how to yield to them and unable to endure the second places, let us compete with the angels in dignity and glory. When we have willed it, we shall be not at all below them.

MODERN PHILOSOPHY

To a large extent, modern philosophy begins with a rejection of tradition. Whereas medieval philosophers such as Thomas Aquinas had taken great pains to incorporate and reconcile ancient writings, early modern philosophers such as René Descartes encouraged their readers to make a clean sweep of the past. Previous thinkers had been deluded by errors in thinking or had relied too heavily on authority. In the modern age, the wisdom of the past was to be discarded as error-prone. As Descartes observed in his *Meditations*,

Some years ago I was struck by the large number of falsehoods that I had accepted as true in my childhood, and by the highly doubtful nature of the whole edifice that I had subsequently based on them. I realized that it was necessary, once in the course of my life, to demolish everything completely and start again right from the foundations if I wanted to establish anything at all in the sciences that was stable and likely to last.

This quest to establish a stable intellectual foundation on which to build something “likely to last” characterized seventeenth- and eighteenth-century European philosophy. “British Empiricists,” such as Thomas Hobbes, John Locke, and David Hume found such a foundation in sensory experience and developed their thought on that basis. On the other hand, the “Continent Rationalists,” philosophers such as Descartes, Baruch Spinoza, and Gottfried Leibniz, thought the senses inadequate for such a task. They considered reason superior to experience and sought to establish their philosophies on the basis of more certain principles. The greatest of the modern philosophers, Immanuel Kant, sought to combine

these two approaches and in so doing developed a uniquely influential system of philosophy.

Contemporary thinkers in the West are still trying to come to grips with these modern philosophers. For better or for worse, their ideas have influenced virtually all areas of Euro-American civilization. The subtlety and clarity with which these thinkers wrote continues to demand careful study even in this “postmodern” age.

* * *

There are a number of fine introductions to modern philosophy. Among the classics in this area are Étienne Gilson, *Modern Philosophy: Descartes to Kant* (New York: Random House, 1963); the appropriate works from Frederick Copleston, *A History of Philosophy, Volume IV: Descartes to Leibniz; Volume V: Hobbes to Hume; and Volume VI: Wolff to Kant* (1950; reprinted New York: Image Doubleday, 1959–1960); and W.T. Jones’ books, *Hobbes to Hume*, 2nd edition and *Kant and the Nineteenth Century*, 2nd edition, revised (both New York: Harcourt, Brace & World, 1969 and 1975). More recent general surveys include Roger Scruton, *A Short History of Modern Philosophy: From Descartes to Wittgenstein* (London: Routledge, 1984), Wallace I. Matson, *A New History of Philosophy, Volume II: Modern* (San Diego, CA: Harcourt Brace Jovanovich, 1987); Jeffrey Tlumak, *Classical Modern Philosophy* (London: Routledge, 2006); and Anthony Kenny, *The Rise of Modern Philosophy: A New History of Western Philosophy* (Oxford: Oxford University Press, 2006). The following volumes from the *Routledge History of Philosophy* series include essays on this period: G.H.R. Parkinson, ed., *Volume 4: The Renaissance and Seventeenth Century Rationalism*; Stuart Brown, ed., *Volume 5: British Empiricism and the Enlightenment*; and Robert Solomon and Kathleen Higgins, eds., *Volume 6: The Age of German Idealism* (all London: Routledge, 1993), as does Steven Nadler, ed., *A Companion to Early Modern Philosophy* (London: Routledge, 2002). A sampling of the many specialized books on specific topics from this era includes Louis E. Loeb, *From Descartes to Hume: Continental Metaphysics and the Development of Modern Philosophy* (Ithaca, NY: Cornell University Press, 1981); Robert C. Solomon, *Continental Philosophy Since 1750: The Rise and Fall of the Self* (Oxford: Oxford University Press, 1988); and Iain Hampshire-Monk, *A History of Modern Political Thought* (Oxford: Blackwell, 1992).

RENÉ DESCARTES

1596–1650

René Descartes was born into the family of a minor noble in the town of La Haye in Touraine, France. At age 10, René began a nine-year course of studies at the Royal Jesuit College of La Flèche. There he studied the humanities, theology, and philosophy (which included morals, logic, mathematics, metaphysics, and science). Though he did well in school, he was disillusioned by the uncertainty of his studies and their contradictory conclusions. Like many modern students, he felt overwhelmed by the multitude of opinions he encountered. He later wrote in his *Discourse on Method* that upon completing his course of study, “I found myself embarrassed with so many doubts and errors that it seemed to me that the effort to instruct myself had no effect other than the increasing discovery of my own ignorance.”

However, there was one discipline in which he found the certainty he was seeking: mathematics. The truths of mathematics were assured regardless of one’s metaphysical or epistemological assumptions: $2 + 2 = 4$ whether one is a Platonist or an Aristotelian; $3 \times 3 = 9$ whether one is a Roman Catholic or a Protestant. Given mathematical certainty, Descartes found it odd that on such a firm basis “no loftier edifice had been reared.”

Left a modest inheritance by his father, Descartes spent the rest of his life seeking the certainty not found in college. After receiving a law degree at Poitiers in 1616, he served as a gentleman volunteer in the army of Maurice of Nassau. While soldiering, he began to develop the idea of connecting mathematical certainty with philosophy. In 1619, he had a series of dreams convincing him that the “spirit of truth” was leading him and that he had divine approval for his studies. For the next ten years, while traveling and serving in the army, he developed his ideas. In 1628, he had a debate with Chandoux, a scientist who claimed that science could be founded only on probability. Descartes argued eloquently that

knowledge must be based on certainty and that he had a system that provided that basis. Encouraged by others to develop his system, he retired to Holland, where he found a greater degree of intellectual freedom and spent the next twenty years writing and publishing his ideas. His major philosophical works include *Rules for the Direction of the Mind* (written 1628, but not published until 1701), *Discourse on Method* (published in 1637 as a preface to the essays *Geometry*, *Dioptric*, and *Meteors*), and *Meditations on First Philosophy* (1641). Descartes also published seven sets of *Objections to the Meditations* of thinkers such as Hobbes, Arnauld, and Gassendi, accompanied by his *Reply to Objections*. In addition to his work in philosophy, Descartes made major contributions to the fields of optics, anatomy, physiology, and mathematics (especially analytic geometry in which “Cartesian coordinates” are still used).

Descartes chose to write his works in French as well as Latin in order to reach beyond the academics to a wider audience. His writings did, indeed, reach learned people throughout Europe and that fact, unfortunately, led indirectly to his death. In 1649, Queen Christina of Sweden invited Descartes to join a circle of leading thinkers to instruct her in philosophy. Although he initially resisted the invitation, he finally felt compelled to accept. Upon arriving in Sweden, Descartes discovered that Queen Christina had time to see him only at five each morning. Descartes had been used to lying in bed until late in the morning, reflecting and philosophizing. Within a year, the rigorous new schedule, together with Sweden’s harsh weather, led to his death.

* * *

Descartes began his philosophy by sweeping away all the “errors of the past.” Whereas Bacon turned to empirical observation to escape the “tyranny” of the past, Descartes turned to mathematics, specifically geometry. He began by establishing twenty-one *Rules for the Direction of the Mind*. He would begin by finding knowledge that he could “clearly and evidently intuit, or deduce with certainty.” Then he would build from this knowledge deductively, one step at a time. This procedure would parallel the geometrical method of moving with deductive certainty from postulates to axioms. His *Meditations on First Philosophy*, reprinted here (complete) in the outstanding John Cottingham translation, chronicles this process.

The key was to find the knowledge that he could “clearly and evidently intuit” that could serve as his starting point. Although uncertainty and doubt were the enemies, Descartes hit upon the idea of using doubt as a tool or a weapon. Instead of fighting doubt, he would use it to find certainty. He would use doubt as an acid to pour over every “truth” to see if there was anything that would not be dissolved, any “truth” that could not be doubted. Some of his doubts may seem extreme (such as that the earth may not exist or that I may be dreaming all this), but in order to find 100-percent certainty he had to find a starting point with zero-percent doubt.

After subjecting all his knowledge to the acid of doubt, he concluded that there was one thing he could not doubt: that he was doubting. The one fact the acid of doubt could not dissolve was doubt itself. This meant there had to be an “I” who was doing the doubting. Even if he were deceived about everything else, he had to exist in order to be deceived. This led Descartes to his famous statement, *Cogito ergo sum*, meaning “I think, therefore I am” (although these exact

words do not appear in the *Meditations*). Here was the “clearly and evidently intuited” knowledge, the starting point, that Descartes had been seeking.

Having established that there is an “I,” a self, a starting point, Descartes began to explore the nature of this “I”:

But what then am I? A thing that thinks. What is that? A thing that doubts, understands, affirms, denies, is willing, is unwilling, and also imagines and has sensory perceptions.

Among the ideas of this “thinking thing” called the “I” is the idea of a perfect God. Descartes went on to argue that nothing less than God could have caused the idea of God. He therefore concluded with a second certainty: that God exists.

From here Descartes moved to his third certainty: We have a strong tendency to believe in the existence of a reality beyond our consciousness. If there is no such external world, then we are terribly deceived. But a perfect God would not allow us to be unavoidably deceived, since deceit implies imperfection. Accordingly, we can conclude that we are not misled about those natural beliefs, such as the existence of an external world, so long as they can withstand the scrutiny of reason and are not willfully disregarded.

The Anatomy Lesson, 1632, by Rembrandt (1606–1669). Members of the Surgeons and Physicians Guild personify the Age of Observation with their intense scientific inquiry into human anatomy. Descartes was also interested in anatomy, making such important discoveries as that muscles work in opposition to each other. (©Heritage Image Partnership Ltd/Alamy Stock)

Descartes had now established a basis for accepting the “obvious” truths he had thrown out earlier by his method of doubt. He had at the same time identified the criterion needed to distinguish the foundational truths upon which his knowledge rested, namely, the criterion that a truth must be “clearly and distinctly perceived.” An example of his rationalistic dependence upon such intuitions is his claim that the essential nature of a material object can only be known intuitively, not through sense perceptions.

One final point needs to be noted. The “I” that Descartes found at the end of his methodological doubting was “entirely distinct from the body.” This “I” was an immaterial mind, a “spiritual” thing. The body is an “extended, non-thinking thing.” As such, it is part of the material world, subject to the same laws of motion as a billiard ball. The “I,” or the mind, on the other hand, is not bound by physical laws. This Cartesian distinction leads to a problem about the relationship between body and mind. One of the first to raise the issue was Princess Elizabeth of Bohemia (1618–1680). Her correspondence with Descartes, given here in the Anscombe and Geach translation, addresses questions with which we still struggle today.

Moyal, ed., *René Descartes: Critical Assessments* (Oxford: Routledge, 1992); Stephen Voss, ed., *Essays on the Philosophy and Science of René Descartes* (Oxford: Oxford University Press, 1993); John Cottingham, ed., *Descartes* (Oxford: Oxford University Press, 1998); Tom Sorell, ed., *Descartes* (New York: Ashgate, 1999); and Paul Hoffman, ed., *Essays on Descartes* (Oxford: Oxford University Press, 2009). Gilbert Ryle, *The Concept of Mind* (London: Hutchinson's University Library, 1949) is the classic critique of Descartes' views on body and mind, while Marleen Rozemond, *Descartes' Dualism* (Cambridge, MA: Harvard University Press, 1998); Lilli Alanen, *Descartes's Concept of Mind* (Cambridge, MA: Harvard University Press, 2003); and Desmond Clarke, *Descartes's Theory of Mind* (Oxford: Oxford University Press, 2003) are more recent studies.

MEDITATIONS ON THE FIRST PHILOSOPHY

[Dedicatory letter to the Sorbonne]

To those most learned and distinguished men, the Dean and Doctors of the Sacred Faculty of Theology at Paris, from René Descartes. 1

I have a very good reason for offering this book to you, and I am confident that you will have an equally good reason for giving it your protection once you understand the principle behind my undertaking; so much so, that my best way of commending it to you will be to tell you briefly of the goal which I shall be aiming at in the book.

I have always thought that two topics—namely God and the soul—are prime examples of subjects where demonstrative proofs ought to be given with the aid of philosophy rather than theology. For us who are believers, it is enough to accept on faith that the human soul does not die with the body, and that God exists; but in the case of unbelievers, it seems that there is no religion, and practically no moral virtue, that they can be persuaded to adopt until these two truths are proved to them by natural reason. And since in this life the rewards offered to vice are often greater than the rewards of virtue, few people would prefer what is right to what is expedient if they did not fear God or have the expectation of an after-life. It is of course quite true that we must believe in the existence of God because it is a doctrine of Holy Scripture, and conversely, that we must believe Holy Scripture because it comes from God; for since faith 2

René Descartes, *Meditations on the First Philosophy with Selections from the Objections and Replies*, translated by John Cottingham (Cambridge: Cambridge University Press, 1986). Copyright © 1986 by Cambridge University Press. Reprinted with the permission of Cambridge University Press.

is the gift of God, he who gives us grace to believe other things can also give us grace to believe that he exists. But this argument cannot be put to unbelievers because they would judge it to be circular. Moreover, I have noticed both that you and all other theologians assert that the existence of God is capable of proof by natural reason, and also that the inference from Holy Scripture is that the knowledge of God is easier to acquire than the knowledge we have of many created things—so easy, indeed, that those who do not acquire it are at fault. This is clear from a passage in the Book of Wisdom, Chapter 13: “Howbeit they are not to be excused; for if their knowledge was so great that they could value this world, why did they not rather find out the Lord thereof?” And in Romans, Chapter I it is said that they are “without excuse.” And in the same place, in the passage “that which is known of God is manifest in them,” we seem to be told that everything that may be known of God can be demonstrated by reasoning which has no other source but our own mind. Hence I thought it was quite proper for me to inquire how this may be, and how God may be more easily and more certainly known than the things of this world.

- 3 As regards the soul, many people have considered that it is not easy to discover its nature, and some have even had the audacity to assert that, as far as human reasoning goes, there are persuasive grounds for holding that the soul dies along with the body and that the opposite view is based on faith alone. But in its eighth session the Lateran Council held under Leo X condemned those who take this position,* and expressly enjoined Christian philosophers to refute their arguments and use all their powers to establish the truth; so I have not hesitated to attempt this task as well.

In addition, I know that the only reason why many irreligious people are unwilling to believe that God exists and that the human mind is distinct from the body is the alleged fact that no one has hitherto been able to demonstrate these points. Now I completely disagree with this: I think that when properly understood almost all the arguments that have been put forward on these issues by the great men have the force of demonstrations, and I am convinced that it is scarcely possible to provide any arguments which have not already been produced by someone else. Nevertheless, I think there can be no more useful service to be rendered in philosophy than to conduct a careful search, once and for all, for the best of these arguments, and to set them out so precisely and clearly as to produce for the future a general agreement that they amount to demonstrative proofs. And finally, I was strongly pressed to undertake this task by several people who knew that I had developed a method for resolving certain difficulties in the sciences—not a new method (for nothing is older than the truth), but one which they had seen me use with some success in other areas; and I therefore thought it my duty to make some attempt to apply it to the matter in hand.

- 4 The present treatise contains everything that I have been able to accomplish in this area. Not that I have attempted to collect here all the different arguments that could be put forward to establish the same results, for this does not seem worthwhile except in cases where no single argument is regarded as sufficiently reliable. What I have done is to take merely the principal and most important arguments and develop them in such a way that I would now venture to put them forward as very certain and evident demonstrations. I will add that these proofs are of such a kind that I reckon they leave no room for the possibility that the human mind will ever discover better ones. The vital importance of the cause and the glory of God, to which the entire

*The Lateran Council of 1513 condemned the Averroist heresy that denied personal immortality.

undertaking is directed, here compel me to speak somewhat more freely about my own achievements than is my custom. But although I regard the proofs as quite certain and evident, I cannot therefore persuade myself that they are suitable to be grasped by everyone. In geometry there are many writings left by Archimedes, Apollonius, Pappus, and others which are accepted by everyone as evident and certain because they contain absolutely nothing that is not very easy to understand when considered on its own, and each step fits in precisely with what has gone before; yet because they are somewhat long, and demand a very attentive reader, it is only comparatively few people who understand them. In the same way, although the proofs I employ here are in my view as certain and evident as the proofs of geometry, if not more so, it will, I fear, be impossible for many people to achieve an adequate perception of them, both because they are rather long and some depend on others, and also, above all, because they require a mind which is completely free from preconceived opinions and which can easily detach itself from involvement with the senses. Moreover, people who have an aptitude for metaphysical studies are certainly not to be found in the world in any greater numbers than those who have an aptitude for geometry. What is more, there is the difference that in geometry everyone has been taught to accept that as a rule no proposition is put forward in a book without there being a conclusive demonstration available; so inexperienced students make the mistake of accepting what is false, in their desire to appear to understand it, more often than they make the mistake of rejecting what is true. In philosophy, by contrast, the belief is that everything can be argued either way; so few people pursue the truth, while the great majority build up their reputation for ingenuity by boldly attacking whatever is most sound.

Hence, whatever the quality of my arguments may be, because they have to do with philosophy I do not expect they will enable me to achieve any very worthwhile results unless you come to my aid by granting me your patronage.* The reputation of your Faculty is so firmly fixed in the minds of all, and the name of the Sorbonne has such authority that, with the exception of the Sacred Councils, no institution carries more weight than yours in matters of faith; while as regards human philosophy, you are thought of as second to none, both for insight and soundness and also for the integrity and wisdom of your pronouncements. Because of this, the results of your careful attention to this book, if you deigned to give it, would be threefold. First, the errors in it would be corrected—for when I remember not only that I am a human being, but above all that I am an ignorant one, I cannot claim it is free of mistakes. Secondly, any passages which are defective, or insufficiently developed or requiring further explanation, would be supplemented, completed and clarified, either by yourselves or by me after you have given me your advice. And lastly, once the arguments in the book proving that God exists and that the mind is distinct from the body have been brought, as I am sure they can be, to such a pitch of clarity that they are fit to be regarded as very exact demonstrations, you may be willing to declare as much, and make a public statement to that effect. If all this were to happen, I do not doubt that all the errors which have ever existed on these subjects would soon be eradicated from the minds of men. In the case of all those who share your intelligence and learning, the truth itself will readily ensure that they subscribe to your opinion. As for the atheists, who are generally posers rather than people of real intelligence or learning, your authority will induce them to lay aside the spirit of contradiction; and, since they know that the arguments are regarded as

*Although the title page of the first edition of the *Meditations* carries the words “with the approval of the learned doctors,” Descartes never, in fact, obtained the endorsement from the Sorbonne which he sought.

demonstrations by all who are intellectually gifted, they may even go so far as to defend them, rather than appear not to understand them. And finally, everyone else will confidently go along with so many declarations of assent, and there will be no one left in the world who will dare to call into doubt either the existence of God or the real distinction between the human soul and body. The great advantage that this would bring is something which you, in your singular wisdom, are in a better position to evaluate than anyone; and it would ill become me to spend any more time commending the cause of God and religion to you, who have always been the greatest tower of strength to the Catholic Church.

7 PREFACE TO READER

I briefly touched on the topics of God and the human mind in my *Discourse on the method of rightly conducting reason and seeking the truth in the sciences*, which was published in French in 1637. My purpose there was not to provide a full treatment, but merely to offer a sample, and learn from the views of my readers how I should handle these topics at a later date. The issues seemed to me of such great importance that I considered they ought to be dealt with more than once; and the route which I follow in explaining them is so untrodden and so remote from the normal way, that I thought it would not be helpful to give a full account of it in a book written in French and designed to be read by all and sundry, in case weaker intellects might believe that they ought to set out on the same path.

In the *Discourse* I asked anyone who found anything worth criticizing in what I had written to be kind enough to point it out to me. In the case of my remarks concerning God and the soul, only two objections worth mentioning were put to me, which I shall now briefly answer before embarking on a more precise elucidation of these topics.

- 8 The first objection is this. From the fact that the human mind, when directed towards itself, does not perceive itself to be anything other than a thinking thing, it does not follow that its nature or essence consists only in its being a thinking thing, where the word “only” excludes everything else that could be said to belong to the nature of the soul. My answer to this objection is that in that passage it was not my intention to make those exclusions in an order corresponding to the actual truth of the matter (which I was not dealing with at that stage) but merely in an order corresponding to my own perception. So the sense of the passage was that I was aware of nothing at all that I knew belonged to my essence, except that I was a thinking thing, or a thing possessing within itself the faculty of thinking. I shall, however, show below how it follows from the fact that I am aware of nothing else belonging to my essence, that nothing else does in fact belong to it.

The second objection is this. From the fact that I have within me an idea of a thing more perfect than myself, it does not follow that the idea itself is more perfect than me, still less that what is represented by the idea exists. My reply is that there is an ambiguity here in the word “idea.” “Idea” can be taken materially, as an operation of the intellect, in which case it cannot be said to be more perfect than me. Alternatively, it can be taken objectively, as the thing represented by that operation; and this thing, even if it is not regarded as existing outside the intellect, can still, in virtue of its essence, be more

perfect than myself. As to how, from the mere fact that there is within me an idea of something more perfect than me, it follows that this thing really exists, this is something which will be fully explained below.

Apart from these objections, there are two fairly lengthy essays which I have looked at, but these did not attack my reasoning on these matters so much as my conclusions, and employed arguments lifted from the standard sources of the atheists. But arguments of this sort can carry no weight with those who understand my reasoning. Moreover, the judgement of many people is so silly and weak that, once they have accepted a view, they continue to believe it, however false and irrational it may be, in preference to a true and well-grounded refutation which they hear subsequently. So I do not wish to reply to such arguments here, if only to avoid having to state them. I will only make the general point that all the objections commonly tossed around by atheists to attack the existence of God invariably depend either on attributing human feelings to God or on arrogantly supposing our own minds to be so powerful and wise that we can attempt to grasp and set limits to what God can or should perform. So, provided only that we remember that our minds must be regarded as finite, while God is infinite and beyond our comprehension, such objections will not cause us any difficulty. 9

But now that I have, after a fashion, taken an initial sample of people's opinions, I am again tackling the same questions concerning God and the human mind; and this time I am also going to deal with the foundations of First Philosophy in its entirety. But I do not expect any popular approval, or indeed any wide audience. On the contrary I would not urge anyone to read this book except those who are able and willing to meditate seriously with me, and to withdraw their minds from the senses and from all preconceived opinions. Such readers, as I well know, are few and far between. Those who do not bother to grasp the proper order of my arguments and the connection between them, but merely try to carp at individual sentences, as is the fashion, will not get much benefit from reading this book. They may well find an opportunity to quibble in many places, but it will not be easy for them to produce objections which are telling or worth replying to. 10

But I certainly do not promise to satisfy my other readers straightaway on all points, and I am not so presumptuous as to believe that I am capable of foreseeing all the difficulties which anyone may find. So first of all, in the *Meditations*, I will set out the very thoughts which have enabled me, in my view, to arrive at a certain and evident knowledge of the truth, so that I can find out whether the same arguments which have convinced me will enable me to convince others. Next, I will reply to the objections of various men of outstanding intellect and scholarship who had these *Meditations* sent to them for scrutiny before they went to press. For the objections they raised were so many and so varied that I would venture to hope that it will be hard for anyone else to think of any point—at least of any importance—which these critics have not touched on. I therefore ask my readers not to pass judgement on the *Meditations* until they have been kind enough to read through all these objections and my replies to them.

SYNOPSIS OF FOLLOWING SIX MEDITATIONS

12

In the First Meditation reasons are provided which give us possible grounds for doubt about all things, especially material things, so long as we have no foundations for the

sciences other than those which we have had up till now. Although the usefulness of such extensive doubt is not apparent at first sight, its greatest benefit lies in freeing us from all our preconceived opinions, and providing the easiest route by which the mind may be led away from the senses. The eventual result of this doubt is to make it impossible for us to have any further doubts about what we subsequently discover to be true.

- In the Second Meditation, the mind uses its own freedom and supposes the non-existence of all the things about whose existence it can have even the slightest doubt; and in so doing the mind notices that it is impossible that it should not itself exist during this time. This exercise is also of the greatest benefit, since it enables the mind to distinguish without difficulty what belongs to itself, i.e. to an intellectual nature, from what belongs to the body. But since some people may perhaps expect arguments for the immortality of the soul in this section, I think they should be warned here and now that I have tried not to put down anything which I could not precisely demonstrate. Hence the only order which I could follow was that normally employed by geometers, namely to set out all the premisses on which a desired proposition depends, before drawing any conclusions about it. Now the first and most important prerequisite for knowledge of the immortality of the soul is for us to form a concept of the soul which is as clear as possible and is also quite distinct from every concept of body; and that is just what has been done in this section. A further requirement is that we should know that everything that we clearly and distinctly understand is true in a way which corresponds exactly to our understanding of it; but it was not possible to prove this before the Fourth Meditation. In addition we need to have a distinct concept of corporeal nature, and this is developed partly in the Second Meditation itself, and partly in the Fifth and Sixth Meditations. The inference to be drawn from these results is that all the things that we clearly and distinctly conceive of as different substances (as we do in the case of mind and body) are in fact substances which are really distinct one from the other; and this conclusion is drawn in the Sixth Meditation. This conclusion is confirmed in the same Meditation by the fact that we cannot understand a body except as being divisible, while by contrast we cannot understand a mind except as being indivisible. For we cannot conceive of half of a mind, while we can always conceive of half of a body, however small; and this leads us to recognize that the natures of mind and body are not only different, but in some way opposite. But I have not pursued this topic any further in this book, first because these arguments are enough to show that the decay of the body does not imply the destruction of the mind, and are hence enough to give mortals the hope of an after-life, and secondly because the premisses which lead to the conclusion that the soul is immortal depend on an account of the whole of physics. This is required for two reasons. First, we need to know that absolutely all substances, or things which must be created by God in order to exist, are by their nature incorruptible and cannot ever cease to exist unless they are reduced to nothingness by God's denying his concurrence* to them. Secondly, we need to recognize that body, taken in the general sense, is a substance, so that it too never perishes. But the human body, in so far as it differs from other bodies, is simply made up of a certain configuration of limbs and other accidents** of this sort; whereas the human mind is not made up of any accidents in

*The continuous divine action necessary to maintain things in existence.

**Descartes here uses this scholastic term to refer to those features of a thing which may alter, e.g. the particular size, shape, etc. of a body, or the particular thoughts, desires, etc. of a mind.

this way, but is a pure substance. For even if all the accidents of the mind change, so that it has different objects of the understanding and different desires and sensations, it does not on that account become a different mind; whereas a human body loses its identity merely as a result of a change in the shape of some of its parts. And it follows from this that while the body can very easily perish, the mind* is immortal by its very nature.

In the Third Meditation I have explained quite fully enough, I think, my principal argument for proving the existence of God. But in order to draw my readers' minds away from the senses as far as possible, I was not willing to use any comparison taken from bodily things. So it may be that many obscurities remain; but I hope they will be completely removed later, in my Replies to the Objections. One such problem, among others, is how the idea of a supremely perfect being, which is in us, possesses so much objective reality that it can come only from a cause which is supremely perfect. In the Replies this is illustrated by the comparison of a very perfect machine, the idea of which is in the mind of some engineer. Just as the objective intricacy belonging to the idea must have some cause, namely the scientific knowledge of the engineer, or of someone else who passed the idea on to him, so the idea of God which is in us must have God himself as its cause. 15

In the Fourth Meditation it is proved that everything that we clearly and distinctly perceive is true, and I also explain what the nature of falsity consists in. These results need to be known both in order to confirm what has gone before and also to make intelligible what is to come later. (But here it should be noted in passing that I do not deal at all with sin, i.e. the error which is committed in pursuing good and evil, but only with the error that occurs in distinguishing truth from falsehood. And there is no discussion of matters pertaining to faith or the conduct of life, but simply of speculative truths which are known solely by means of the natural light.)

In the Fifth Meditation, besides an account of corporeal nature taken in general, there is a new argument demonstrating the existence of God. Again, several difficulties may arise here, but these are resolved later in the Replies to the Objections. Finally I explain the sense in which it is true that the certainty even of geometrical demonstrations depends on the knowledge of God.

Lastly, in the Sixth Meditation, the intellect is distinguished from the imagination; the criteria for this distinction are explained; the mind is proved to be really distinct from the body, but is shown, notwithstanding, to be so closely joined to it that the mind and the body make up a kind of unit; there is a survey of all the errors which commonly come from the senses, and an explanation of how they may be avoided; and, lastly, there is a presentation of all the arguments which enable the existence of material things to be inferred. The great benefit of these arguments is not, in my view, that they prove what they establish—namely that there really is a world, and that human beings have bodies and so on—since no sane person has ever seriously doubted these things. The point is that in considering these arguments we come to realize that they are not as solid or as transparent as the arguments which lead us to knowledge of our own minds and of God, so that the latter are the most certain and evident of all possible objects of knowledge for the human intellect. Indeed, this is the one thing that I set myself to prove in these Meditations. And for that reason I will not now go over the various other issues in the book which are dealt with as they come up. 16

*“... or the soul of man, for I make no distinction between them” (added in French version).

FIRST MEDITATION

What can be called into doubt

Some years ago I was struck by the large number of falsehoods that I had accepted as true in my childhood, and by the highly doubtful nature of the whole edifice that I had subsequently based on them. I realized that it was necessary, once in the course of my life, to demolish everything completely and start again right from the foundations if I wanted to establish anything at all in the sciences that was stable and likely to last. But the task looked an enormous one, and I began to wait until I should reach a mature enough age to ensure that no subsequent time of life would be more suitable for tackling such inquiries. This led me to put the project off for so long that I would now be to blame if by pondering over it any further I wasted the time still left for carrying it out. So today I have expressly rid my mind of all worries and arranged for myself a clear stretch of free time. I am here quite alone, and at last I will devote myself sincerely and without reservation to the general demolition of my opinions.

But to accomplish this, it will not be necessary for me to show that all my opinions are false, which is something I could perhaps never manage. Reason now leads me to think that I should hold back my assent from opinions which are not completely certain and indubitable just as carefully as I do from those which are patently false. So, for the purpose of rejecting all my opinions, it will be enough if I find in each of them at least some reason for doubt. And to do this I will not need to run through them all individually, which would be an endless task. Once the foundations of a building are undermined, anything built on them collapses of its own accord; so I will go straight for the basic principles on which all my former beliefs rested.

Whatever I have up till now accepted as most true I have acquired either from the senses or through the senses. But from time to time I have found that the senses deceive, and it is prudent never to trust completely those who have deceived us even once.

Yet although the senses occasionally deceive us with respect to objects which are very small or in the distance, there are many other beliefs about which doubt is quite impossible, even though they are derived from the senses—for example, that I am here, sitting by the fire, wearing a winter dressing-gown, holding this piece of paper in my hands, and so on. Again, how could it be denied that these hands or this whole body are mine? Unless perhaps I were to liken myself to madmen, whose brains are so damaged by the persistent vapours of melancholia that they firmly maintain they are kings when they are paupers, or say they are dressed in purple when they are naked, or that their heads are made of earthenware or that they are pumpkins, or made of glass. But such people are insane and I would be thought equally mad if I took anything from them as: model for myself.

A brilliant piece of reasoning! As if I were not a man who sleeps a night, and regularly has all the same experiences while asleep a madmen do when awake—indeed sometimes even more improbable ones. How often, asleep at night, am I convinced of just such familiar events—that I am here in my dressing-gown, sitting by the fire—when in fact I am lying undressed in bed! Yet at the moment my eyes are certainly wide awake when I look at this piece of paper; I shake my head and it is not asleep; as I stretch out and feel my hand I do so deliberately, and I know what I am doing. All this would not happen with such distinctness to someone asleep. Indeed! As if I did not remember other occasions when I have been tricked by exactly similar thoughts while asleep! As I think about this more carefully, I see plainly that there are never any sure signs by means of

which being awake can be distinguished from being asleep. The result is that I begin to feel dazed, and this very feeling only reinforces the notion that I may be asleep.

Suppose then that I am dreaming, and that these particulars—that my eyes are open, that I am moving my head and stretching out my hands—are not true. Perhaps, indeed, I do not even have such hands or such a body at all. Nonetheless, it must surely be admitted that the visions which come in sleep are like paintings, which must have been fashioned in the likeness of things that are real, and hence that at least these general kinds of things—eyes, head, hands and the body as a whole—are things which are not imaginary but are real and exist. For even when painters try to create sirens and satyrs with the most extraordinary bodies, they cannot give them natures which are new in all respects; they simply jumble up the limbs of different animals. Or if perhaps they manage to think up something so new that nothing remotely similar has ever been seen before—something which is therefore completely fictitious and unreal—at least the colours used in the composition must be real. By similar reasoning, although these general kinds of things—eyes, head, hands and so on—could be imaginary, it must at least be admitted that certain other even simpler and more universal things are real. These are as it were the real colours from which we form all the images of things, whether true or false, that occur in our thought. 20

This class appears to include corporeal nature in general, and its extension; the shape of extended things; the quantity, or size and number of these things; the place in which they may exist, the time through which they may endure, and so on.

So a reasonable conclusion from this might be that physics, astronomy, medicine, and all other disciplines which depend on the study of composite things, are doubtful; while arithmetic, geometry and other subjects of this kind, which deal only with the simplest and most general things, regardless of whether they really exist in nature or not, contain something certain and indubitable. For whether I am awake or asleep, two and three added together are five, and a square has no more than four sides. It seems impossible that such transparent truths should incur any suspicion of being false.

And yet firmly rooted in my mind is the long-standing opinion that there is an omnipotent God who made me the kind of creature that I am. How do I know that he has not brought it about that there is no earth, no sky, no extended thing, no shape, no size, no place, while at the same time ensuring that all these things appear to me to exist just as they do now? What is more, since I sometimes believe that others go astray in cases where they think they have the most perfect knowledge, may I not similarly go wrong every time I add two and three or count the sides of a square, or in some even simpler matter, if that is imaginable? But perhaps God would not have allowed me to be deceived in this way, since he is said to be supremely good. But if it were inconsistent with his goodness to have created me such that I am deceived all the time, it would seem equally foreign to his goodness to allow me to be deceived even occasionally; yet this last assertion cannot be made. 21

Perhaps there may be some who would prefer to deny the existence of so powerful a God rather than believe that everything else is uncertain. Let us not argue with them, but grant them that everything said about God is a fiction. According to their supposition, then, I have arrived at my present state by fate or chance or a continuous chain of events, or by some other means; yet since deception and error seem to be imperfections, the less powerful they make my original cause, the more likely it is that I am so imperfect as to be deceived all the time. I have no answer to these arguments, but am finally compelled to admit that there is not one of my former beliefs about which a doubt may not properly be raised; and this is not a flippant or ill-considered

- 22 conclusion, but is based on powerful and well thought-out reasons. So in future I must withhold my assent from these former beliefs just as carefully as I would from obvious falsehoods, if I want to discover any certainty.

But it is not enough merely to have noticed this; I must make an effort to remember it. My habitual opinions keep coming back, and, despite my wishes, they capture my belief, which is as it were bound over to them as a result of long occupation and the law of custom. I shall never get out of the habit of confidently assenting to these opinions, so long as I suppose them to be what in fact they are, namely highly probable opinions—opinions which, despite the fact that they are in a sense doubtful, as has just been shown, it is still much more reasonable to believe than to deny. In view of this, I think it will be a good plan to turn my will in completely the opposite direction and deceive myself, by pretending for a time that these former opinions are utterly false and imaginary. I shall do this until the weight of preconceived opinion is counter-balanced and the distorting influence of habit no longer prevents my judgement from perceiving things correctly. In the meantime, I know that no danger or error will result from my plan, and that I cannot possibly go too far in my distrustful attitude. This is because the task now in hand does not involve action but merely the acquisition of knowledge.

- I will suppose therefore that not God, who is supremely good and the source of truth, but rather some malicious demon of the utmost power and cunning has employed all his energies in order to deceive me. I shall think that the sky, the air, the earth, colours, shapes, sounds and all external things are merely the delusions of
 23 dreams which he has devised to ensnare my judgement. I shall consider myself as not having hands or eyes, or flesh, or blood or senses, but as falsely believing that I have all these things. I shall stubbornly and firmly persist in this meditation; and, even if it is not in my power to know any truth, I shall at least do what is in my power, that is, resolutely guard against assenting to any falsehoods, so that the deceiver, however powerful and cunning he may be, will be unable to impose on me in the slightest degree. But this is an arduous undertaking, and a kind of laziness brings me back to normal life. I am like a prisoner who is enjoying an imaginary freedom while asleep; as he begins to suspect that he is asleep, he dreads being woken up, and goes along with the pleasant illusion as long as he can. In the same way, I happily slide back into my old opinions and dread being shaken out of them, for fear that my peaceful sleep may be followed by hard labour when I wake, and that I shall have to toil not in the light, but amid the inextricable darkness of the problems I have now raised.

SECOND MEDITATION

The nature of the human mind, and how it is better known than the body

- So serious are the doubts into which I have been thrown as a result of yesterday's meditation that I can neither put them out of my mind nor see any way of resolving
 24 them. It feels as if I have fallen unexpectedly into a deep whirlpool which tumbles me around so that I can neither stand on the bottom nor swim up to the top. Nevertheless I will make an effort and once more attempt the same path which I started on yesterday. Anything which admits of the slightest doubt I will set aside just as if I had found it to be wholly false; and I will proceed in this way until I recognize something certain, or, if

nothing else, until I at least recognize for certain that there is no certainty. Archimedes used to demand just one firm and immovable point in order to shift the entire earth; so I too can hope for great things if I manage to find just one thing, however slight, that is certain and unshakeable.

I will suppose then, that everything I see is spurious. I will believe that my memory tells me lies, and that none of the things that it reports ever happened. I have no senses. Body, shape, extension, movement and place are chimeras. So what remains true? Perhaps just the one fact that nothing is certain.

Yet apart from everything I have just listed, how do I know that there is not something else which does not allow even the slightest occasion for doubt? Is there not a God, or whatever I may call him, who puts into me the thoughts I am now having? But why do I think this, since I myself may perhaps be the author of these thoughts? In that case am not I, at least, something? But I have just said that I have no senses and no body. This is the sticking point: what follows from this? Am I not so bound up with a body and with senses that I cannot exist without them? But I have convinced myself that there is absolutely nothing in the world, no sky, no earth, no minds, no bodies. Does it now follow that I too do not exist? No: if I convinced myself of something then I certainly existed. But there is a deceiver of supreme power and cunning who is deliberately and constantly deceiving me. In that case I too undoubtedly exist, if he is deceiving me; and let him deceive me as much as he can, he will never bring it about that I am nothing so long as I think that I am something. So after considering everything very thoroughly, I must finally conclude that this proposition, *I am, I exist*, is necessarily true whenever it is put forward by me or conceived in my mind. 25

But I do not yet have a sufficient understanding of what this “I” is, that now necessarily exists. So I must be on my guard against carelessly taking something else to be this “I,” and so making a mistake in the very item of knowledge that I maintain is the most certain and evident of all. I will therefore go back and meditate on what I originally believed myself to be, before I embarked on this present train of thought. I will then subtract anything capable of being weakened, even minimally, by the arguments now introduced, so that what is left at the end may be exactly and only what is certain and unshakeable.

What then did I formerly think I was? A man. But what is a man? Shall I say “a rational animal”? No; for then I should have to inquire what an animal is, what rationality is, and in this way one question would lead me down the slope to other harder ones, and I do not now have the time to waste on subtleties of this kind. Instead I propose to concentrate on what came into my thoughts spontaneously and quite naturally whenever I used to consider what I was. Well, the first thought to come to mind was that I had a face, hands, arms and the whole mechanical structure of limbs which can be seen in a corpse, and which I called the body. The next thought was that I was nourished, that I moved about, and that I engaged in sense-perception and thinking; and these actions I attributed to the soul. But as to the nature of this soul, either I did not think about this or else I imagined it to be something tenuous, like a wind or fire or ether, which permeated my more solid parts. As to the body, however, I had no doubts about it, but thought I knew its nature distinctly. If I had tried to describe the mental conception I had of it, I would have expressed it as follows: by a body I understand whatever has a determinable shape and a definable location and can occupy a space in such a way as to exclude any other body; it can be perceived by touch, sight, hearing, taste or smell, and can be moved in various ways, not by itself but by whatever else comes into contact with it. For, according to my judgement, the power of self-movement, like the power of 26

sensation or of thought, was quite foreign to the nature of a body; indeed, it was a source of wonder to me that certain bodies were found to contain faculties of this kind.

- 27 But what shall I now say that I am, when I am supposing that there is some supremely powerful and, if it is permissible to say so, malicious deceiver, who is deliberately trying to trick me in every way he can? Can I now assert that I possess even the most insignificant of all the attributes which I have just said belong to the nature of a body? I scrutinize them, think about them, go over them again, but nothing suggests itself; it is tiresome and pointless to go through the list once more. But what about the attributes I assigned to the soul? Nutrition or movement? Since now I do not have a body, these are mere fabrications. Sense-perception? This surely does not occur without a body, and besides, when asleep I have appeared to perceive through the senses many things which I afterwards realized I did not perceive through the senses at all. Thinking? At last I have discovered it—thought; this alone is inseparable from me. I am, I exist—that is certain. But for how long? For as long as I am thinking. For it could be that were I totally to cease from thinking, I should totally cease to exist. At present I am not admitting anything except what is necessarily true. I am, then, in the strict sense only a thing that thinks; that is, I am a mind, or intelligence, or intellect, or reason—words whose meaning I have been ignorant of until now. But for all that I am a thing which is real and which truly exists. But what kind of a thing? As I have just said—a thinking thing.

- 28 What else am I? I will use my imagination. I am not that structure of limbs which is called a human body. I am not even some thin vapour which permeates the limbs—a wind, fire, air, breath, or whatever I depict in my imagination; for these are things which I have supposed to be nothing. Let this supposition stand; for all that I am still something. And yet may it not perhaps be the case that these very things which I am supposing to be nothing, because they are unknown to me, are in reality identical with the “I” of which I am aware? I do not know, and for the moment I shall not argue the point, since I can make judgements only about things which are known to me. I know that I exist; the question is, what is this “I” that I know? If the “I” is understood strictly as we have been taking it, then it is quite certain that knowledge of it does not depend on things of whose existence I am as yet unaware; so it cannot depend on any of the things which I invent in my imagination. And this very word “invent” shows me my mistake. It would indeed be a case of fictitious invention if I used my imagination to establish that I was something or other; for imagining is simply contemplating the shape or image of a corporeal thing. Yet now I know for certain both that I exist and at the same time that all such images and, in general, everything relating to the nature of body, could be mere dreams [and chimeras]. Once this point has been grasped, to say “I will use my imagination to get to know more distinctly what I am” would seem to be as silly as saying “I am now awake, and see some truth; but since my vision is not yet clear enough, I will deliberately fall asleep so that my dreams may provide a truer and clearer representation.” I thus realize that none of the things that the imagination enables me to grasp is at all relevant to this knowledge of myself which I possess, and that the mind must therefore be most carefully diverted from such things if it is to perceive its own nature as distinctly as possible.

But what then am I? A thing that thinks. What is that? A thing that doubts, understands, affirms, denies, is willing, is unwilling, and also imagines and has sensory perceptions.

This is a considerable list, if everything on it belongs to me. But does it? Is it not one and the same “I” who is now doubting almost everything, who nonetheless understands some things, who affirms that this one thing is true, denies everything else, desires

to know more, is unwilling to be deceived, imagines many things even involuntarily, and is aware of many things which apparently come from the senses? Are not all these things just as true as the fact that I exist, even if I am asleep all the time, and even if he who created me is doing all he can to deceive me? Which of all these activities is distinct from my thinking? Which of them can be said to be separate from myself? The fact that it is I who am doubting and understanding and willing is so evident that I see no way of making it any clearer. But it is also the case that the "I" who imagines is the same "I." For even if, as I have supposed, none of the objects of imagination are real, the power of imagination is something which really exists and is part of my thinking. Lastly, it is also the same "I" who has sensory perceptions, or is aware of bodily things as it were through the senses. For example, I am now seeing light, hearing a noise, feeling heat. But I am asleep, so all this is false. Yet I certainly *seem* to see, to hear, and to be warmed. This cannot be false; what is called "having a sensory perception" is strictly just this, and in this restricted sense of the term it is simply thinking.

From all this I am beginning to have a rather better understanding of what I am. But it still appears—and I cannot stop thinking this—that the corporeal things of which images are formed in my thought, and which the senses investigate, are known with much more distinctness than this puzzling "I" which cannot be pictured in the imagination. And yet it is surely surprising that I should have a more distinct grasp of things which I realize are doubtful, unknown and foreign to me, than I have of that which is true and known—my own self. But I see what it is: my mind enjoys wandering off and will not yet submit to being restrained within the bounds of truth. Very well then; just this once let us give it a completely free rein, so that after a while, when it is time to tighten the reins, it may more readily submit to being curbed.

Let us consider the things which people commonly think they understand most distinctly of all; that is, the bodies which we touch and see. I do not mean bodies in general—for general perceptions are apt to be somewhat more confused—but one particular body. Let us take, for example, this piece of wax. It has just been taken from the honeycomb; it has not yet quite lost the taste of the honey; it retains some of the scent of the flowers from which it was gathered; its colour, shape and size are plain to see; it is hard, cold and can be handled without difficulty; if you rap it with your knuckle it makes a sound. In short, it has everything which appears necessary to enable a body to be known as distinctly as possible. But even as I speak, I put the wax by the fire, and look: the residual taste is eliminated, the smell goes away, the colour changes, the shape is lost, the size increases; it becomes liquid and hot; you can hardly touch it, and if you strike it, it no longer makes a sound. But does the same wax remain? It must be admitted that it does; no one denies it, no one thinks otherwise. So what was it in the wax that I understood with such distinctness? Evidently none of the features which I arrived at by means of the senses; for whatever came under taste, smell, sight, touch or hearing has now altered—yet the wax remains.

Perhaps the answer lies in the thought which now comes to my mind; namely, the wax was not after all the sweetness of the honey, or the fragrance of the flowers, or the whiteness, or the shape, or the sound, but was rather a body which presented itself to me in these various forms a little while ago, but which now exhibits different ones. But what exactly is it that I am now imagining? Let us concentrate, take away everything which does not belong to the wax, and see what is left: merely something extended, flexible and changeable. But what is meant here by "flexible" and "changeable"? Is it what I picture in my imagination: that this piece of wax is capable of changing from a round shape to a square shape, or from a square shape to a triangular shape? Not at all;

for I can grasp that the wax is capable of countless changes of this kind, yet I am unable to run through this immeasurable number of changes in my imagination, from which it follows that it is not the faculty of imagination that gives me my grasp of the wax as flexible and changeable. And what is meant by “extended”? Is the extension of the wax also unknown? For it increases if the wax melts, increases again if it boils, and is greater still if the heat is increased. I would not be making a correct judgement about the nature of wax unless I believed it capable of being extended in many more different ways than I will ever encompass in my imagination. I must therefore admit that the nature of this piece of wax is in no way revealed by my imagination, but is perceived by the mind alone. (I am speaking of this particular piece of wax; the point is even clearer with regard to wax in general.) But what is this wax which is perceived by the mind alone? It is of course the same wax which I see, which I touch, which I picture in my imagination, in short the same wax which I thought it to be from the start. And yet, and here is the point, the perception I have of it is a case not of vision or touch or imagination—nor has it ever been, despite previous appearances—but of purely mental scrutiny; and this can be imperfect and confused, as it was before, or clear and distinct as it is now, depending on how carefully I concentrate on what the wax consists in.

32 But as I reach this conclusion I am amazed at how [weak and] prone to error my mind is. For although I am thinking about these matters within myself, silently and without speaking, nonetheless the actual words bring me up short, and I am almost tricked by ordinary ways of talking. We say that we see the wax itself, if it is there before us, not that we judge it to be there from its colour or shape; and this might lead me to conclude without more ado that knowledge of the wax comes from what the eye sees, and not from the scrutiny of the mind alone. But then if I look out of the window and see men crossing the square, as I just happen to have done, I normally say that I see the men themselves, just as I say that I see the wax. Yet do I see any more than hats and coats which could conceal automatons? I *judge* that they are men. And so something which I thought I was seeing with my eyes is in fact grasped solely by the faculty of judgement which is in my mind.

However, one who wants to achieve knowledge above the ordinary level should feel ashamed at having taken ordinary ways of talking as a basis for doubt. So let us proceed, and consider on which occasion my perception of the nature of the wax was more perfect and evident. Was it when I first looked at it, and believed I knew it by my external senses, or at least by what they call the “common” sense—that is, the power of imagination? Or is my knowledge more perfect now, after a more careful investigation of the nature of the wax and of the means by which it is known? Any doubt on this issue would clearly be foolish; for what distinctness was there in my earlier perception? Was there anything in it which an animal could not possess? But when I distinguish the wax from its outward forms—take the clothes off, as it were, and consider it naked—then although my judgement may still contain errors, at least my perception now requires a human mind.

33 But what am I to say about this mind, or about myself? (So far, remember, I am not admitting that there is anything else in me except a mind.) What, I ask, is this “I” which seems to perceive the wax so distinctly? Surely my awareness of my own self is not merely much truer and more certain than my awareness of the wax, but also much more distinct and evident. For if I judge that the wax exists from the fact that I see it, clearly this same fact entails much more evidently that I myself also exist. It is possible that what I see is not really the wax; it is possible that I do not even have eyes with which to see anything. But when I see, or think I see (I am not here distinguishing the

THIRD MEDITATION

The existence of God

I will now shut my eyes, stop my ears, and withdraw all my senses. I will eliminate from my thoughts all images of bodily things, or rather, since this is hardly possible, I will regard all such images as vacuous, false and worthless. I will converse with myself and scrutinize myself more deeply; and in this way I will attempt to achieve, little by little, a more intimate knowledge of myself. I am a thing that thinks: that is, a thing that doubts, affirms, denies, understands a few things, is ignorant of many things, is willing, is unwilling, and also which imagines and has sensory perceptions; for as I have noted before, even though the objects of my sensory experience and imagination may have no existence outside me, nonetheless the modes of thinking which I refer to as

35 cases of sensory perception and imagination, in so far as they are simply modes of thinking, do exist within me—of that I am certain.

In this brief list I have gone through everything I truly know, or at least everything I have so far discovered that I know. Now I will cast around more carefully to see whether there may be other things within me which I have not yet noticed. I am certain that I am a thinking thing. Do I not therefore also know what is required for my being certain about anything? In this first item of knowledge there is simply a clear and distinct perception of what I am asserting; this would not be enough to make me certain of the truth of the matter if it could ever turn out that something which I perceived with such clarity and distinctness was false. So I now seem to be able to lay it down as a general rule that whatever I perceive very clearly and distinctly is true.

Yet I previously accepted as wholly certain and evident many things which I afterwards realized were doubtful. What were these? The earth, sky, stars, and everything else that I apprehended with the senses. But what was it about them that I perceived clearly? Just that the ideas, or thoughts, of such things appeared before my mind. Yet even now I am not denying that these ideas occur within me. But there was something else which I used to assert, and which through habitual belief I thought I perceived clearly, although I did not in fact do so. This was that there were things outside me which were the sources of my ideas and which resembled them in all respects. Here was my mistake; or at any rate, if my judgement was true, it was not thanks to the strength of my perception.

But what about when I was considering something very simple and straightforward in arithmetic or geometry, for example that two and three added together make five, and so on? Did I not see at least these things clearly enough to affirm their truth? Indeed, the only reason for my later judgement that they were open to doubt was that it occurred to me that perhaps some God could have given me a nature such that I was deceived even in matters which seemed most evident. And whenever my preconceived belief in the supreme power of God comes to mind, I cannot but admit that it would be easy for him, if he so desired, to bring it about that I go wrong even in those matters which I think I see utterly clearly with my mind's eye. Yet when I turn to the things themselves which I think I perceive very clearly, I am so convinced by them that I spontaneously declare: let whoever can do so deceive me, he will never bring it about that I am nothing, so long as I continue to think I am something; or make it true at some future time that I have never existed, since it is now true that I exist; or bring it about that two and three added together are more or less than five, or anything of this kind in which

36

I see a manifest contradiction. And since I have no cause to think that there is a deceiving God, and I do not yet even know for sure whether there is a God at all, any reason for doubt which depends simply on this supposition is a very slight and, so to speak, metaphysical one. But in order to remove even this slight reason for doubt, as soon as the opportunity arises I must examine whether there is a God, and, if there is, whether he can be a deceiver. For if I do not know this, it seems that I can never be quite certain about anything else.

First, however, considerations of order appear to dictate that I now classify my thoughts into definite kinds, and ask which of them can properly be said to be the bearers of truth and falsity. Some of my thoughts are as it were the images of things, and it is only in these cases that the term “idea” is strictly appropriate—for example, when I think of a man, or a chimera, or the sky, or an angel, or God. Other thoughts have various additional forms: thus when I will, or am afraid, or affirm, or deny, there is always a particular thing which I take as the object of my thought, but my thought includes something more than the likeness of that thing. Some thoughts in this category are called volitions or emotions, while others are called judgements. 37

Now as far as ideas are concerned, provided they are considered solely in themselves and I do not refer them to anything else, they cannot strictly speaking be false; for whether it is a goat or a chimera that I am imagining, it is just as true that I imagine the former as the latter. As for the will and the emotions, here too one need not worry about falsity; for even if the things which I may desire are wicked or even non-existent, that does not make it any less true that I desire them. Thus the only remaining thoughts where I must be on my guard against making a mistake are judgements. And the chief and most common mistake which is to be found here consists in my judging that the ideas which are in me resemble, or conform to, things located outside me. Of course, if I considered just the ideas themselves simply as modes of my thought, without referring them to anything else, they could scarcely give me any material for error.

Among my ideas, some appear to be innate, some to be adventitious,* and others to have been invented by me. My understanding of what a thing is, what truth is, and what thought is, seems to derive simply from my own nature. But my hearing a noise, as I do now, or seeing the sun, or feeling the fire, comes from things which are located outside me, or so I have hitherto judged. Lastly, sirens, hippogriffs and the like are my own invention. But perhaps all my ideas may be thought of as adventitious, or they may all be innate, or all made up; for as yet I have not clearly perceived their true origin. 38

But the chief question at this point concerns the ideas which I take to be derived from things existing outside me: what is my reason for thinking that they resemble these things? Nature has apparently taught me to think this. But in addition I know by experience that these ideas do not depend on my will, and hence that they do not depend simply on me. Frequently I notice them even when I do not want to: now, for example, I feel the heat whether I want to or not, and this is why I think that this sensation or idea of heat comes to me from something other than myself, namely the heat of the fire by which I am sitting. And the most obvious judgement for me to make is that the thing in question transmits to me its own likeness rather than something else.

I will now see if these arguments are strong enough. When I say “Nature taught me to think this,” all I mean is that a spontaneous impulse leads me to believe it, not that its truth has been revealed to me by some natural light. There is a big difference here. Whatever is revealed to me by the natural light—for example that from the fact that

*“... foreign to me and coming from outside” (French version).

I am doubting it follows that I exist, and so on—cannot in any way be open to doubt. This is because there cannot be another faculty both as trustworthy as the natural light and also capable of showing me that such things are not true. But as for my natural impulses, I have often judged in the past that they were pushing me in the wrong direction when it was a question of choosing the good, and I do not see why I should place any greater confidence in them in other matters.

Then again, although these ideas do not depend on my will, it does not follow that they must come from things located outside me. Just as the impulses which I was speaking of a moment ago seem opposed to my will even though they are within me, so there may be some other faculty not yet fully known to me, which produces these ideas without any assistance from external things; this is, after all, just how I have always thought ideas are produced in me when I am dreaming.

And finally, even if these ideas did come from things other than myself, it would not follow that they must resemble those things. Indeed, I think I have often discovered a great disparity [between an object and its idea] in many cases. For example, there are two different ideas of the sun which I find within me. One of them, which is acquired as it were from the senses and which is a prime example of an idea which I reckon to come from an external source, makes the sun appear very small. The other idea is based on astronomical reasoning, that is, it is derived from certain notions which are innate in me (or else it is constructed by me in some other way), and this idea shows the sun to be several times larger than the earth. Obviously both these ideas cannot resemble the sun which exists outside me; and reason persuades me that the idea which seems to have emanated most directly from the sun itself has in fact no resemblance to it at all.

All these considerations are enough to establish that it is not reliable judgement but merely some blind impulse that has made me believe up till now that there exist things distinct from myself which transmit to me ideas or images of themselves through the sense organs or in some other way.

But it now occurs to me that there is another way of investigating whether some of the things of which I possess ideas exist outside me. In so far as the ideas are [considered] simply [as] modes of thought, there is no recognizable inequality among them: they all appear to come from within me in the same fashion. But in so far as different ideas [are considered as images which] represent different things, it is clear that they differ widely. Undoubtedly, the ideas which represent substances to me amount to something more and, so to speak, contain within themselves more objective reality than the ideas which merely represent modes or accidents. Again, the idea that gives me my understanding of a supreme God, eternal, infinite, [immutable,] omniscient, omnipotent and the creator of all things that exist apart from him, certainly has in it more objective reality than the ideas that represent finite substances.

Now it is manifest by the natural light that there must be at least as much [reality] in the efficient and total cause as in the effect of that cause. For where, I ask, could the effect get its reality from, if not from the cause? And how could the cause give it to the effect unless it possessed it? It follows from this both that something cannot arise from nothing, and also that what is more perfect—that is, contains in itself more reality—cannot arise from what is less perfect. And this is transparently true not only in the case of effects which possess [what the philosophers call] actual or formal reality, but also in the case of ideas, where one is considering only [what they call] objective reality. A stone, for example, which previously did not exist, cannot begin to exist unless it is produced by something which contains, either formally or eminently everything to be found in the stone; similarly, heat cannot be produced in an object which was not

previously hot, except by something of at least the same order [degree or kind] of perfection as heat, and so on. But it is also true that the idea of heat, or of a stone, cannot exist in me unless it is put there by some cause which contains at least as much reality as I conceive to be in the heat or in the stone. For although this cause does not transfer any of its actual or formal reality to my idea, it should not on that account be supposed that it must be less real. The nature of an idea is such that of itself it requires no formal reality except what it derives from my thought, of which it is a mode. But in order for a given idea to contain such and such objective reality, it must surely derive it from some cause which contains at least as much formal reality as there is objective reality in the idea. For if we suppose that an idea contains something which was not in its cause, it must have got this from nothing; yet the mode of being by which a thing exists objectively [or representatively] in the intellect by way of an idea, imperfect though it may be, is certainly not nothing, and so it cannot come from nothing.

And although the reality which I am considering in my ideas is merely objective reality, I must not on that account suppose that the same reality need not exist formally in the causes of my ideas, but that it is enough for it to be present in them objectively. For just as the objective mode of being belongs to ideas by their very nature, so the formal mode of being belongs to the causes of ideas—or at least the first and most important ones—by *their* very nature. And although one idea may perhaps originate from another, there cannot be an infinite regress here; eventually one must reach a primary idea, the cause of which will be like an archetype which contains formally [and in fact] all the reality [or perfection] which is present only objectively [or representatively] in the idea. So it is clear to me, by the natural light, that the ideas in me are like [pictures, or] images which can easily fall short of the perfection of the things from which they are taken, but which cannot contain anything greater or more perfect.

The longer and more carefully I examine all these points, the more clearly and distinctly I recognize their truth. But what is my conclusion to be? If the objective reality of any of my ideas turns out to be so great that I am sure the same reality does not reside in me, either formally or eminently, and hence that I myself cannot be its cause, it will necessarily follow that I am not alone in the world, but that some other thing which is the cause of this idea also exists. But if no such idea is to be found in me, I shall have no arguments to convince me of the existence of anything apart from myself. For despite a most careful and comprehensive survey, this is the only argument I have so far been able to find.

Among my ideas, apart from the idea which gives me a representation of myself, which cannot present any difficulty in this context, there are ideas which variously represent God, corporeal and inanimate things, angels, animals and finally other men like myself.

As far as concerns the ideas which represent other men, or animals, or angels, I have no difficulty in understanding that they could be put together from the ideas I have of myself, of corporeal things and of God, even if the world contained no men besides me, no animals and no angels.

As to my ideas of corporeal things, I can see nothing in them which is so great [or excellent] as to make it seem impossible that it originated in myself. For if I scrutinize them thoroughly and examine them one by one, in the way in which I examined the idea of the wax yesterday, I notice that the things which I perceive clearly and distinctly in them are very few in number. The list comprises size, or extension in length, breadth and depth; shape, which is a function of the boundaries of this extension; position, which is a relation between various items possessing shape; and motion, or

change in position; to these may be added substance, duration and number. But as for all the rest, including light and colours, sounds, smells, tastes, heat and cold and the other tactile qualities, I think of these only in a very confused and obscure way, to the extent that I do not even know whether they are true or false, that is, whether the ideas I have of them are ideas of real things or of non-things. For although, as I have noted before, falsity in the strict sense, or formal falsity, can occur only in judgements, there is another kind of falsity, material falsity, which occurs in ideas, when they represent
 44 non-things as things. For example, the ideas which I have of heat and cold contain so little clarity and distinctness that they do not enable me to tell whether cold is merely the absence of heat or vice versa, or whether both of them are real qualities, or neither is. And since there can be no ideas which are not as it were of things, if it is true that cold is nothing but the absence of heat, the idea which represents it to me as something real and positive deserves to be called false; and the same goes for other ideas of this kind.

Such ideas obviously do not require me to posit a source distinct from myself. For on the one hand, if they are false, that is, represent non-things, I know by the natural light that they arise from nothing—that is, they are in me only because of a deficiency and lack of perfection in my nature. If on the other hand they are true, then since the reality which they represent is so extremely slight that I cannot even distinguish it from a non-thing, I do not see why they cannot originate from myself.

With regard to the clear and distinct elements in my ideas of corporeal things, it appears that I could have borrowed some of these from my idea of myself, namely substance, duration, number and anything else of this kind. For example, I think that a stone is a substance, or is a thing capable of existing independently, and I also think that I am a substance. Admittedly I conceive of myself as a thing that thinks and is not extended, whereas I conceive of the stone as a thing that is extended and does not think, so that the two conceptions differ enormously; but they seem to agree with respect to the classification “substance.” Again, I perceive that I now exist, and remember that I have existed for some time; moreover, I have various thoughts which I can count; it is
 45 in these ways that I acquire the ideas of duration and number which I can then transfer to other things. As for all the other elements which make up the ideas of corporeal things, namely extension, shape, position and movement, these are not formally contained in me, since I am nothing but a thinking thing; but since they are merely modes of a substance, and I am a substance, it seems possible that they are contained in me eminently.

So there remains only the idea of God; and I must consider whether there is anything in the idea which could not have originated in myself. By the word “God” I understand a substance that is infinite, [eternal, immutable,] independent, supremely intelligent, supremely powerful, and which created both myself and everything else (if anything else there be) that exists. All these attributes are such that, the more carefully I concentrate on them, the less possible it seems that they could have originated from me alone. So from what has been said it must be concluded that God necessarily exists.

It is true that I have the idea of substance in me in virtue of the fact that I am a substance; but this would not account for my having the idea of an infinite substance, when I am finite, unless this idea proceeded from some substance which really was infinite.

And I must not think that, just as my conceptions of rest and darkness are arrived at by negating movement and light, so my perception of the infinite is arrived at not by means of a true idea but merely by negating the finite. On the contrary, I clearly understand that

there is more reality in an infinite substance than in a finite one, and hence that my perception of the infinite, that is God, is in some way prior to my perception of the finite, that is myself. For how could I understand that I doubted or desired—that is, lacked something—and that I was not wholly perfect, unless there were in me some idea of a more perfect being which enabled me to recognize my own defects by comparison? 46

Nor can it be said that this idea of God is perhaps materially false and so could have come from nothing, which is what I observed just a moment ago in the case of the ideas of heat and cold, and so on. On the contrary, it is utterly clear and distinct, and contains in itself more objective reality than any other idea; hence there is no idea which is in itself truer or less liable to be suspected of falsehood. This idea of a supremely perfect and infinite being is, I say, true in the highest degree; for although perhaps one may imagine that such a being does not exist, it cannot be supposed that the idea of such a being represents something unreal, as I said with regard to the idea of cold. The idea is, moreover, utterly clear and distinct; for whatever I clearly and distinctly perceive as being real and true, and implying any perfection, is wholly contained in it. It does not matter that I do not grasp the infinite, or that there are countless additional attributes of God which I cannot in any way grasp, and perhaps cannot even reach in my thought; for it is in the nature of the infinite not to be grasped by a finite being like myself. It is enough that I understand the infinite,* and that I judge that all the attributes which I clearly perceive and know to imply some perfection—and perhaps countless others of which I am ignorant—are present in God either formally or eminently. This is enough to make the idea that I have of God the truest and most clear and distinct of all my ideas.

But perhaps I am something greater than I myself understand, and all the perfections which I attribute to God are somehow in me potentially, though not yet emerging or actualized. For I am now experiencing a gradual increase in my knowledge, and I see nothing to prevent its increasing more and more to infinity. Further, I see no reason why I should not be able to use this increased knowledge to acquire all the other perfections of God. And finally, if the potentiality for these perfections is already within me, why should not this be enough to generate the idea of such perfections? 47

But all this is impossible. First, though it is true that there is a gradual increase in my knowledge, and that I have many potentialities which are not yet actual, this is all quite irrelevant to the idea of God, which contains absolutely nothing that is potential; indeed, this gradual increase in knowledge is itself the surest sign of imperfection. What is more, even if my knowledge always increases more and more, I recognize that it will never actually be infinite, since it will never reach the point where it is not capable of a further increase; God, on the other hand, I take to be actually infinite, so that nothing can be added to his perfection. And finally, I perceive that the objective being of an idea cannot be produced merely by potential being, which strictly speaking is nothing, but only by actual or formal being.

If one concentrates carefully, all this is quite evident by the natural light. But when I relax my concentration, and my mental vision is blinded by the images of things perceived by the senses, it is not so easy for me to remember why the idea of a being more perfect than myself must necessarily proceed from some being which is in reality more perfect. I should therefore like to go further and inquire whether I myself, who have this idea, could exist if no such being existed. 48

*According to Descartes one can know or understand something without fully grasping it “just as we can touch a mountain but not put our arms around it. To grasp something is to embrace it in one’s thought; to know something, it suffices to touch it with one’s thought” (letter to Mersenne, 26 May 1630).

From whom, in that case, would I derive my existence? From myself presumably, or from my parents, or from some other beings less perfect than God; for nothing more perfect than God, or even as perfect, can be thought of or imagined.

Yet if I derived my existence from myself, then I should neither doubt nor want, nor lack anything at all; for I should have given myself all the perfections of which I have any idea, and thus I should myself be God. I must not suppose that the items I lack would be more difficult to acquire than those I now have. On the contrary, it is clear that, since I am a thinking thing or substance, it would have been far more difficult for me to emerge out of nothing than merely to acquire knowledge of the many things of which I am ignorant—such knowledge being merely an accident of that substance. And if I had derived my existence from myself, which is a greater achievement, I should certainly not have denied myself the knowledge in question, which is something much easier to acquire, or indeed any of the attributes which I perceive to be contained in the idea of God; for none of them seem any harder to achieve. And if any of them were harder to achieve, they would certainly appear so to me, if I had indeed got all my other attributes from myself, since I should experience a limitation of my power in this respect.

I do not escape the force of these arguments by supposing that I have always existed as I do now, as if it followed from this that there was no need to look for any author of my existence. For a life-span can be divided into countless parts, each completely independent of the others, so that it does not follow from the fact that I existed a little while ago that I must exist now, unless there is some cause which as it were creates me afresh at this moment—that is, which preserves me. For it is quite clear to anyone who attentively considers the nature of time that the same power and action are needed to preserve anything at each individual moment of its duration as would be required to create that thing anew if it were not yet in existence. Hence the distinction between preservation and creation is only a conceptual one, and this is one of the things that are evident by the natural light.

I must therefore now ask myself whether I possess some power enabling me to bring it about that I who now exist will still exist a little while from now. For since I am nothing but a thinking thing—or at least since I am now concerned only and precisely with that part of me which is a thinking thing—if there were such a power in me, I should undoubtedly be aware of it. But I experience no such power, and this very fact makes me recognize most clearly that I depend on some being distinct from myself.

But perhaps this being is not God, and perhaps I was produced either by my parents or by other causes less perfect than God. No; for as I have said before, it is quite clear that there must be at least as much in the cause as in the effect. And therefore whatever kind of cause is eventually proposed, since I am a thinking thing and have within me some idea of God, it must be admitted that what caused me is itself a thinking thing and possesses the idea of all the perfections which I attribute to God. In respect of this cause one may again inquire whether it derives its existence from itself or from another cause. If from itself, then it is clear from what has been said that it is itself God, since if it has the power of existing through its own might, then undoubtedly it also has the power of actually possessing all the perfections of which it has an idea—that is, all the perfections which I conceive to be in God. If, on the other hand, it derives its existence from another cause, then the same question may be repeated concerning this further cause, namely whether it derives its existence from itself or from another cause, until eventually the ultimate cause is reached, and this will be God.

It is clear enough that an infinite regress is impossible here, especially since I am dealing not just with the cause that produced me in the past, but also and most importantly with the cause that preserves me at the present moment.

Nor can it be supposed that several partial causes contributed to my creation, or that I received the idea of one of the perfections which I attribute to God from one cause and the idea of another from another—the supposition here being that all the perfections are to be found somewhere in the universe but not joined together in a single being, God. On the contrary, the unity, the simplicity, or the inseparability of all the attributes of God is one of the most important of the perfections which I understand him to have. And surely the idea of the unity of all his perfections could not have been placed in me by any cause which did not also provide me with the ideas of the other perfections; for no cause could have made me understand the interconnection and inseparability of the perfections without at the same time making me recognize what they were.

Lastly, as regards my parents, even if everything I have ever believed about them is true, it is certainly not they who preserve me; and in so far as I am a thinking thing, they did not even make me; they merely placed certain dispositions in the matter which I have always regarded as containing me, or rather my mind, for that is all I now take myself to be. So there can be no difficulty regarding my parents in this context. Altogether then, it must be concluded that the mere fact that I exist and have within me an idea of a most perfect being, that is, God, provides a very clear proof that God indeed exists. 51

It only remains for me to examine how I received this idea from God. For I did not acquire it from the senses; it has never come to me unexpectedly, as usually happens with the ideas of things that are perceivable by the senses, when these things present themselves to the external sense organs—or seem to do so. And it was not invented by me either; for I am plainly unable either to take away anything from it or to add anything to it. The only remaining alternative is that it is innate in me, just as the idea of myself is innate in me.

And indeed it is no surprise that God, in creating me, should have placed this idea in me to be, as it were, the mark of the craftsman stamped on his work—not that the mark need be anything distinct from the work itself. But the mere fact that God created me is a very strong basis for believing that I am somehow made in his image and likeness, and that I perceive that likeness, which includes the idea of God, by the same faculty which enables me to perceive myself. That is, when I turn my mind's eye upon myself, I understand that I am a thing which is incomplete and dependent on another and which aspires without limit to ever greater and better things; but I also understand at the same time that he on whom I depend has within him all those greater things, not just indefinitely and potentially but actually and infinitely, and hence that he is God. The whole force of the argument lies in this: I recognize that it would be impossible for me to exist with the kind of nature I have—that is, having within me the idea of God—were it not the case that God really existed. By “God” I mean the very being the idea of whom is within me, that is, the possessor of all the perfections which I cannot grasp, but can somehow reach in my thought, who is subject to no defects whatsoever. It is clear enough from this that he cannot be a deceiver, since it is manifest by the natural light that all fraud and deception depend on some defect. 52

But before examining this point more carefully and investigating other truths which may be derived from it, I should like to pause here and spend some time in the contemplation of God; to reflect on his attributes, and to gaze with wonder and adoration on the beauty of this immense light, so far as the eye of my darkened intellect can bear it. For just as we believe through faith that the supreme happiness of the next life consists solely in the contemplation of the divine majesty, so experience tells us that this same contemplation, albeit much less perfect, enables us to know the greatest joy of which we are capable in this life.

FOURTH MEDITATION

Truth and falsity

During these past few days I have accustomed myself to leading my mind away from the senses; and I have taken careful note of the fact that there is very little about
 53 corporeal things that is truly perceived, whereas much more is known about the human mind, and still more about God. The result is that I now have no difficulty in turning my mind away from imaginable things and towards things which are objects of the intellect alone and are totally separate from matter. And indeed the idea I have of the human mind, in so far as it is a thinking thing, which is not extended in length, breadth or height and has no other bodily characteristics, is much more distinct than the idea of any corporeal thing. And when I consider the fact that I have doubts, or that I am a thing that is incomplete and dependent, then there arises in me a clear and distinct idea of a being who is independent and complete, that is, an idea of God. And from the mere fact that there is such an idea within me, or that I who possess this idea exist, I clearly infer that God also exists, and that every single moment of my entire existence depends on him. So clear is this conclusion that I am confident that the human intellect cannot know anything that is more evident or more certain. And now, from this contemplation of the true God, in whom all the treasures of wisdom and the sciences lie hidden, I think I can see a way forward to the knowledge of other things.

To begin with, I recognize that it is impossible that God should ever deceive me. For in every case of trickery or deception some imperfection is to be found; and although the ability to deceive appears to be an indication of cleverness or power, the will to deceive is undoubtedly evidence of malice or weakness, and so cannot apply to God.

Next, I know by experience that there is in me a faculty of judgement which, like
 54 everything else which is in me, I certainly received from God. And since God does not wish to deceive me, he surely did not give me the kind of faculty which would ever enable me to go wrong while using it correctly.

There would be no further doubt on this issue were it not that what I have just said appears to imply that I am incapable of ever going wrong. For if everything that is in me comes from God, and he did not endow me with a faculty for making mistakes, it appears that I can never go wrong. And certainly, so long as I think only of God, and turn my whole attention to him, I can find no cause of error or falsity. But when I turn back to myself, I know by experience that I am prone to countless errors. On looking for the cause of these errors, I find that I possess not only a real and positive idea of God, or a being who is supremely perfect, but also what may be described as a negative idea of nothingness, or of that which is farthest removed from all perfection. I realize that I am, as it were, something intermediate between God and nothingness, or between supreme being and non-being: my nature is such that in so far as I was created by the supreme being, there is nothing in me to enable me to go wrong or lead me astray; but in so far as I participate in nothingness or non-being, that is, in so far as I am not myself the supreme being and am lacking in countless respects, it is no wonder that I make mistakes. I understand, then, that error as such is not something real which depends on God, but merely a defect. Hence my going wrong does not require me to have a faculty specially bestowed on me by God; it simply happens as a result of the fact that the faculty of true judgement which I have from God is in my case not infinite.

But this is still not entirely satisfactory. For error is not a pure negation, but rather a privation or lack of some knowledge which somehow should be in me. And when I concentrate on the nature of God, it seems impossible that he should have placed in me a faculty which is not perfect of its kind, or which lacks some perfection which it ought to have. The more skilled the craftsman the more perfect the work produced by him; if this is so, how can anything produced by the supreme creator of all things not be complete and perfect in all respects? There is, moreover, no doubt that God could have given me a nature such that I was never mistaken; again, there is no doubt that he always wills what is best. Is it then better that I should make mistakes than that I should not do so? 55

As I reflect on these matters more attentively, it occurs to me first of all that it is no cause for surprise if I do not understand the reasons for some of God's actions; and there is no call to doubt his existence if I happen to find that there are other instances where I do not grasp why or how certain things were made by him. For since I now know that my own nature is very weak and limited, whereas the nature of God is immense, incomprehensible and infinite, I also know without more ado that he is capable of countless things whose causes are beyond my knowledge. And for this reason alone I consider the customary search for final causes to be totally useless in physics; there is considerable rashness in thinking myself capable of investigating the [impenetrable] purposes of God.

It also occurs to me that whenever we are inquiring whether the works of God are perfect, we ought to look at the whole universe, not just at one created thing on its own. For what would perhaps rightly appear very imperfect if it existed on its own is quite perfect when its function as a part of the universe is considered. It is true that, since my decision to doubt everything, it is so far only myself and God whose existence I have been able to know with certainty; but after considering the immense power of God, I cannot deny that many other things have been made by him, or at least could have been made, and hence that I may have a place in the universal scheme of things. 56

Next, when I look more closely at myself and inquire into the nature of my errors (for these are the only evidence of some imperfection in me), I notice that they depend on two concurrent causes, namely on the faculty of knowledge which is in me, and on the faculty of choice or freedom of the will; that is, they depend on both the intellect and the will simultaneously. Now all that the intellect does is to enable me to perceive the ideas which are subjects for possible judgements; and when regarded strictly in this light, it turns out to contain no error in the proper sense of that term. For although countless things may exist without there being any corresponding ideas in me, it should not, strictly speaking, be said that I am deprived of these ideas, but merely that I lack them, in a negative sense. This is because I cannot produce any reason to prove that God ought to have given me a greater faculty of knowledge than he did; and no matter how skilled I understand a craftsman to be, this does not make me think he ought to have put into every one of his works all the perfections which he is able to put into some of them. Besides, I cannot complain that the will or freedom of choice which I received from God is not sufficiently extensive or perfect, since I know by experience that it is not restricted in any way. Indeed, I think it is very noteworthy that there is nothing else in me which is so perfect and so great that the possibility of a further increase in its perfection or greatness is beyond my understanding. If, for example, I consider the faculty of understanding, I immediately recognize that in my case it is extremely slight and very finite, and I at once form the idea of an understanding which is much greater—indeed supremely great and infinite; and from the very fact that I can form an idea of it, I perceive that it belongs to the nature of God. Similarly, if I examine the faculties of 57

memory or imagination, or any others, I discover that in my case each one of these faculties is weak and limited, while in the case of God it is immeasurable. It is only the will, or freedom of choice, which I experience within me to be so great that the idea of any greater faculty is beyond my grasp; so much so that it is above all in virtue of the will that I understand myself to bear in some way the image and likeness of God. For although God's will is incomparably greater than mine, both in virtue of the knowledge and power that accompany it and make it more firm and efficacious, and also in virtue of its object, in that it ranges over a greater number of items, nevertheless it does not seem any greater than mine when considered as will in the essential and strict sense. This is because the will simply consists in our ability to do or not do something (that is, to affirm or deny, to pursue or avoid); or rather, it consists simply in the fact that when the intellect puts something forward for affirmation or denial or for pursuit or avoidance, our inclinations are such that we do not feel we are determined by any external force. In order to be free, there is no need for me to be inclined both ways; on the contrary, the more I incline in one direction—either because I clearly understand that reasons of truth and goodness point that way, or because of a divinely produced disposition of my inmost thoughts—the freer is my choice. Neither divine grace nor natural knowledge ever diminishes freedom; on the contrary, they increase and strengthen it. But the indifference I feel when there is no reason pushing me in one direction rather than another is the lowest grade of freedom; it is evidence not of any perfection of freedom, but rather of a defect in knowledge or a kind of negation. For if I always saw clearly what was true and good, I should never have to deliberate about the right judgement or choice; in that case, although I should be wholly free, it would be impossible for me ever to be in a state of indifference.

From these considerations I perceive that the power of willing which I received from God is not, when considered in itself, the cause of my mistakes; for it is both extremely ample and also perfect of its kind. Nor is my power of understanding to blame; for since my understanding comes from God, everything that I understand I undoubtedly understand correctly, and any error here is impossible. So what then is the source of my mistakes? It must be simply this: the scope of the will is wider than that of the intellect; but instead of restricting it within the same limits, I extend its use to matters which I do not understand. Since the will is indifferent in such cases, it easily turns aside from what is true and good, and this is the source of my error and sin.

For example, during these past few days I have been asking whether anything in the world exists, and I have realized that from the very fact of my raising this question it follows quite evidently that I exist. I could not but judge that something which I understood so clearly was true; but this was not because I was compelled so to judge by any external force, but because a great light in the intellect was followed by a great inclination in the will, and thus the spontaneity and freedom of my belief was all the greater in proportion to my lack of indifference. But now, besides the knowledge that I exist, in so far as I am a thinking thing, an idea of corporeal nature comes into my mind; and I happen to be in doubt as to whether the thinking nature which is in me, or rather which I am, is distinct from this corporeal nature or identical with it. I am making the further supposition that my intellect has not yet come upon any persuasive reason in favour of one alternative rather than the other. This obviously implies that I am indifferent as to whether I should assert or deny either alternative, or indeed refrain from making any judgement on the matter.

What is more, this indifference does not merely apply to cases where the intellect is wholly ignorant, but extends in general to every case where the intellect does not have

sufficiently clear knowledge at the time when the will deliberates. For although probable conjectures may pull me in one direction, the mere knowledge that they are simply conjectures, and not certain and indubitable reasons, is itself quite enough to push my assent the other way. My experience in the last few days confirms this: the mere fact that I found that all my previous beliefs were in some sense open to doubt was enough to turn my absolutely confident belief in their truth into the supposition that they were wholly false.

If, however, I simply refrain from making a judgement in cases where I do not perceive the truth with sufficient clarity and distinctness, then it is clear that I am behaving correctly and avoiding error. But if in such cases I either affirm or deny, then I am not using my free will correctly. If I go for the alternative which is false, then obviously I shall be in error; if I take the other side, then it is by pure chance that I arrive at the truth, and I shall still be at fault since it is clear by the natural light that the perception of the intellect should always precede the determination of the will. In this incorrect use of free will may be found the privation which constitutes the essence of error. The privation, I say, lies in the operation of the will in so far as it proceeds from me, but not in the faculty of will which I received from God, nor even in its operation, in so far as it depends on him. 60

And I have no cause for complaint on the grounds that the power of understanding or the natural light which God gave me is no greater than it is; for it is in the nature of a finite intellect to lack understanding of many things, and it is in the nature of a created intellect to be finite. Indeed, I have reason to give thanks to him who has never owed me anything for the great bounty that he has shown me, rather than thinking myself deprived or robbed of any gifts he did not bestow.

Nor do I have any cause for complaint on the grounds that God gave me a will which extends more widely than my intellect. For since the will consists simply of one thing which is, as it were, indivisible, it seems that its nature rules out the possibility of anything being taken away from it. And surely, the more widely my will extends, then the greater thanks I owe to him who gave it to me.

Finally, I must not complain that the forming of those acts of will or judgements in which I go wrong happens with God's concurrence. For in so far as these acts depend on God, they are wholly true and good; and my ability to perform them means that there is in a sense more perfection in me than would be the case if I lacked this ability. As for the privation involved—which is all that the essential definition of falsity and wrong consists in—this does not in any way require the concurrence of God, since it is not a thing; indeed, when it is referred to God as its cause, it should be called not a privation but simply a negation. For it is surely no imperfection in God that he has given me the freedom to assent or not to assent in those cases where he did not endow my intellect with a clear and distinct perception; but it is undoubtedly an imperfection in me to misuse that freedom and make judgements about matters which I do not fully understand. I can see, however, that God could easily have brought it about that without losing my freedom, and despite the limitations in my knowledge, I should nonetheless never make a mistake. He could, for example, have endowed my intellect with a clear and distinct perception of everything about which I was ever likely to deliberate; or he could simply have impressed it unforgettably on my memory that I should never make a judgement about anything which I did not clearly and distinctly understand. Had God made me this way, then I can easily understand that, considered as a totality, I would have been more perfect than I am now. But I cannot therefore deny that there may in some way be more perfection in the universe as a whole because some of its parts are not immune from 61

error, while others are immune, than there would be if all the parts were exactly alike. And I have no right to complain that the role God wished me to undertake in the world is not the principal one or the most perfect of all.

62 What is more, even if I have no power to avoid error in the first way just mentioned, which requires a clear perception of everything I have to deliberate on, I can avoid error in the second way, which depends merely on my remembering to withhold judgement on any occasion when the truth of the matter is not clear. Admittedly, I am aware of a certain weakness in me, in that I am unable to keep my attention fixed on one and the same item of knowledge at all times; but by attentive and repeated meditation I am nevertheless able to make myself remember it as often as the need arises, and thus get into the habit of avoiding error.

It is here that man's greatest and most important perfection is to be found, and I therefore think that today's meditation, involving an investigation into the cause of error and falsity, has been very profitable. The cause of error must surely be the one I have explained; for if, whenever I have to make a judgement, I restrain my will so that it extends to what the intellect clearly and distinctly reveals, and no further, then it is quite impossible for me to go wrong. This is because every clear and distinct perception is undoubtedly something, and hence cannot come from nothing, but must necessarily have God for its author. Its author, I say, is God, who is supremely perfect, and who cannot be a deceiver on pain of contradiction; hence the perception is undoubtedly true. So today I have learned not only what precautions to take to avoid ever going wrong, but also what to do to arrive at the truth. For I shall unquestionably reach the truth, if only I give sufficient attention to all the things which I perfectly understand, and separate these from all the other cases where my apprehension is more confused and obscure. And this is just what I shall take good care to do from now on.

63 FIFTH MEDITATION

The essence of material things, and the existence of God considered a second time

There are many matters which remain to be investigated concerning the attributes of God and the nature of myself, or my mind; and perhaps I shall take these up at another time. But now that I have seen what to do and what to avoid in order to reach the truth, the most pressing task seems to be to try to escape from the doubts into which I fell a few days ago, and see whether any certainty can be achieved regarding material objects.

But before I inquire whether any such things exist outside me, I must consider the ideas of these things, in so far as they exist in my thought, and see which of them are distinct, and which confused.

Quantity, for example, or "continuous" quantity as the philosophers commonly call it, is something I distinctly imagine. That is, I distinctly imagine the extension of the quantity (or rather of the thing which is quantified) in length, breadth and depth. I also enumerate various parts of the thing, and to these parts I assign various sizes, shapes, positions and local motions; and to the motions I assign various durations.

64 Not only are all these things very well known and transparent to me when regarded in this general way, but in addition there are countless particular features regarding shape, number, motion, and so on, which I perceive when I give them my attention. And the truth of these matters is so open and so much in harmony with my nature, that on first

discovering them it seems that I am not so much learning something new as remembering what I knew before; or it seems like noticing for the first time things which were long present within me although I had never turned my mental gaze on them before.

But I think the most important consideration at this point is that I find within me countless ideas of things which even though they may not exist anywhere outside me still cannot be called nothing; for although in a sense they can be thought of at will, they are not my invention but have their own true and immutable natures. When, for example, I imagine a triangle, even if perhaps no such figure exists, or has ever existed, anywhere outside my thought, there is still a determinate nature, or essence, or form of the triangle which is immutable and eternal, and not invented by me or dependent on my mind. This is clear from the fact that various properties can be demonstrated of the triangle, for example that its three angles equal two right angles, that its greatest side subtends its greatest angle, and the like; and since these properties are ones which I now clearly recognize whether I want to or not, even if I never thought of them at all when I previously imagined the triangle, it follows that they cannot have been invented by me.

It would be beside the point for me to say that since I have from time to time seen bodies of triangular shape, the idea of the triangle may have come to me from external things by means of the sense organs. For I can think up countless other shapes which there can be no suspicion of my ever having encountered through the senses, and yet I can demonstrate various properties of these shapes, just as I can with the triangle. All these properties are certainly true, since I am clearly aware of them, and therefore they are something, and not merely nothing; for it is obvious that whatever is true is something; and I have already amply demonstrated that everything of which I am clearly aware is true. And even if I had not demonstrated this, the nature of my mind is such that I cannot but assent to these things, at least so long as I clearly perceive them. I also remember that even before, when I was completely preoccupied with the objects of the senses, I always held that the most certain truths of all were the kind which I recognized clearly in connection with shapes, or numbers or other items relating to arithmetic or geometry, or in general to pure and abstract mathematics. 65

But if the mere fact that I can produce from my thought the idea of something entails that everything which I clearly and distinctly perceive to belong to that thing really does belong to it, is not this a possible basis for another argument to prove the existence of God? Certainly, the idea of God, or a supremely perfect being, is one which I find within me just as surely as the idea of any shape or number. And my understanding that it belongs to his nature that he always exists is no less clear and distinct than is the case when I prove of any shape or number that some property belongs to its nature. Hence, even if it turned out that not everything on which I have meditated in these past days is true, I ought still to regard the existence of God as having at least the same level of certainty as I have hitherto attributed to the truths of mathematics. 66

At first sight, however, this is not transparently clear, but has some appearance of being a sophism. Since I have been accustomed to distinguish between existence and essence in everything else, I find it easy to persuade myself that existence can also be separated from the essence of God, and hence that God can be thought of as not existing. But when I concentrate more carefully, it is quite evident that existence can no more be separated from the essence of God than the fact that its three angles equal two right angles can be separated from the essence of a triangle, or than the idea of a mountain can be separated from the idea of a valley. Hence it is just as much of a contradiction to think of God (that is, a supremely perfect being) lacking existence (that is, lacking a perfection), as it is to think of a mountain without a valley.

However, even granted that I cannot think of God except as existing, just as I cannot think of a mountain without a valley, it certainly does not follow from the fact that I think of a mountain with a valley that there is any mountain in the world; and similarly, it does not seem to follow from the fact that I think of God as existing that he does exist. For my thought does not impose any necessity on things; and just as I may imagine a winged horse even though no horse has wings, so I may be able to attach existence to God even though no God exists.

67 But there is a sophism concealed here. From the fact that I cannot think of a mountain without a valley, it does not follow that a mountain and valley exist anywhere, but simply that a mountain and a valley, whether they exist or not, are mutually inseparable. But from the fact that I cannot think of God except as existing, it follows that existence is inseparable from God, and hence that he really exists. It is not that my thought makes it so, or imposes any necessity on any thing; on the contrary, it is the necessity of the thing itself, namely the existence of God, which determines my thinking in this respect. For I am not free to think of God without existence (that is, a supremely perfect being without a supreme perfection) as I am free to imagine a horse with or without wings.

And it must not be objected at this point that while it is indeed necessary for me to suppose God exists, once I have made the supposition that he has all perfections (since existence is one of the perfections), nevertheless the original supposition was not necessary. Similarly, the objection would run, it is not necessary for me to think that all quadrilaterals can be inscribed in a circle; but given this supposition, it will be necessary for me to admit that a rhombus can be inscribed in a circle—which is patently false. Now admittedly, it is not necessary that I ever light upon any thought of God; but whenever I do choose to think of the first and supreme being, and bring forth the idea of God from the treasure house of my mind as it were, it is necessary that I attribute all perfections to him, even if I do not at that time enumerate them or attend to them individually. And this necessity plainly guarantees that, when I later realize that existence is a perfection, I am correct in inferring that the first and supreme being exists. In the same way, it is not necessary for me ever to imagine a triangle; but whenever I do wish to consider a rectilinear figure having just three angles, it is necessary
68 that I attribute to it the properties which license the inference that its three angles equal no more than two right angles, even if I do not notice this at the time. By contrast, when I examine what figures can be inscribed in a circle, it is in no way necessary for me to think that this class includes all quadrilaterals. Indeed, I cannot even imagine this, so long as I am willing to admit only what I clearly and distinctly understand. So there is a great difference between this kind of false supposition and the true ideas which are innate in me, of which the first and most important is the idea of God. There are many ways in which I understand that this idea is not something fictitious which is dependent on my thought, but is an image of a true and immutable nature. First of all, there is the fact that, apart from God, there is nothing else of which I am capable of thinking such that existence belongs to its essence. Second, I cannot understand how there could be two or more Gods of this kind; and after supposing that one God exists, I plainly see that it is necessary that he has existed from eternity and will abide for eternity. And finally, I perceive many other attributes of God, none of which I can remove or alter.

But whatever method of proof I use, I am always brought back to the fact that it is only what I clearly and distinctly perceive that completely convinces me. Some of the things I clearly and distinctly perceive are obvious to everyone, while others are discovered only by those who look more closely and investigate more carefully; but once they

have been discovered, the latter are judged to be just as certain as the former. In the case of a right-angled triangle, for example, the fact that the square on the hypotenuse is equal to the square on the other two sides is not so readily apparent as the fact that the hypotenuse subtends the largest angle; but once one has seen it, one believes it just as strongly. But as regards God, if I were not overwhelmed by preconceived opinions, and if the images of things perceived by the senses did not besiege my thought on every side, I would certainly acknowledge him sooner and more easily than anything else. For what is more self-evident than the fact that the supreme being exists, or that God, to whose essence alone existence belongs, exists? 69

Although it needed close attention for me to perceive this, I am now just as certain of it as I am of everything else which appears most certain. And what is more, I see that the certainty of all other things depends on this, so that without it nothing can ever be perfectly known.

Admittedly my nature is such that so long as I perceive something very clearly and distinctly I cannot but believe it to be true. But my nature is also such that I cannot fix my mental vision continually on the same thing, so as to keep perceiving it clearly; and often the memory of a previously made judgement may come back, when I am no longer attending to the arguments which led me to make it. And so other arguments can now occur to me which might easily undermine my opinion, if I did not possess knowledge of God; and I should thus never have true and certain knowledge about anything, but only shifting and changeable opinions. For example, when I consider the nature of a triangle, it appears most evident to me, steeped as I am in the principles of geometry, that its three angles are equal to two right angles; and so long as I attend to the proof, I cannot but believe this to be true. But as soon as I turn my mind's eye away from the proof, then in spite of still remembering that I perceived it very clearly, I can easily fall into doubt about its truth, if I am without knowledge of God. For I can convince myself that I have a natural disposition to go wrong from time to time in matters which I think I perceive as evidently as can be. This will seem even more likely when I remember that there have been frequent cases where I have regarded things as true and certain, but have later been led by other arguments to judge them to be false. 70

Now, however, I have perceived that God exists, and at the same time I have understood that everything else depends on him, and that he is no deceiver; and I have drawn the conclusion that everything which I clearly and distinctly perceive is of necessity true. Accordingly, even if I am no longer attending to the arguments which led me to judge that this is true, as long as I remember that I clearly and distinctly perceived it, there are no counter-arguments which can be adduced to make me doubt it, but on the contrary I have true and certain knowledge of it. And I have knowledge not just of this matter, but of all matters which I remember ever having demonstrated, in geometry and so on. For what objections can now be raised? That the way I am made makes me prone to frequent error? But I now know that I am incapable of error in those cases where my understanding is transparently clear. Or can it be objected that I have in the past regarded as true and certain many things which I afterwards recognized to be false? But none of these were things which I clearly and distinctly perceived: I was ignorant of this rule for establishing the truth, and believed these things for other reasons which I later discovered to be less reliable. So what is left to say? Can one raise the objection I put to myself a while ago, that I may be dreaming, or that everything which I am now thinking has as little truth as what comes to the mind of one who is asleep? Yet even this does not change anything. For even though I might be dreaming, if there is anything which is evident to my intellect, then it is wholly true. 71

Thus I see plainly that the certainty and truth of all knowledge depends uniquely on my knowledge of the true God, to such an extent that I was incapable of perfect knowledge about anything else until I knew him. And now it is possible for me to achieve full and certain knowledge of countless matters, both concerning God himself and other things whose nature is intellectual, and also concerning the whole of that corporeal nature which is the subject-matter of pure mathematics.

SIXTH MEDITATION

The existence of material things, and the real distinction between mind and body

It remains for me to examine whether material things exist. And at least I now know they are capable of existing, in so far as they are the subject-matter of pure mathematics, since I perceive them clearly and distinctly. For there is no doubt that God is capable of creating everything that I am capable of perceiving in this manner; and I have never judged that something could not be made by him except on the grounds that there would be a contradiction in my perceiving it distinctly. The conclusion that material things exist is also suggested by the faculty of imagination, which I am aware of using when I turn my mind to material things. For when I give more attentive consideration to what imagination is, it seems to be nothing else but an application of the cognitive
72 faculty to a body which is intimately present to it, and which therefore exists.

To make this clear, I will first examine the difference between imagination and pure understanding. When I imagine a triangle, for example, I do not merely understand that it is a figure bounded by three lines, but at the same time I also see the three lines with my mind's eye as if they were present before me; and this is what I call imagining. But if I want to think of a chiliagon, although I understand that it is a figure consisting of a thousand sides just as well as I understand the triangle to be a three-sided figure, I do not in the same way imagine the thousand sides or see them as if they were present before me. It is true that since I am in the habit of imagining something whenever I think of a corporeal thing, I may construct in my mind a confused representation of some figure; but it is clear that this is not a chiliagon. For it differs in no way from the representation I should form if I were thinking of a myriagon, or any figure with very many sides. Moreover, such a representation is useless for recognizing the properties which distinguish a chiliagon from other polygons. But suppose I am dealing with a pentagon: I can ofcourse understand the figure of a pentagon, just as I can the figure of a chiliagon, without the help of the imagination; but I can also imagine a pentagon, by applying my mind's eye to its five sides and the area contained within them. And in doing this I notice quite clearly that imagination requires a peculiar effort of mind
73 which is not required for understanding; this additional effort of mind clearly shows the difference between imagination and pure understanding.

Besides this, I consider that this power of imagining which is in me, differing as it does from the power of understanding, is not a necessary constituent of my own essence, that is, of the essence of my mind. For if I lacked it, I should undoubtedly remain the same individual as I now am; from which it seems to follow that it depends on something distinct from myself. And I can easily understand that, if there does exist some body to which the mind is so joined that it can apply itself to contemplate it, as it were, whenever it pleases, then it may possibly be this very body that enables me to imagine

corporeal things. So the difference between this mode of thinking and pure understanding may simply be this: when the mind understands, it in some way turns towards itself and inspects one of the ideas which are within it; but when it imagines, it turns towards the body and looks at something in the body which conforms to an idea understood by the mind or perceived by the senses. I can, as I say, easily understand that this is how imagination comes about, if the body exists; and since there is no other equally suitable way of explaining imagination that comes to mind, I can make a probable conjecture that the body exists. But this is only a probability; and despite a careful and comprehensive investigation, I do not yet see how the distinct idea of corporeal nature which I find in my imagination can provide any basis for a necessary inference that some body exists.

But besides that corporeal nature which is the subject-matter of pure mathematics, there is much else that I habitually imagine, such as colours, sounds, tastes, pain and so on—though not so distinctly. Now I perceive these things much better by means of the senses, which is how, with the assistance of memory, they appear to have reached the imagination. So in order to deal with them more fully, I must pay equal attention to the senses, and see whether the things which are perceived by means of that mode of thinking which I call “sensory perception” provide me with any sure argument for the existence of corporeal things. 74

To begin with, I will go back over all the things which I previously took to be perceived by the senses, and reckoned to be true; and I will go over my reasons for thinking this. Next, I will set out my reasons for subsequently calling these things into doubt. And finally I will consider what I should now believe about them.

First of all then, I perceived by my senses that I had a head, hands, feet and other limbs making up the body which I regarded as part of myself, or perhaps even as my whole self. I also perceived by my senses that this body was situated among many other bodies which could affect it in various favourable or unfavourable ways; and I gauged the favourable effects by a sensation of pleasure, and the unfavourable ones by a sensation of pain. In addition to pain and pleasure, I also had sensations within me of hunger, thirst, and other such appetites, and also of physical propensities towards cheerfulness, sadness, anger and similar emotions. And outside me, besides the extension, shapes and movements of bodies, I also had sensations of their hardness and heat, and of the other tactile qualities. In addition, I had sensations of light, colours, smells, tastes and sounds, the variety of which enabled me to distinguish the sky, the earth, the seas, and all other bodies, one from another. Considering the ideas of all these qualities which presented themselves to my thought, although the ideas were, strictly speaking, the only immediate objects of my sensory awareness, it was not unreasonable for me to think that the items which I was perceiving through the senses were things quite distinct from my thought, namely bodies which produced the ideas. For my experience was that these ideas came to me quite without my consent, so that I could not have sensory awareness of any object, even if I wanted to, unless it was present to my sense organs; and I could not avoid having sensory awareness of it when it was present. And since the ideas perceived by the senses were much more lively and vivid and even, in their own way, more distinct than any of those which I deliberately formed through meditating or which I found impressed on my memory, it seemed impossible that they should have come from within me; so the only alternative was that they came from other things. Since the sole source of my knowledge of these things was the ideas themselves, the supposition that the things resembled the ideas was bound to occur to me. In addition, I remembered that the use of my senses had come first, while the use of my reason came only later; and I saw that the ideas which I formed myself were less vivid than those which I perceived with the senses and were, for the most 75

76 part, made up of elements of sensory ideas. In this way I easily convinced myself that I had nothing at all in the intellect which I had not previously had in sensation. As for the body which by some special right I called "mine," my belief that this body, more than any other, belonged to me had some justification. For I could never be separated from it, as I could from other bodies; and I felt all my appetites and emotions in, and on account of, this body; and finally, I was aware of pain and pleasurable ticklings in parts of this body, but not in other bodies external to it. But why should that curious sensation of pain give rise to a particular distress of mind; or why should a certain kind of delight follow on a tickling sensation? Again, why should that curious tugging in the stomach which I call hunger tell me that I should eat, or a dryness of the throat tell me to drink, and so on? I was not able to give any explanation of all this, except that nature taught me so. For there is absolutely no connection (at least that I can understand) between the tugging sensation and the decision to take food, or between the sensation of something causing pain and the mental apprehension of distress that arises from that sensation. These and other judgements that I made concerning sensory objects, I was apparently taught to make by nature; for I had already made up my mind that this was how things were, before working out any arguments to prove it.

77 Later on, however, I had many experiences which gradually undermined all the faith I had had in the senses. Sometimes towers which had looked round from a distance appeared square from close up; and enormous statues standing on their pediments did not seem large when observed from the ground. In these and countless other such cases, I found that the judgements of the external senses were mistaken. And this applied not just to the external senses but to the internal senses as well. For what can be more internal than pain? And yet I had heard that those who had had a leg or an arm amputated sometimes still seemed to feel pain intermittently in the missing part of the body. So even in my own case it was apparently not quite certain that a particular limb was hurting, even if I felt pain in it. To these reasons for doubting, I recently added two very general ones. The first was that every sensory experience I have ever thought I was having while awake I can also think of myself as sometimes having while asleep; and since I do not believe that what I seem to perceive in sleep comes from things located outside me, I did not see why I should be any more inclined to believe this of what I think I perceive while awake. The second reason for doubt was that since I did not know the author of my being (or at least was pretending not to), I saw nothing to rule out the possibility that my natural constitution made me prone to error even in matters which seemed to me most true. As for the reasons for my previous confident belief in the truth of the things perceived by the senses, I had no trouble in refuting them. For since I apparently had natural impulses towards many things which reason told me to avoid, I reckoned that a great deal of confidence should not be placed in what I was taught by nature. And despite the fact that the perceptions of the senses were not dependent on my will, I did not think that I should on that account infer that they proceeded from things distinct from myself, since I might perhaps have a faculty not yet known to me which produced them.

78 But now, when I am beginning to achieve a better knowledge of myself and the author of my being, although I do not think I should heedlessly accept everything I seem to have acquired from the senses, neither do I think that everything should be called into doubt.

First, I know that everything which I clearly and distinctly understand is capable of being created by God so as to correspond exactly with my understanding of it. Hence the fact that I can clearly and distinctly understand one thing apart from another is enough to

make me certain that the two things are distinct, since they are capable of being separated, at least by God. The question of what kind of power is required to bring about such a separation does not affect the judgement that the two things are distinct. Thus, simply by knowing that I exist and seeing at the same time that absolutely nothing else belongs to my nature or essence except that I am a thinking thing, I can infer correctly that my essence consists solely in the fact that I am a thinking thing. It is true that I may have (or, to anticipate, that I certainly have) a body that is very closely joined to me. But nevertheless, on the one hand I have a clear and distinct idea of myself, in so far as I am simply a thinking, non-extended thing; and on the other hand I have a distinct idea of body,* in so far as this is simply an extended, non-thinking thing. And accordingly, it is certain that I am really distinct from my body, and can exist without it.

Besides this, I find in myself faculties for certain special modes of thinking, namely imagination and sensory perception. Now I can clearly and distinctly understand myself as a whole without these faculties; but I cannot, conversely, understand these faculties without me, that is, without an intellectual substance to inhere in. This is because there is an intellectual act included in their essential definition; and hence I perceive that the distinction between them and myself corresponds to the distinction between the modes of a thing and the thing itself. Of course I also recognize that there are other faculties (like those of changing position, of taking on various shapes, and so on) which, like sensory perception and imagination, cannot be understood apart from some substance for them to inhere in, and hence cannot exist without it. But it is clear that these other faculties, if they exist, must be in a corporeal or extended substance and not an intellectual one; for the clear and distinct conception of them includes extension, but does not include any intellectual act whatsoever. Now there is in me a passive faculty of sensory perception, that is, a faculty for receiving and recognizing the ideas of sensible objects; but I could not make use of it unless there was also an active faculty, either in me or in something else, which produced or brought about these ideas. But this faculty cannot be in me, since clearly it presupposes no intellectual act on my part, and the ideas in question are produced without my cooperation and often even against my will. So the only alternative is that it is in another substance distinct from me—a substance which contains either formally or eminently all the reality which exists objectively in the ideas produced by this faculty (as I have just noted). This substance is either a body, that is, a corporeal nature, in which case it will contain formally [and in fact] everything which is to be found objectively [or representatively] in the ideas; or else it is God, or some creature more noble than a body, in which case it will contain eminently whatever is to be found in the ideas. But since God is not a deceiver, it is quite clear that he does not transmit the ideas to me either directly from himself, or indirectly, via some creature which contains the objective reality of the ideas not formally but only eminently. For God has given me no faculty at all for recognizing any such source for these ideas; on the contrary, he has given me a great propensity to believe that they are produced by corporeal things. So I do not see how God could be understood to be anything but a deceiver if the ideas were transmitted from a source other than corporeal things. It follows that corporeal things exist. They may not all exist in a way that exactly corresponds with my sensory grasp of them, for in many cases the grasp of the senses is very obscure and confused. But at least they possess all the properties which I clearly and distinctly understand, that is, all those which, viewed in general terms, are comprised within the subject-matter of pure mathematics.

*The Latin term *corpus* as used here by Descartes is ambiguous between “body” (i.e. corporeal matter in general) and “the body” (i.e. this particular body of mine). The French version preserves the ambiguity.

What of the other aspects of corporeal things which are either particular (for example that the sun is of such and such a size or shape), or less clearly understood, such as light or sound or pain, and so on? Despite the high degree of doubt and uncertainty involved here, the very fact that God is not a deceiver, and the consequent impossibility of there being any falsity in my opinions which cannot be corrected by some other faculty supplied by God, offers me a sure hope that I can attain the truth even in these matters. Indeed, there is no doubt that everything that I am taught by nature contains some truth. For if nature is considered in its general aspect, then I understand by the term nothing other than God himself, or the ordered system of created things established by God. And by my own nature in particular I understand nothing other than the totality of things bestowed on me by God.

There is nothing that my own nature teaches me more vividly than that I have a body, and that when I feel pain there is something wrong with the body, and that when I am hungry or thirsty the body needs food and drink, and so on. So I should not doubt that there is some truth in this.

- 81 Nature also teaches me, by these sensations of pain, hunger, thirst and so on, that I am not merely present in my body as a sailor is present in a ship, but that I am very closely joined and, as it were, intermingled with it, so that I and the body form a unit. If this were not so, I, who am nothing but a thinking thing, would not feel pain when the body was hurt, but would perceive the damage purely by the intellect, just as a sailor perceives by sight if anything in his ship is broken. Similarly, when the body needed food or drink, I should have an explicit understanding of the fact, instead of having confused sensations of hunger and thirst. For these sensations of hunger, thirst, pain and so on are nothing but confused modes of thinking which arise from the union and, as it were, intermingling of the mind with the body.

I am also taught by nature that various other bodies exist in the vicinity of my body, and that some of these are to be sought out and others avoided. And from the fact that I perceive by my senses a great variety of colours, sounds, smells and tastes, as well as differences in heat, hardness and the like, I am correct in inferring that the bodies which are the source of these various sensory perceptions possess differences corresponding to them, though perhaps not resembling them. Also, the fact that some of the perceptions are agreeable to me while others are disagreeable makes it quite certain that my body, or rather my whole self, in so far as I am a combination of body and mind, can be affected by the various beneficial or harmful bodies which surround it.

- 82 There are, however, many other things which I may appear to have been taught by nature, but which in reality I acquired not from nature but from a habit of making ill-considered judgements; and it is therefore quite possible that these are false. Cases in point are the belief that any space in which nothing is occurring to stimulate my senses must be empty; or that the heat in a body is something exactly resembling the idea of heat which is in me; or that when a body is white or green, the selfsame whiteness or greenness which I perceive through my senses is present in the body; or that in a body which is bitter or sweet there is the selfsame taste which I experience, and so on; or, finally, that stars and towers and other distant bodies have the same size and shape which they present to my senses, and other examples of this kind. But to make sure that my perceptions in this matter are sufficiently distinct, I must more accurately define exactly what I mean when I say that I am taught something by nature. In this context I am taking nature to be something more limited than the totality of things bestowed on me by God. For this includes many things that belong to the mind alone—for example my perception that what is done cannot be undone, and all other things that are known by the natural light; but at this stage I am not speaking

of these matters. It also includes much that relates to the body alone, like the tendency to move in a downward direction, and so on; but I am not speaking of these matters either. My sole concern here is with what God has bestowed on me as a combination of mind and body. My nature, then, in this limited sense, does indeed teach me to avoid what induces a feeling of pain and to seek out what induces feelings of pleasure, and so on. But it does not appear to teach us to draw any conclusions from these sensory perceptions about things located outside us without waiting until the intellect has examined the matter. For knowledge of the truth about such things seems to belong to the mind alone, not to the combination of mind and body. Hence, although a star has no greater effect on my eye than the flame of a small light, that does not mean that there is any real or positive inclination in me to believe that the star is no bigger than the light; I have simply made this judgement from childhood onwards without any rational basis. Similarly, although I feel heat when I go near a fire and feel pain when I go too near, there is no convincing argument for supposing that there is something in the fire which resembles the heat, any more than for supposing that there is something which resembles the pain. There is simply reason to suppose that there is something in the fire, whatever it may eventually turn out to be, which produces in us the feelings of heat or pain. And likewise, even though there is nothing in any given space that stimulates the senses, it does not follow that there is no body there. In these cases and many others I see that I have been in the habit of misusing the order of nature. For the proper purpose of the sensory perceptions given me by nature is simply to inform the mind of what is beneficial or harmful for the composite of which the mind is a part; and to this extent they are sufficiently clear and distinct. But I misuse them by treating them as reliable touchstones for immediate judgements about the essential nature of the bodies located outside us; yet this is an area where they provide only very obscure information. 83

I have already looked in sufficient detail at how, notwithstanding the goodness of God, it may happen that my judgements are false. But a further problem now comes to mind regarding those very things which nature presents to me as objects which I should seek out or avoid, and also regarding the internal sensations, where I seem to have detected errors—e.g. when someone is tricked by the pleasant taste of some food into eating the poison concealed inside it. Yet in this case, what the man's nature urges him to go for is simply what is responsible for the pleasant taste, and not the poison, which his nature knows nothing about. The only inference that can be drawn from this is that his nature is not omniscient. And this is not surprising, since man is a limited thing, and so it is only fitting that his perfection should be limited. 84

And yet it is not unusual for us to go wrong even in cases where nature does urge us towards something. Those who are ill, for example, may desire food or drink that will shortly afterwards turn out to be bad for them. Perhaps it may be said that they go wrong because their nature is disordered, but this does not remove the difficulty. A sick man is no less one of God's creatures than a healthy one, and it seems no less a contradiction to suppose that he has received from God a nature which deceives him. Yet a clock constructed with wheels and weights observes all the laws of its nature just as closely when it is badly made and tells the wrong time as when it completely fulfils the wishes of the clockmaker. In the same way, I might consider the body of a man as a kind of machine equipped with and made up of bones, nerves, muscles, veins, blood and skin in such a way that, even if there were no mind in it, it would still perform all the same movements as it now does in those cases where movement is not under the control of the will or, consequently, of the mind. I can easily see that if such a body suffers from dropsy, for example, and is affected by the dryness of the throat which normally produces in the mind the sensation of thirst, the resulting condition of the nerves and other parts will dispose the

body to take a drink, with the result that the disease will be aggravated. Yet this is just as natural as the body's being stimulated by a similar dryness of the throat to take a drink
 85 when there is no such illness and the drink is beneficial. Admittedly, when I consider the purpose of the clock, I may say that it is departing from its nature when it does not tell the right time; and similarly when I consider the mechanism of the human body, I may think that, in relation to the movements which normally occur in it, it too is deviating from its nature if the throat is dry at a time when drinking is not beneficial to its continued health. But I am well aware that "nature" as I have just used it has a very different significance from "nature" in the other sense. As I have just used it, "nature" is simply a label which depends on my thought; it is quite extraneous to the things to which it is applied, and depends simply on my comparison between the idea of a sick man and a badly-made clock, and the idea of a healthy man and a well-made clock. But by "nature" in the other sense I understand something which is really to be found in the things themselves; in this sense, therefore, the term contains something of the truth.

When we say, then, with respect to the body suffering from dropsy, that it has a disordered nature because it has a dry throat and yet does not need drink, the term "nature" is here used merely as an extraneous label. However, with respect to the composite, that is, the mind united with this body, what is involved is not a mere label, but a true error of nature, namely that it is thirsty at a time when drink is going to cause it harm. It thus remains to inquire how it is that the goodness of God does not prevent nature, in this sense, from deceiving us.

The first observation I make at this point is that there is a great difference between the mind and the body, inasmuch as the body is by its very nature always divisible, while
 86 the mind is utterly indivisible. For when I consider the mind, or myself in so far as I am merely a thinking thing, I am unable to distinguish any parts within myself; I understand myself to be something quite single and complete. Although the whole mind seems to be united to the whole body, I recognize that if a foot or arm or any other part of the body is cut off, nothing has thereby been taken away from the mind. As for the faculties of willing, of understanding, of sensory perception and so on, these cannot be termed parts of the mind, since it is one and the same mind that wills, and understands and has sensory perceptions. By contrast, there is no corporeal or extended thing that I can think of which in my thought I cannot easily divide into parts; and this very fact makes me understand that it is divisible. This one argument would be enough to show me that the mind is completely different from the body, even if I did not already know as much from other considerations.

My next observation is that the mind is not immediately affected by all parts of the body, but only by the brain, or perhaps just by one small part of the brain, namely the part which is said to contain the "common" sense. Every time this part of the brain is in a given state, it presents the same signals to the mind, even though the other parts of the body may be in a different condition at the time. This is established by countless observations, which there is no need to review here.

I observe, in addition, that the nature of the body is such that whenever any part of it is moved by another part which is some distance away, it can always be moved in the same fashion by any of the parts which lie in between, even if the more distant part
 87 does nothing. For example, in a cord ABCD, if one end D is pulled so that the other end A moves, the exact same movement could have been brought about if one of the intermediate points B or C had been pulled, and D had not moved at all. In similar fashion, when I feel a pain in my foot, physiology tells me that this happens by means of nerves distributed throughout the foot, and that these nerves are like cords which go from the foot right up to the brain. When the nerves are pulled in the foot, they in turn

A diagram from Descartes' *Tractatus de Homine* (1677) showing how the pineal gland (shown here at the back of the head) connects sensory images from the eyes to the muscles of the arm. (© Science & Society Picture Library/Getty)

pull on inner parts of the brain to which they are attached, and produce a certain motion in them; and nature has laid it down that this motion should produce in the mind a sensation of pain, as occurring in the foot. But since these nerves, in passing from the foot to the brain, must pass through the calf, the thigh, the lumbar region, the back and the neck, it can happen that, even if it is not the part in the foot but one of the intermediate parts which is being pulled, the same motion will occur in the brain as occurs when the foot is hurt, and so it will necessarily come about that the mind feels the same sensation of pain. And we must suppose the same thing happens with regard to any other sensation.

My final observation is that any given movement occurring in the part of the brain that immediately affects the mind produces just one corresponding sensation; and hence the best system that could be devised is that it should produce the one sensation which, of all possible sensations, is most especially and most frequently conducive to the preservation of the healthy man. And experience shows that the sensations which nature has given us are all of this kind; and so there is absolutely nothing to be found in them that does not bear witness to the power and goodness of God. For example, when the nerves in the foot are set in motion in a violent and unusual manner, this motion, by way of the spinal cord, reaches the inner parts of the brain, and there gives the mind its signal for having a certain sensation, namely the sensation of a pain as occurring in the foot. This stimulates the mind to do its best to get rid of the cause of the pain, which it takes to be harmful to the foot. It is true that God could have made the nature of man such that this particular motion in the brain indicated something else to the mind; it might, for example, have made the mind aware of the actual motion occurring in the

brain, or in the foot, or in any of the intermediate regions; or it might have indicated something else entirely. But there is nothing else which would have been so conducive to the continued well-being of the body. In the same way, when we need drink, there arises a certain dryness in the throat; this sets in motion the nerves of the throat, which in turn move the inner parts of the brain. This motion produces in the mind a sensation of thirst, because the most useful thing for us to know about the whole business is that we need drink in order to stay healthy. And so it is in the other cases.

It is quite clear from all this that, notwithstanding the immense goodness of God, the nature of man as a combination of mind and body is such that it is bound to mislead him from time to time. For there may be some occurrence, not in the foot but in one of the other areas through which the nerves travel in their route from the foot to the brain, or even in the brain itself; and if this cause produces the same motion which is generally produced by injury to the foot, then pain will be felt as if it were in the foot. This deception of the senses is natural, because a given motion in the brain must always produce the same sensation in the mind; and the origin of the motion in question is much more often going to be something which is hurting the foot, rather than something existing elsewhere. So it is reasonable that this motion should always indicate to the mind a pain in the foot rather than in any other part of the body. Again, dryness of the throat may sometimes arise not, as it normally does, from the fact that a drink is necessary to the health of the body, but from some quite opposite cause, as happens in the case of the man with dropsy. Yet it is much better that it should mislead on this occasion than that it should always mislead when the body is in good health. And the same goes for the other cases.

This consideration is the greatest help to me, not only for noticing all the errors to which my nature is liable, but also for enabling me to correct or avoid them without difficulty. For I know that in matters regarding the well-being of the body, all my senses report the truth much more frequently than not. Also, I can almost always make use of more than one sense to investigate the same thing; and in addition, I can use both my memory, which connects present experiences with preceding ones, and my intellect, which has by now examined all the causes of error. Accordingly, I should not have any further fears about the falsity of what my senses tell me every day; on the contrary, the exaggerated doubts of the last few days should be dismissed as laughable. This applies especially to the principal reason for doubt, namely my inability to distinguish between being asleep and being awake. For I now notice that there is a vast difference between the two, in that dreams are never linked by memory with all the other actions of life as waking experiences are. If, while I am awake, anyone were suddenly to appear to me and then disappear immediately, as happens in sleep, so that I could not see where he had come from or where he had gone to, it would not be unreasonable for me to judge that he was a ghost, or a vision created in my brain, rather than a real man. But when I distinctly see where things come from and where and when they come to me, and when I can connect my perceptions of them with the whole of the rest of my life without a break, then I am quite certain that when I encounter these things I am not asleep but awake. And I ought not to have even the slightest doubt of their reality if, after calling upon all the senses as well as my memory and my intellect in order to check them, I receive no conflicting reports from any of these sources. For from the fact that God is not a deceiver it follows that in cases like these I am completely free from error. But since the pressure of things to be done does not always allow us to stop and make such a meticulous check, it must be admitted that in this human life we are often liable to make mistakes about particular things, and we must acknowledge the weakness of our nature.

CORRESPONDENCE WITH PRINCESS ELIZABETH (selections)

1.a. Princess Elizabeth to Descartes [On the Relation of Soul and Body]

The Hague, 6–16 May 1643.

... I beg of you to tell me how the human soul can determine the movement of the animal spirits in the body so as to perform voluntary acts—being as it is merely a conscious (*pensante*) substance. For the determination of movement seems always to come about from the moving body's being propelled—to depend on the kind of impulse it gets from what sets it in motion, or again, on the nature and shape of this latter thing's surface. Now the first two conditions involve contact, and the third involves that the impelling thing has extension; but you utterly exclude extension from your notion of soul, and contact seems to me incompatible with a thing's being immaterial.

I therefore ask you for a more specific definition of the soul than you give in your metaphysics: a definition of its substance, as distinct from its activity, consciousness (*pensée*). Even if we supposed these to be in fact inseparable—a matter hard to prove in regard to children in their mother's womb and severe fainting-fits—to be inseparable as the divine attributes are: nevertheless we may get a more perfect idea of them by considering them apart.

1.b. Descartes to Princess Elizabeth

Egmond, 21 May 1643.

... I may truly say that what your Highness is propounding seems to me to be the question people have most right to ask me in view of my published works. For there are two facts about the human soul on which there depends any knowledge we may have as to its nature: first, that it is conscious; secondly, that, being united to a body, it is able to act and suffer along with it. Of the second fact I said almost nothing; my aim was simply to make the first properly understood; for my main object was to prove the distinction of soul and body; and to this end only the first was serviceable, the second might have been prejudicial. But since your Highness sees too clearly for dissimulation to be possible, I will here try to explain how I conceive the union of soul and body and how the soul has the power of moving the body.

My first observation is that there are in us certain primitive notions—the originals, so to say, on the pattern of which we form all other knowledge. These notions are very few in number. First, there are the most general ones, existence, number, duration, etc., which apply to everything we can conceive. As regards body in particular, we have merely the notion of extension and the consequent notions of shape and movement. As

regards the soul taken by itself, we have merely the notion of consciousness, which comprises the conceptions (*perceptions*) of the intellect and the inclinations of the will. Finally, as regards the soul and body together, we have merely the notion of their union; and on this there depend our notions of the soul's power to move the body, and of the body's power to act on the soul and cause sensations and emotions.

I would also observe that all human knowledge consists just in properly distinguishing these notions and attaching each of them only to the objects that it applies to. If we try to explain some problem by means of a notion that does not apply, we cannot help making mistakes; we are just as wrong if we try to explain one of these notions in terms of another, since, being primitive, each such notion has to be understood in itself. The use of our senses has made us much more familiar with notions of extension, shape, and movement than with others; thus the chief cause of our errors is that ordinarily we try to use these notions to explain matters to which they do not apply; e.g. we try to use our imagination in conceiving the nature of the soul, or to conceive the way the soul moves the body in terms of the way that one body is moved by another body.

In the Meditations that your Highness condescended to read, I tried to bring before the mind the notions that apply to the soul taken by itself, and to distinguish them from those that apply to the body taken by itself. Accordingly, the next thing I have to explain is how we are to form the notions that apply to the union of the soul with the body, as opposed to those that apply to the body taken by itself or the mind taken by itself. . . . These simple notions are to be sought only within the soul, which is naturally endowed with all of them, but does not always adequately distinguish between them, or again, does not always attach them to the right objects.

So I think people have hitherto confused the notions of the soul's power to act within the body and the power one body has to act within another; and they have ascribed both powers not to soul, whose nature was so far unknown, but to various qualities of bodies—gravity, heat, etc. These qualities were imagined to be real, i.e. to have an existence distinct from the existence of bodies; consequently, they were imagined to be substances, although they were called qualities. In order to conceive of them, people have used sometimes notions that we have for the purpose of knowing body, and sometimes those that we have for the purpose of knowing the soul, according as they were ascribing to them a material or an immaterial nature. For example, on the supposition that gravity is a real quality, about which we know no more than its power of moving the body in which it occurs towards the centre of the Earth, we find no difficulty in conceiving how it moves the body or how it is united to it; and we do not think of this as taking place by means of real mutual contact between two surfaces; our inner experience shows (*nous expérimentons*) that that notion is a specific one. Now I hold that we misuse this notion by applying it to gravity (which, as I hope to show in my Physics, is nothing really distinct from body), but that it has been given to us in order that we may conceive of the way that the soul moves the body.

2.a. Princess Elizabeth to Descartes [On the Relation of Soul and Body]

The Hague, 10–20 June 1643.

. . . [I cannot] understand the idea by means of which we are to judge of the way that the soul, unextended and immaterial, moves the body, in terms of the idea you used to have about gravity. You used falsely to ascribe to gravity, under the style of a “quality,” the power of carrying bodies towards the centre of the Earth. But I cannot see why this should convince us that a body may be impelled by something immaterial; why we should not rather be confirmed in the view that this is impossible, by the demonstration

of a true [view of gravity], opposed [to this], which you promise us in your *Physics*; especially as the idea [that a body may be so impelled] cannot claim the same degree of perfection and representative reality (*réalité objective*) as the idea of God, and may be a figment resulting from ignorance of what really moves bodies towards the centre. Since no material cause was apparent to the senses, people may well have ascribed this to the opposite cause, the immaterial, but I have never been able to conceive *that*, except as a negation of matter, which can have no communication with matter.

And I must confess that I could more readily allow that the soul has matter and extension than that an immaterial being has the capacity of moving a body and being affected by it. If the first, [the soul's moving the body], took place by [the soul's giving] information [to the body], then the [animal] spirits, which carry out the movement, would have to be intelligent; but you do not allow intelligence to anything corporeal. You do indeed show the possibility of the second thing [the body's affecting the soul], in your Metaphysical Meditations; but it is very hard to see how a soul such as you describe, after possessing the power and the habit of correct reasoning, may lose all that because of some vapours [in the brain]; or why the soul is so much governed by the body, when it can subsist separately, and has nothing in common with it. . . .

2.b. Descartes to Princess Elizabeth

Egmond, 28 June 1643.

I am most deeply obliged to your Highness for condescending, after experience of my previous ill success in explaining the problem you were pleased to propound to me, to be patient enough to listen to me once more on the same subject, and to give me an opportunity of making remarks on matters I had passed over. My chief omissions seem to be the following. I began by distinguishing three kinds of primitive ideas or notions, each of which is known in a specific way and not by comparison to another kind; viz. the notion of soul, the notion of body, and the notion of the union between soul and body. I still had to explain the difference between the operations of the soul by means of which we get them, and to show the means of becoming readily familiar with each kind. Further, I had to explain why I used the comparison of gravity. Next, I had to show that even if we try to conceive of the soul as material (which means, properly speaking, to conceive of its union with the body), we cannot help going on to recognise that it is separable from the body. This, I think, is the sum of the task your Highness has set me.

In the first place, then, I discern this great difference between the three kinds of notions: the soul is conceived only by pure intellect; body (i.e. extension, shape, and movement) can likewise be known by pure intellect, but is known much better when intellect is aided by imagination; finally, what belongs to the union of soul and body can be understood only in an obscure way either by pure intellect or even when the intellect is aided by imagination, but is understood very clearly by means of the senses. Consequently, those who never do philosophise and make use only of their senses have no doubt that the soul moves the body and the body acts on the soul; indeed, they consider the two as a single thing, i.e. they conceive of their union; for to conceive of the union between two things is to conceive of them as a single thing. Metaphysical reflections, which exercise the pure intellect, are what make us familiar with the notion of soul; the study of mathematics, which chiefly exercises the imagination in considering figures and movements, accustoms us to form very distinct notions of body; finally, it is just by means of ordinary life and conversation, by abstaining from meditating and from studying things that exercise the imagination, that one learns to conceive the union of soul and body.

I am half afraid that your Highness may think I am not speaking seriously here; but that would be contrary to the respect that I owe to your Highness and will never fail to pay. I can truly say that the chief rule I have always observed in my studies, and the one I think has been most serviceable to me in acquiring some measure of knowledge, has been never to spend more than a few hours a day in thoughts that demand imagination, or more than a few hours a year in thoughts that demand pure intellect; I have given all the rest of my time to the relaxation of my senses and the repose of my mind. I here count among exercises of imagination all serious conversations, and everything that demands attention. This is what made me retire to the country; it is true that in the busiest city in the world I might have as many hours to myself as I now spend in study, but I could not employ them so usefully when my mind was wearied by the attention that the troubles of life demand.

I take the liberty of writing thus to your Highness, to express my sincere admiration of your Highness's ability, among all the business and cares that are never lacking to persons who combine high intelligence and high birth, to find leisure for the meditations that are necessary for proper understanding of the distinction between soul and body. I formed the opinion that it was these meditations, rather than thoughts demanding less attention, that made your Highness find some obscurity in our notion of their union. It seems to me that the human mind is incapable of distinctly conceiving both the distinction between body and soul and their union, at one and the same time; for that requires our conceiving them as a single thing and simultaneously conceiving them as two things, which is self-contradictory. I supposed that your Highness still had very much in mind the arguments proving the distinction of soul and body; and I did not wish to ask you to lay them aside, in order to represent to yourself that notion of their union which everybody always has in himself without doing philosophy—viz. that there is one single person who has at once body and consciousness, so that this consciousness can move the body and be aware of the events that happen to it. Accordingly, I used in my previous letter the simile of gravity and other qualities, which we imagine to be united to bodies as consciousness is united to ours. I did not worry over the fact that this simile is lame, because these qualities are not, as one imagines, realities; for I thought your Highness was already fully convinced that the soul is a substance distinct from the body.

Your Highness, however, makes the remark that it is easier to ascribe matter and extension to the soul than to ascribe to it the power of moving a body and being moved by it without having any matter. Now I would ask your Highness to hold yourself free to ascribe "matter and extension" to the soul; for this is nothing else than to conceive the soul as united to the body. After forming a proper conception of this, and experiencing it in your own case, your Highness will find it easy to reflect that the matter you thus ascribe to your consciousness (*pensée*) is not the consciousness itself; again, the extension of the matter is essentially different from the extension of the consciousness, for the first extension is determined to a certain place, and excludes any other corporeal extension from that place, whereas the second does not. In this way your Highness will assuredly find it easy to come back to a realisation of the distinction between soul and body, in spite of having conceived of them as united.

Finally, I think it is very necessary to have got a good understanding, for once in one's life, of the principles of metaphysics, because it is from these that we have knowledge of God and of our soul. But I also think it would be very harmful to occupy one's intellect often with meditating on them, for it would be the less able to find leisure for the functioning of the imagination and the senses; the best thing is to be content with retaining in memory and in belief the conclusions one has drawn once for all, and to spend the rest of one's time for study in reflections in which the intellect cooperates with the imagination and the senses. . . .

THOMAS HOBBES

1588–1679

Born prematurely when his mother heard of the approach of the Spanish Armada, Thomas Hobbes often quipped that he was born “a twin with fear.” Hobbes saw much to fear in his long life. He observed a civil war, the execution of Charles I, and periods of great political and social upheaval. On more than one occasion, he was forced to flee England, and he often feared for his life. It is not surprising, then, that he developed a political philosophy emphasizing fear of death and the need for security.

Hobbes was born in Malmesbury, Wiltshire, England, the son of a disreputable vicar. His father was forced to leave the Wiltshire area after brawling outside his church. Young Thomas was sent to live with a rich uncle. At the age of 14, he went to Oxford University. Like Descartes, he found most of his schooling to be a waste of time. He particularly disliked the Aristotelianism of his college, Magdalen Hall. In 1608, he became the tutor to the son of William Cavendish, Earl of Devonshire. For the rest of his life, Hobbes remained a friend of the Cavendish family and a royalist sympathizer.

Hobbes made several extended visits to the Continent—some voluntary, some a result of running for his life. At home and on the Continent, Hobbes met and conversed with leading thinkers such as Descartes, Galileo, and Bacon. Although he, of course, had differences with them, he nevertheless used each thinker’s ideas to refine his own philosophy. From Descartes, he learned to value the geometric method. Descartes used geometry to establish epistemological certainty. Hobbes used geometry to develop a political theory. In opposition to the dominant Aristotelian thesis that rest is the natural state of objects, Galileo had proposed that all bodies are naturally in motion. Hobbes took Galileo’s postulate and proceeded to argue that all things in the world, including human beings, are bodies in motion. With Bacon, Hobbes agreed that scientific knowledge was primarily useful for improving the human condition.

In 1628, Hobbes published his first literary work: a translation of *Thucydides*, by which he hoped to use history to enlighten the English people. In Thucydides' *Peloponnesian War*, democratic Athens had been defeated by monarchical Sparta. Hobbes wanted to warn his fellow citizens of the creeping democracy threatening England. Hobbes was convinced that democracy led to chaos and that a strong central government was essential for national stability. In 1640, Hobbes was forced to flee England for Paris when the Long Parliament supplanted the king. In Paris, Hobbes wrote the book for which he is famous, *Leviathan or the Matter, Form, and Power of a Commonwealth, Ecclesiastical and Civil*. The book was published between the execution of Charles I (1649) and the Protectorate of Cromwell (1653), a time ripe for political philosophy.

Cromwell permitted Hobbes to return to England in 1652. Although Hobbes had always been a royalist, his argument for the absolute power of the sovereign was not restricted to kings. Thus Cromwell had no reason to consider Hobbes's doctrine seditious—nor did Charles II, whom Hobbes had tutored in Paris, and who was later restored to the monarchy.

Hobbes's later years were spent writing and arguing for his ideas. Although he continued to have enemies, with the king's friendship he managed to stay out of serious trouble. In his early eighties, Hobbes wrote a history of the period 1640 to 1660, which he called *Behemoth*. When he was 84, Hobbes published his autobiography in Latin verse; at 86, he produced a verse translation of both the *Iliad* and the *Odyssey* (for lack of anything better to do, he commented). He died in 1679 at the age of 91.

* * *

The *Leviathan* is known primarily for its political philosophy, but it touches on a number of other issues including epistemology, metaphysics, ethics, and religion. Hobbes begins with a thoroughgoing version of materialism. Everything in the world, including humans, consists of bodies in motion. Knowledge of the world begins in sensation. Bodies in motion outside of a person cause motion within the person. Memories, imagination, and other "mental" phenomena are the after-shocks of sensations—what Hobbes calls "decaying sense." *Willing* is that "beginning of motion" that leads to action when individuals move and so move other bodies.

Using a mechanistic explanation of "voluntary motions," which he calls "endeavors," Hobbes believes that in human life, self-interest and the desire for power are the basic motive powers. According to Hobbes, each person constantly seeks an advantage over everyone else. Yet since all are born equal, there is no inherent reason why one person should give way to another. The result is what Hobbes calls "a war of every man against every man . . . [in which] the notions of right and wrong, justice and injustice, have no place." In such an environment, life is "solitary, poor, nasty, brutish, and short."

To avoid this natural state of anarchy, individuals must enter into a social contract or covenant with all other individuals to give up their power irrevocably to a sovereign: "This is the generation of that great LEVIATHAN, or rather, to speak more reverently, of that 'mortal god,' to which we owe under the 'immortal God,' our peace and defence." This contract is not binding on the

sovereign, as the sovereign is not a party to it. Hence there is no legal limitation on the sovereign's power. The sovereign is the essence of the commonwealth, which can be defined as

one person, of whose acts a great multitude, by mutual covenants one with another, have made themselves every one the author, to the end he may use the strength and means of them all, as he shall think expedient, for their peace and common defence. . . . And he that carries this person, is called SOVEREIGN, and said to have sovereign power; and every one besides, his SUBJECT.

Hobbes believes this sovereign did not have to be a single person—sovereignty could reside in an individual (a monarchy), a small group (an aristocracy), or in the entire population (a democracy)—though he shows a marked preference for monarchy because of its greater stability and efficiency. What matters to Hobbes above all else is that the sovereign has absolute power in order to keep the peace and to guarantee security. To be sure, an absolute sovereign might abuse power, but the only alternative to this possible abuse, Hobbes claims, is an unthinkable anarchy.

* * *

Hobbes wrote many books over the course of his long life—the standard Oxford edition of his English works includes eleven volumes with another five volumes of his Latin works—but *Leviathan* (1651) is the basis of his fame. The key sections of this work, from Chapters 1–3, 6, 9, 12, 15, 17–18, and 21, are reprinted here. The spelling has been updated and standardized.

LEVIATHAN OR THE MATTER, FORM, AND POWER OF A COMMONWEALTH, ECCLESIASTICAL AND CIVIL (in part)

PART I—OF MAN

CHAPTER I. OF SENSE

Concerning the thoughts of man, I will consider them first singly, and afterwards in train, or dependence upon one another. Singly, they are every one a “representation” or “appearance” of some quality, or other accident of a body without us, which is commonly called an “object.” Which object works on the eyes, ears, and other parts of a man’s body, and, by diversity of working, produces diversity of appearances.

The title page of Hobbes's *Leviathan* (1651). The sovereign in the background, whose body is composed of the people, is supreme. He is shown here holding the symbols of both church and state.
(Library of Congress)

The original of them all is that which we call “sense,” for there is no conception in a man’s mind which hath not at first, totally or by parts, been begotten upon the organs of sense. The rest are derived from that original.

To know the natural cause of sense is not very necessary to the business now in hand; and I have elsewhere written of the same at large. Nevertheless, to fill each part of my present method I will briefly deliver the same in this place.

The cause of sense is the external body, or object, which presses the organ proper to each sense, either immediately, as in the taste and touch, or mediately, as in seeing, hearing, and smelling; which pressure, by the mediation of the nerves and other strings and membranes of the body continued inwards to the brain and heart, causes there a resistance, or counter-pressure, or endeavor of the heart to deliver itself, which endeavor, because “outward,” seems to be some matter without. And this “seeming” or “fancy” is that which men call “sense” and consists, as to the eye, in a “light” or “color figured”; to the ear, in a “sound”; to the nostril, in an “odor”; to the tongue and palate, in a “savor”; and to the rest of the body, in “heat,” “cold,” “hardness,” “softness,” and such other qualities as we discern by “feeling.” All which qualities, called “sensible” are in the object that causes them but so many several motions of the matter, by which it presses our organs diversely. Neither in us that are pressed are they anything else but divers motions; for motion produces nothing but motion. But their appearance to us is fancy, the same waking that dreaming. And as pressing, rubbing, or striking the eye, makes us fancy a light, and pressing the ear produces a din, so do the bodies also we see or hear produce the same by their strong, though unobserved, action. For if those colors and sounds were in the bodies, or objects that cause them, they could not be severed from them, as by glasses, and in echoes by reflection, we see they are, where we know the thing we see is in one place, the appearance in another. And though at some certain distance the real and very object seem invested with the fancy it begets in us, yet still the object is one thing, the image or fancy is another. So that sense in all cases is nothing else but original fancy, caused, as I have said, by the pressure, that is by the motion, of external things upon our eyes, ears, and other organs thereunto ordained.

But the philosophy schools through all the universities of Christendom, grounded upon certain texts of Aristotle, teach another doctrine, and say, for the cause of “vision,” that the thing seen sends forth on every side a “visible species,” in English, a “visible show,” “apparition,” or “aspect,” or “a being seen”; the receiving whereof into the eye is “seeing.” And for the cause of “hearing,” that the thing heard sends forth an “audible species,” that is an “audible aspect,” or “audible being seen,” which entering at the ear makes “hearing.” Nay, for the cause of “understanding” also, they say the thing understood sends forth an “intelligible species,” that is, an “intelligible being seen,” which, coming into the understanding, makes us understand. I say not this as disproving the use of universities; but, because I am to speak hereafter of their office in a commonwealth. I must let you see on all occasions by the way what things would be amended in them, amongst which the frequency of insignificant speech is one.

CHAPTER 2. OF IMAGINATION

That when a thing lies still, unless somewhat else stir it, it will lie still for ever, is a truth that no man doubts of. But that when a thing is in motion, it will eternally be in motion, unless somewhat else stay it, though the reason be the same, namely that nothing can change itself, is not so easily assented to. For men measure not only other men but all

other things, by themselves; and, because they find themselves subject after motion to pain and lassitude, think everything else grows weary of motion, and seeks repose of its own accord; little considering whether it be not some other motion wherein that desire of rest they find in themselves consists. From hence it is that the schools say heavy bodies fall downwards out of an appetite to rest, and to conserve their nature in that place which is most proper for them; ascribing appetite and knowledge of what is good for their conservation, which is more than man has, to things inanimate, absurdly.

When a body is once in motion, it moves, unless something else hinder it, eternally; and whatsoever hinders it cannot in an instant, but in time and by degrees, quite extinguish it; and, as we see in the water though the wind cease the waves give not over rolling for a long time after: so also it happens in that motion which is made in the internal parts of a man, then, when he sees, dreams, etc. For, after the object is removed, or the eye shut, we still retain an image of the thing seen, though more obscure than when we see it. And this is it the Latins call "imagination," from the image made in seeing; and apply the same, though improperly, to all the other senses. But the Greeks call it "fancy," which signifies "appearance," and is as proper to one sense as to another. "Imagination," therefore, is nothing but "decaying sense," and is found in men, and many other living creatures, as well sleeping as waking.

The decay of sense in men waking is not the decay of the motion made in sense, but an obscuring of it in such manner as the light of the sun obscures the light of the stars, which stars do no less exercise their virtue, by which they are visible, in the day than in the night. But because amongst many strokes which our eyes, ears, and other organs, receive from external bodies, the predominant only is sensible; therefore, the light of the sun being predominant, we are not affected with the action of the stars. And any object being removed from our eyes, though the impression it made in us remain, yet other objects more present succeeding and working on us, the imagination of the past is obscured and made weak, as the voice of a man is in the noise of the day. From whence it follows that the longer the time is, after the sight or sense of any object, the weaker is the imagination. For the continual change of man's body destroys in time the parts which in sense were moved; so that distance of time, and of place, hath one and the same effect in us. For as at a great distance of place that which we look at appears dim and without distinction of the smaller parts, and as voices grow weak and inarticulate, so also after great distance of time our imagination of the past is weak; and we lose, for example, of cities we have seen many particular streets, and of actions many particular circumstances. This "decaying sense," when we would express the thing itself, I mean "fancy" itself, we call "imagination," as I said before; but when we would express the decay, and signify that the sense is fading, old, and past, it is called "memory." So that imagination and memory are but one thing, which for divers considerations hath divers names.

Much memory, or memory of many things, is called "experience." Again, imagination being only of those things which have been formerly perceived by sense, either all at once or by parts at several times the former, which is the imagining the whole object as it was presented to the sense, is "simple" imagination, as when one imagines a man, or horse, which he hath seen before. The other is "compounded," as when, from the sight of a man at one time, and of a horse at another, we conceive in our mind a Centaur. So when a man compounds the image of his own person with the image of the actions of another man, as when a man images himself a Hercules or an Alexander, which happens often to them that are much taken with reading of romances, it is a compound imagination, and properly but a fiction of the mind. There be also other imaginations that rise in men, though waking, from the great impression made in sense; as, from gazing upon the sun,

the impression leaves an image of the sun before our eyes a long time after; and, from being long and vehemently intent upon geometrical figures, a man shall in the dark, though awake, have the images of lines and angles before his eyes; which kind of fancy hath no particular name, as being a thing that doth not commonly fall into men's discourse.

The imaginations of them that sleep are those we call "dreams." And these also, as also all other imaginations, have been before, either totally or by parcels, in the sense. And, because in sense, the brain and nerves, which are the necessary organs of sense, are so benumbed in sleep as not easily to be moved by the action of external objects, there can happen in sleep no imagination, and therefore no dream, but what proceeds from the agitation of the inward parts of man's body; which inward parts, for the connection they have with the brain and other organs, when they be distempered, do keep the same in motion; whereby the imaginations there formerly made, appear as if a man were waking; saving that the organs of sense being now benumbed, so as there is no new object which can master and obscure them with a more vigorous impression, a dream must needs be more clear in this silence of sense than our waking thoughts. And hence it comes to pass that it is a hard matter, and by many thought impossible, to distinguish exactly between sense and dreaming. For my part, when I consider that in dreams I do not often nor constantly think of the same persons, places, objects, and actions, that I do waking, nor remember so long a train of coherent thoughts, dreaming, as at other times, and because waking I often observe the absurdity of dreams, but never dream of the absurdities of my waking thoughts, I am well satisfied, that, being awake, I know I dream not, though when I dream I think myself awake.

And, seeing dreams are caused by the distemper of some of the inward parts of the body, divers distempers must needs cause different dreams. And hence it is that lying cold breeds dreams of fear, and raises the thought and image of some fearful object, the motion from the brain to the inner parts and from the inner parts to the brain being reciprocal; and that, as anger causes heat in some parts of the body when we are awake, so when we sleep the overheating of the same parts causes anger, and raises up in the brain the imagination of an enemy. In the same manner, as natural kindness, when we are awake, causes desire, and desire makes heat in certain other parts of the body; so also too much heat in those parts, while we sleep, raises in the brain an imagination of some kindness shown. In sum, our dreams are the reverse of our waking imaginations, the motion when we are awake beginning at one end, and when we dream at another.

The most difficult discerning of a man's dream from his waking thoughts is, then, when by some accident we observe not that we have slept: which is easy to happen to a man full of fearful thoughts, and whose conscience is much troubled, and that sleeps without the circumstances of going to bed or putting off his clothes, as one that nods in a chair. For he that takes pains, and industriously lays himself to sleep, in case any uncouth and exorbitant fancy come unto him, cannot easily think it other than a dream. We read of Marcus Brutus (one that had his life given him by Julius Cæsar, and was also his favorite, and notwithstanding murdered him) how at Philippi, the night before he gave battle to Augustus Cæsar, he saw a fearful apparition, which is commonly related by historians as a vision; but, considering the circumstances, one may easily judge to have been but a short dream. For, sitting in his tent, pensive and troubled with the horror of his rash act, it was not hard for him, slumbering in the cold, to dream of that which most frightened him; which fear, as by degrees it made him wake, so also it must needs make the apparition by degrees to vanish; and, having no assurance that he slept, he could have no cause to think it a dream or anything but a vision. And this is no very rare accident; for

even they that be perfectly awake, if they be timorous and superstitious, possessed with fearful tales, and alone in the dark, are subject to the like fancies, and believe they see spirits and dead men's ghosts walking in churchyards; whereas it is either their fancy only, or else the knavery of such persons as make use of such superstitious fear to pass disguised in the night to places they would not be known to haunt.

From this ignorance of how to distinguish dreams and other strong fancies from vision and sense, did arise the greatest part of the religion of the Gentiles in time past, that worshipped satyrs, fawns, nymphs, and the like; and now-a-days the opinion that rude people have of fairies, ghosts, and goblins, and of the power of witches. For as for witches, I think not that their witchcraft is any real power; but yet that they are justly punished for the false belief they have that they can do such mischief, joined with their purpose to do it if they can; their trade being nearer to a new religion than to a craft or science. And for fairies and walking ghosts, the opinion of them has, I think, been on purpose either taught, or not confuted, to keep in credit the use of exorcism, of crosses, of holy water, and other such inventions of ghostly men. Nevertheless there is no doubt but God can make unnatural apparitions; but that He does it so often as men need to fear such things more than they fear the stay or change of the course of nature, which He also can stay and change, is no point of Christian faith. But evil men, under pretext that God can do anything, are so bold as to say anything when it serves their turn, though they think it untrue; it is the part of a wise man to believe them no farther than right reason makes that which they say appear credible. If this superstitious fear of spirits were taken away, and with it prognostics from dreams, false prophecies, and many other things depending thereon, by which crafty ambitious persons abuse the simple people, men would be much more fitted than they are for civil obedience.

And this ought to be the work of the schools; but they rather nourish such doctrine. For, not knowing what imagination or the senses are, what they receive they teach; some saying that imaginations rise of themselves and have no cause; others that they rise most commonly from the will, and that good thoughts are blown (inspired) into a man by God, and evil thoughts by the devil; or that good thoughts are poured (infused) into a man by God, and evil ones by the devil. Some say the senses receive the species of things, and deliver them to the common sense, and the common sense delivers them over to the fancy, and the fancy to the memory, and the memory to the judgment, like handling of things from one to another, with many words making nothing understood.

The imagination that is raised in man, or any other creature endowed with the faculty of imagining, by words or other voluntary signs, is that we generally call "understanding," and is common to man and beast. For a dog by custom will understand the call or the rating of his master; and so will many other beasts. That understanding which is peculiar to man, is the understanding not only his will, but his conceptions and thoughts, by the sequel and contexture of the names of things into affirmations, negations, and other forms of speech; and of this kind of understanding I shall speak hereafter.

CHAPTER 3. OF THE CONSEQUENCE OR TRAIN OF IMAGINATIONS

By "consequence," or "train," of thoughts I understand that succession of one thought to another which is called, to distinguish it from discourse in words, "mental discourse."

When a man thinks on anything whatever, his next thought after is not altogether so casual as it seems to be. Not every thought to every thought succeeds indifferently.

But as we have no imagination whereof we have not formerly had sense, in whole or in parts, so we have no transition from one imagination to another whereof we never had the like before in our senses. The reason whereof is this. All fancies are motions within us, relics of those made in the sense, and those motions that immediately succeeded one another in the sense continue also together after sense: in so much as the former coming again to take place, and be predominant, the latter followeth, by coherence of the matter moved, in such manner as water upon a plane table is drawn which way any one part of it is guided by the finger. But because in sense to one and the same thing perceived, sometimes one thing sometimes another, succeeds, it comes to pass in time that in the imagining of anything there is no certainty what we shall imagine next: only this is certain, it shall be something that succeeded the same before, at one time or another.

This train of thoughts, or mental discourse, is of two sorts. The first is “unguided,” “without design,” and inconstant; wherein there is no passionate thought, to govern and direct those that follow, to itself, as the end and scope of some desire or other passion: in which case the thoughts are said to wander, and seem impertinent one to another as in a dream. Such are commonly the thoughts of men that are not only without company but also without care of anything; though even then their thoughts are as busy as at other times, but without harmony; as the sound which a lute out of tune would yield to any man, or in tune to one that could not play. And yet in this wild ranging of the mind a man may oft-times perceive the way of it, and the dependence of one thought upon another. For in a discourse of our present civil war, what could seem more impertinent than to ask, as one did, what was the value of a Roman penny. Yet the coherence to me was manifest enough. For the thought of the war introduced the thought of the delivering up the king to his enemies, the thought of that brought in the thought of the delivering up of Christ; and that again the thought of the thirty pence, which was the price of that treason; and thence easily followed that malicious question; and all this in a moment of time—for thought is quick.

The second is more constant; as being “regulated” by some desire and design. For the impression made by such things as we desire, or fear, is strong and permanent, or, if it cease for a time, of quick return: so strong it is sometimes as to hinder and break our sleep. From desire arises the thought of some means we have seen produce the like of that which we aim at; and from the thought of that, the thought of means to that mean, and so continually till we come to some beginning within our own power. And because the end, by the greatness of the impression, comes often to mind, in case our thoughts begin to wander, they are quickly again reduced into the way: which observed by one of the Seven Wise Men, made him give men this precept, which is now worn out, *Respice finem*; that is to say, in all your actions look often upon what you would have as the thing that directs all your thoughts in the way to attain it.

The train of regulated thoughts is of two kinds; one, when of an effect imagined we seek the causes or means that produce it; and this is common to man and beast. The other is when imagining anything whatsoever we seek all the possible effects that can by it be produced, that is to say, we imagine what we can do with it when we have it. Of which I have not at any time seen any sign but in man only; for this is a curiosity hardly incident to the nature of any living creature that has no other passion but sensual, such as are hunger, thirst, lust, and anger. In sum, the discourse of the mind, when it is governed by design, is nothing but “seeking,” or the faculty of invention, which the Latins called *sagacitas*, and *solertia*; a hunting out of the causes, of some effect, present or past; or of the effects, of some present or past cause. Sometimes a man seeks what he hath lost; and from that place and time wherein he misses it his mind runs back, from

place to place, and time to time, to find where and when he had it, that is to say, to find some certain and limited time and place in which to begin a method of seeking. Again, from thence his thoughts run over the same places and times to find what action or other occasion might make him lose it. This we call "remembrance," or calling to mind: the Latins call it *reminiscentia*, as it were a "re-conning" of our former actions.

Sometimes a man knows a place determinate, within the compass whereof he is to seek; and then his thoughts run over all the parts thereof, in the same manner as one would sweep a room to find a jewel, or as a spaniel ranges the field till he find a scent, or as a man should run over the alphabet to start a rhyme.

Sometimes a man desires to know the event of an action; and then he thinks of some like action past, and the events thereof one after another, supposing like events will follow like actions. As he that foresees what will become of a criminal recons what he has seen follow on the like crime before, having this order of thoughts, the crime, the officer, the prison, the judge, and the gallows. Which kind of thoughts is called "foresight," and "prudence," or "providence," and sometimes "wisdom," though such conjecture, through the difficulty of observing all circumstances, be very fallacious. But this is certain: by how much one man has more experience of things past than another, by so much also he is more prudent, and his expectations the seldomer fail him. The "present" only has a being in nature; things "past" have a being in the memory only, but things "to come" have no being at all, the "future" being but a fiction of the mind, applying the sequels of actions past to the actions that are present; which with most certainty is done by him that has most experience, but not with certainty enough. And though it be called prudence, when the event answers our expectation, yet, in its own nature, it is but presumption. For the foresight of things to come, which is providence, belongs only to him by whose will they are to come. From him only, and supernaturally, proceeds prophecy. The best prophet naturally is the best guesser; and the best guesser he that is most versed and studied in the matters he guesses at, for he hath most "signs" to guess by.

A "sign" is the event antecedent of the consequent; and, contrarily, the consequent of the antecedent, when the like consequences have been observed before; and the oftener they have been observed, the less uncertain is the sign. And therefore he that has most experience in any kind of business has most signs whereby to guess at the future time, and consequently is the most prudent; and so much more prudent than he that is new in that kind of business as not to be equalled by any advantage of natural and extemporary wit; though perhaps many young men think the contrary.

Nevertheless it is not prudence that distinguishes man from beast. There be beasts that at a year old observe more, and pursue that which is for their good more prudently than a child can do at ten.

As prudence is a "presumption" of the "future" contracted from the "experience" of time "past," so there is a presumption of things past taken from other things, not future, but past also. For he that hath seen by what courses and degrees a flourishing state hath first come into civil war, and then to ruin, upon the sight of the ruins of any other state will guess the like war and the like courses have been there also. But this conjecture has the same uncertainty almost with the conjecture of the future, both being grounded only upon experience.

There is no other act of man's mind that I can remember naturally planted in him, so as to need no other thing to the exercise of it but to be born a man, and live with the use of his five senses. Those other faculties of which I shall speak by and by, and which seem proper to man only, are acquired and increased by study and industry, and of most men learned by instruction and discipline; and proceed all from the invention of words

and speech. For besides sense, and thoughts, and the train of thoughts, the mind of man has no other motion, though by the help of speech and method the same faculties may be improved to such a height as to distinguish men from all other living creatures.

Whatsoever we imagine is “finite.” Therefore there is no idea or conception of any thing we call “infinite.” No man can have in his mind an image of infinite magnitude, nor conceive infinite swiftness, infinite time, or infinite force, or infinite power. When we say anything is infinite, we signify only that we are not able to conceive the ends and bounds of the things named; having no conception of the thing, but of our own inability. And therefore the name of God is used, not to make us conceive Him, for He is incomprehensible, and His greatness and power are inconceivable, but that we may honor Him. Also because, whatsoever, as I said before, we conceive, has been perceived first by sense, either all at once or by parts; a man can have no thought representing anything not subject to sense. No man therefore can conceive anything but he must conceive it in some place, and endowed with some determinate magnitude, and which may be divided into parts; nor that anything is all in this place and all in another place at the same time; nor that two or more things can be in one and the same place at once: for none of these things ever have or can be incident to sense, but are absurd speeches, taken upon credit, without any signification at all, from deceived philosophers, and deceived or deceiving schoolmen.

* * *

CHAPTER 6. OF THE INTERIOR BEGINNINGS OF VOLUNTARY MOTIONS; COMMONLY CALLED THE PASSIONS; AND THE SPEECHES BY WHICH THEY ARE EXPRESSED

There be in animals two sorts of “motions” peculiar to them: one called “vital,” begun in generation, and continued without interruption through their whole life, such as are the “course” of the “blood,” the “pulse,” the “breathing,” the “concoction, nutrition, excretion,” etc., to which motions there needs no help of imagination: the other is “animal motion,” otherwise called “voluntary motion,” as to “go,” to “speak,” to “move” any of our limbs in such manner as is first fancied in our minds. That sense is motion in the organs and interior parts of man’s body, caused by the action of the things we see, hear, etc.; and that fancy is but the relics of the same motion, remaining after sense, has been already said in the first and second chapters. And, because “going,” “speaking,” and the like voluntary motions, depend always upon a precedent thought of “whither,” “which way,” and “what,” it is evident that the imagination is the first internal beginning of all voluntary motion. And, although unstudied men do not conceive any motion at all to be there where the thing moved is invisible, or the space it is moved in is, for the shortness of it, insensible, yet that doth not hinder but that such motions are. For, let a space be never so little, that which is moved over a greater space, whereof that little one is part, must first be moved over that. These small beginnings of motion within the body of man before they appear in walking, speaking, striking, and other visible actions, are commonly called “endeavor.”

This endeavor, when it is toward something which causes it, is called “appetite,” or “desire,” the latter being the general name, and the other oftentimes restrained to signify the desire of food, namely “hunger” and “thirst.” And, when the endeavor is fromward

something, it is generally called “aversion.” These words, “appetite” and “aversion,” we have from the Latins—and they both of them signify the motions, one of approaching, the other of retiring. So also do the Greek words for the same, which are (*horma*) and (*aphorma*). For Nature itself does often press upon men those truths which afterwards, when they look for somewhat beyond Nature, they stumble at. For the schools find in mere appetite to go, or move, no actual motion at all; but, because some motion they must acknowledge, they call it metaphorical motion, which is but an absurd speech; for though words may be called metaphorical, bodies and motions cannot.

That which men desire they are also said to “love”; and to “hate” those things for which they have aversion. So that desire and love are the same thing, save that by desire we always signify the absence of the object, by love most commonly the presence of the same. So also by aversion we signify the absence, and by hate, the presence of the object.

Of appetites and aversions, some are born with men, as appetite of food, appetite of excretion, and exoneration, which may also and more properly be called aversions from somewhat they feel in their bodies; and some other appetites, not many. The rest, which are appetites of particular things, proceed from experience and trial of their effects upon themselves or other men. For of things we know not at all, or believe not to be, we can have no further desire than to taste and try. But aversion we have for things not only which we know have hurt us, but also that we do not know whether they will hurt us or not.

Those things which we neither desire nor hate we are said to “contemn,” “contempt” being nothing else but an immobility or contumacy of the heart in resisting the action of certain things, and proceeding from that the heart is already moved otherwise by other more potent objects, or from want of experience of them.

And, because the constitution of a man’s body is in continual mutation, it is impossible that all the same things should always cause in him the same appetites and aversions: much less can all men consent in the desire of almost any one and the same object.

But whatsoever is the object of any man’s appetite or desire, that is it which he for his part calls “good”; and the object of his hate and aversion, “evil”; and of his contempt “vile” and “inconsiderable.” For these words of good, evil, and contemptible, are ever used with relation to the person that uses them, there being nothing simply and absolutely so; nor any common rule of good and evil, to be taken from the nature of the objects themselves; but from the person of the man, where there is no commonwealth, or, in a commonwealth, from the person that represents it; or from an arbitrator or judge, whom men disagreeing shall by consent set up, and make his sentence the rule thereof.

The Latin tongue has two words whose significations approach to those of good and evil, but are not precisely the same; and those are *pulchrum* and *turpe*. Whereof the former signifies that which by some apparent signs promises good; and the latter that which promises evil. But in our tongue we have not so general names to express them by. But for *pulchrum* we say in some things “fair,” in others, “beautiful,” or “handsome,” or “gallant,” or “honorable,” or “comely,” or “amiable”; and for *turpe*, “foul,” “deformed,” “ugly,” “base,” “nauseous,” and the like, as the subject shall require; all which words, in their proper places, signify nothing else but the “mien,” or countenance, that promises good and evil. So that of good there be three kinds: good in the promise, that is *pulchrum*; good in effect, as the end desired, which is called *jucundum*, “delightful”; and good as the means which is called *utile*, “profitable”; and as many of evil: for “evil” in promise is that they call *turpe*; evil in effect, and end is molestum, “unpleasant,” “troublesome”; and evil in the means, *inutile*, “unprofitable,” “hurtful.”

As, in sense, that which is really within us is, as I have said before, only motion caused by the action of external objects but in appearance—to the sight, light and color; to the ear, sound; to the nostril, odor, etc.; so, when the action of the same object is continued from the eyes, ears, and other organs to the heart, the real effect there is nothing but motion or endeavor which consists in appetite, or aversion, to or from the object moving. But the appearance, or sense of that motion, is that we either call “delight” or “trouble of mind.”

This motion, which is called appetite, and for the appearance of it “delight” and “pleasure,” seems to be a corroboration of vital motion, and a help thereunto; and therefore such things as caused delight were not improperly called *jucunda*—*juvando*, from helping or fortifying; and the contrary *molesta*, “offensive,” from hindering and troubling the motion vital.

“Pleasure,” therefore, or “delight,” is the appearance or sense of good; and “molestation,” or “displeasure,” the appearance or sense of evil. And consequently all appetite, desire, and love, is accompanied with some delight more or less; and all hatred and aversion with more or less displeasure and offence.

Of pleasures or delights some arise from the sense of an object present; and those may be called “pleasures of sense,” the word “sensual,” as it is used by those only that condemn them, having no place till there be laws. Of this kind are all operations and exonerations of the body, as also all that is pleasant in the “sight,” “hearing,” “smell,” “taste,” or “touch.” Others arise from the expectation that proceeds from foresight of the end or consequence of things, whether those things in the sense please or displease. And these are “pleasures of the mind” of him that draws those consequences, and are generally called “joy.” In the like manner, displeasures are some in the sense, and called “pain”; others in the expectation of consequences, and are called “grief.”

These simple passions called “appetite,” “desire,” “love,” “aversion,” “hate,” “joy,” and “grief,” have their names for divers considerations diversified. As first, when they one succeed another, they are diversely called from the opinion men have of the likelihood of attaining what they desire. Secondly, from the object loved or hated. Thirdly, from the consideration of many of them together. Fourthly, from the alteration or succession itself.

For “appetite” with an opinion of attaining is called “hope.”

The same without such opinion, “despair.”

“Aversion” with opinion of “hurt” from the object “fear.”

The same with hope of avoiding that hurt by resistance, “courage.”

Sudden “courage,” “anger.”

Constant “hope,” “confidence” of ourselves.

Constant “despair,” “diffidence” of ourselves.

“Anger” for great hurt done to another, when we conceive the same to be done by injury, “indignation.”

“Desire” of good to another, “benevolence,” “good will,” “charity.” If to man generally, “good-nature.”

“Desire” of riches, “covetousness,” a name used always in signification of blame, because men contending for them are displeased with one another attaining them, though the desire in itself be to be blamed, or allowed, according to the means by which those riches are sought.

“Desire” of office, or precedence, “ambition,” a name used also in the worse sense, for the reason before mentioned.

“Desire” of things that conduce but a little to our ends, and fear of things that are but of little hindrance, “pusillanimity.”

“Contempt” of little helps and hindrances, “magnanimity.”

“Magnanimity” in danger of death or wounds, “valor,” “fortitude.”

“Magnanimity” in the use of riches, “liberality.”

“Pusillanimity” in the same, “wretchedness,” “miserableness,” or “parsimony,” as it is liked or disliked.

“Love” of persons for society, “kindness.”

“Love” of persons for pleasing the sense only, “natural lust.”

“Love” of the same, acquired from rumination, that is imagination of pleasure past, “luxury.”

“Love” of one singularly, with desire to be singularly beloved, “the passion of love.” The same, with fear that the love is not mutual, “jealousy.”

“Desire,” by doing hurt to another, to make him condemn some fact of his own, “revengefulness.”

“Desire” to know why and how, “curiosity,” such as is in no living creature but “man,” so that man is distinguished not only by his reason but also by this singular passion from other “animals,” in whom the appetite of food, and other pleasures of sense, by predominance take away the care of knowing causes, which is a lust of the mind, that by a perseverance of delight in the continual and indefatigable generation of knowledge exceeds the short vehemence of any carnal pleasure.

“Fear” of power invisible, feigned by the mind or imagined from tales publicly allowed, “religion,” not allowed, “superstition.” And when the power imagined is truly such as we imagine, “true religion.”

“Fear,” without the apprehension of why or what, “panic terror,” called so from the fables that make Pan the author of them, whereas in truth there is always in him that so fears, first some apprehension of the cause, though the rest run away by example, every one supposing his fellow to know why. And therefore this passion happens to none but in a throng or multitude of people.

“Joy,” from apprehension of novelty “admiration,” proper to man, because it excites the appetite of knowing the cause.

“Joy,” arising from imagination of a man’s own power and ability is that exultation of the mind which is called “glorying,” which, if grounded upon the experience of his own former actions, is the same as “confidence,” but if grounded on the flattery of others or only supposed by himself for delight in the consequences of it, is called “vain-glory,” which name is properly given, because a well-grounded “confidence” begets attempt, whereas the supposing of power does not, and is therefore rightly called “vain.”

“Grief” from opinion of want of power is called “dejection of mind.”

The “vain-glory” which consists in the feigning or supposing of abilities in ourselves which we know are not is most incident to young men, and nourished by the histories or fictions of gallant persons, and is corrected oftentimes by age and employment.

“Sudden glory” is the passion which makes those “grimaces” called “laughter”; and is caused either by some sudden act of their own that pleases them, or by the apprehension of some deformed thing in another by comparison whereof they suddenly applaud themselves. And it is incident most to them that are conscious of the fewest abilities in themselves; who are forced to keep themselves in their own favor by observing the imperfections of other men. And therefore much laughter at the defects of others is a sign of pusillanimity. For of great minds one of the proper works is to help and free others from scorn and compare themselves only with the most able.

On the contrary, “sudden dejection” is the passion that causes “weeping,” and is caused by such accidents as suddenly take away some vehement hope or some prop of

their power; and they are most subject to it that rely principally on helps external, such as are women and children. Therefore some weep for the loss of friends, others for their unkindness, others for the sudden stop made to their thoughts of revenge by reconciliation. But in all cases, both laughter and weeping, are sudden motions, custom taking them both away. For no man laughs at old jests, or weeps for an old calamity.

"Grief" for the discovery of some defect of ability is "shame," or the passion that discovers itself in "blushing," and consists in the apprehension of something dishonorable; and in young men is a sign of the love of good reputation, and commendable: in old men it is a sign of the same; but, because it comes too late, not commendable.

The "contempt" of good reputation is called "impudence."

"Grief" for the calamity of another is "pity," and arises from the imagination that the like calamity may befall himself; and therefore is called also "compassion," and in the phrase of this present time a "fellow-feeling"; and therefore for calamity arriving from great wickedness the best men have the least pity; and for the same calamity those have least pity that think themselves least obnoxious to the same.

"Contempt," or little sense of the calamity of others, is that which men call "cruelty," proceeding from security of their own fortune. For, that any man should take pleasure in other men's great harms without other end of his own, I do not conceive it possible.

"Grief" for the success of a competitor in wealth, honor, or other good, if it be joined with endeavor to enforce our own abilities to equal or exceed him, is called "emulation"; but joined with endeavor to supplant or hinder a competitor, "envy."

When in the mind of man, appetites and aversions, hopes and fears, concerning one and the same thing, arise alternately, and divers good and evil consequences of the doing or omitting the thing propounded, come successively into our thoughts, so that sometimes we have an appetite to it, sometimes an aversion from it, sometimes hope to be able to do it, sometimes despair or fear to attempt it, the whole sum of desires, aversions, hopes, and fears, continued till the thing be either done or thought impossible, is that we call "deliberation."

Therefore of things past there is no "deliberation," because manifestly impossible to be changed; nor of things known to be impossible, or thought so, because men know, or think, such deliberation vain. But of things impossible which we think possible we may deliberate, not knowing it is in vain. And it is called "deliberation," because it is a putting an end to the "liberty" we had of doing or omitting according to our own appetite or aversion.

This alternate succession of appetites, aversions, hopes, and fears, is no less in other living creatures than in man; and therefore beasts also deliberate.

Every "deliberation" is then said to "end" when that whereof they deliberate is either done or thought impossible because till then we retain the liberty of doing or omitting according to our appetite or aversion.

In "deliberation," the last appetite, or aversion, immediately adhering to the action, or to the omission thereof, is that we call the "will," the act, not the faculty, of "willing." And beasts that have "deliberation" must necessarily also have "will." The definition of the "will" given commonly by the schools, that it is a "rational appetite," is not good. For if it were, then could there be no voluntary act against reason. For a "voluntary act" is that which proceeds from the "will" and no other. But if instead of a rational appetite we shall say an appetite resulting from a precedent deliberation, then the definition is the same that I have given here. Will, therefore, is the last appetite in deliberating. And, though we say in common discourse a man had a will once to do a thing, that nevertheless he forbore to

do, yet that is properly but an inclination, which makes no action voluntary; because the action depends not of it, but of the last inclination or appetite. For if the intervenient appetites make any action voluntary, then by the same reason all intervenient aversions should make the same action involuntary; and so one and the same action should be both voluntary and involuntary.

By this it is manifest that not only actions that have their beginning from covetousness, ambition, lust, or other appetites to the thing propounded, but also those that have their beginning from aversion, or fear of those consequences that follow the omission, are "voluntary actions."

The forms of speech by which the passions are expressed are partly the same, and partly different from those by which we express our thoughts. And, first, generally all passions may be expressed "indicatively," as "I love," "I fear," "I joy," "I deliberate," "I will," "I command," but some of them have particular expressions by themselves, which nevertheless are not affirmations, unless it be when they serve to make other inferences besides that of the passion they proceed from. Deliberation is expressed "subjunctively," which is a speech proper to signify suppositions, with their consequences: as, "if this be done, then this will follow," and differs not from the language of reasoning, save that reasoning is in general words—but deliberation for the most part is of particulars. The language of desire, and aversion, is "imperative," as "do this," "forbear that," which when the party is obliged to do, or forbear, is "command"; otherwise "prayer," or else "counsel." The language of vain-glory, of indignation, pity and revengefulness, "optative," but of the desire to know there is a peculiar expression, called "interrogative," as "what is it"? "when shall it"? "how is it done"? and "why so"? Other language of the passions I find none; for cursing, swearing, reviling, and the like, do not signify as speech, but as the actions of a tongue accustomed.

These forms of speech, I say, are expressions, or voluntary significations of our passions—but certain signs they be not, because they may be used arbitrarily, whether they that use them have such passions or not. The best signs of passions present are either in the countenance, motions of the body, actions, and ends, or aims, which we otherwise know the man to have.

And because in deliberation the appetites and aversions are raised by foresight of the good and evil consequences, and sequels of the action whereof we deliberate, the good or evil effect thereof depends on the foresight of a long chain of consequences of which very seldom any man is able to see to the end. But for so far as a man sees, if the good in those consequences be greater than the evil, the whole chain is that which writers call "apparent" or "seeming good." And, contrarily, when the evil exceeds the good, the whole is "apparent" or "seeming evil," so that he who hath by experience, or reason, the greatest and surest prospect of consequences, deliberates best himself, and is able, when he will, to give the best counsel unto others.

"Continual success" in obtaining those things which a man from time to time desires, that is to say continual prospering, is that men call "felicity"; I mean the felicity of this life. For there is no such thing as perpetual tranquility of mind while we live here, because life itself is but motion, and can never be without desire, nor without fear, no more than without sense. What kind of felicity God hath ordained to them that devoutly honor Him a man shall no sooner know than enjoy, being joys that now are as incomprehensible as the word of schoolmen "beatifical vision" is unintelligible.

The form of speech whereby men signify their opinion of the goodness of anything is "praise." That whereby they signify the power and greatness of anything is "magnifying." And that whereby they signify the opinion they have of a man's felicity is

by the Greeks called *(makarismos)* for which we have no name in our tongue. And thus much is sufficient for the present purpose, to have been said of the “passions.”

* * *

CHAPTER 9. OF THE SEVERAL SUBJECTS OF KNOWLEDGE

There are of “knowledge” two kinds, whereof one is “knowledge of fact,” the other “knowledge of the consequence of one affirmation to another.” The former is nothing else but sense and memory, and is “absolute knowledge,” as when we see a fact doing or remember it done; and this is the knowledge required in a witness. The latter is called “science,” and is “conditional,” as when we know that “if the figure shown be a circle, then any straight line through the center shall divide it into two equal parts.” And this is the knowledge required in a philosopher, that is to say of him that pretends to reasoning.

The register of “knowledge of fact” is called “history,” whereof there be two sorts: one called “natural history,” which is the history of such facts or effects of Nature as have no dependence on man’s “will,” such as are the histories of “metals,” “plants,” “animals,” “regions,” and the like. The other is “civil history,” which is the history of the voluntary actions of men in commonwealths.

The registers of science are such “books,” as contain the “demonstrations” of consequences of one affirmation to another, and are commonly called “books of philosophy,” whereof the sorts are many, according to the diversity of the matter, and may be divided in such manner as I have divided them in the . . . table [see following page].

* * *

CHAPTER 12. OF RELIGION

Seeing there are no signs nor fruit of “religion” but in man only, there is no cause to doubt but that the seed of “religion” is also only in man—and consists in some peculiar quality or at least in some eminent degree thereof not to be found in other living creatures.

And, first, it is peculiar to the nature of man to be inquisitive into the causes of the events they see, some more, some less; but all men so much as to be curious in the search of the causes of their own good and evil fortune.

Secondly, upon the sight of anything that hath a beginning to think also it had a cause which determined the same to begin, then when it did, rather than sooner or later.

Thirdly, whereas there is no other felicity of beasts but the enjoying of their quotidian food, ease, and lusts, as having little or no foresight of the time to come, for want of observation and memory of the order, consequence, and dependence of the things they see, man observes how one event hath been produced by another, and remembers in them antecedence and consequence; and, when he cannot assure himself of the true causes of things (for the causes of good and evil fortune for the most part are invisible), he supposes causes of them, either such as his own fancy suggests, or trusts the authority of other men, such as he thinks to be his friends and wiser than himself.

The two first make anxiety. For, being assured that there be causes of all things that have arrived hitherto or shall arrive hereafter, it is impossible for a man, who continually endeavors to secure himself against the evil he fears and procure the good he desires, not to be in a perpetual solicitude of the time to come; so that every man, especially those that are over-provident, are in a state like to that of Prometheus. For as Prometheus, which interpreted is “the prudent man,” was bound to the hill Caucasus, a place of large prospect, where an eagle feeding on his liver devoured in the day as much as was repaired in the night, so that man, which looks too far before him in the care of future time, hath his heart all the day long gnawed on by fear of death, poverty, or other calamity, and has no repose nor pause of his anxiety but in sleep.

This perpetual fear, always accompanying mankind in the ignorance of causes, as it were in the dark, must needs have for object something. And therefore, when there is nothing to be seen, there is nothing to accuse, either of their good or evil fortune, but some “power” or agent “invisible” in which sense perhaps it was that some of the old poets said that the gods were at first created by human fear; which spoken of the gods, that is to say of the many gods of the Gentiles, is very true. But the acknowledging of one God, eternal, infinite, and omnipotent, may more easily be derived, from the desire men have to know the causes of natural bodies and their several virtues and operations, than from the fear of what was to befall them in time to come. For he that from any effect he sees come to pass should reason to the next and immediate cause thereof, and from thence to the cause of that cause, and plunge himself profoundly in the pursuit of causes, shall at last come to this, that there must be, as even the heathen philosophers confessed, one first mover, that is, a first and an eternal cause of all things, which is that which men mean by the name of God, and all this without thought of their fortune; the solicitude whereof both inclines to fear and hinders them from the search of the causes of other things, and thereby gives occasion of feigning of as many gods as there be men that feign them.

* * *

CHAPTER 13. OF THE NATURAL CONDITION OF MANKIND AS CONCERNING THEIR FELICITY AND MISERY

Nature hath made men so equal in the faculties of the body and mind, as that, though there be found one man sometimes manifestly stronger in body or of quicker mind than another, yet when all is reckoned together the difference between man and man is not so considerable as that one man can thereupon claim to himself any benefit to which another may not pretend as well as he. For, as to the strength of body, the weakest has strength enough to kill the strongest, either by secret machination or by confederacy with others that are in the same danger with himself.

And, as to the faculties of the mind, setting aside the arts grounded upon words and especially that skill of proceeding upon general and infallible rules called science, which very few have and but in few things, as being not a native faculty born with us, nor attained, as prudence, while we look after somewhat else, I find yet a greater equality amongst men than that of strength. For prudence is but experience, which equal time equally bestows on all men in those things they equally apply themselves unto. That which may perhaps make such equality incredible is but a vain conceit of one’s own

wisdom, which almost all men think they have in a greater degree than the vulgar, that is, than all men but themselves, and a few others whom by fame or for concurring with themselves they approve. For such is the nature of men that, howsoever they may acknowledge many others to be more witty or more eloquent or more learned, yet they will hardly believe there be many so wise as themselves, for they see their own wit at hand and other men's at a distance. But this proves rather that men are in that point equal than unequal. For there is not ordinarily a greater sign of the equal distribution of anything than that every man is contented with his share.

From this equality of ability arises equality of hope in the attaining of our ends. And therefore, if any two men desire the same thing which nevertheless they cannot both enjoy, they become enemies—and, in the way to their end, which is principally their own conservation and sometimes their delectation only, endeavor to destroy or subdue one another. And from hence it comes to pass that, where an invader hath no more to fear than another man's single power, if one plant, sow, build, or possess, a convenient seat others may probably be expected to come prepared with forces united to dispossess and deprive him not only of the fruit of his labor but also of his life or liberty. And the invader again is in the like danger of another.

And from this diffidence of one another there is no way for any man to secure himself so reasonable as anticipation, that is, by force or wiles to master the persons of all men he can so long till he see no other power great enough to endanger him; and this is no more than his own conservation requires and is generally allowed. Also, because there be some that, taking pleasure in contemplating their own power in the acts of conquest, which they pursue farther than their security requires, if others, that otherwise would be glad to be at ease within the modest bounds, should not by invasion increase their power, they would not be able for a long time, by standing only on their defence, to subsist. And by consequence, such augmentation of dominion over men being necessary to a man's conservation, it ought to be allowed him.

Again, men have no pleasure, but on the contrary a great deal of grief, in keeping company where there is no power able to overawe them all. For every man looks that his companion should value him at the same rate he sets upon himself, and, upon all signs of contempt or undervaluing, naturally endeavors as far as he dares (which amongst them that have no common power to keep them in quiet, is far enough to make them destroy each other) to extort a greater value from his condemners by damage, and from others by the example.

So that in the nature of man we find three principal causes of quarrel. First, competition; secondly, diffidence; thirdly, glory.

The first makes man invade for gain; the second, for safety; and the third, for reputation. The first use violence, to make themselves masters of other men's persons, wives, children, and cattle; the second, to defend them; the third, for trifles, as a word, a smile, a different opinion, and any other sign of undervalue, either direct in their persons or by reflection in their kindred, their friends, their nation, their profession, or their name.

Hereby it is manifest that, during the time men live without a common power to keep them all in awe, they are in that condition which is called war, and such a war as is of every man against every man. For "war" consists not in battle only or the act of fighting, but in a tract of time wherein the will to contend by battle is sufficiently known, and therefore the notion of "time" is to be considered in the nature of war, as it is in the nature of weather. For as the nature of foul weather lies not in a shower or two of rain but in an inclination thereto of many days together, so the nature of war consists not in

actual fighting but in the known disposition thereto during all the time there is no assurance to the contrary. All other time is "peace."

Whatsoever therefore is consequent to a time of war where every man is enemy to every man, the same is consequent to the time wherein men live without other security than what their own strength and their own invention shall furnish them withal. In such condition there is no place for industry, because the fruit thereof is uncertain, and consequently no culture of the earth, no navigation nor use of the commodities that may be imported by sea, no commodious building, no instruments of moving and removing such things as require much force, no knowledge of the face of the earth; no account of time, no arts, no letters, no society, and, which is worst of all, continual fear and danger of violent death, and the life of man solitary, poor, nasty, brutish, and short.

It may seem strange to some man that has not well weighed these things that Nature should thus dissociate and render men apt to invade and destroy one another; and he may therefore, not trusting to this inference made from the passions, desire perhaps to have the same confirmed by experience. Let him therefore consider with himself, when taking a journey, he arms himself and seeks to go well accompanied; when going to sleep, he locks his doors; when even in his house, he locks his chests; and this when he knows there be laws and public officers armed to revenge all injuries shall be done him; what opinion he has of his fellow-subjects, when he rides armed—of his fellow-citizens, when he locks his doors; and of his children and servants, when he locks his chests. Does he not there as much accuse mankind by his actions as I do by my words? But neither of us accuse man's nature in it. The desires and other passions of man are in themselves no sin. No more are the actions that proceed from those passions, till they know a law that forbids them; which, till laws be made, they cannot know, nor can any law be made till they have agreed upon the person that shall make it.

It may peradventure be thought there was never such a time nor condition of war as this; and I believe it was never generally so over all the world, but there are many places where they live so now. For the savage people in many places of America, except the government of small families the concord whereof depends on natural lust, have no government at all, and live at this day in that brutish manner as I said before. Howsoever, it may be perceived what manner of life there would be where there were no common power to fear, by the manner of life which men that have formerly lived under a peaceful government use to degenerate into, in a civil war. But, though there had never been any time wherein particular men were in a condition of war one against another, yet in all times kings and persons of sovereign authority, because of their independence, are in continual jealousies and in the state and posture of gladiators, having their weapons pointing, and their eyes fixed on one another, that is, their forts, garrisons, and guns, upon the frontiers of their kingdoms, and continual spies upon their neighbors: which is a posture of war. But because they uphold thereby the industry of their subjects, there does not follow from it that misery which accompanies the liberty of particular men.

To this war of every man against every man this also is consequent, that nothing can be unjust. The notions of right and wrong, justice and injustice, have there no place. Where there is no common power, there is no law; where no law, no injustice. Force and fraud are in war the two cardinal virtues. Justice and injustice are none of the faculties neither of the body nor mind. If they were, they might be in a man that were alone in the world, as well as his senses and passions. They are qualities that relate to men in society, not in solitude. It is consequent also to the same condition that there be no propriety, no dominion, no "mine" and "thine" distinct, but only that to be every man's that he can get,

and for so long as he can keep it. And thus much for the ill condition which man by mere nature is actually placed in, though with a possibility to come out of it, consisting partly in the passions, partly in his reason.

The passions that incline men to peace are fear of death, desire of such things as are necessary to commodious living, and a hope by their industry to obtain them. And reason suggests convenient articles of peace, upon which men may be drawn to agreement. These articles are they which otherwise are called the Laws of Nature, whereof I shall speak more particularly in the two following chapters.

CHAPTER 14. OF THE FIRST AND SECOND NATURAL LAWS, AND OF CONTRACTS

“The right of Nature,” which writers commonly call *jus naturale*, is the liberty each man hath to use his own power as he will himself for the preservation of his own nature, that is to say, of his own life; and consequently of doing anything which in his own judgment and reason he shall conceive to be the aptest means thereunto.

By “liberty” is understood, according to the proper signification of the word, the absence of external impediments which impediments may oft take away part of a man’s power to do what he would, but cannot hinder him from using the power left him according as his judgment and reason shall dictate to him.

A “law of Nature,” *lex naturalis*, is a precept or general rule found out by reason by which a man is forbidden to do that which is destructive of his life or takes away the means of preserving the same, and to omit that by which he thinks it may be best preserved. For, though they that speak of this subject use to confound *jus* and *lex*, “right” and “law,” yet they ought to be distinguished; because “right” consists in liberty to do or to forbear, whereas “law” determines and binds to one of them: so that law and right differ as much as obligation and liberty; which in one and the same matter are inconsistent.

And because the condition of man, as hath been declared in the precedent chapter, is a condition of war of every one against every one, in which case every one is governed by his own reason, and there is nothing he can make use of that may not be a help unto him in preserving his life against his enemies, it follows that in such a condition every man has a right to everything, even to one another’s body. And therefore, as long as this natural right of every man to everything endures, there can be no security to any man, how strong or wise soever he be, of living out the time which Nature ordinarily allows men to live. And consequently it is a precept or general rule of reason “that every man ought to endeavor peace as far as he has hope of obtaining it, and, when he cannot obtain it, that he may seek and use all helps and advantages of war.” The first branch of which rule contains the first and fundamental law of Nature, which is, “to seek peace, and follow it.” The second, the sum of the right of Nature, which is, “by all means we can, to defend ourselves.”

From this fundamental law of Nature, by which men are commanded to endeavor peace, is derived this second law, “that a man be willing, when others are so too, as far forth as for peace and defence of himself he shall think it necessary, to lay down this right to all things, and be contented with so much liberty against other men as he would allow other men against himself.” For as long as every man holds this right of doing anything he likes, so long are all men in the condition of war. But if other men will not lay down their right as well as he, then there is no reason for any one to divest himself of his: for that were to expose himself to prey, which no man is bound to, rather than to

dispose himself to peace. This is that law of the Gospel: "whatsoever you require that others should do to you, that do ye to them." And that law of all men, *quod tibi fieri non vis, alteri ne feceris*.

To "lay down" a man's "right" to anything is to "divest" himself of the "liberty," of hindering another of the benefit of his own right to the same. For he that renounces or passes away his right gives not to any other man a right which he had not before, because there is nothing to which every man had not right by Nature; but only stands out of his way that he may enjoy his own original right without hindrance from him, not without hindrance from another. So that the effect which redounds to one man, by another man's defect of right, is but so much diminution of impediments to the use of his own right original.

Right is laid aside either by simply renouncing it, or by transferring it to another. By "simply renouncing" when he cares not to whom the benefit thereof redounds. By "transferring," when he intends the benefit thereof to some certain person or persons. And, when a man hath in either manner abandoned or granted away his right, then is he said to be "obliged" or "bound" not to hinder those to whom such right is granted or abandoned from the benefit of it; and that he "ought," and it is his "duty," not to make void that voluntary act of his own; and that such hindrance is "injustice" and "injury" as being sine jure, the right being before renounced or transferred. So that "injury" or "injustice," in the controversies of the world, is somewhat like to that which in the disputations of scholars is called "absurdity." For, as it is there called an absurdity to contradict what one maintained in the beginning, so in the world it is called injustice and injury voluntarily to undo that from the beginning he had voluntarily done. The way by which a man either simply renounces or transfers his right is a declaration or signification, by some voluntary and sufficient sign or signs, that he doth so renounce or transfer, or hath so renounced or transferred, the same, to him that accepts it. And these signs are either words only or actions only, or, as it happens most often, both words and actions. And the same are the "bonds" by which men are bound and obliged: bonds that have their strength not from their own nature, for nothing is more easily broken than a man's word, but from fear of some evil consequence upon the rupture.

Whensoever a man transfers his right or renounces it, it is either in consideration of some right reciprocally transferred to himself, or for some other good he hopes for thereby. For it is a voluntary act: and of the voluntary acts of every man the object is some good "to himself." And therefore there be some rights which no man can be understood by any words or other signs to have abandoned or transferred. As first a man cannot lay down the right of resisting them that assault him by force to take away his life, because he cannot be understood to aim thereby at any good to himself. The same may be said of wounds, and chains, and imprisonment, both because there is no benefit consequent to such patience, as there is to the patience of suffering another to be wounded or imprisoned, as also because a man cannot tell when he sees men proceed against him by violence whether they intend his death or not. And lastly the motive and end for which this renouncing and transferring of right is introduced is nothing else but the security of a man's person in his life and in the means of so preserving life as not to be weary of it. And therefore if a man by words or other signs seem to despoil himself of the end for which those signs were intended, he is not to be understood as if he meant it or that it was his will, but that he was ignorant of how such words and actions were to be interpreted.

The mutual transferring of right is that which men call "contract."

CHAPTER 15. OTHER LAWS OF NATURE

From that law of Nature by which we are obliged to transfer to another such rights as, being retained, hinder the peace of mankind, there follows a third, which is this, “that men perform their covenants made”; without which covenants are in vain, and but empty words: and the right of all men to all things remaining, we are still in the condition of war.

And in this law of Nature consists the fountain and original of “justice.” For, where no covenant hath preceded, there hath no right been transferred, and every man has right to everything; and consequently, no action can be unjust. But when a covenant is made, then to break it is “unjust”; and the definition of “injustice” is no other than “the not performance of covenant.” And whatsoever is not unjust is “just.”

But because covenants of mutual trust, where there is a fear of not performance on either part, as hath been said in the former chapter, are invalid, though the original of justice be the making of covenants, yet injustice actually there can be none, till the cause of such fear be taken away, which, while men are in the natural condition of war, cannot be done. Therefore, before the names of just and unjust can have place, there must be some coercive power to compel men equally to the performance of their covenants, by the terror of some punishment greater than the benefit they expect by the breach of their covenant; and to make good that propriety which by mutual contract men acquire in recompense of the universal right they abandon; and such power there is none before the erection of a commonwealth. And this is also to be gathered out of the ordinary definition of justice in the schools; for they say that “justice is the constant will of giving to every man his own.” And therefore where there is no “own” there is no propriety, there is no injustice; and where there is no coercive power erected, that is, where there is no commonwealth, there is no propriety, all men having right to all things: therefore, where there is no commonwealth, there nothing is unjust. So that the nature of justice consists in keeping of valid covenants; but the validity of covenants begins not but with the constitution of a civil power sufficient to compel men to keep them; and then it is also that propriety begins.

The fool hath said in his heart there is no such thing as justice, and sometimes also with his tongue, seriously alleging that every man’s conservation and contentment, being committed to his own care, there could be no reason why every man might not do what he thought conduced thereunto; and therefore also to make or not make, keep or not keep, covenants was not against reason when it conduced to one’s benefit. He does not therein deny that there be covenants, and that they are sometimes broken, sometimes kept, and that such breach of them may be called injustice, and the observance of them justice; but he questions whether injustice taking away the fear of God, for the same fool hath said in his heart there is no God, may not sometimes stand with that reason which dictates to every man his own good; and particularly then when it conduces to such a benefit as shall put a man in a condition to neglect not only the dispraise and revilings, but also the power, of other men. The kingdom of God is gotten by violence; but what if it could be gotten by unjust violence? Were it against reason so to get it, when it is impossible to receive hurt by it? And, if it be not against reason, it is not against justice, or else justice is not to be approved for good. From such reasoning as this, successful wickedness hath obtained the name of virtue, and some that in all other things have disallowed the violation of faith, yet have allowed it when it is for the getting of a kingdom. And the heathen that believed that Saturn was deposed by his son Jupiter believed nevertheless the same Jupiter to be the avenger of injustice somewhat

like to a piece of law in Coke's *Commentaries on Littleton*, where he says, if the right heir of the crown be attainted of treason, yet the crown shall descend to him, and *eo instante* the attainer be void; from which instances a man will be very prone to infer that, when the heir apparent of a kingdom shall kill him that is in possession, though his father, you may call it injustice or by what other name you will, yet it can never be against reason seeing all the voluntary actions of men tend to the benefit of themselves; and those actions are most reasonable that conduce most to their ends. This specious reasoning is nevertheless false.

For the question is not of promises mutual, where there is no security of performance on either side, as when there is no civil power erected over the parties promising, for such promises are no covenants, but either where one of the parties has performed already, or where there is a power to make him perform, there is the question whether it be against reason, that is against the benefit of the other to perform or not. And I say it is not against reason. For the manifestation whereof we are to consider, first that when a man doth a thing which notwithstanding anything can be foreseen and reckoned on tends to his own destruction, howsoever some accident which he could not expect, arriving may turn it to his benefit, yet such events do not make it reasonably or wisely done. Secondly, that, in a condition of war, wherein every man to every man, for want of a common power to keep them all in awe, is an enemy, there is no man who can hope by his own strength or wit to defend himself from destruction without the help of confederates; where every one expects the same defence by the confederation that any one else does; and therefore he which declares he thinks it reason to deceive those that help him can in reason expect no other means of safety than what can be had from his own single power. He therefore that breaks his covenant, and consequently declares that he thinks he may with reason do so, cannot be received into any society that unite themselves for peace and defence but by the error of them that receive him; nor, when he is received, be retained in it without seeing the danger of their error; which errors a man cannot reasonably reckon upon as the means of his security; and therefore, if he be left or cast out of society, he perishes; and if he live in society, it is by the errors of other men which he could not foresee nor reckon upon, and consequently against the reason of his preservation; and so, as all men that contribute not to his destruction, forbear him only out of ignorance of what is good for themselves.

As for the instance of gaining the secure and perpetual felicity of heaven by any way, it is frivolous; there being but one way imaginable; and that is not breaking, but keeping of covenant.

And, for the other instance of attaining sovereignty by rebellion, it is manifest that, though the event follow, yet, because it cannot reasonably be expected, but rather the contrary, and because by gaining it so, others are taught to gain the same in like manner, the attempt thereof is against reason. Justice therefore, that is to say keeping of covenant, is a rule of reason by which we are forbidden to do anything destructive to our life; and consequently a law of Nature.

There be some that proceed further, and will not have the law of Nature to be those rules which conduce to the preservation of man's life on earth, but to the attaining of an eternal felicity after death; to which they think the breach of covenant may conduce; and consequently be just and reasonable; such are they that think it a work of merit to kill or depose or rebel against the sovereign power constituted over them by their own consent. But, because there is no natural knowledge of man's estate after death, much less of the reward that is then to be given to breach of faith, but only a belief grounded upon other men's saying that they know it supernaturally, or that they

know those that knew them, that knew others, that knew it supernaturally; breach of faith cannot be called a precept of reason or nature.

Others that allow for a law of Nature the keeping of faith do nevertheless make exception of certain persons as heretics and such as use not to perform their covenant to others; and this also is against reason. For if any fault of a man be sufficient to discharge our covenant made, the same ought in reason to have been sufficient to have hindered the making of it.

The names of just and unjust, when they are attributed to men, signify one thing; and when they are attributed to actions, another. When they are attributed to men they signify conformity or inconformity of manners to reason. But, when they are attributed to actions, they signify the conformity or inconformity to reason, not of manners or manner of life but of particular actions. A just man, therefore, is he that takes all the care he can that his actions may be all just, and an unjust man is he that neglects it. And such men are more often in our language styled by the names of righteous and unrighteous than just and unjust, though the meaning be the same. Therefore a righteous man does not lose that title by one or a few unjust actions that proceed from sudden passion or mistake of things or persons; nor does an unrighteous man lose his character for such actions as he does, or forbears to do, for fear, because his will is not framed by the justice but by the apparent benefit of what he is to do. That which gives to human actions the relish of justice is a certain nobleness or gallantness of courage, rarely found, by which a man scorns to be beholden for the contentment of his life to fraud or breach of promise. This justice of the manners is that which is meant where justice is called a virtue, and injustice a vice.

But the justice of actions denominates men not just, “guiltless”; and the injustice of the same, which is also called injury, gives them but the name of “guilty.”

Again, the injustice of manners is the disposition or aptitude to do injury, and is injustice before it proceeds to act, and without supposing any individual person injured. But the injustice of an action, that is to say injury, supposes an individual person injured, namely him to whom the covenant was made; and therefore many times the injury is received by one man when the damage redounds to another. As when the master commands his servant to give money to a stranger: if it be not done, the injury is done to the master, whom he had before covenanted to obey; but the damage redounds to the stranger, to whom he had no obligation, and therefore could not injure him. And so also in commonwealths. Private men may remit to one another their debts, but not robberies or other violences whereby they are endamaged, because the detaining of debt is an injury to themselves, but robbery and violence are injuries to the person of the commonwealth.

Whatsoever is done to a man conformable to his own will signified to the doer is no injury to him. For, if he that does it hath not passed away his original right to do what he please by some antecedent covenant, there is no breach of covenant, and therefore no injury done him. And if he have, then his will to have it done being signified is a release of that covenant, and so again there is no injury done him.

Justice of action is by writers divided into “commutative” and “distributive”; and the former they say consists in proportion arithmetical, the latter in proportion geometrical. Commutative, therefore, they place in the equality of value of the things contracted for—and distributive, in the distribution of equal benefit to men of equal merit. As if it were injustice to sell dearer than we buy, or to give more to a man than he merits. The value of all things contracted for is measured by the appetite of the contractors; and therefore the just value is that which they be contented to give. And merit, besides that

which is by covenant, where the performance on one part merits the performance of the other part, and falls under justice commutative not distributive, is not due by justice, but is rewarded of grace only. And therefore this distinction, in the sense wherein it uses to be expounded, is not right. To speak properly, commutative justice is the justice of a contractor; that is, a performance of covenant in buying and selling, hiring and letting to hire, lending and borrowing, exchanging, bartering, and other acts of contract.

And distributive justice, the justice of an arbitrator; that is to say, the act of defining what is just. Wherein, being trusted by them that make him arbitrator, if he perform his trust he is said to distribute to every man his own; and this is indeed just distribution, and may be called, though improperly, distributive justice, but more properly equity, which also is a law of Nature, as shall be shown in due place.

As justice depends on antecedent covenant, so does "gratitude" depend on antecedent grace, that is to say, antecedent free gift; and is the fourth law of Nature; which may be conceived in this form, "that a man, which receives benefit from another of mere grace, endeavor that he which gives it have no reasonable cause to repent him of his good will." For no man gives but with intention of good to himself; because gift is voluntary; and of all voluntary acts the object is to every man his own good, of which, if men see they shall be frustrated, there will be no beginning of benevolence, or trust, nor consequently of mutual help, nor of reconciliation of one man to another; and therefore they are to remain still in the condition of "war," which is contrary to the first and fundamental law of Nature, which commands men to "seek peace." The breach of this law is called "ingratitude," and hath the same relation to grace that injustice hath to obligation by covenant.

A fifth law of Nature, is "complaisance," that is to say, "that every man strive to accommodate himself to the rest." For the understanding whereof, we may consider that there is in men's aptness to society, a diversity of nature, rising from their diversity of affections, not unlike to that we see in stones brought together for building of an edifice. For as that stone which by the asperity and irregularity of figure takes more room from others than itself fills, and for the hardness cannot be easily made plain, and thereby hinders the building, is by the builders cast away as unprofitable and troublesome, so also a man that by asperity of nature will strive to retain those things which to himself are superfluous and to others necessary, and for the stubbornness of his passions cannot be corrected, is to be left or cast out of society as cumbersome thereunto. For seeing every man, not only by right but also by necessity of nature, is supposed to endeavor all he can to obtain that which is necessary for his conversation, he that shall oppose himself against it for things superfluous is guilty of the war that thereupon is to follow; and therefore doth that which is contrary to the fundamental law of Nature, which commands "to seek peace." The observers of this law may be called "sociable"—the Latins call them *commodi*; the contrary, "stubborn," "insociable," "froward," "intractable."

A sixth law of Nature is this, "that, upon caution of the future time, a man ought to pardon the offenses past of them that, repenting, desire it." For "pardon" is nothing but granting of peace, which, though granted to them that persevere in their hostility, be not peace but fear; yet not granted to them that give caution of the future time is sign of an aversion to peace, and therefore contrary to the law of Nature.

A seventh is, "that in revenges," that is, retribution of evil for evil, "men look not at the greatness of the evil past but the greatness of the good to follow." Whereby we are forbidden to inflict punishment with any other design than for correction of the offender or direction of others. For this law is consequent to the next before it, that commands pardon, upon security of the future time. Besides, revenge, without respect to the example

and profit to come, is a triumph or glorying in the hurt of another tending to no end; for the end is always somewhat to come; and glorying to no end is vain-glory and contrary to reason, and to hurt without reason tends to the introduction of war, which is against the law of Nature, and is commonly by the name of “cruelty.”

* * *

PART II—OF COMMONWEALTH

CHAPTER 17. OF THE CAUSES, GENERATION, AND DEFINITION OF A COMMONWEALTH

The final cause, end, or design of men, who naturally love liberty, and dominion over others, in the introduction of that restraint upon themselves, in which we see them live in commonwealths, is the foresight of their own preservation, and of a more contented life thereby; that is to say, of getting themselves out from that miserable condition of war, which is necessarily consequent, as hath been shown in Chapter XIII, to the natural passions of men, when there is no visible power to keep them in awe, and tie them by fear of punishment to the performance of their covenants, and observation of those laws of nature set down in the fourteenth and fifteenth chapters.

For the laws of nature, as “justice,” “equity,” “modesty,” “mercy,” and, in sum, “doing to others, as we would be done to,” of themselves, without the terror of some power, to cause them to be observed, are contrary to our natural passions, that carry us to partiality, pride, revenge, and the like. And covenants, without the sword, are but words, and of no strength to secure a man at all. Therefore notwithstanding the laws of nature (which every one hath then kept, when he has the will to keep them, when he can do it safely) if there be no power erected, or not great enough for our security; every man will, and may lawfully rely on his own strength and art, for caution against all other men. And in all places, where men have lived by small families, to rob and spoil one another, has been a trade, and so far from being reputed against the law of nature, that the greater spoils they gained, the greater was their honor; and men observed no other laws therein, but the laws of honor; that is, to abstain from cruelty, leaving to men their lives, and instruments of husbandry. And as small families did then; so now do cities and kingdoms which are but greater families, for their own security, enlarge their dominions, upon all pretenses of danger, and fear of invasion, or assistance that may be given to invaders, and endeavor as much as they can, to subdue, or weaken their neighbors, by open force, and secret arts, for want of other caution, justly; and are remembered for it in after ages with honor.

Nor is it the joining together of a small number of men, that gives them this security; because in small numbers, small additions on the one side or the other, make the advantage of strength so great, as is sufficient to carry the victory; and therefore gives encouragement to an invasion. The multitude sufficient to confide in for our security, is not determined by any certain number, but by comparison with the enemy we fear; and is then sufficient, when the odds of the enemy is not of so visible and conspicuous moment, to determine the event of war, as to move him to attempt.

The execution of King Charles I of England, 1649, engraving by Wenceslaus Holler (1607–1677). Hobbes considered this event a horrible example of what happens when the sovereign does not have absolute power. (Library of Congress)

And be there never so great a multitude; yet if their actions be directed according to their particular judgments, and particular appetites, they can expect thereby no defence, nor protection, neither against a common enemy, nor against the injuries of one another. For being distracted in opinions concerning the best use and application of their strength, they do not help but hinder one another; and reduce their strength by mutual opposition to nothing: whereby they are easily, not only subdued by a very few that agree together; but also when there is no common enemy, they make war upon each other, for their particular interests. For if we could suppose a great multitude of men to consent in the observation of justice, and other laws of nature, without a common power to keep them all in awe; we might as well suppose all mankind to do the same; and then there neither would be, nor need to be any civil government, or commonwealth at all; because there would be peace without subjection.

Nor is it enough for the security, which men desire should last all the time of their life, that they be governed, and directed by one judgment, for a limited time; as in one battle, or one war. For though they obtain a victory by their unanimous endeavor against a foreign enemy; yet afterwards, when either they have no common enemy, or he that by one part is held for an enemy, is by another part held for a friend, they must needs by the difference of their interests dissolve, and fall again into a war amongst themselves.

It is true that certain living creatures, as bees, and ants, live sociably one with another, which are therefore by Aristotle numbered amongst political creatures; and yet

have no other direction, than their particular judgments and appetites; nor speech, whereby one of them can signify to another, what he thinks expedient for the common benefit: and therefore some man may perhaps desire to know, why mankind cannot do the same. To which I answer,

First, that men are continually in competition for honor and dignity, which these creatures are not; and consequently amongst men there arises on that ground, envy and hatred, and finally war; but amongst these not so.

Secondly, that amongst these creatures, the common good differs not from the private; and being by nature inclined to their private, they procure thereby the common benefit. But man, whose joy consists in comparing himself with other men, can relish nothing but what is eminent.

Thirdly, that these creatures, having not, as man, the use of reason, do not see, nor think they see any fault, in the administration of their common business; whereas amongst men, there are very many, that think themselves wiser, and abler to govern the public, better than the rest; and these strive to reform and innovate, one this way, another that way; and thereby bring it into distraction and civil war.

Fourthly, that these creatures, though they have some use of voice, in making known to one another their desires, and other affections; yet they want that art of words, by which some men can represent to others, that which is good, in the likeness of evil; and evil, in the likeness of good; and augment, or diminish the apparent greatness of good and evil; discontenting men, and troubling their peace at their pleasure.

Fifthly, irrational creatures cannot distinguish between “injury,” and “damage”; and therefore as long as they be at ease, they are not offended with their fellows: whereas man is then most troublesome, when he is most at ease: for then it is that he loves to shew his wisdom, and control the actions of them that govern the commonwealth.

Lastly, the agreement of these creatures is natural; that of men, is by covenant only, which is artificial: and therefore it is no wonder if there be somewhat else required, besides covenant, to make their agreement constant and lasting; which is a common power, to keep them in awe, and to direct their actions to the common benefit.

The only way to erect such a common power, as may be able to defend them from the invasion of foreigners, and the injuries of one another, and thereby to secure them in such sort, as that by their own industry, and by the fruits of the earth, they may nourish themselves and live contentedly; is, to confer all their power and strength upon one man, or upon one assembly of men, that may reduce all their wills, by plurality of voices, unto one will: which is as much as to say, to appoint one man, or assembly of men, to bear their person; and every one to own, and acknowledge himself to be author of whatsoever he that so bears their person, shall act, or cause to be acted, in those things which concern the common Peace and safety; and therein to submit their wills, every one to his will, and their judgments, to his judgment. This is more than consent, or concord; it is a real unity of them all, in one and the same person, made by covenant of every man with every man, in such manner, as if every man should say to every man, “I authorize and give up my right of governing myself to this man, or to this assembly of men, on this condition, that thou give up thy right to him, and authorize all his actions in like manner.” This done, the multitude so united in one person, is called a COMMONWEALTH, in Latin *CIVITAS*. This is the generation of that great LEVIATHAN, or rather, to speak more reverently, of that “mortal god,” to which we owe under the “immortal God,” our peace and defence. For by this authority, given him by every particular man in the commonwealth, he hath the use of so much power and strength conferred on him, that by terror thereof, he is enabled to form the wills of them all, to peace at home, and mutual aid against their

enemies abroad. And in him consists the essence of the commonwealth; which, to define it, “is one person, of whose acts a great multitude, by mutual covenants one with another, have made themselves every one the author, to the end he may use the strength and means of them all, as he shall think expedient, for their peace and common defence.”

And he that carries this person, is called SOVEREIGN, and said to have sovereign power; and every one besides, his SUBJECT.

The attaining to this sovereign power, is by two ways. One, by natural force; as when a man makes his children, to submit themselves, and their children to his government, as being able to destroy them if they refuse; or by war subdues his enemies to his will, giving them their lives on that condition. The other, is when men agree amongst themselves, to submit to some man, or assembly of men, voluntarily, on confidence to be protected by him against all others. This latter, may be called a political commonwealth, or commonwealth by “institution”; and the former, a commonwealth by “acquisition.” And first, I shall speak of a commonwealth by institution.

CHAPTER 18. OF THE RIGHTS OF SOVEREIGNS BY INSTITUTION

A “commonwealth” is said to be “instituted,” when a “multitude” of men do agree, and “covenant, every one, with every one,” that to whatsoever “man,” or “assembly of men,” shall be given by the major part, the “right” to “present” the person of them all, that is to say, to be their “representative”; every one, as well he that “voted for it,” as he that “voted against it,” shall “authorize” all the actions and judgments, of that man, or assembly of men, in the same manner, as if they were his own, to the end, to live peaceably amongst themselves, and be protected against other men.

From this institution of a commonwealth are derived all the “rights,” and faculties of him, or them, on whom the sovereign power is conferred by the consent of the people assembled.

First, because they covenant, it is to be understood, they are not obliged by former covenant to any thing repugnant hereunto. And consequently they that have already instituted a commonwealth, being thereby bound by covenant, to own the actions, and judgments of one, cannot lawfully make a new covenant, amongst themselves, to be obedient to any other, in any thing whatsoever, without his permission. And therefore, they that are subjects to a monarch, cannot without his leave cast off monarchy, and return to the confusion of a disunited multitude; nor transfer their person from him that bears it, to another man, or other assembly of men: for they are bound, every man to every man, to own, and be reputed author of all, that he that already is their sovereign, shall do, and judge fit to be done: so that any one man dissenting, all the rest should break their covenant made to that man, which is injustice: and they have also every man given the sovereignty to him that bears their person; and therefore if they depose him, they take from him that which is his own, and so again it is injustice. Besides, if he that attempts to depose his sovereign, be killed, or punished by him for such attempt, he is author of his own punishment, as being by the institution, author of all his sovereign shall do: and because it is injustice for a man to do any thing, for which he may be punished by his own authority, he is also upon that title, unjust. And whereas some men have pretended for their disobedience to their sovereign, a new covenant, made, not with men, but with God; this also is unjust: for there is no covenant with God, but by mediation of somebody that represents God’s person which none doth but God’s lieutenant, who hath the sovereignty under God. But this pretence of covenant with God, is

so evident a lie, even in the pretenders' own consciences, that it is not only an act of an unjust, but also of a vile, and unmanly disposition.

Secondly, because the right of bearing the person of them all, is given to him they make sovereign, by covenant only of one to another, and not of him to any of them; there can happen no breach of covenant on the part of the sovereign; and consequently none of his subjects, by any pretence of forfeiture, can be freed from his subjection. That he which is made sovereign makes no covenant with his subjects beforehand, is manifest; because either he must make it with the whole multitude, as one party to the covenant; or he must make a several covenant with every man. With the whole, as one party, it is impossible; because as yet they are not one person: and if he make so many several covenants as there be men, those covenants after he hath the sovereignty are void; because what act soever can be pretended by any one of them for breach thereof, is the act both of himself, and of all the rest, because done in the person, and by the right of every one of them in particular. Besides, if any one, or more of them, pretend a breach of the covenant made by the sovereign at his institution; and others, or one other of his subjects, or himself alone, pretend there was no such breach, there is in this case, no judge to decide the controversy; it returns therefore to the sword again; and every man recovers the right of protecting himself by his own strength, contrary to the design they had in the institution. It is therefore in vain to grant sovereignty by way of precedent covenant. The opinion that any monarch receives his power by covenant, that is to say, on condition, proceeds from want of understanding this easy truth, that covenants being but words and breath, have no force to oblige, contain, constrain, or protect any man, but what it has from the public sword; that is, from the untied hands of that man, or assembly of men that hath the sovereignty, and whose actions are avouched by them all, and performed by the strength of them all, in him united. But when an assembly of men is made sovereign; then no man imagines any such covenant to have passed in the institution; for no man is so dull as to say, for example, the people of Rome made a covenant with the Romans, to hold the sovereignty on such or such conditions; which not performed, the Romans might lawfully depose the Roman people. That men see not the reason to be alike in a monarchy, and in a popular government, proceeds from the ambition of some, that are kinder to the government of an assembly, whereof they may hope to participate, than of monarchy, which they despair to enjoy.

Thirdly, because the major part hath by consenting voices declared a sovereign; he that dissented must now consent with the rest—that is, be contented to avow all the actions he shall do, or else justly be destroyed by the rest. For if he voluntarily entered into the congregation of them that were assembled, he sufficiently declared thereby his will, and therefore tacitly covenanted, to stand to what the major part should ordain: and therefore if he refuse to stand thereto, or make protestation against any of their decrees, he does contrary to his covenant, and therefore unjustly. And whether he be of the congregation, or not; and whether his consent be asked, or not, he must either submit to their decrees, or be left in the condition of war he was in before; wherein he might without injustice be destroyed by any man whatsoever.

Fourthly, because every subject is by this institution author of all the actions, and judgments of the sovereign instituted; it follows, that whatsoever he doth, it can be no injury to any of his subjects; nor ought he to be by any of them accused of injustice. For he that doth anything by authority from another, doth therein no injury to him by whose authority he acts: but by this institution of a commonwealth, every particular man is author of all the sovereign doth: and consequently he that complains of injury from his sovereign, complains of that whereof he himself is author, and therefore ought not to

accuse any man but himself; no nor himself of injury; because to do injury to one's self, is impossible. It is true that they that have sovereign power may commit iniquity; but not injustice, or injury in the proper signification.

Fifthly, and consequently to that which was said last, no man that hath sovereign power can justly be put to death, or otherwise in any manner by his subject punished. For seeing every subject is author of the actions of his sovereign; he punishes another for the actions committed by himself.

And because the end of this institution, is the peace and defence of them all; and whosoever has right to the end, has right to the means; it belongs of right, to whatsoever man, or assembly that hath the sovereignty, to be judge both of the means of peace and defence, and also of the hindrances, and disturbances of the same; and to do whatsoever he shall think necessary to be done, both beforehand, for the preserving of peace and security, by prevention of discord at home, and hostility from abroad; and, when peace and security are lost, for the recovery of the same. And therefore,

Sixthly, it is annexed to the sovereignty, to be judge of what opinions and doctrines are averse, and what conducing to peace; and consequently, on what occasions, how far, and what men are to be trusted withal, in speaking to multitudes of people; and who shall examine the doctrines of all books before they be published. For the actions of men proceed from their opinions; and in the well-governing of opinions, consists the well-governing of men's actions, in order to their peace, and concord. And though in matter of doctrine, nothing ought to be regarded but the truth; yet this is not repugnant to regulating the same by peace. For doctrine repugnant to peace, can no more be true, than peace and concord can be against the law of nature. It is true, that in a commonwealth, where by the negligence, or unskillfulness of governors, and teachers, false doctrines are by time generally received; the contrary truths may be generally offensive. Yet the most sudden, and rough bustling in of a new truth, that can be, does never break the peace, but only sometimes awake the war. For those men that are so remissly governed, that they dare take up arms to defend, or introduce an opinion, are still in war; and their condition not peace, but only a cessation of arms for fear of one another; and they live, as it were, in the precincts of battle continually. It belongs therefore to him that hath the sovereign power, to be judge, or constitute all judges of opinions and doctrines, as a thing necessary to peace; thereby to prevent discord and civil war.

Seventhly, is annexed to the sovereignty, the whole power of prescribing the rules, whereby every man may know, what goods he may enjoy, and what actions he may do, without being molested by any of his fellow-subjects; and this is it men call "propriety." For before constitution of sovereign power, as hath already been shown, all men had right to all things; which necessarily causes war: and therefore this propriety, being necessary to peace, and depending on sovereign power, is the act of that power, in order to the public peace. These rules of propriety, or *meum* and *tuum*, and of "good," "evil," "lawful," and "unlawful" in the actions of subjects, are the civil laws; that is to say, the laws of each commonwealth in particular; though the name of civil law be now restrained to the ancient civil laws of the city of Rome—which being the head of a great part of the world, her laws at that time were in these parts the civil law.

Eighthly, is annexed to the sovereignty, the right judicature; that is to say, of hearing and deciding all controversies, which may arise concerning law, either civil, or natural; or concerning fact. For without the decision of controversies, there is no protection of one subject, against the injuries of another; the laws concerning *meum* and *tuum* are in vain; and to every man remains, from the natural and necessary appetite of his own

conservation, the right of protecting himself by his private strength, which is the condition of war, and contrary to the end for which every commonwealth is instituted.

Ninthly, is annexed to the sovereignty, the right of making war and peace with other nations, and commonwealths; that is to say, of judging when it is for the public good, and how great forces are to be assembled, armed, and paid for that end; and to levy money upon the subjects, to defray the expenses thereof. For the power by which the people are to be defended, consists in their armies; and the strength of an army, in the union of their strength under one command, which command the sovereign instituted, therefore hath; because the command of the "militia," without other institution, makes him that hath it sovereign. And therefore whosoever is made general of an army, he that hath the sovereign power is always generalissimo.

Tenthly, is annexed to the sovereignty, the choosing of all counsellors, ministers, magistrates, and officers, both in peace, and war. For seeing the sovereign is charged with the end, which is the common peace and defence, he is understood to have power to use such means, as he shall think most fit for his discharge.

Eleventhly, to the sovereign is committed the power of rewarding with riches, or honor, and of punishing with corporal or pecuniary punishment, or with ignominy, every subject according to the law he hath formerly made; or if there be no law made, according as he shall judge most to conduce to the encouraging of men to serve the commonwealth, or deterring of them from doing disservice to the same.

Lastly, considering what value men are naturally apt to set upon themselves; what respect they look for from others; and how little they value other men; from whence continually arise amongst them, emulation, quarrels, factions, and at last war, to the destroying of one another, and diminution of their strength against a common enemy; it is necessary that there be laws of honor, and a public rate of the worth of such men as have deserved, or are able to deserve well of the commonwealth; and that there be force in the hands of some or other, to put those laws in execution. But it hath already been shown, that not only the whole "militia," or forces of the commonwealth; but also the judicature of all controversies, is annexed to the sovereignty. To the sovereign therefore it belongs also to give titles of honor; and to appoint what order of place, and dignity, each man shall hold; and what signs of respect, in public or private meetings, they shall give to one another.

These are the rights, which make the essence of sovereignty, and which are the marks, whereby a man may discern in what man, or assembly of men, the sovereign power is placed, and resides. For these are incommunicable, and inseparable. The power to coin money; to dispose of the estate and persons of infant heirs; to have pre-emption in markets; and all other statute prerogatives, may be transferred by the sovereign; and yet the power to protect his subjects be retained. But if he transfer the "militia," he retains the judicature in vain, for want of execution of the laws: or if he grant away the power of raising money; the "militia" is in vain; or if he give away the government of doctrines, men will be frighted into rebellion with the fear of spirits. And so if we consider any one of the said rights, we shall presently see, that the holding of all the rest will produce no effect, in the conservation of peace and justice, the end for which all commonwealths are instituted. And this division is it, whereof it is said, "a kingdom divided in itself cannot stand": for unless this division precede, division into opposite armies can never happen. If there had not first been an opinion received of the greatest part of England, that these powers were divided between the King, and the Lords, and the House of Commons, the people had never been divided and fallen into this civil war; first between those that disagreed in politics; and after between the dissenters about the liberty of religion; which

have so instructed men in this point of sovereign right, that there be few now in England that do not see, that these rights are inseparable, and will be so generally acknowledged at the next return of peace; and so continue, till their miseries are forgotten; and no longer, except the vulgar be better taught than they have hitherto been.

And because they are essential and inseparable rights, it follows necessarily, that in whatsoever words any of them seem to be granted away, yet if the sovereign power itself be not in direct terms renounced, and the name of sovereign no more given by the grantees to him that grants them, the grant is void: for when he has granted all he can, if we grant back the sovereignty, all is restored, as inseparably annexed thereunto.

This great authority being indivisible and inseparably annexed to the sovereignty, there is little ground for the opinion of them, that say of sovereign kings, though they be *singulis majores*, of greater power than every one of their subjects, yet they be *universis minores*, of less power than them all together. For if by “all together,” they mean not the collective body as one person, then “all together,” and “every one,” signify the same; and the speech is absurd. But if by “all together,” they understand them as one person, which person the sovereign bears, then the power of all together, is the same with the sovereign’s power; and so again the speech is absurd: which absurdity they see well enough, when the sovereignty is in an assembly of the people; but in a monarch they see it not; and yet the power of sovereignty is the same in whomsoever it be placed.

And as the power, so also the honor of the sovereign, ought to be greater, than that of any, or all the subjects. For in the sovereignty is the fountain of honor. The dignities of lord, earl, duke, and prince are his creatures. As in the presence of the master, the servants are equal, and without any honor at all; so are the subjects, in the presence of the sovereign. And though they shine some more, some less, when they are out of his sight; yet in his presence, they shine no more than the stars in the presence of the sun.

But a man may here object, that the condition of subjects is very miserable; as being obnoxious to the lusts, and other irregular passions of him, or them that have so unlimited a power in their hands. And commonly they that live under a monarch, think it the fault of monarchy; and they that live under the government of democracy, or other sovereign assembly, attribute all the inconvenience to that form of commonwealth; whereas the power in all forms, if they be perfect enough to protect them, is the same: not considering that the state of man can never be without some incommodity or other; and that the greatest, that in any form of government can possibly happen to the people in general, is scarce sensible in respect of the miseries, and horrible calamities, that accompany a civil war, or that dissolute condition of masterless men, without subjection to laws, and a coercive power to tie their hands from rapine and revenge: nor considering that the greatest pressure of sovereign governors, proceeds not from any delight, or profit they can expect in the damage or weakening of their subjects, in whose vigor, consists their own strength and glory; but in the restiveness of themselves, that unwillingly contributing to their own defence, make it necessary for their governors to draw from them what they can in time of peace, that they may have means on any emergent occasion, or sudden need, to resist, or take advantage on their enemies. For all men are by nature provided of notable multiplying glasses, that is their passions and self-love, through which, every little payment appears a great grievance; but are destitute of those prospective glasses, namely moral and civil science, to see afar off the miseries that hang over them, and cannot without such payments be avoided.

CHAPTER 21. OF THE LIBERTY OF SUBJECTS

LIBERTY, or FREEDOM, signifies, properly, the absence of opposition; by opposition, I mean external impediments of motion; and may be applied no less to irrational, and inanimate creatures, than to rational. For whatsoever is so tied, or environed, as it cannot move but within a certain space, which space is determined by the opposition of some external body, we say it hath not liberty to go further. And so of all living creatures, whilst they are imprisoned, or restrained, with walls, or chains; and of the water whilst it is kept in by banks, or vessels, that otherwise would spread itself into a larger space, we use to say, they are not at liberty, to move in such manner, as without those external impediments they would. But when the impediment of motion, is in the constitution of the thing itself, we use not to say; it wants the liberty; but the power to move; as when a stone lies still, or a man is fastened to his bed by sickness.

And according to this proper, and generally received meaning of the word, a FREEMAN, is he, that in those things, which by his strength and wit he is able to do, is not hindered to do what he has a will to. But when the words “free,” and “liberty,” are applied to any thing but “bodies,” they are abused; for that which is not subject to motion, is not subject to impediment: and therefore, when it is said, for example, the way is free, no liberty of the way is signified, but of those that walk in it without stop. And when we say a gift is free, there is not meant any liberty of the gift but of the giver, that was not bound by any law or covenant to give it. So when we “speak freely,” it is not the liberty of voice, or pronunciation, but of the man, whom no law hath obliged to speak otherwise than he did. Lastly, from the use of the word “free-will,” no liberty can be inferred of the will, desire, or inclination, but the liberty of the man; which consists in this, that he finds no stop, in doing what he has the will, desire, or inclination to do.

Fear and liberty are consistent; as when a man throws his goods into the sea for “fear” the ship should sink, he doth it nevertheless very willingly, and may refuse to do it if he will: it is therefore the action of one that was “free”; so a man sometimes pays his debt, only for “fear” of imprisonment, which because nobody hindered him from detaining, was the action of a man at “liberty.” And generally all actions which men do in commonwealths, for fear of the law, are actions, which the doers had liberty to omit.

“Liberty,” and “necessity” are consistent: as in the water, that hath not only “liberty,” but a “necessity” of descending by the channel; so likewise in the actions which men voluntarily do: which, because they proceed from their will, proceed from liberty; and yet, because every act of man’s will, and every desire, and inclination proceeds from some cause, and that from another cause, in a continual chain, whose first link is in the hand of God the first of all causes, proceed from “necessity.” So that to him that could see the connection of those causes, the necessity of all men’s voluntary actions, would appear manifest. And therefore God, that sees, and disposes all things, sees also that the “liberty” of man in doing what he will, is accompanied with the “necessity” of doing that which God will, and no more, nor less. For though men may do many things, which God does not command, nor is therefore author of them; yet they can have no passion, nor appetite to any thing, of which appetite God’s will is not the cause. And did not his will assure the “necessity” of man’s will, and consequently of all that on man’s will depends, the “liberty” of men would be a contradiction, and impediment to the omnipotence and “liberty” of God. And this shall suffice, as to the matter in hand, of that natural “liberty,” which only is properly called “liberty.”

But as men, for the attaining of peace, and conservation of themselves thereby, have made an artificial man, which we call a commonwealth; so also have they made

artificial chains, called “civil laws,” which they themselves, by mutual covenants, have fastened at one end, to the lips of that man, or assembly, to whom they have given the sovereign power; and at the other end to their own ears. These bonds, in their own nature but weak, may nevertheless be made to hold, by the danger, though not by the difficulty of breaking them.

In relation to these bonds only it is, that I am to speak now, of the “liberty” of “subjects.” For seeing there is no commonwealth in the world, wherein there be rules enough set down, for the regulating of all the actions, and words of men; as being a thing impossible: it follows necessarily, that in all kinds of actions by the laws pretermitted, men have the liberty, of doing what their own reasons shall suggest, for the most profitable to themselves. For if we take liberty in the proper sense, for corporal liberty; that is to say, freedom from chains and prison; it were very absurd for men to clamor as they do, for the liberty they so manifestly enjoy. Again, if we take liberty, for an exemption from laws, it is no less absurd, for men to demand as they do, that liberty, by which all other men may be masters of their lives. And yet, as absurd as it is, this is it they demand; not knowing that the laws are of no power to protect them, without a sword in the hands of a man, or men, to cause those laws to be put in execution. The liberty of a subject, lies therefore only in those things, which in regulating their actions, the sovereign hath pretermitted: such as is the liberty to buy, and sell, and otherwise contract with one another; to choose their own abode, their own diet, their own trade of life, and institute their children as they themselves think fit; and the like.

Nevertheless we are not to understand, that by such liberty, the sovereign power of life and death, is either abolished, or limited. For it has been already shown, that nothing the sovereign representative can do to a subject, on what pretence soever, can properly be called injustice, or injury; because every subject is author of every act the sovereign doth; so that he never wants right to any thing, otherwise, than as he himself is the subject of God, and bound thereby to observe the laws of nature. And therefore it may, and doth often happen in commonwealths, that a subject may be put to death, by the command of the sovereign power; and yet neither do the other wrong: as when Jephtha caused his daughter to be sacrificed: in which, and the like cases, he that so dies, had liberty to do the action, for which he is nevertheless, without injury put to death. And the same holds also in a sovereign prince, that puts to death an innocent subject. . . .

The liberty, whereof there is so frequent and honorable mention, in the histories, and philosophy of the ancient Greeks, and Romans, and in the writings, and discourse of those that from them have received all their learning in the politics, is not the liberty of particular men; but the liberty of the commonwealth: which is the same with that which every man then should have, if there were no civil laws, nor commonwealth at all. And the effects of it also be the same. For as amongst masterless men, there is perpetual war, of every man against his neighbor; no inheritance, to transmit to the son, nor to expect from the father; no propriety of goods, or lands; no security; but a full and absolute liberty in every particular man: so in states, and commonwealths not dependent on one another, every commonwealth, not every man, has an absolute liberty, to do what it shall judge, that is to say, what that man, or assembly that represents it, shall judge most conducing to their benefit. But withal, they live in the condition of a perpetual war, and upon the confines of battle, with their frontiers armed, and cannons planted against their neighbors round about. The Athenians, and Romans were free; that is, free commonwealths: not that any particular men had the liberty to resist their own representative; but that their representative had the liberty to resist, or invade other people.

There is written on the turrets of the city of Lucca in great characters at this day, the word LIBERTAS; yet no man can thence infer, that a particular man has more liberty, or immunity from the service of the commonwealth there, than in Constantinople. Whether a commonwealth be monarchical, or popular, the freedom is still the same.

But it is an easy thing, for men to be deceived, by the specious name of liberty; and for want of judgment to distinguish, mistake that for their private inheritance, and birth-right, which is the right of the public only. And when the same error is confirmed by the authority of men in reputation for their writings on this subject, it is no wonder if it produce sedition, and change of government. . . .

To come now to the particulars of the true liberty of a subject; that is to say, what are the things, which though commanded by the sovereign, he may nevertheless, without injustice, refuse to do; we are to consider, what rights we pass away, when we make a commonwealth; or, which is all one, what liberty we deny ourselves, by owning all the actions, without exception, of the man, or assembly we make our sovereign. For in the act of our "submission," consists both our "obligation," and our "liberty"; which must therefore be inferred by arguments taken from thence; there being no obligation on any man, which arises not from some act of his own; for all men equally, are by nature free. And because such arguments, must either be drawn from the express words, I "authorize all his actions," or from the intention of him that submits himself to his power, which intention is to be understood by the end for which he so submits; the obligation, and liberty of the subject, is to be derived, either from those words, or others equivalent; or else from the end of the institution of sovereignty, namely, the peace of the subjects within themselves, and their defence against a common enemy.

First therefore, seeing sovereignty by institution, is by covenant of every one to every one; and sovereignty by acquisition, by covenants of the vanquished to the victor, or child to the parent; it is manifest, that every subject has liberty in all those things, the right whereof cannot by covenant be transferred. I have shown before in the 14th chapter, that covenants, not to defend a man's own body, are void. Therefore,

If the sovereign command a man, though justly condemned, to kill, wound, or maim himself; or not to resist those that assault him; or to abstain from the use of food, air, medicine, or any other thing, without which he cannot live; yet hath that man the liberty to disobey.

If a man be interrogated by the sovereign, or his authority, concerning a crime done by himself, he is not bound, without assurance of pardon, to confess it; because no man, as I have shown in the same chapter, can be obliged by covenant to accuse himself.

Again, the consent of a subject to sovereign power, is contained in these words, "I authorize, or take upon me, all his actions"; in which there is no restriction at all, of his own former natural liberty: for by allowing him to "kill me," I am not bound to kill myself when he commands me. It is one thing to say, "kill me, or my fellow, if you please"; another thing to say, "I will kill myself, or my fellow." It follows therefore, that No man is bound by the words themselves, either to kill himself, or any other man; and consequently, that the obligation a man may sometimes have, upon the command of the sovereign to execute any dangerous, or dishonorable office, depends not on the words of our submission; but on the intention, which is to be understood by the end thereof. When therefore our refusal to obey, frustrates the end for which the sovereignty was ordained; then there is no liberty to refuse: otherwise there is.

Upon this ground, a man that is commanded as a soldier to fight against the enemy, though his sovereign have right enough to punish his refusal with death, may nevertheless in many cases refuse, without injustice; as when he substitutes a sufficient

soldier in his place: for in this case he deserts not the service of the commonwealth. And there is allowance to be made for natural timorousness; not only to women, of whom no such dangerous duty is expected, but also to men of feminine courage. When armies fight, there is on one side, or both, a running away; yet when they do it not out of treachery, but fear, they are not esteemed to do it unjustly, but dishonorably. For the same reason, to avoid battle, is not injustice, but cowardice. But he that enrolls himself a soldier, or takes impress money, takes away the excuse of a timorous nature; and is obliged, not only to go to the battle, but also not to run from it, without his captain's leave. And when the defence of the commonwealth, requires at once the help of all that are able to bear arms, every one is obliged; because otherwise the institution of the commonwealth, which they have not the purpose, or courage to preserve, was in vain.

To resist the sword of the commonwealth, in defence of another man, guilty, or innocent, no man hath liberty; because such liberty, takes away from the sovereign, the means of protecting us; and is therefore destructive of the very essence of government. But in case a great many men together, have already resisted the sovereign power unjustly, or committed some capital crime, for which every one of them expects death, whether have they not the liberty then to join together, and assist, and defend one another? Certainly they have: for they but defend their lives, which the guilty man may as well do, as the innocent. There was indeed injustice in the first breach of their duty; their bearing of arms subsequent to it, though it be to maintain what they have done, is no new unjust act. And if it be only to defend their persons, it is not unjust at all. But the offer of pardon takes from them, to whom it is offered, the plea of self-defence, and makes their perseverance in assisting, or defending the rest, unlawful.

As for other liberties, they depend on the silence of the law. In cases where the sovereign has prescribed no rule, there the subject hath the liberty to do, or forbear, according to his own discretion. And therefore such liberty is in some places more, and in some less; and in some times more, in other times less, according as they that have the sovereignty shall think most convenient. As for example, there was a time, when in England a man might enter into his own land, and dispossess such as wrongfully possessed it, by force. But in aftertimes, that liberty of forcible entry, was taken away by a statute made, by the king, in parliament. And in some places of the world, men have the liberty of many wives: in other places, such liberty is not allowed.

If a subject have a controversy with his sovereign, of debt, or of right of possession of lands or goods, or concerning any service required at his hands, or concerning any penalty, corporal, or pecuniary, grounded on a precedent law; he hath the same liberty to sue for his right, as if it were against a subject; and before such judges, as are appointed by the sovereign. For seeing the sovereign demands by force of a former law, and not by virtue of his power; he declares thereby, that he requires no more, than shall appear to be due by that law. The suit therefore is not contrary to the will of the sovereign; and consequently the subject hath the liberty to demand the hearing of his cause; and sentence, according to that law. But if he demand, or take any thing by pretence of his power; there lies, in that case, no action of law; for all that is done by him in virtue of his power, is done by the authority of every subject, and consequently he that brings an action against the sovereign, brings it against himself.

If a monarch, or sovereign assembly, grant a liberty to all, or any of his subjects, which grant standing, he is disabled to provide for their safety, the grant is void; unless he directly renounce, or transfer the sovereignty to another. For in that he might openly, if it had been his will, and in plain terms, have renounced, or transferred it, and did not; it is to be understood it was not his will, but that the grant proceeded from ignorance of the

repugnancy between such a liberty and the sovereign power; and therefore the sovereignty is still retained; and consequently all those powers, which are necessary to the exercising thereof; such as are the power of war, and peace, of judicature, of appointing officers, and councilors, of levying money, and the rest named in the eighteenth chapter.

The obligation of subjects to the sovereign, is understood to last as long, and no longer, than the power lasts, by which he is able to protect them. For the right men have by nature to protect themselves, when none else can protect them, can by no covenant be relinquished. The sovereignty is the soul of the commonwealth which once departed from the body, the members do no more receive their motion from it. The end of obedience is protection; which, wheresoever a man sees it, either in his own, or in another's sword, nature applies his obedience to it, and his endeavor to maintain it. And though sovereignty, in the intention of them that make it, be immortal; yet is it in its own nature, not only subject to violent death, by foreign war; but also through the ignorance, and passions of men, it hath in it, from the very institution, many seeds of a natural mortality, by intestine discord.

If a subject be taken prisoner in war; or his person, or his means of life be within the guards of the enemy, and hath his life and corporal liberty given him, on condition to be subject to the victor, he hath liberty to accept the condition; and having accepted it, is the subject of him that took him; because he had no other way to preserve himself. The case is the same, if he be detained on the same terms, in a foreign country. But if a man be held in prison, or bonds, or is not trusted with the liberty of his body; he cannot be understood to be bound by covenant to subjection; and therefore may, if he can, make his escape by any means whatsoever.

If a monarch shall relinquish the sovereignty, both for himself, and his heirs; his subjects return to the absolute liberty of nature; because, though nature may declare who are his sons, and who are the nearest of his kin; yet it depends on his own will, as hath been said in the precedent chapter, who shall be his heir. If therefore he will have no heir, there is no sovereignty, nor subjection. The case is the same, if he die without known kindred, and without declaration of his heir. For then there can no heir be known, and consequently no subjection be due.

If the sovereign banish his subject; during the banishment, he is not subject. But he that is sent on a message, or hath leave to travel, is still subject; but it is, by contract between sovereigns, not by virtue of the covenant of subjection. For whosoever enters into another's dominion, is subject to all the laws thereof; unless he have a privilege by the amity of the sovereigns, or by special license.

If a monarch subdued by war, render himself subject to the victor; his subjects are delivered from their former obligation, and become obliged to the victor. But if he be held prisoner, or have not the liberty of his own body; he is not understood to have given away the right of sovereignty; and therefore his subjects are obliged to yield obedience to the magistrates formerly placed, governing not in their own name, but in his. For, his right remaining, the question is only of the administration; that is to say, of the magistrates and officers; which, if he have not means to name, he is supposed to approve those, which he himself had formerly appointed.

BLAISE PASCAL

1623–1662

Blaise Pascal was the middle child of an upper-class magistrate in Clermont-Ferrand, France. His mother died when he was 3 years old, and five years later Pascal's father moved the family to Paris. His father, Etienne, an excellent amateur mathematician, educated young Blaise at home. Etienne first taught Blaise Latin and Greek, deciding to wait on his own love, mathematics, until his son was older. By the age of 12, however, Blaise had figured out many of the principles of Euclidian geometry on his own. His father finally relented and bought Blaise a copy of Euclid, which he devoured. Over the next several years, father and son attended weekly mathematical lectures and were regular guests at important intellectual salons in Paris. In 1638, the family underwent another trauma when Etienne Pascal was forced to flee Paris because of a conflict with the powerful Cardinal Richelieu. However, Blaise Pascal's younger sister, Jacqueline, performed so well in a children's play for the Cardinal that their father was given a pardon and installed as tax commissioner for Rouen.

At Rouen, Blaise Pascal began to concentrate on mathematics. While still a teenager, he wrote his first book (on conic sections in geometry) and developed a plan for a calculating machine to help his father with his tax work. In 1644, he built the first of the machine's several working models—no small feat given the state of metalworking at the time. Pascal's contributions to mathematics and computing machines were so important that a major contemporary programming language is named in his honor. Pascal also experimented on the nature of a vacuum showing that, contrary to Aristotle's belief, "Nature has no abhorrence of a vacuum."

In 1647, Pascal became seriously ill and returned to Paris with his younger sister to recover. Following his father's death in 1651, his sister entered a convent, leaving Pascal alone. Over the next several years, Pascal seemed to drift: he outwardly enjoyed the social life of Paris as a successful mathematician and eligible bachelor, but he was inwardly dissatisfied. Although he had undergone a conversion in 1646

there, then, no rational basis for making the Christian commitment? In the selection given here, Pascal appeals to the *bon vivants* of Paris by asking them to consider faith as a wager. If you bet your life on God and you turn out to be right, you have gained eternity. If you are wrong and there is no God, what have you lost—except the possibility of “those poisonous pleasures, glory and luxury”? But, if you bet your life against the reality of God, you gain little if correct, but lose eternally if wrong.

Some critics have argued that Pascal’s Wager hardly seems like faith at all—that it is a “calculating and self-regarding attitude” and is “profoundly irreligious.”* Others have claimed that the wager leads not to Christianity, but to any religion with a great reward for belief and a great penalty for disbelief. Still others argue that the most reasonable choice is to avoid wagering at all until the evidence is clear. (See the suggested readings that follow.) However, to be fair, Pascal never claimed the wager was the way to faith or that it provided the *means* for proving Christian truth. His two goals were to show that while being *suprarational*, belief is not *irrational* and one *must* decide. As Pascal put it,

Do not then reprove for error those who have made a choice; for you know nothing about it. “No, but I blame them for having made, not this choice, but a choice . . . The true course is not to wager at all.”

Yes; but you must wager. It is not optional. You are embarked. Which will you choose then?

* * *

There is little consistency in the numbering of different editions of the *Pensées*. The translation and numbering used here are by W.F. Trotter.

The best general introduction to Pascal remains J.H. Broome, *Pascal* (London: E. Arnold, 1972). Other general studies include Émile Cailliet, *Pascal: The Emergence of Genius*, 2nd edition (New York: Harper, 1961); Morris Bishop, *Pascal: The Life of a Genius* (1936; reprint Westport, CO: Greenwood Press, 1968); Jean Mesnard, *Pascal*, translated by Claude and Marcia Abraham (University, AL: University of Alabama Press, 1969); Alban Krailsheimer, *Pascal*, Past Masters Series (Oxford: Oxford University Press, 1980); Hugh M. Davidson, *Blaise Pascal* (Boston: Twayne, 1983); Ben Rogers, *Pascal* (London: Routledge, 1999); and Nicholas Hammond, ed., *The Cambridge Companion to Pascal* (Cambridge: Cambridge University Press, 2003). More specialized studies include F.T.H. Fletcher, *Pascal and the Mystical Tradition* (Oxford: Basil Blackwell, 1954); Jan Miel, *Pascal and Theology* (Baltimore, MD: Johns Hopkins University Press, 1969); Robert James Nelson, *Pascal: Adversary and Advocate* (Cambridge, MA: Harvard University Press, 1981); Sara E. Melzer, *Discourses of the Fall: A Study of Pascal’s Pensées* (Berkeley, CA: University of California Press, 1986); Nicholas Hammond, *Playing with Truth: Language and the Human Condition in Pascal’s ‘Pensées’* (Oxford: Oxford University Press, 1994); and Charles Sherrard MacKenzie, *Blaise Pascal: Apologist to Skeptics* (Lanham, MD: University Press of America, 2008). For discussions of Pascal’s wager, see Nicholas Rescher, *Pascal’s Wager: A Study of Practical Reasoning in Philosophical Theology* (Notre Dame, IN: University of Notre Dame Press, 1985) and Jeff Jordan, ed., *Gambling on God: Essays on Pascal’s Wager* (Lanham, MD: Rowman & Littlefield, 1994).

*John Hick, *Philosophy of Religion*, 4th ed. (Englewood Cliffs, NJ: Prentice Hall, 1990), p. 59.

PENSÉES (selections)

185. The conduct of God, who disposes all things kindly, is to put religion into the mind by reason, and into the heart by grace. But to will to put it into the mind and heart by force and threats is not to put religion there, but terror. . . .

187. Order.—Men despise religion; they hate it, and fear it is true. To remedy this, we must begin by showing that religion is not contrary to reason; that it is venerable, to inspire respect for it; then we must make it lovable, to make good men hope it is true; finally, we must prove it is true.

194. . . . Let them at least learn what is the religion they attack, before attacking it. If this religion boasted of having a clear view of God, and of possessing it open and unveiled, it would be attacking it to say that we see nothing in the world which shows it with this clearness. But since, on the contrary, it says that men are in darkness and estranged from God, that He has hidden Himself from their knowledge, that this is in fact the name which He gives Himself in the Scriptures, *Deus absconditus* [hidden God]; and finally, if it endeavors equally to establish these two things: that God has set up in the Church visible signs to make Himself known to those who should seek Him sincerely, and that He has nevertheless so disguised them that He will only be perceived by those who seek Him with all their heart; . . .

We do not require great education of the mind to understand that here is no real and lasting satisfaction; that our pleasures are only vanity; that our evils are infinite; and, lastly, that death, which threatens us every moment, must infallibly place us within a few years under the dreadful necessity of being for ever either annihilated or unhappy.

There is nothing more real than this, nothing more terrible. Be we as heroic as we like, that is the end which awaits the noblest life in the world. Let us reflect on this, and then say whether it is not beyond doubt that there is no good in this life but in the hope of another; that we are happy only in proportion as we draw near it; and that, as there are no more woes for those who have complete assurance of eternity, so there is no more happiness for those who have no insight into it.

199. Let us imagine a number of men in chains, and all condemned to death, where some are killed each day in the sight of the others, and those who remain see their own fate in that of their fellows, and wait their turn, looking at each other sorrowfully and without hope. It is an image of the condition of men.

205. When I consider the short duration of my life, swallowed up in the eternity before and after, the little space which I fill, and even can see, engulfed in the infinite immensity of spaces of which I am ignorant, and which know me not, I am frightened, and am astonished at being here rather than there; for there is no reason why here rather than there, why now rather than then. Who has put me here? By whose order and direction have this place and time been allotted to me? . . .

206. The eternal silence of these infinite spaces frightens me.

210. The last act is tragic, however happy all the rest of the play is; at the last a little earth is thrown upon our head, and that is the end for ever.

229. . . . If I saw nothing there which revealed a Divinity, I would come to a negative conclusion; if I saw everywhere the signs of a Creator, I would remain peacefully in

A mechanical calculator invented by Blaise Pascal (1623–1662) with numerals visible in slots above a row of numbered metal wheels. (Dave King © Dorling Kindersley, Courtesy of The Science Museum, London)

faith. But, seeing too much to deny and too little to be sure, I am in a state to be pitied; wherefore I have a hundred times wished that if a God maintains nature, she should testify to Him unequivocally, and that, if the signs she gives are deceptive, she should suppress them altogether; that she should say everything or nothing, that I might see which cause I ought to follow. Whereas in my present state, ignorant of what I am or of what I ought to do, I know neither my condition nor my duty. My heart inclines wholly to know where is the true good, in order to follow it; nothing would be too dear to me for eternity.

I envy those whom I see living in the faith with such carelessness, and who make such a bad use of a gift of which it seems to me I would make such a different use.

230. It is incomprehensible that God should exist, and it is incomprehensible that He should not exist; that the soul should be joined to the body, and that we should have no soul; that the world should be created, and that it should not be created, etc., that original sin should be, and that it should not be.

233. [*The Wager*] . . . Let us then examine this point, and say, “God is, or He is not.”

But to which side shall we incline? Reason can decide nothing here. There is an infinite chaos which separated us. A game is being played at the extremity of this infinite distance where heads or tails will turn up. What will you wager? According to reason, you can do neither the one thing nor the other; according to reason, you can defend neither of the propositions.

Do not then reprove for error those who have made a choice; for you know nothing about it. “No, but I blame them for having made, not this choice, but a choice; for again both he who chooses heads and he who chooses tails are equally at fault, they are both in the wrong. The true course is not to wager at all.”

Yes; but you must wager. It is not optional. You are embarked. Which will you choose then? Let us see. Since you must choose, let us see which interests you least. You have two things to lose, the true and the good; and two things to stake, your reason and your will, your knowledge and your happiness; and your nature has two things to shun, error and misery. Your reason is no more shocked in choosing one rather than the other, since you must of necessity choose. This is one point settled. But your happiness? Let us weight the gain and the loss in wagering that God is. Let us estimate these two chances. If you gain, you gain all; if you lose, you lose nothing. Wager, then, without hesitation that

He is.—“That is very fine. Yes, I must wager; but I may perhaps wager too much.”—Let us see. Since there is an equal risk of gain and of loss, but if you had only to gain two lives, instead of one, you might still wager. But if there were three lives to gain, you would have to play (since you are under the necessity of playing), and you would be imprudent, when you are forced to play, not chance your life to gain three at a game where there is an equal risk of loss and gain. But there is an eternity of life and happiness. And this being so, if there were an infinity of chances, of which one only would be for you, you would still be right in wagering one to win two, and you would act stupidly, being obliged to play, by refusing to stake one life against three at a game in which out of an infinity of chances there is one for you, if there were an infinity of an infinitely happy life to gain. But there is here an infinity of an infinitely happy life to gain, a chance to gain against a finite number of chances to lose, and what you stake is finite. . . .

And so our proposition is of infinite force, when there is the finite to stake in a game where there are equal risks of gain and of loss, and the infinite to gain. This is demonstrable: and if men are capable of any truths, this is one.

“I confess it, I admit it. But, still, is there no means of seeing the faces of the cards?”—Yes, Scripture and the rest, etc. “Yes, but I have my hands tied and my mouth closed; I am forced to wager, and am not free. I am not released, and am so made that I cannot believe. What, then, would you have me do?”

True. But at least learn your inability to believe, since reason brings you to this, and yet you cannot believe. Endeavour then to convince yourself, not by increase of proofs of God, but by the abatement of your passions. You would like to attain faith, and do not know the way; you would like to cure yourself of unbelief, and ask the remedy for it. Learn of those who have been bound like you, and who now stake all their possessions. These are people who know the way which you would follow, and who are cured of an ill of which you would be cured. Follow the way by which they began; by acting as if they believed, taking the holy water, having masses said, etc. Even this will naturally make you believe, and deaden your acuteness.—“But this is what I am afraid of.”—And why? What have you to lose? . . .

The end of this discourse.—Now, what harm will befall you in taking this side? You will be faithful, honest, humble, grateful, generous, a sincere friend, truthful. Certainly you will not have those poisonous pleasures, glory and luxury; but will you not have other? I will tell you that you will thereby gain in this life, and that, at each step you take on this road, you will see so great certainty of gain, so much nothingness in what you risk, that you will at last recognize that you have wagered for something certain and infinite, for which you have given nothing.

“Ah! This discourse transports me, charms me,” etc.

If this discourse pleases you and seems impressive, know that it is made by a man who has knelt, both before and after it, in prayer to that Being, infinite and without parts, before whom he lays all he has, for you also to lay before Him all you have for your own good and for His glory, so that strength may be given to lowliness.

240. “I would soon have renounced pleasure,” say they, “had I faith.”

For my part I tell you, “You would soon have faith, if you renounced pleasure.” Now, it is for you to begin. . . .

242. I admire the boldness with which these persons undertake to speak of God. In addressing their argument to infidels, their first chapter is to prove Divinity from the works of nature. I should not be astonished at their enterprise, if they were addressing their argument to the faithful; for it is certain that those who have the living faith in their heart see at once that all existence is none other than the work of the God whom they adore. But for

those in whom this light is extinguished, and in whom we purpose to rekindle it, persons destitute of faith and grace, who, seeking with all their light, whatever they see in nature that can bring them to this knowledge, find only obscurity and darkness; to tell them that they have only to look at the smallest things which surround them, and they will see God openly, to give them, as a complete proof of this great and important matter, the course of the moon and planets, and to claim to have concluded the proof with such an argument, is to give them ground for believing that the proofs of our religion are very weak. And I see by reason and experience that nothing is more calculated to arouse their contempt.

It is not after this manner that Scripture speaks, which has a better knowledge of the things that are of God. It says, on the contrary, that God is a hidden God, and that, since the corruption of nature, He has left men in a darkness from which they can escape only through Jesus Christ, without whom all communion with God is cut off. . . .

253. Two extremes: to exclude reason, to admit reason only.

277. The heart has its reasons, which reason does not know. We feel it in a thousand things. I say that the heart naturally loves the Universal Being, and also itself naturally, according as it gives itself to them; and it hardens itself against one or the other at its will. You have rejected the one, and kept the other at its will. You have rejected the one, and kept the other. Is it by reason that you love yourself?

278. It is the heart which experiences God, and not the reason. This, then, is faith: God felt by the heart, not by the reason.

Faith is a gift of God; do not believe that we said it was a gift of reasoning. Other religions do not say this of their faith. They only give reasoning in order to arrive at it, and yet it does not bring them to it.

280. The knowledge of God is very far from the love of Him.

282. We know truth, not only by the reason, but also by the heart, and it is in this last way that we know first principles; and reason, which has no part in it, tries in vain to impugn them. The skeptics, who have only this for their object, labor to no purpose. We know that we do not dream, and however impossible it is for us to prove it by reason, this inability demonstrates only the weakness of our reason, but not, as they affirm, the uncertainty of all our knowledge. For the knowledge of first principles, as space, time, motion, number, is as sure as any of those which we get from reasoning. And reason must trust these intuitions of the heart, and must base on them every argument. (We have intuitive knowledge of the tri-dimensional nature of space, and of the infinity of number, and reason then shows that there are no two square numbers one of which is double of the other. Principles are intuited, propositions are inferred, all with certainty, though in different ways.) And it is as useless and absurd for reason to demand from the heart proofs of her first principles, before admitting them, as it would be for the heart to demand from reason an intuition of all demonstrated propositions before accepting them.

This inability ought, then, to serve only to humble reason, which would judge all, but not to impugn our certainty, as if only reason were capable of instructing us. Would to God, on the contrary, that we had never need of it, and that we knew everything by instinct and intuition! But nature has refused us this boon. On the contrary, she has given us but very little knowledge of this kind; and all the rest can be acquired only by reasoning.

Therefore, those to whom God has imparted religion by intuition are very fortunate, and justly convinced. But to those who do not have it, we can give it only by reasoning, waiting for God to give them spiritual insight, without which faith is only human, and useless for salvation.

347. Man is but a reed, the most feeble thing in nature; but he is a thinking reed. The entire universe need not arm itself to crush him. A vapor, a drop of water suffices to kill him. But, if the universe were to crush him, man would still be more noble than that which killed him, because he knows that he dies and the advantage which the universe has over him; the universe knows nothing of this.

All our dignity consists, then, in thought. By it we must elevate ourselves, and not by space and time which we cannot fill. Let us endeavour, then, to think well; this is the principle of morality.

365. Thought.—All the dignity of man consists in thought. Thought is therefore by its nature a wonderful and incomparable thing. It must have strange defects to be contemptible. But it has such, so that nothing is more ridiculous. How great it is in its nature! How vile it is in its defects!

But what is this thought? How foolish it is!

409. The greatness of man.—The greatness of man is so evident, that it is even proved by his wretchedness. For what in animals is nature we call in man wretchedness; by which we recognize that, his nature being now like that of animals, he has fallen from a better nature which once was his.

For who is unhappy at not being a king, except a deposed king? Was Paulus Aemilius unhappy at being no longer consul? On the contrary, everybody thought him happy in having been consul, because the office could only be held for a time. But men thought Perseus so unhappy in being no longer king, because the condition of kingship implied his being always king, that they thought it strange that he endured life. Who is unhappy at having only one eye? Probably no man ever ventured to mourn at not having three eyes. But any one is inconsolable at having none.

430. The greatness and the wretchedness of man are so evident that the true religion must necessarily teach us both that there is in man some great source of greatness, and a great source of wretchedness. It must then give us a reason for these astonishing contradictions. . . .

434. . . . Again, no person is certain, apart from faith, whether he is awake or sleeps, seeing that during sleep we believe that we are awake as firmly as we do when we are awake; we believe that we see space, figure, and motion; we are aware of the passage of time, we measure it; and in fact we act as if we were awake. So that half of our life being passed in sleep, we have on our own admission no idea of truth, whatever we may imagine. As all our intuitions are then illusions, who knows whether the other half of our life, in which we think we are awake, is not another sleep a little different from the former, from which we awake when we suppose ourselves asleep? . . .

What then shall man do in this state? Shall he doubt everything? Shall he doubt whether he is awake, whether he is being pinched, or whether he is being burned? Shall he doubt whether he doubts? Shall he doubt whether he exists? We cannot go so far as that; and I lay it down as a fact that there never has been a real complete skeptic. Nature sustains our feeble reason, and prevents it raving to this extent.

Shall he then say, on the contrary, that he certainly possesses truth—he who, when pressed ever so little, can show no title to it, and is forced to let go his hold?

What a chimera then is man! What a novelty! What a monster, what a chaos, what a contradiction, what a prodigy! Judge of all things, imbecile worm of the earth; depositary of truth, a sink of uncertainty and error; the pride and refuse of the universe!

Who will unravel this tangle? Nature confutes the skeptics, and reason confutes the dogmatists. What then will you become, O men! who try to find out by your natural reason what is your true condition? You cannot avoid one of these sects, nor adhere to one of them.

Know then, proud man, what a paradox you are to yourself. Humble yourself, weak reason; be silent, foolish nature; learn that man infinitely transcends man, and learn from your Master your true condition, of which you are ignorant. Hear God. . . .

555. . . . The Christian religion, then, teaches men these two truths; that there is a God whom men can know, and that there is a corruption in their nature which renders them unworthy of Him. It is equally important to men to know both these points; and it is equally dangerous for man to know God without knowing his own wretchedness, and to know his own wretchedness without knowing the Redeemer who can free him from it. The knowledge of only one of these points gives rise either to the pride of philosophers, who have known God, and not their own wretchedness, or to the despair of atheists, who know their own wretchedness, but not the Redeemer.

And, as it is alike necessary to man to know these two points, so is it alike merciful to God to have made us know them. The Christian religion does this; it is in this that it consists.

Let us herein examine the order of the world, and see if all things do not tend to establish these two chief points of this religion: Jesus Christ is the end of all, and the center to which all tends. Whoever knows Him knows the reason of everything.

Those who fall into error err only through failure to see one of these two things. We can then have an excellent knowledge of God without that of our own wretchedness, and of our own wretchedness without that of God. But we cannot know Jesus Christ without knowing at the same time both God and our own wretchedness. . . .

The God of Christians is not a God who is simply the author of mathematical truths, or of the order of the elements; that is the view of heathens and Epicureans. He is not merely a God who exercises His providence over the life and fortunes of men, to bestow on those who worship Him a long and happy life. That was the portion of the Jews. But the God of Abraham, the God of Isaac, and God of Jacob, and God of Christians, is a God of love and of comfort, a God who fills the soul and heart of those whom He possesses, a God who makes them conscious of their inward wretchedness, and His infinite mercy, who unites Himself to their inmost soul, who fills it with humility and joy, with confidence and love, who renders them incapable of any other end than Himself.

All who seek God without Jesus Christ, and who rest in nature, either find no light to satisfy them, or come to form for themselves a means of knowing God and serving Him without a mediator. Thereby they fall either into atheism, or into deism, two things which the Christian religion abhors almost equally.

563. The prophecies, the very miracles and proofs of our religion, are not of such a nature that they can be said to be absolutely convincing. But they are also of such a kind that it cannot be said that it is unreasonable to believe them. Thus there is both evidence and obscurity to enlighten some and confuse others. But the evidence is such that it surpasses, or at least equals, the evidence to the contrary; so that it is not reason which can determine men not to follow it, and thus it can only be lust or malice of heart. And by this means there is sufficient evidence to condemn, and insufficient to convince; so that it appears in those who follow it, that it is grace, and not reason, which makes them follow it; and in those who shun it, that it is lust, not reason, which makes them shun it.

BARUCH SPINOZA

1632–1677

Except for Socrates himself, it would be difficult to find a philosopher who was a more highly regarded person than Benedict (Baruch) Spinoza. Like Socrates, he was not interested in power or wealth. Like Socrates, he was accused of atheism and was hounded for his unorthodox beliefs. Like Socrates, he was interested in philosophy as a way of life, not as a professional discipline.

Spinoza was born in Amsterdam, the son of Jewish refugees who had fled from Portugal to escape persecution. As a young man, he was trained in Jewish tradition under a celebrated Talmudist, Saul Levi Morteira. He later studied with Manasseh ben Israel, the man who persuaded Cromwell to allow Jews to return to England, and with a Dutch physician, Franz van der Ende.

As a Jew, Spinoza was an outsider in Holland—not even entitled to citizenship because of his faith. As an original thinker, Spinoza soon became an outsider within the Jewish community as well. He was accused of heresy by the synagogue of Amsterdam and required to disavow his teachings. Spinoza refused and was officially excommunicated in 1656, when he was 23 years old. (In the twentieth century, the new state of Israel formally revoked the ban.)

With no wish to join any other religious community, Spinoza left Amsterdam and eventually settled in The Hague. He lived very simply, supporting himself by grinding and polishing lenses, a craft he had adopted out of respect for the Jewish tradition, which required scholars to learn a trade.

Spinoza published only two works during his lifetime. His first work was *Principles of Descartes' Philosophy* (1663), which critically examined the pre-suppositions and structure of Descartes' system. Using what later came to be called "higher criticism," his second book, *Theological-Political Treatise* (1670), subjected Scripture to rational analysis. He concluded that the Bible does not aim at truth but at pious and obedient behavior. Writing soon after the Thirty Years

War (1618–1648), he proposed that religion and truth be separated altogether. This separation, he believed, would be the best safeguard against fanaticism. And pious conduct flourishes best in an atmosphere of free speech.

His *Theological-Political Treatise* attracted a great deal of criticism. It also brought an invitation to the chair of philosophy at the University of Heidelberg, Germany. Although the invitation included a guarantee of academic freedom, Spinoza rejected it out of his passion for freedom to speak and write as he saw fit.

The rigor of his simple life, with the glass dust of his trade, hastened his death from consumption at the age of 44, two years before Hobbes died at 91. Immediately following his death, Spinoza's other works, including *Political Treatise* (which supports individual liberty, religious tolerance, and democracy); *On the Improvement of the Intellect*; and his masterpiece, *Ethics*, were published.

* * *

Whereas Descartes and Hobbes used the geometrical *method*, Spinoza used geometrical *form* as well. The *Ethics* is presented as a geometrical system, developing propositions from axioms and definitions.

In Books I and II of his *Ethics*, reprinted here in the Samuel Shirley translation, Spinoza explores God and the nature and origin of mind. He begins by accepting Descartes' idea that "infinite substance" is completely independent and necessary. But he claims that Descartes had contradicted himself by allowing for "finite substances" as well. Instead, Spinoza claims that there could only be one substance: God. God exists necessarily and as God is the only substance, what we call "Nature" is also God. This also means that whatever happens is necessary (though individuals are often confused and do not understand the connections).

Although God is the only substance, God has infinite attributes. The only two divine attributes we can know are thought (of which minds are modifications) and extension (of which bodies are modifications). To Spinoza, Descartes was wrong to present mind and body as two separate substances (with all the concomitant problems of interaction). Instead, says Spinoza, body and mind are both attributes of the One substance. Thinking substance and extended substance are really the same substance.

In Books III to V of the *Ethics*, Spinoza argues that we must free ourselves from the tyranny of the passions. The key to this freedom is an understanding of God that allows us to see the necessary, rational structure of reality: "The more this knowledge, that things are necessary, is applied to particular things . . . the greater is the power of the mind over the emotions." The final goal of this knowledge is "blessedness," which consists of intellectual love toward God. This program of overcoming the passions by reason may be difficult, but Spinoza concludes that "all things excellent are as difficult as they are rare" (an apt description of Spinoza's classic).

* * *

For a general introduction to Spinoza's life and thought, see Stuart Hampshire, *Spinoza* (Baltimore, MD: Penguin Books, 1952); Henry E. Allison, *Benedict De Spinoza*, rev. ed. (New Haven, CT: Yale University Press, 1987); Alan Donagan, *Spinoza* (Chicago: University of Chicago Press, 1988); Herman De Dijn, *Spinoza: The Way to Wisdom* (West Lafayette, IN: Purdue University Press, 1996); Roger

Scruton, *Spinoza* (London: Routledge, 1999); Steven Nadler, *Spinoza: A Life* (Cambridge: Cambridge University Press, 1999); and Michael Della Rocca, *Spinoza* (Abingdon, UK: Routledge, 2008). For an interesting study of Spinoza's thought in relation to the other Continental rationalists, see John Cottingham, *The Rationalists* (Oxford: Oxford University Press, 1988). The generally accepted "classic" commentary on the *Ethics* remains Harry Austryn Wolfson, *The Philosophy of Spinoza: Unfolding the Latent Processes of His Reasoning* (1934; reprint New York: Schocken, 1969). For more recent discussions of Spinoza's *Ethics*, see Jonathan Bennett, *A Study of Spinoza's Ethics* (Indianapolis, IN: Hackett, 1984); Edwin Curley, *Behind the Geometrical Method: A Reading of Spinoza's Ethics* (Princeton, NJ: Princeton University Press, 1988); Genevieve Lloyd, *Spinoza and the Ethics* (Oxford: Routledge, 1996); Steven Nadler, *Spinoza's Ethics: An Introduction* (Cambridge: Cambridge University Press, 2006); and J. Thomas Cook, *Spinoza's Ethics: A Reader's Guide* (London: Continuum, 2007). For collections of essays on Spinoza, see S. Paul Kashap, ed., *Studies in Spinoza* (Berkeley: University of California Press, 1972); Robert W. Shahan and J.I. Biro, eds., *Spinoza: New Perspectives* (Norman, OK: University of Oklahoma Press, 1978); Richard Kennington, ed., *The Philosophy of Baruch Spinoza* (Washington, DC: Catholic University of America Press, 1980); Don Garrett, ed., *The Cambridge Companion to Spinoza* (Cambridge: Cambridge University Press, 1995); and Yirmiyahu Yovel and Gideon Segal, eds., *Spinoza* (New York: Ashgate, 2000). Richard Mason, *The God of Spinoza: A Philosophical Study* (Cambridge: Cambridge University Press, 1997) is a study of Spinoza's philosophy of religion while the Jewish character of Spinoza's thought is discussed in Yirmiyahu Yovel's pair of books, *The Marrano of Reason* and *The Adventures of Immanence* (both Princeton, NJ: Princeton University Press, 1991) and Steven Smith, *Spinoza, Liberalism, and the Question of Jewish Identity* (New Haven, CT: Yale University Press, 1997).

ETHICS (in part)

PART I

CONCERNING GOD

Definitions

1. By that which is self-caused I mean that whose essence involves existence; or that whose nature can be conceived only as existing.

2. A thing is said to be finite in its own kind [*in suo genere finita*] when it can be limited by another thing of the same nature. For example, a body is said to be finite

because we can always conceive of another body greater than it. So, too, a thought is limited by another thought. But body is not limited by thought, nor thought by body.

3. By substance I mean that which is in itself and is conceived through itself; that is, that the conception of which does not require the conception of another thing from which it has to be formed.

4. By attribute I mean that which the intellect perceives of substance as constituting its essence.

5. By mode I mean the affections of substance, that is, that which is in something else and is conceived through something else.

6. By God I mean an absolutely infinite being, that is, substance consisting of infinite attributes, each of which expresses eternal and infinite essence.

Explication: I say “absolutely infinite,” not “infinite in its kind.” For if a thing is only infinite in its kind, one may deny that it has infinite attributes. But if a thing is absolutely infinite, whatever expresses essence and does not involve any negation belongs to its essence.

7. That thing is said to be free [*liber*] which exists solely from the necessity of its own nature, and is determined to action by itself alone. A thing is said to be necessary [*necessarius*] or rather, constrained [*coactus*], if it is determined by another thing to exist and to act in a definite and determinate way.

8. By eternity I mean existence itself insofar as it is conceived as necessarily following solely from the definition of an eternal thing.

Explication: For such existence is conceived as an eternal truth, just as is the essence of the thing, and therefore cannot be explicated through duration or time, even if duration be conceived as without beginning and end.

Axioms

1. All things that are, are either in themselves or in something else.

2. That which cannot be conceived through another thing must be conceived through itself.

3. From a given determinate cause there necessarily follows an effect; on the other hand, if there be no determinate cause, it is impossible that an effect should follow.

4. The knowledge of an effect depends on, and involves, the knowledge of the cause.

5. Things which have nothing in common with each other cannot be understood through each other; that is, the conception of the one does not involve the conception of the other.

6. A true idea must agree with that of which it is the idea [*ideatum*].

7. If a thing can be conceived as not existing, its essence does not involve existence.

PROPOSITION 1: *Substance is by nature prior to its affections.*

Proof: This is evident from Defs. 3 and 5.

PROPOSITION 2: *Two substances having different attributes have nothing in common.*

Proof: This too is evident from Def. 3; for each substance must be in itself and be conceived through itself; that is, the conception of the one does not involve the conception of the other.

PROPOSITION 3: *When things have nothing in common, one cannot be the cause of the other.*

Proof: If things have nothing in common, then (Ax. 5) they cannot be understood through one another, and so (Ax. 4) one cannot be the cause of the other.

PROPOSITION 4: *Two or more distinct things are distinguished from one another either by the difference of the attributes of the substances or by the difference of the affections of the substances.*

Proof: All things that are, are either in themselves or in something else (Ax. 1); that is (Defs. 3 and 5), nothing exists external to the intellect except substances and their affections. Therefore, there can be nothing external to the intellect through which several things can be distinguished from one another except substances or (which is the same thing) (Def. 4) the attributes and the affections of substances.

PROPOSITION 5: *In the universe there cannot be two or more substances of the same nature or attribute.*

Proof: If there were several such distinct substances, they would have to be distinguished from one another either by a difference of attributes or by a difference of affections (Pr. 4). If they are distinguished only by a difference of attributes, then it will be granted that there cannot be more than one substance of the same attribute. But if they are distinguished by a difference of affections, then, since substance is by nature prior to its affections (Pr. 1), disregarding therefore its affections and considering substance in itself, that is (Def. 3 and Ax. 6), considering it truly, it cannot be conceived as distinguishable from another substance. That is (Pr. 4), there cannot be several such substances but only one.

PROPOSITION 6: *One substance cannot be produced by another substance.*

Proof: In the universe there cannot be two substances of the same attribute (Pr. 5), that is (Pr. 2), two substances having something in common. And so (Pr. 3) one cannot be the cause of the other; that is, one cannot be produced by the other.

Corollary: Hence it follows that substance cannot be produced by anything else. For in the universe there exists nothing but substances and their affections, as is evident from Ax. 1 and Defs. 3 and 5. But, by Pr. 6, it cannot be produced by another substance. Therefore, substance cannot be produced by anything else whatsoever.

Another Proof: This can be proved even more readily by the absurdity of the contradictory. For if substance could be produced by something else, the knowledge of substance would have to depend on the knowledge of its cause (Ax. 4), and so (Def. 3) it would not be substance.

PROPOSITION 7: *Existence belongs to the nature of substance.*

Proof: Substance cannot be produced by anything else (Cor. Pr. 6) and is therefore self-caused [*causa sui*]; that is (Def. 1), its essence necessarily involves existence; that is, existence belongs to its nature.

PROPOSITION 8: *Every substance is necessarily infinite.*

Proof: There cannot be more than one substance having the same attribute (Pr. 5), and existence belongs to the nature of substance (Pr. 7). It must therefore exist either as finite or as infinite. But it cannot exist as finite, for (Def. 2) it would have to be limited by another substance of the same nature, and that substance also would have to exist (Pr. 7). And so there would exist two substances of the same attribute, which is absurd (Pr. 5). Therefore, it exists as infinite.

Scholium 1: Since in fact to be finite is in part a negation and to be infinite is the unqualified affirmation of the existence of some nature, it follows from Proposition 7 alone that every substance must be infinite.

Scholium 2: I do not doubt that for those who judge things confusedly and are not accustomed to know things through their primary causes it is difficult to grasp the proof of Proposition 7. Surely, this is because they neither distinguish between the modification of substances and substances themselves, nor do they know how things are produced. And so it comes about that they ascribe to substances a beginning which they see natural things as having; for those who do not know the true causes of things confuse everything. Without any hesitation they imagine trees as well as men talking and stones as well as men being formed from seeds; indeed, any forms whatsoever are imagined to change into any other forms. So too, those who confuse the divine nature with human nature easily ascribe to God human emotions, especially so long as they are ignorant of how the latter are produced in the mind. But if men were to attend to the nature of substance, they would not doubt at all the truth of Proposition 7; indeed, this Proposition would be an axiom to all and would be ranked among universally accepted truisms. For by substance they would understand that which is in itself and is conceived through itself; that is, that the knowledge of which does not require the knowledge of any other thing. By modifications they would understand that which is in another thing, and whose conception is formed from the thing in which they are. Therefore, in the case of nonexistent modifications we can have true ideas of them since their essence is included in something else, with the result that they can be conceived through that something else, although they do not exist in actuality externally to the intellect. However, in the case of substances, because they are conceived only through themselves, their truth external to the intellect is only in themselves. So if someone were to say that he has a clear and distinct—that is, a true—idea of substance and that he nevertheless doubts whether such a substance exists, this would surely be just the same as if he were to declare that he has a true idea but nevertheless suspects that it may be false (as is obvious to anyone who gives his mind to it). Or if anyone asserts that substance is created, he at the same time asserts that a false idea has become true, than which nothing more absurd can be conceived. So it must necessarily be admitted that the existence of substance is as much an eternal truth as is its essence.

From here we can derive in another way that there cannot be but one [substance] of the same nature, and I think it worthwhile to set out the proof here. Now to do this in an orderly fashion I ask you to note:

1. The true definition of each thing involves and expresses nothing beyond the nature of the thing defined. Hence it follows that—

2. No definition involves or expresses a fixed number of individuals, since it expresses nothing but the nature of the thing defined. For example, the definition of a triangle expresses nothing other than simply the nature of a triangle, and not a fixed number of triangles.

3. For each individual existent thing there must necessarily be a definite cause for its existence.

4. The cause for the existence of a thing must either be contained in the very nature and definition of the existent thing (in effect, existence belongs to its nature) or must have its being independently of the thing itself.

From these premises it follows that if a fixed number of individuals exist in Nature, there must necessarily be a cause why those individuals and not more or fewer exist. If, for example, in Nature twenty men were to exist (for the sake of greater clarity I suppose that they exist simultaneously and that no others existed in Nature before them), in order to account for the existence of these twenty men, it will not be enough for us to demonstrate the cause of human nature in general; it will furthermore be necessary to demonstrate the cause why not more or fewer than twenty men exist, since (Note 3) there must necessarily be a cause for the existence of each one. But this cause (Notes 2 and 3) cannot be contained in the nature of man, since the true definition of man does not involve the number twenty. So (Note 4) the cause of the existence of these twenty men, and consequently of each one, must necessarily be external to each one, and therefore we can reach the unqualified conclusion that whenever several individuals of a kind exist, there must necessarily be an external cause for their existence. Now since existence belongs to the nature of substance (as has already been shown in this Scholium) the definition of substance must involve necessary existence, and consequently the existence of substance must be concluded solely from its definition. But the existence of several substances cannot follow from the definition of substance (as I have already shown in Notes 2 and 3). Therefore, from the definition of substance it follows necessarily that there exists only one substance of the same nature, as was proposed.

PROPOSITION 9: *The more reality or being a thing has, the more attributes it has.*

Proof: This is evident from Definition 4.

PROPOSITION 10: *Each attribute of one substance must be conceived through itself.*

Proof: For an attribute is that which intellect perceives of substance as constituting its essence (Def. 4), and so (Def. 3) it must be conceived through itself.

Scholium: From this it is clear that although two attributes be conceived as really distinct, that is, one without the help of the other, still we cannot deduce therefrom that they constitute two entities, or two different substances. For it is in the nature of substance that each of its attributes be conceived through itself, since all the attributes it possesses have always been in it simultaneously, and one could not have been produced by another; but each expresses the reality or being of substance. So it is by no means absurd to ascribe more than one attribute to one substance. Indeed, nothing in Nature is clearer than that each entity must be conceived under some attribute, and the more reality or being it has, the more are its attributes which express necessity, or eternity, and infinity. Consequently, nothing can be clearer than this, too, that an absolutely infinite entity must necessarily be defined (Def. 6) as an entity consisting of infinite attributes, each of which expresses a definite essence, eternal and infinite. Now if anyone asks by what mark can we distinguish between different substances, let him read the following Propositions, which show that in Nature there exists only one substance, absolutely infinite. So this distinguishing mark would be sought in vain.

PROPOSITION 11: *God, or substance consisting of infinite attributes, each of which expresses eternal and infinite essence, necessarily exists.*

Proof: If you deny this, conceive, if you can, that God does not exist. Therefore (Ax. 7), his essence does not involve existence. But this is absurd (Pr. 7). Therefore, God necessarily exists.

Second Proof: For every thing a cause or reason must be assigned either for its existence or for its nonexistence. For example, if a triangle exists, there must be a reason, or cause, for its existence. If it does not exist, there must be a reason or cause which prevents it from existing, or which annuls its existence. Now this reason or cause must either be contained in the nature of the thing or be external to it. For example, the reason why a square circle does not exist is indicated by its very nature, in that it involves a contradiction. On the other hand, the reason for the existence of substance also follows from its nature alone, in that it involves existence (Pr. 7). But the reason for the existence or nonexistence of a circle or a triangle does not follow from their nature, but from the order of universal corporeal Nature. For it is from this latter that it necessarily follows that either the triangle necessarily exists at this moment or that its present existence is impossible. This is self-evident, and therefore it follows that a thing necessarily exists if there is no reason or cause which prevents its existence. Therefore, if there can be no reason or cause which prevents God from existing or which annuls his existence, we are bound to conclude that he necessarily exists. But if there were such a reason or cause, it would have to be either within God's nature or external to it; that is, it would have to be in another substance of another nature. For if it were of the same nature, by that very fact it would be granted that God exists. But a substance of another nature would have nothing in common with God (Pr. 2), and so could neither posit nor annul his existence. Since, therefore, there cannot be external to God's nature a reason or cause that would annul God's existence, then if indeed he does not exist, the reason or cause must necessarily be in God's nature, which would therefore involve a contradiction. But to affirm this of a Being absolutely infinite and in the highest degree perfect is absurd. Therefore, neither in God nor external to God is there any cause or reason which would annul his existence. Therefore, God necessarily exists.

A Third Proof: To be able to not exist is weakness; on the other hand, to be able to exist is power, as is self-evident. So if what now necessarily exists is nothing but finite entities, then finite entities are more potent than an absolutely infinite Entity—which is absurd. Therefore, either nothing exists, or an absolutely infinite Entity necessarily exists, too. But we do exist, either in ourselves or in something else which necessarily exists (Ax. 1 and Pr. 7). Therefore, an absolutely infinite Entity—that is (Def. 6), God—necessarily exists.

Scholium: In this last proof I decided to prove God's existence a posteriori so that the proof may be more easily perceived, and not because God's existence does not follow a priori from this same basis. For since the ability to exist is power, it follows that the greater the degree of reality that belongs to the nature of a thing, the greater amount of energy it has for existence. So an absolutely infinite Entity or God will have from himself absolutely infinite power to exist, and therefore exists absolutely.

But perhaps many will not readily find this proof convincing because they are used to considering only such things as derive from external causes. Of these things they observe that those which come quickly into being—that is, which readily exist—likewise readily perish, while things which they conceive as more complex they regard as more difficult to bring into being—that is, not so ready to exist. However, to free them from these misconceptions I do not need at this point to show what measure of truth there is in the saying, "Quickly come, quickly go," neither need I raise the question whether or not everything is equally easy in respect of Nature as a whole. It is enough to note simply this, that I am not here speaking of things that come into being through external causes, but only of substances, which (Pr. 6) cannot be produced by any external cause.

For whether they consist of many parts or few, things that are brought about by external causes owe whatever degree of perfection or reality they possess entirely to the power of the external cause, and so their existence has its origin solely in the perfection of the external cause, and not in their own perfection. On the other hand, whatever perfection substance possesses is due to no external cause; therefore its existence, too, must follow solely from its own nature, and is therefore nothing else but its essence. So perfection does not annul a thing's existence: on the contrary, it posits it; whereas imperfection annuls a thing's existence. So there is nothing of which we can be more certain than the existence of an absolutely infinite or perfect Entity; that is, God. For since his essence excludes all imperfection and involves absolute perfection, it thereby removes all reason for doubting his existence and affords the utmost certainty of it. This, I think, must be quite clear to all who give a modicum of attention to the matter.

PROPOSITION 12: *No attribute of substance can be truly conceived from which it would follow that substance can be divided.*

Proof: The parts into which substance thus conceived would be divided will either retain the nature of substance or they will not. In the first case each part will have to be infinite (Pr. 8) and self-caused (Pr. 6) and consist of a different attribute (Pr. 5); and so several substances could be formed from one substance, which is absurd (Pr. 6). Furthermore, the parts would have nothing in common with the whole (Pr. 2), and the whole could exist and be conceived without its parts (Def. 4 and Pr. 10), the absurdity of which none can doubt. But in the latter case in which the parts will not retain the nature of substance—then when the whole substance would have been divided into equal parts it would lose the nature of substance and would cease to be. This is absurd (Pr. 7).

PROPOSITION 13: *Absolutely infinite substance is indivisible.*

Proof: If it were divisible, the parts into which it would be divided will either retain the nature of absolutely infinite substance, or not. In the first case, there would therefore be several substances of the same nature, which is absurd (Pr. 5). In the second case, absolutely infinite substance can cease to be, which is also absurd (Pr. 11).

Corollary: From this it follows that no substance, and consequently no corporeal substance, insofar as it is substance, is divisible.

Scholium: The indivisibility of substance can be more easily understood merely from the fact that the nature of substance can be conceived only as infinite, and that a part of substance can mean only finite substance, which involves an obvious contradiction (Pr. 8).

PROPOSITION 14: *There can be, or be conceived, no other substance but God.*

Proof: Since God is an absolutely infinite being of whom no attribute expressing the essence of substance can be denied (Def. 6), and since he necessarily exists (Pr. 11), if there were any other substance but God, it would have to be explicated through some attribute of God, and so there would exist two substances with the same attribute, which is absurd (Pr. 5). So there can be no substance external to God, and consequently no such substance can be conceived. For if it could be conceived, it would have to be conceived necessarily as existing; but this is absurd (by the first part of this proof). Therefore, no substance can be or be conceived external to God.

Corollary 1: Hence it follows quite clearly that God is one: that is (Def. 6), in the universe there is only one substance, and this is absolutely infinite, as I have already indicated in Scholium Pr. 10.

Corollary 2: It follows that the thing extended and the thing thinking are either attributes of God or (Ax. 1) affections of the attributes of God.

PROPOSITION 15: *Whatever is, is in God, and nothing can be or be conceived without God.*

Proof: Apart from God no substance can be or be conceived (Pr. 14), that is (Def. 3), something which is in itself and is conceived through itself. Now modes (Def. 5) cannot be or be conceived without substance; therefore, they can be only in the divine nature and can be conceived only through the divine nature. But nothing exists except substance and modes (Ax. 1). Therefore, nothing can be or be conceived without God.

Scholium: Some imagine God in the likeness of man, consisting of mind and body, and subject to passions. But it is clear from what has already been proved how far they stray from the true knowledge of God. These I dismiss, for all who have given any consideration to the divine nature deny that God is corporeal. They find convincing proof of this in the fact that by body we understand some quantity having length, breadth, and depth, bounded by a definite shape; and nothing more absurd than this can be attributed to God, a being absolutely infinite.

At the same time, however, by other arguments which they try to prove their point, they show clearly that in their thinking corporeal or extended substance is set completely apart from the divine nature, and they assert that it is created by God. But they have no idea from what divine power it could have been created, which clearly shows that they don't know what they are saying. Now I have clearly proved—at any rate, in my judgment (Cor. Pr. 6 and Sch. 2 Pr. 8)—that no substance can be produced or created by anything else. Furthermore, in Proposition 14 we showed that apart from God no substance can be or be conceived, and hence we deduced that extended substance is one of God's infinite attributes.

However, for a fuller explanation I will refute my opponents' arguments, which all seem to come down to this. Firstly, they think that corporeal substance, insofar as it is substance, is made up of parts, and so they deny that it can be infinite, and consequently that it can pertain to God. This they illustrate with many examples, of which I will take one or two. They say that if corporeal substance is infinite, suppose it to be divided into two parts. Each of these parts will be either finite or infinite. If the former, then the infinite is made up of two finite parts, which is absurd. If the latter, then there is an infinite which is twice as great as another infinite, which is also absurd.

Again, if an infinite length is measured in feet, it will have to consist of an infinite number of feet; and if it is measured in inches, it will consist of an infinite number of inches. So one infinite number will be twelve times greater than another infinite number.

Lastly, if from one point in an infinite quantity two lines, AB and AC, be drawn of fixed and determinate length, and thereafter be produced to infinity, it is clear that the distance between B and C continues to increase and finally changes from a determinate distance to an indeterminate distance.

As these absurdities follow, they think, from supposing quantity to be infinite, they conclude that corporeal substance must be finite and consequently cannot pertain to God's essence.

The second argument is also drawn from God's consummate perfection. Since God, they say, is a supremely perfect being, he cannot be that which is acted upon. But corporeal substance, being divisible, can be acted upon. It therefore follows that corporeal substance does not pertain to God's essence.

These are the arguments I find put forward by writers who thereby seek to prove that corporeal substance is unworthy of the divine essence and cannot pertain to it. However, the student who looks carefully into these arguments will find that I have already replied to them, since they are all founded on the same supposition that material substance is composed of parts, and this I have already shown to be absurd (Pr. 12 and Cor. Pr. 13). Again, careful reflection will show that all those alleged absurdities (if indeed they are absurdities, which is not now under discussion) from which they seek to prove that extended substance is finite do not at all follow from the supposition that quantity is infinite, but that infinite quantity is measurable and is made up of finite parts. Therefore, from the resultant absurdities no other conclusion can be reached but that infinite quantity is not measurable and cannot be made up of finite parts. And this is exactly what we have already proved (Pr. 12). So the weapon they aimed at us is in fact turned against themselves. If therefore from this "reductio ad absurdum" argument of theirs they still seek to deduce that extended substance must be finite, they are surely just like one who, having made the supposition that a circle has the properties of a square, deduces therefrom that a circle does not have a center from which all lines drawn to the circumference are equal. For corporeal substance, which can be conceived only as infinite, one, and indivisible (Prs. 8, 5, and 12) they conceive as made up of finite parts, multiplex, and divisible, so as to deduce that it is finite. In the same way others, too, having supposed that a line is composed of points, can find many arguments to prove that a line cannot be infinitely divided. Indeed, it is just as absurd to assert that corporeal substance is composed of bodies or parts as that a body is composed of surfaces, surfaces of lines, and lines of points. This must be admitted by all who know clear reason to be infallible, and particularly those who say that a vacuum cannot exist. For if corporeal substance could be so divided that its parts were distinct in reality, why could one part not be annihilated while the others remain joined together as before? And why should all the parts be so fitted together as to leave no vacuum? Surely, in the case of things which are in reality distinct from one another, one can exist without the other and remain in its original state. Since therefore there is no vacuum in Nature (of which [more] elsewhere) and all its parts must so harmonize that there is no vacuum, it also follows that the parts cannot be distinct in reality; that is, corporeal substance, insofar as it is substance, cannot be divided.

If I am now asked why we have this natural inclination to divide quantity, I reply that we conceive quantity in two ways, to wit, abstractly, or superficially—in other words, as represented in the imagination—or as substance, which we do only through the intellect. If therefore we consider quantity insofar as we represent it in the imagination—and this is what we more frequently and readily do—we find it to be finite, divisible, and made up of parts. But if we consider it intellectually and conceive it insofar as it is substance—and this is very difficult—then it will be found to be infinite, one, and indivisible, as we have already sufficiently proved. This will be quite clear to those who can distinguish between the imagination and the intellect, especially if this point also is stressed, that matter is everywhere the same, and there are no distinct parts in it except insofar as we conceive matter as modified in various ways. Then its parts are distinct, not

really but only modally. For example, we conceive water to be divisible and to have separate parts insofar as it is water, but not insofar as it is material substance. In this latter respect it is not capable of separation or division. Furthermore, water, qua water, comes into existence and goes out of existence; but qua substance it does not come into existence nor go out of existence [*corrumpitur*].

I consider that in the above I have also replied to the second argument, since this too is based on the supposition that matter, insofar as it is substance, is divisible and made up of parts. And even though this were not so, I do not know why matter should be unworthy of the divine nature, since (Pr. 14) there can be no substance external to God by which it can be acted upon. All things, I repeat, are in God, and all things that come to pass do so only through the laws of God's infinite nature and follow through the necessity of his essence (as I shall later show). Therefore, by no manner of reasoning can it be said that God is acted upon by anything else or that extended substance is unworthy of the divine nature, even though it be supposed divisible, as long as it is granted to be eternal and infinite.

But enough of this subject for the present.

PROPOSITION 16: *From the necessity of the divine nature there must follow infinite things in infinite ways [modis] (that is, everything that can come within the scope of infinite intellect).*

Proof: This proposition should be obvious to everyone who will but consider this point, that from the given definition of any one thing the intellect infers a number of properties which necessarily follow in fact from the definition (that is, from the very essence of the thing), and the more reality the definition of the thing expresses (that is, the more reality the essence of the thing defined involves), the greater the number of its properties. Now since divine nature possesses absolutely infinite attributes (Def. 6), of which each one also expresses infinite essence in its own kind, then there must necessarily follow from the necessity of the divine nature an infinity of things in infinite ways (that is, everything that can come within the scope of the infinite intellect).

Corollary 1: Hence it follows that God is the efficient cause of all things that can come within the scope of the infinite intellect.

Corollary 2: Secondly, it follows that God is the cause through himself, not *per accidens*.

Corollary 3: Thirdly, it follows that God is absolutely the first cause.

PROPOSITION 17: *God acts solely from the laws of his own nature, constrained by none.*

Proof: We have just shown that an infinity of things follow, absolutely, solely from the necessity of divine nature, or—which is the same thing—solely from the laws of that same nature (Pr. 16); and we have proved (Pr. 15) that nothing can be or be conceived without God, but that everything is in God. Therefore, there can be nothing external to God by which he can be determined or constrained to act. Thus, God acts solely from the laws of his own nature and is constrained by none.

Corollary 1: Hence it follows, firstly, that there is no cause, except the perfection of his nature, which either extrinsically or intrinsically moves God to act.

Corollary 2: It follows, secondly, that God alone is a free cause. For God alone exists solely from the necessity of his own nature (Pr. 11 and Cor. 1 Pr. 14) and acts solely from the necessity of his own nature (Pr. 17). So he alone is a free cause (Def. 7).

Scholium: Others take the view that God is a free cause because—so they think—he can bring it about that those things which we have said follow from his

nature—that is, which are within his power—should not come about; that is, they should not be produced by him. But this is as much as to say that God can bring it about that it should not follow from the nature of a triangle that its three angles are equal to two right angles, or that from a given cause the effect should not follow, which is absurd.

Furthermore, I shall show later on without the help of this proposition that neither intellect nor will pertain to the nature of God. I know indeed that there are many who think they can prove that intellect in the highest degree and free will belong to the nature of God; for they say they know of nothing more perfect which they may attribute to God than that which is the highest perfection in us. Again, although they conceive of God as having in actuality intellect in the highest degree, they yet do not believe he can bring about the existence of everything which in actuality he understands, for they think they would thereby be nullifying God's power. If, they say, he had created everything that is within his intellect, then he would not have been able to create anything more; and this they regard as inconsistent with God's omnipotence. So they have preferred to regard God as indifferent to everything and as creating nothing but what he has decided, by some absolute exercise of will, to create. However, I think I have shown quite clearly (Pr. 16) that from God's supreme power or infinite nature an infinity of things in infinite ways—that is, everything—has necessarily flowed or is always following from that same necessity, just as from the nature of a triangle it follows from eternity to eternity that its three angles are equal to two right angles. Therefore, God's omnipotence has from eternity been actual and will remain for eternity in the same actuality. In this way, I submit, God's omnipotence is established as being far more perfect. Indeed my opponents—let us speak frankly—seem to be denying God's omnipotence. For they are obliged to admit that God understands an infinite number of creatable things which nevertheless he can never create. If this were not so, that is, if he were to create all the things that he understands, he would exhaust his omnipotence, according to them, and render himself imperfect. Thus, to affirm God as perfect they are reduced to having to affirm at the same time that he cannot bring about everything that is within the bounds of his power. I cannot imagine anything more absurd than this, or more inconsistent with God's omnipotence.

Furthermore, I have something here to say about the intellect and will that is usually attributed to God. If intellect and will do indeed pertain to the eternal essence of God, one must understand in the case of both these attributes something very different from the meaning widely entertained. For the intellect and will that would constitute the essence of God would have to be vastly different from human intellect and will, and would have no point of agreement except the name. They could be no more alike than the celestial constellation of the Dog and the dog that barks. This I will prove as follows. If intellect does pertain to the divine nature, it cannot, like man's intellect, be posterior to (as most thinkers hold) or simultaneous with the objects of understanding, since God is prior in causality to all things (Cor. 1 Pr. 16). On the contrary, the truth and formal essence of things is what it is because it exists as such in the intellect of God as an object of thought. Therefore, God's intellect, insofar as it is conceived as constituting God's essence, is in actual fact the cause of things, in respect both of their essence and their existence. This seems to have been recognized also by those who have asserted that God's intellect, will, and power are one and the same. Since therefore God's intellect is the one and only cause of things, both of their essence and their existence, as we have shown, it must necessarily be different from

them both in respect of essence and existence. For that which is caused differs from its cause precisely in what it has from its cause. For example, a man is the cause of the existence of another man, but not of the other's essence; for the essence is an eternal truth. So with regard to their essence the two men can be in full agreement, but they must differ with regard to existence; and for that reason if the existence of the one should cease, the existence of the other would not thereby cease. But if the essence of the one could be destroyed and rendered false, so too would the essence of the other. Therefore, a thing which is the cause of the essence and existence of some effect must differ from that effect both in respect of essence and existence. But God's intellect is the cause of the essence and existence of man's intellect. Therefore, God's intellect, insofar as it is conceived as constituting the divine essence, differs from man's intellect both in respect of essence and existence, and cannot agree with it in any respect other than name—which is what I sought to prove. In the matter of will, the proof is the same, as anyone can readily see.

PROPOSITION 18: *God is the immanent, not the transitive, cause of all things.*

Proof: All things that are, are in God, and must be conceived through God (Pr. 15), and so (Cor. 1 Pr. 16) God is the cause of the things that are in him, which is the first point. Further, there can be no substance external to God (Pr. 14); that is (Def. 3), a thing which is in itself external to God—which is the second point. Therefore, God is the immanent, not the transitive, cause of all things.

PROPOSITION 19: *God [is eternal], that is, all the attributes of God are eternal.*

Proof: God is substance (Def. 6) which necessarily exists (Pr. 11); that is (Pr. 7), a thing to whose nature it pertains to exist, or—and this is the same thing—a thing from whose definition existence follows; and so (Def. 8) God is eternal. Further, by the attributes of God must be understood that which expresses the essence of the Divine substance (Def. 4), that is, that which pertains to substance. It is this, I say, which the attributes themselves must involve. But eternity pertains to the nature of substance (as I have shown in Pr. 7). Therefore, each of the attributes must involve eternity, and so they are all eternal.

Scholium: This proposition is also perfectly clear from the manner in which I proved the existence of God (Pr. 11). From this proof, I repeat, it is obvious that God's existence is, like his essence, an eternal truth. Again, I have also proved God's eternity in another way in Proposition 19 of my *Descartes's Principles of Philosophy*, and there is no need here to go over that ground again.

PROPOSITION 20: *God's existence and his essence are one and the same.*

Proof: God and all his attributes are eternal (Pr. 19); that is, each one of his attributes expresses existence (Def. 8). Therefore, the same attributes of God that explicate his eternal essence (Def. 4) at the same time explicate his eternal existence; that is, that which constitutes the essence of God at the same time constitutes his existence, and so his existence and his essence are one and the same.

Corollary 1: From this it follows, firstly, that God's existence, like his essence, is an eternal truth.

Corollary 2: It follows, secondly, that God is immutable; that is, all the attributes of God are immutable. For if they were to change in respect of existence, they would also have to change in respect of essence (Pr. 10); that is—and this is self-evident—they would have to become false instead of true, which is absurd.

PROPOSITION 21: *All things that follow from the absolute nature of any attribute of God must have existed always, and as infinite; that is, through the said attribute they are eternal and infinite.*

Proof: Suppose this proposition be denied and conceive, if you can, that something in some attribute of God, following from its absolute nature, is finite and has a determinate existence or duration; for example, the idea of God in Thought. Now Thought, being assumed to be an attribute of God, is necessarily infinite by its own nature (Pr. 11). However, insofar as it has the idea of God, it is being supposed as finite. Now (Def. 2) it cannot be conceived as finite unless it is determined through Thought itself. But it cannot be determined through Thought itself insofar as Thought constitutes the idea of God, for it is in that respect that Thought is supposed to be finite. Therefore, it is determined through Thought insofar as Thought does not constitute the idea of God, which Thought must nevertheless necessarily exist (Pr. 11). Therefore, there must be Thought which does not constitute the idea of God, and so the idea of God does not follow necessarily from its nature insofar as it is absolute Thought. (For it is conceived as constituting and as not constituting the idea of God.) This is contrary to our hypothesis. Therefore, if the idea of God in Thought, or anything in some attribute of God (it does not matter what is selected, since the proof is universal), follows from the necessity of the absolute nature of the attribute, it must necessarily be infinite. That was our first point.

Furthermore, that which thus follows from the necessity of the nature of some attribute cannot have a determinate existence, or duration. If this be denied, suppose that there is in some attribute of God a thing following from the necessity of the nature of the attribute, for example, the idea of God in Thought, and suppose that this thing either did not exist at some time, or will cease to exist in the future. Now since Thought is assumed as an attribute of God, it must necessarily exist, and as immutable (Pr. 11 and Cor. 2 Pr. 20). Therefore, outside the bounds of the duration of the idea of God (for this idea is supposed at some time not to have existed, or will at some point cease to exist), Thought will have to exist without the idea of God. But this is contrary to the hypothesis, for it is supposed that when Thought is granted the idea of God necessarily follows. Therefore, the idea of God in Thought, or anything that necessarily follows from the absolute nature of some attribute of God, cannot have a determinate existence, but is eternal through that same attribute. That was our second point. Note that the same holds for anything in an attribute of God which necessarily follows from the absolute nature of God.

PROPOSITION 22: *Whatever follows from some attribute of God, insofar as the attribute is modified by a modification that exists necessarily and as infinite through that same attribute, must also exist both necessarily and as infinite.*

Proof: This proposition is proved in the same way as the preceding one.

PROPOSITION 23: *Every mode which exists necessarily and as infinite must have necessarily followed either from the absolute nature of some attribute of God or from some attribute modified by a modification which exists necessarily and as infinite.*

Proof: A mode is in something else through which it must be conceived (Def. 5); that is (Pr. 15), it is in God alone and can be conceived only through God. Therefore, if a mode is conceived to exist necessarily and to be infinite, both these characteristics must necessarily be inferred or perceived through some attribute of God insofar as that attribute is conceived to express infinity and necessity of existence, or (and by Def. 8 this is the same) eternity; that is (Def. 6 and Pr. 19), insofar as it is considered

absolutely. Therefore, a mode which exists necessarily and as infinite must have followed from the absolute nature of some attribute of God, either directly (Pr. 21) or through the mediation of some modification which follows from the absolute nature of the attribute; that is (Pr. 22), which exists necessarily and as infinite.

PROPOSITION 24: *The essence of things produced by God does not involve existence.*

Proof: This is evident from Def. 1. For only that whose nature (considered in itself) involves existence is self-caused and exists solely from the necessity of its own nature.

Corollary: Hence it follows that God is the cause not only of the coming into existence of things but also of their continuing in existence, or, to use a scholastic term, God is the cause of the being of things [*essendi rerum*]. For whether things exist or do not exist, in reflecting on their essence we realize that this essence involves neither existence nor duration. So it is not their essence which can be the cause of either their existence or their duration, but only God, to whose nature alone existence pertains (Cor. 1 Pr. 14).

PROPOSITION 25: *God is the efficient cause not only of the existence of things but also of their essence.*

Proof: If this is denied, then God is not the cause of the essence of things, and so (Ax. 4) the essence of things can be conceived without God. But this is absurd (Pr. 15). Therefore, God is also the cause of the essence of things.

Scholium: This proposition follows more clearly from Pr. 16; for from that proposition it follows that from the given divine nature both the essence and the existence of things must be inferred. In a word, in the same sense that God is said to be self-caused he must also be said to be the cause of all things. This will be even clearer from the following Corollary.

Corollary: Particular things are nothing but affections of the attributes of God, that is, modes wherein the attributes of God find expression in a definite and determinate way. The proof is obvious from Pr. 15 and Def. 5.

PROPOSITION 26: *A thing which has been determined to act in a particular way has necessarily been so determined by God; and a thing which has not been determined by God cannot determine itself to act.*

Proof: That by which things are said to be determined to act in a particular way must necessarily be something positive (as is obvious). So God, from the necessity of his nature, is the efficient cause both of its essence and its existence (Prs. 25 and 16)—which was the first point. From this the second point quite clearly follows as well. For if a thing which has not been determined by God could determine itself, the first part of this proposition would be false, which, as I have shown, is absurd.

PROPOSITION 27: *A thing which has been determined by God to act in a particular way cannot render itself undetermined.*

Proof: This proposition is evident from Axiom 3.

PROPOSITION 28: *Every individual thing, i.e., anything whatever which is finite and has a determinate existence, cannot exist or be determined to act unless it be determined to exist and to act by another cause which is also finite and has a determinate existence, and this cause again cannot exist or be determined to act unless it be determined to exist and to act by another cause which is also finite and has a determinate existence, and so ad infinitum.*

The Synagogue, Amsterdam, n.d., by Rembrandt (1606–1669).

Spinoza was a member of the Amsterdam Synagogue until he was excommunicated in 1656.

Art Resource, NY)

Proof: Whatever is determined to exist and to act has been so determined by God (Pr. 26 and Cor. Pr. 24). But that which is finite and has a determinate existence cannot have been produced by the absolute nature of one of God's attributes, for whatever follows from the absolute nature of one of God's attributes is infinite and eternal (Pr. 21). It must therefore have followed from God or one of his attributes insofar as that is considered as affected by some mode; for nothing exists but substance and its modes (Ax. 1 and Defs. 3 and 5), and modes (Cor. Pr. 25) are nothing but affections of God's attributes. But neither could a finite and determined thing have followed from God or one of his attributes insofar as that is affected by a modification which is eternal and infinite (Pr. 22). Therefore, it must have followed, or been determined to exist and to act, by God or one of his attributes insofar as it was modified by a modification which is finite and has a determinate existence. That was the first point. Then again this cause or this mode (the reasoning is the same as in the first part of this proof) must also have been determined by another cause, which is also finite and has a determinate existence, and again this last (the reasoning is the same) by another, and so ad infinitum.

Scholium: Since some things must have been produced directly by God (those things, in fact, which necessarily follow from his absolute nature) and others through the medium of these primary things (which other things nevertheless cannot be or be conceived without God), it follows, firstly, that God is absolutely the proximate cause of things directly produced by him. I say "absolutely" [*absolute*], and not "within their own kind" [*suo genere*], as some say. For the effects of God can neither

be nor be conceived without their cause (Pr. 15 and Cor. Pr. 24). It follows, secondly, that God cannot properly be said to be the remote cause of individual things, unless perchance for the purpose of distinguishing these things from things which he has produced directly, or rather, things which follow from his absolute nature. For by “remote cause” we understand a cause which is in no way conjoined with its effect. But all things that are, are in God, and depend on God in such a way that they can neither be nor be conceived without him.

PROPOSITION 29: *Nothing in nature is contingent, but all things are from the necessity of the divine nature determined to exist and to act in a definite way.*

Proof: Whatever is, is in God (Pr. 15). But God cannot be termed a contingent thing, for (Pr. 11) he exists necessarily, not contingently. Again, the modes of the divine nature have also followed from it necessarily, not contingently (Pr. 16), and that, too, whether insofar as the divine nature is considered absolutely (Pr. 21) or insofar as it is considered as determined to act in a definite way (Pr. 27). Furthermore, God is the cause of these modes not only insofar as they simply exist (Cor. Pr. 26), but also insofar as they are considered as determined to a particular action (Pr. 26). Now if they are not determined by God (Pr. 26), it is an impossibility, not a contingency, that they should determine themselves. On the other hand (Pr. 27), if they are determined by God, it is an impossibility, not a contingency, that they should render themselves undetermined. Therefore, all things are determined from the necessity of the divine nature not only to exist but also to exist and to act in a definite way. Thus, there is no contingency.

Scholium: Before I go any further, I wish to explain at this point what we must understand by “*Natura naturans*” and “*Natura naturata*.” I should perhaps say not “explain,” but “remind the reader,” for I consider that it is already clear from what has gone before that by “*Natura naturans*” we must understand that which is in itself and is conceived through itself; that is, the attributes of substance that express eternal and infinite essence; or (Cor. 1 Pr. 14 and Cor. 2 Pr. 17), God insofar as he is considered a free cause. By “*Natura naturata*” I understand all that follows from the necessity of God’s nature, that is, from the necessity of each one of God’s attributes; or all the modes of God’s attributes insofar as they are considered as things which are in God and can neither be nor be conceived without God.

PROPOSITION 30: *The finite intellect in act or the infinite intellect in act must comprehend the attributes of God and the affections of God, and nothing else.*

Proof: A true idea must agree with its object [*ideatum*] (Ax. 6); that is (as is self-evident), that which is contained in the intellect as an object of thought must necessarily exist in Nature. But in Nature (Cor. 1 Pr. 14) there is but one substance—God—and no other affections (Pr. 15) than those which are in God and that can neither be nor be conceived (Pr. 15) without God. Therefore, the finite intellect in act or the infinite intellect in act must comprehend the attributes of God and the affections of God, and nothing else.

PROPOSITION 31: *The intellect in act, whether it be finite or infinite, as also will, desire, love, etc., must be related to Natura naturata, not to Natura naturans.*

Proof: By intellect (as is self-evident) we do not understand absolute thought, but only a definite mode of thinking which differs from other modes such as desire, love, etc., and so (Def. 5) must be conceived through absolute thought—that is (Pr. 15 and Def. 6), an attribute of God which expresses the eternal and infinite essence of thought—in such a way that without this attribute it can neither be nor be

conceived; and therefore (Sch. Pr. 29) it must be related to *Natura naturata*, not to *Natura naturans*, just like the other modes of thinking.

Scholium: The reason for my here speaking of the intellect in act is not that I grant there can be any intellect in potentiality, but that, wishing to avoid any confusion, I want to confine myself to what we perceive with the utmost clarity, to wit, the very act of understanding, than which nothing is more clearly apprehended by us. For we can understand nothing that does not lead to a more perfect cognition of the understanding.

PROPOSITION 32: *Will cannot be called a free cause, but only a necessary cause.*

Proof: Will, like intellect, is only a definite mode of thinking, and so (Pr. 28) no single volition can exist or be determined to act unless it is determined by another cause, and this cause again by another, and so ad infinitum. Now if will be supposed infinite, it must also be determined to exist and to act by God, not insofar as he is absolutely infinite substance, but insofar as he possesses an attribute which expresses the infinite and eternal essence of Thought (Pr. 23). Therefore, in whatever way will is conceived, whether finite or infinite, it requires a cause by which it is determined to exist and to act; and so (Def. 7) it cannot be said to be a free cause, but only a necessary or constrained cause.

Corollary 1: Hence it follows, firstly, that God does not act from freedom of will.

Corollary 2: It follows, secondly, that will and intellect bear the same relationship to God's nature as motion-and-rest and, absolutely, as all natural phenomena that must be determined by God (Pr. 29) to exist and to act in a definite way. For will, like all the rest, stands in need of a cause by which it may be determined to exist and to act in a definite manner. And although from a given will or intellect infinite things may follow, God cannot on that account be said to act from freedom of will any more than he can be said to act from freedom of motion-and-rest because of what follows from motion-and-rest (for from this, too, infinite things follow). Therefore, will pertains to God's nature no more than do other natural phenomena. It bears the same relationship to God's nature as does motion-and-rest and everything else that we have shown to follow from the necessity of the divine nature and to be determined by that divine nature to exist and to act in a definite way.

PROPOSITION 33: *Things could not have been produced by God in any other way or in any other order than is the case.*

Proof: All things have necessarily followed from the nature of God (Pr. 16) and have been determined to exist and to act in a definite way from the necessity of God's nature (Pr. 29). Therefore, if things could have been of a different nature or been determined to act in a different way so that the order of Nature would have been different, then God's nature, too, could have been other than it now is, and therefore (Pr. 11) this different nature, too, would have had to exist, and consequently there would have been two or more Gods, which (Cor. 1 Pr. 14) is absurd. Therefore, things could not have been produced by God in any other way or in any other order than is the case.

Scholium 1 Since I have here shown more clearly than the midday sun that in things there is absolutely nothing by virtue of which they can be said to be "contingent," I now wish to explain briefly what we should understand by "contingent"; but I must first deal with "necessary" and "impossible." A thing is termed "necessary" either by reason of its essence or by reason of its cause. For a thing's existence necessarily follows either from its essence and definition or from a given efficient cause. Again, it is for these same reasons that a thing is termed "impossible"—that is, either because its

essence or definition involves a contradiction or because there is no external cause determined to bring it into existence. But a thing is termed "contingent" for no other reason than the deficiency of our knowledge. For if we do not know whether the essence of a thing involves a contradiction, or if, knowing full well that its essence does not involve a contradiction, we still cannot make any certain judgment as to its existence because the chain of causes is hidden from us, then that thing cannot appear to us either as necessary or as impossible. So we term it either "contingent" or "possible."

Scholium 2 It clearly follows from the above that things have been brought into being by God with supreme perfection, since they have necessarily followed from a most perfect nature. Nor does this imply any imperfection in God, for it is his perfection that has constrained us to make this affirmation. Indeed, from its contrary it would clearly follow (as I have just shown) that God is not supremely perfect, because if things had been brought into being in a different way by God, we should have to attribute to God another nature different from that which consideration of a most perfect Being has made us attribute to him.

However, I doubt not that many will ridicule this view as absurd and will not give their minds to its examination, and for this reason alone, that they are in the habit of attributing to God another kind of freedom very different from that which we (Def. 7) have assigned to him, that is, an absolute will. Yet I do not doubt that if they were willing to think the matter over and carefully reflect on our chain of proofs they would in the end reject the kind of freedom which they now attribute to God not only as nonsensical but as a serious obstacle to science. It is needless for me here to repeat what was said in the Scholium to Proposition 17. Yet for their sake I shall proceed to show that, even if it were to be granted that will pertains to the essence of God, it would nevertheless follow from his perfection that things could not have been created by God in any other way or in any other order. This will readily be shown if we first consider—as they themselves grant—that on God's decree and will alone does it depend that each thing is what it is.

For otherwise God would not be the cause of all things. Further, there is the fact that all God's decrees have been sanctioned by God from eternity, for otherwise he could be accused of imperfection and inconstancy. But since the eternal does not admit of "when" or "before" or "after," it follows merely from God's perfection that God can never decree otherwise nor ever could have decreed otherwise; in other words, God could not have been prior to his decrees nor can he be without them. "But," they will say, "granted the supposition that God had made a different universe, or that from eternity he had made a different decree concerning Nature and her order, no imperfection in God would follow therefrom." But if they say this, they will be granting at the same time that God can change his decrees. For if God's decrees had been different from what in fact he has decreed regarding Nature and her order—that is, if he had willed and conceived differently concerning Nature—he would necessarily have had a different intellect and a different will from that which he now has. And if it is permissible to attribute to God a different intellect and a different will without any change in his essence and perfection, why should he not now be able to change his decrees concerning created things, and nevertheless remain equally perfect? For his intellect and will regarding created things and their order have the same relation to his essence and perfection, in whatever manner it be conceived.

Then again, all philosophers whom I have read grant that in God there is no intellect in potentiality but only intellect in act. Now since all of them also grant that his intellect and will are not distinct from his essence, it therefore follows from this, too, that if God had

had a different intellect in act and a different will, his essence too would necessarily have been different. Therefore—as I deduced from the beginning—if things had been brought into being by God so as to be different from what they now are, God’s intellect and will—that is (as is granted), God’s essence—must have been different, which is absurd. Therefore, since things could not have been brought into being by God in any other way or order—and it follows from God’s supreme perfection that this is true—surely we can have no sound reason for believing that God did not wish to create all the things that are in his intellect through that very same perfection whereby he understands them.

“But,” they will say, “there is in things no perfection or imperfection; that which is in them whereby they are perfect or imperfect, and are called good or bad, depends only on the will of God. Accordingly, if God had so willed it he could have brought it about that that which is now perfection should be utmost imperfection, and vice versa.” But what else is this but an open assertion that God, who necessarily understands that which he wills, can by his will bring it about that he should understand things in a way different from the way he understands them—and this, as I have just shown, is utterly absurd. So I can turn their own argument against them, as follows. All things depend on the power of God. For things to be able to be otherwise than as they are, God’s will, too, would necessarily have to be different. But God’s will cannot be different (as we have just shown most clearly from the consideration of God’s perfection). Therefore, neither can things be different.

I admit that this view which subjects everything to some kind of indifferent will of God and asserts that everything depends on his pleasure diverges less from the truth than the view of those who hold that God does everything with the good in mind. For these people seem to posit something external to God that does not depend upon him, to which in acting God looks as if it were a model, or to which he aims, as if it were a fixed target. This is surely to subject God to fate; and no more absurd assertion can be made about God, whom we have shown to be the first and the only free cause of both the essence and the existence of things. So I need not spend any more time in refuting this absurdity.

PROPOSITION 34: *God’s power is his very essence.*

Proof: From the sole necessity of God’s essence it follows that God is self-caused (Pr. 11) and the cause of all things (Pr. 16 and Cor.). Therefore, God’s power, whereby he and all things are and act, is his very essence.

PROPOSITION 35: *Whatever we conceive to be within God’s power necessarily exists.*

Proof: Whatever is within God’s power must be so comprehended in his essence (Pr. 34) that it follows necessarily from it, and thus necessarily exists.

PROPOSITION 36: *Nothing exists from whose nature an effect does not follow.*

Proof: Whatever exists expresses God’s nature or essence in a definite and determinate way (Cor. Pr. 25); that is (Pr. 34), whatever exists expresses God’s power, which is the cause of all things, in a definite and determinate way, and so (Pr. 16) some effect must follow from it.

Appendix

I have now explained the nature and properties of God: that he necessarily exists, that he is one alone, that he is and acts solely from the necessity of his own nature, that he is the free cause of all things and how so, that all things are in God and are so dependent on

him that they can neither be nor be conceived without him, and lastly, that all things have been predetermined by God, not from his free will or absolute pleasure, but from the absolute nature of God, his infinite power. Furthermore, whenever the opportunity arose I have striven to remove prejudices that might hinder the apprehension of my proofs. But since there still remain a considerable number of prejudices, which have been, and still are, an obstacle—indeed, a very great obstacle—to the acceptance of the concatenation of things in the manner which I have expounded, I have thought it proper at this point to bring these prejudices before the bar of reason.

Now all the prejudices which I intend to mention here turn on this one point, the widespread belief among men that all things in Nature are like themselves in acting with an end in view. Indeed, they hold it as certain that God himself directs everything to a fixed end; for they say that God has made everything for man's sake and has made man so that he should worship God. So this is the first point I shall consider, seeking the reason why most people are victims of this prejudice and why all are so naturally disposed to accept it. Secondly, I shall demonstrate its falsity; and lastly I shall show how it has been the source of misconceptions about good and bad, right and wrong, praise and blame, order and confusion, beauty and ugliness, and the like.

However, it is not appropriate here to demonstrate the origin of these misconceptions from the nature of the human mind. It will suffice at this point if I take as my basis what must be universally admitted, that all men are born ignorant of the causes of things, that they all have a desire to seek their own advantage, a desire of which they are conscious. From this it follows, firstly, that men believe that they are free, precisely because they are conscious of their volitions and desires; yet concerning the causes that have determined them to desire and will they do not think, not even dream about, because they are ignorant of them. Secondly, men act always with an end in view, to wit, the advantage that they seek. Hence it happens that they are always looking only for the final causes of things done, and are satisfied when they find them, having, of course, no reason for further doubt. But if they fail to discover them from some external source, they have no recourse but to turn to themselves, and to reflect on what ends would normally determine them to similar actions, and so they necessarily judge other minds by their own. Further, since they find within themselves and outside themselves a considerable number of means very convenient for the pursuit of their own advantage—as, for instance, eyes for seeing, teeth for chewing, cereals and living creatures for food, the sun for giving light, the sea for breeding fish—the result is that they look on all the things of Nature as means to their own advantage. And realizing that these were found, not produced by them, they come to believe that there is someone else who produced these means for their use. For looking on things as means, they could not believe them to be self-created, but on the analogy of the means which they are accustomed to produce for themselves, they were bound to conclude that there was some governor or governors of Nature, endowed with human freedom, who have attended to all their needs and made everything for their use. And having no information on the subject, they also had to estimate the character of these rulers by their own, and so they asserted that the gods direct everything for man's use so that they may bind men to them and be held in the highest honor by them. So it came about that every individual devised different methods of worshipping God as he thought fit in order that God should love him beyond others and direct the whole of Nature so as to serve his blind cupidity and insatiable greed. Thus it was that this misconception developed into superstition and became deep-rooted in the minds of men, and it was for this reason that every

man strove most earnestly to understand and to explain the final causes of all things. But in seeking to show that Nature does nothing in vain—that is, nothing that is not to man's advantage—they seem to have shown only this, that Nature and the gods are as crazy as mankind.

Consider, I pray, what has been the upshot. Among so many of Nature's blessings they were bound to discover quite a number of disasters, such as storms, earthquakes, diseases and so forth, and they maintained that these occurred because the gods were angry at the wrongs done to them by men, or the faults committed in the course of their worship. And although daily experience cried out against this and showed by any number of examples that blessings and disasters befall the godly and the ungodly alike without discrimination, they did not on that account abandon their ingrained prejudice. For they found it easier to regard this fact as one among other mysteries they could not understand and thus maintain their innate condition of ignorance rather than to demolish in its entirety the theory they had constructed and devise a new one. Hence they made it axiomatic that the judgment of the gods is far beyond man's understanding. Indeed, it is for this reason, and this reason only, that truth might have evaded mankind forever had not Mathematics, which is concerned not with ends but only with the essences and properties of figures, revealed to men a different standard of truth. And there are other causes too—there is no need to mention them here—which could have made men aware of these widespread misconceptions and brought them to a true knowledge of things.

I have thus sufficiently dealt with my first point. There is no need to spend time in going on to show that Nature has no fixed goal and that all final causes are but figments of the human imagination. For I think that this is now quite evident, both from the basic causes from which I have traced the origin of this misconception and from Proposition 16 and the Corollaries to Proposition 32, and in addition from the whole set or proofs I have adduced to show that all things in Nature proceed from all eternal necessity and with supreme perfection. But I will make this additional point, that this doctrine of Final Causes turns Nature completely upside down, for it regards as an effect that which is in fact a cause, and vice versa. Again, it makes that which is by nature first to be last; and finally, that which is highest and most perfect is held to be the most imperfect. Omitting the first two points as self-evident, Propositions 21, 22, and 23 make it clear that that effect is most perfect which is directly produced by God, and an effect is the less perfect in proportion to the number of intermediary causes required for its production. But if the things produced directly by God were brought about to enable him to attain an end, then of necessity the last things for the sake of which the earlier things were brought about would excel all others. Again, this doctrine negates God's perfection; for if God acts with an end in view, he must necessarily be seeking something that he lacks. And although theologians and metaphysicians may draw a distinction between a purpose arising from want and an assimilative purpose, they still admit that God has acted in all things for the sake of himself, and not for the sake of the things to be created. For prior to creation they are not able to point to anything but God as a purpose for God's action. Thus they have to admit that God lacked and desired those things for the procurement of which he willed to create the means—as is self-evident.

I must not fail to mention here that the advocates of this doctrine, eager to display their talent in assigning purpose to things, have introduced a new style of argument to prove their doctrine, i.e., a reduction, not to the impossible, but to ignorance, thus revealing the lack of any other argument in its favor. For example, if a stone falls from

the roof on somebody's head and kills him, by this method of arguing they will prove that the stone fell in order to kill the man; for if it had not fallen for this purpose by the will of God, how could so many circumstances (and there are often many coinciding circumstances) have chanced to concur? Perhaps you will reply that the event occurred because the wind was blowing and the man was walking that way. But they will persist in asking why the wind blew at that time and why the man was walking that way at that very time. If you again reply that the wind sprang up at that time because on the previous day the sea had begun to toss after a period of calm and that the man had been invited by a friend, they will again persist—for there is no end to questions—"But why did the sea toss, and why was the man invited for that time?" And so they will go on and on asking the causes of causes, until you take refuge in the will of God—that is, the sanctuary of ignorance. Similarly, when they consider the structure of the human body, they are astonished, and being ignorant of the causes of such skillful work they conclude that it is fashioned not by mechanical art but by divine or supernatural art, and is so arranged that no one part shall injure another.

As a result, he who seeks the true causes of miracles and is eager to understand the works of Nature as a scholar, and not just to gape at them like a fool, is universally considered an impious heretic and denounced by those to whom the common people bow down as interpreters of Nature and the gods. For these people know that the dispelling of ignorance would entail the disappearance of that astonishment, which is the one and only support for their argument and for safeguarding their authority. But I will leave this subject and proceed to the third point that I proposed to deal with.

When men become convinced that everything that is created is created on their behalf, they were bound to consider as the most important quality in every individual thing that which was most useful to them, and to regard as of the highest excellence all those things by which they were most benefited. Hence they came to form these abstract notions to explain the natures of things: Good, Bad, Order, Confusion, Hot, Cold, Beauty, Ugliness; and since they believed that they are free, the following abstract notions came into being: Praise, Blame, Right, Wrong. The latter I shall deal with later on after I have treated of human nature; at this point I shall briefly explain the former.

All that conduces to well-being and to the worship of God they call Good, and the contrary, Bad. And since those who do not understand the nature of things, but only imagine things, make no affirmative judgments about things themselves and mistake their imagination for intellect, they are firmly convinced that there is order in things, ignorant as they are of things and of their own nature. For when things are in such arrangement that, being presented to us through our senses, we can readily picture them and thus readily remember them, we say that they are well arranged; if the contrary, we say that they are ill arranged, or confused. And since those things we can readily picture we find pleasing compared with other things, men prefer order to confusion, as though order were something in Nature other than what is relative to our imagination. And they say that God has created all things in an orderly way, without realizing that they are thus attributing human imagination to God—unless perchance they mean that God, out of consideration for the human imagination, arranged all things in the way that men could most easily imagine. And perhaps they will find no obstacle in the fact that there are any number of things that far surpass our imagination, and a considerable number that confuse the imagination because of its weakness.

But I have devoted enough time to this. Other notions, too, are nothing but modes of imagining whereby the imagination is affected in various ways, and yet the ignorant consider them as important attributes of things because they believe—as I have said—that all things were made on their behalf, and they call a thing's nature good or bad, healthy or rotten and corrupt, according to its effect on them. For instance, if the motion communicated to our nervous system by objects presented through our eyes is conducive to our feeling of well-being, the objects which are its cause are said to be beautiful, while the objects which provoke a contrary motion are called ugly. Those things that we sense through the nose are called fragrant or fetid; through the tongue, sweet or bitter, tasty or tasteless; those that we sense by touch are called hard or soft, rough or smooth, and so on. Finally, those that we sense through our ears are said to give forth noise, sound, or harmony, the last of which has driven men to such madness that they used to believe that even God delights in harmony. There are philosophers who have convinced themselves that the motions of the heavens give rise to harmony. All this goes to show that everyone's judgment is a function of the disposition of his brain, or rather, that he mistakes for reality the way his imagination is affected. Hence it is no wonder—as we should note in passing—that we find so many controversies arising among men, resulting finally in skepticism. For although human bodies agree in many respects, there are very many differences, and so one man thinks good what another thinks bad; what to one man is well ordered, to another is confused; what to one is pleasing, to another is displeasing, and so forth. I say no more here because this is not the place to treat at length of this subject, and also because all are well acquainted with it from experience. Everybody knows those sayings: "So many heads, so many opinions," "everyone is wise in his own sight," "brains differ as much as palates," all of which show clearly that men's judgment is a function of the disposition of the brain, and they are guided by imagination rather than intellect. For if men understood things, all that I have put forward would be found, if not attractive, at any rate convincing, as Mathematics attests.

We see therefore that all the notions whereby the common people are wont to explain Nature are merely modes of imagining, and denote not the nature of anything but only the constitution of the imagination. And because these notions have names as if they were the names of entities existing independently of the imagination I call them "entities of imagination" [*entia imaginationis*] rather than "entities of reason" [*entia rationis*]. So all arguments drawn from such notions against me can be easily refuted. For many are wont to argue on the following lines: If everything has followed from the necessity of God's most perfect nature, why does Nature display so many imperfections, such as rottenness to the point of putridity, nauseating ugliness, confusion, evil, sin, and so on? But, as I have just pointed out, they are easily refuted. For the perfection of things should be measured solely from their own nature and power; nor are things more or less perfect to the extent that they please or offend human senses, serve or oppose human interests. As to those who ask why God did not create men in such a way that they should be governed solely by reason, I make only this reply, that he lacked not material for creating all things from the highest to the lowest degree of perfection; or, to speak more accurately, the laws of his nature were so comprehensive as to suffice for the production of everything that can be conceived by an infinite intellect, as I proved in Proposition 16.

These are the misconceptions which I undertook to deal with at this point. Any other misconception of this kind can be corrected by everyone with a little reflection.

PART II

OF THE NATURE AND ORIGIN OF THE MIND

I now pass on to the explication of those things that must necessarily have followed from the essence of God, the eternal and infinite Being; not indeed all of them—for we proved in Proposition 16, Part I that from his essence there must follow infinite things in infinite ways—but only those things that can lead us as it were by the hand to the knowledge of the human mind and its utmost blessedness.

Definitions

1. By “body” I understand a mode that expresses in a definite and determinate way God’s essence insofar as he is considered as an extended thing. (See Cor. Pr. 25, I.)

2. I say that there pertains to the essence of a thing that which, when granted, the thing is necessarily posited, and by the annulling of which the thing is necessarily annulled; or that without which the thing can neither be nor be conceived, and, vice versa, that which cannot be or be conceived without the thing.

3. By idea I understand a conception of the Mind which the Mind forms because it is a thinking thing.

Explication: I say “conception” rather than “perception” because the term perception seems to indicate that the Mind is passive to its object whereas conception seems to express an activity of the Mind.

4. By an adequate idea I mean an idea which, insofar as it is considered in itself without relation to its object, has all the properties, that is, intrinsic characteristics, of a true idea [*ideatum*].

Explication: I say “intrinsic” so as to exclude the extrinsic characteristic—to wit the agreement of the idea with that of which it is an idea.

5. Duration is the indefinite continuance of existing.

Explication: I say “indefinite” because it can in no wise be determined through the nature of the existing thing, nor again by the thing’s efficient cause which necessarily posits, but does not annul, the existence of the thing.

6. By reality and perfection I mean the same thing.

7. By individual things [*res singulares*] I mean things that are finite and have a determinate existence. If several individual things concur in one act in such a way as to be all together the simultaneous cause of one effect, I consider them all, in that respect, as one individual.

Axioms

1. The essence of man does not involve necessary existence; that is, from the order of Nature it is equally possible that a certain man exists or does not exist.

2. Man thinks.

3. Modes of thinking such as love, desire, or whatever emotions are designated by name, do not occur unless there is in the same individual the idea of the thing loved, desired, etc. But the idea can be without any other mode of thinking.

4. We feel a certain body to be affected in many ways.

5. We do not feel or perceive any individual things except bodies and modes of thinking. [N.B.: For Postulates, see after Proposition 13.]

PROPOSITION 1: *Thought is an attribute of God; i.e., God is a thinking thing.*

Proof: Individual thoughts, or this and that thought, are modes expressing the nature of God in a definite and determinate way (Cor. Pr. 25, I). Therefore, there belongs to God (Def. 5, I) an attribute the conception of which is involved in all individual thoughts, and through which they are conceived. Thought, therefore, is one of God's infinite attributes, expressing the eternal and infinite essence of God (Def. 6, I); that is, God is a thinking thing.

Scholium: This Proposition is also evident from the fact that we can conceive of an infinite thinking being. For the more things a thinking being can think, the more reality or perfection we conceive it to have. Therefore, a being that can think infinite things in infinite ways is by virtue of its thinking necessarily infinite. Since therefore by merely considering Thought we conceive an infinite being, Thought is necessarily one of the infinite attributes of God (Defs. 4 and 6, I), as we set out to prove.

PROPOSITION 2: *Extension is an attribute of God; i.e., God is an extended thing.*

Proof: This Proposition is proved in the same way as the preceding proposition.

PROPOSITION 3: *In God there is necessarily the idea both of his essence and of everything that necessarily follows from his essence.*

Proof: For God can (Pr. I, II) think infinite things in infinite ways, or (what is the same thing, by Pr. 16, I) can form the idea of his own essence and of everything that necessarily follows from it. But all that is in God's power necessarily exists (Pr. 35, I). Therefore, such an idea necessarily exists, and only in God (Pr. 15, I).

Scholium: By God's power the common people understand free will and God's right over all things that are, which things are therefore commonly considered as contingent. They say that God has power to destroy everything and bring it to nothing. Furthermore, they frequently compare God's power with that of kings. But this doctrine we have refuted in Cors. 1 and 2, Pr. 32, I; and in Pr. 16, I, we proved that God acts by the same necessity whereby he understands himself; that is, just as it follows from the necessity of the divine Nature (as is universally agreed) that God understands himself, by that same necessity it also follows that God acts infinitely in infinite ways. Again, we showed in Pr. 34, I that God's power is nothing but God's essence in action, and so it is as impossible for us to conceive that God does not act as that God does not exist. Furthermore if one wished to pursue the matter, I could easily show here that the power that common people assign to God is not only a human power (which shows that they conceive God as a man or like a man) but also involves negation of power. But I am reluctant to hold forth so often on the same subject. I merely request the reader most earnestly to reflect again and again on what we said on this subject in Part I from Proposition 16 to the end. For

nobody will rightly apprehend what I am trying to say unless he takes great care not to confuse God's power with a king's human power or right.

PROPOSITION 4: *The idea of God, from which infinite things follow in infinite ways, must be one, and one only.*

Proof: Infinite intellect comprehends nothing but the attributes of God and his affections (Pr. 30, I). But God is one, and one only (Cor. 1, Pr. 14, I). Therefore, the idea of God, from which infinite things follow in infinite ways, must be one, and one only.

PROPOSITION 5: *The formal being of ideas recognizes God as its cause only insofar as he is considered as a thinking thing, and not insofar as he is explicated by any other attribute; that is, the ideas both of God's attributes and of individual things recognize as their efficient cause not the things of which they are ideas, that is, the things perceived, but God himself insofar as he is a thinking thing.*

Proof: This is evident from Pr. 3, II. For there our conclusion that God can form the idea of his own essence and of everything that necessarily follows therefrom was inferred solely from God's being a thinking thing, and not from his being the object of his own idea. Therefore, the formal being of ideas recognizes God as its cause insofar as he is a thinking thing. But there is another proof, as follows. The formal being of ideas is a mode of thinking (as is self-evident); that is (Cor. Pr. 25, I), a mode which expresses in a definite manner the nature of God insofar as he is a thinking thing, and so does not involve (Pr. 10, I) the conception of any other attribute of God. Consequently (Ax. 4, I), it is the effect of no other attribute but thought; and so the formal being of ideas recognizes God as its cause only insofar as he is considered as a thinking thing.

PROPOSITION 6: *The modes of any attribute have God for their cause only insofar as he is considered under that attribute, and not insofar as he is considered under any other attribute.*

Proof: Each attribute is conceived through itself independently of any other (Pr. 10, I). Therefore, the modes of any attribute involve the conception of their own attribute, and not that of any other. Therefore, they have God for their cause only insofar as he is considered under the attribute of which they are modes, and not insofar as he is considered under any other attribute (Ax. 4, I).

Corollary: Hence it follows that the formal being of things that are not modes of thinking does not follow from the nature of God by reason of his first having known them; rather, the objects of ideas follow and are inferred from their own attributes in the same way and by the same necessity as we have shown ideas to follow from the attribute of Thought.

PROPOSITION 7: *The order and connection of ideas is the same as the order and connection of things.*

Proof: This is evident from Ax. 4, I; for the idea of what is caused depends on the knowledge of the cause of which it is the effect.

Corollary: Hence it follows that God's power of thinking is on par with his power of acting. That is, whatever follows formally from the infinite nature of God, all this follows from the idea of God as an object of thought in God according to the same order and connection.

Scholium: At this point, before proceeding further, we should recall to mind what I have demonstrated above—that whatever can be perceived by infinite intellect as constituting the essence of substance pertains entirely to the one sole substance. Consequently,

thinking substance and extended substance are one and the same substance, comprehended now under this attribute, now under that. So, too, a mode of Extension and the idea of that mode are one and the same thing, expressed in two ways. This truth seems to have been glimpsed by some of the Hebrews, who hold that God, God's intellect, and the things understood by God are one and the same. For example, a circle existing in Nature and the idea of the existing circle—which is also in God—are one and the same thing, explicated through different attributes. And so, whether we conceive Nature under the attribute of Extension or under the attribute of Thought or under any other attribute, we find one and the same order, or one and the same connection of causes—that is, the same things following one another. When I said that God is the cause, e.g., of the idea of a circle only insofar as he is a thinking thing, and of a circle only insofar as he is an extended thing, my reason was simply this, that the formal being of the idea of a circle can be perceived only through another mode of thinking as its proximate cause, and that mode through another, and so ad infinitum, with the result that as long as things are considered as modes of thought, we must explicate the order of the whole of Nature, or the connection of causes, through the attribute of Thought alone; and insofar as things are considered as modes of Extension, again the order of the whole of Nature must be explicated through the attribute of Extension only. The same applies to other attributes. Therefore God, insofar as he consists of infinite attributes, is in fact the cause of things as they are in themselves. For the present, I cannot give a clearer explanation.

PROPOSITION 8: *The ideas of nonexistent individual things or modes must be comprehended in the infinite idea of God in the same way as the formal essences of individual things or modes are contained in the attributes of God.*

Proof: This proposition is obvious from the preceding one, but may be understood more clearly from the preceding Scholium.

Corollary: Hence it follows that as long as individual things do not exist except insofar as they are comprehended in the attributes of God, their being as objects of thought—that is, their ideas—do not exist except insofar as the infinite idea of God exists; and when individual things are said to exist not only insofar as they are comprehended in the attributes of God but also insofar as they are said to have duration, their ideas also will involve the existence through which they are said to have duration.

Scholium: Should anyone want an example for a clearer understanding of this matter, I can think of none at all that would adequately explicate the point with which I am here dealing, for it has no parallel. Still, I shall try to illustrate it as best I can. The nature of a circle is such that the rectangles formed from the segments of its intersecting chords are equal. Hence an infinite number of equal rectangles are contained in a circle, but none of them can be said to exist except insofar as the circle exists, nor again can the idea of any one of these rectangles be said to exist except insofar as it is comprehended in the idea of the circle. Now of this infinite number of intersecting chords let two, E and D, exist.

Now indeed their ideas also exist not only insofar as they are merely comprehended in the idea of the circle but also insofar as they involve the existence of those rectangles, with the result that they are distinguished from the other ideas of the other rectangles.

PROPOSITION 9: *The idea of an individual thing existing in actuality has God for its cause not insofar as he is infinite but insofar as he is considered as affected by another idea of a thing existing in actuality, of which God is the cause insofar as he is affected by a third idea, and so ad infinitum.*

Proof: The idea of an individual actually existing thing is an individual mode of thinking distinct from other modes (Cor. and Sch. Pr. 8, II), and so (Pr. 6, II) it has God as its cause only insofar as he is a thinking thing. But not (Pr. 28, I) insofar as he is a thinking thing absolutely, but insofar as he is considered as affected by another definite mode of thinking. And of this latter God is also the cause insofar as he is affected by another definite mode of thinking, and so ad infinitum. But the order and connection of ideas is the same as the order and connection of causes (Pr. 7, II). Therefore, an individual idea is caused by another idea; i.e., God insofar as he is considered as affected by another idea. And this last idea is caused by God, insofar as he is affected by yet another idea, and so ad infinitum.

Corollary: Whatsoever happens in the individual object of any idea, knowledge of it is in God only insofar as he has the idea of that object.

Proof: Whatsoever happens in the object of any idea, the idea of it is in God (Pr. 3, II) not insofar as he is infinite, but insofar as he is considered as affected by another idea of an individual thing (preceding Pr.). But the order and connection of ideas is the same as the order and connection of things (Pr. 7, II). Therefore, the knowledge of what happens in an individual object is in God only insofar as he has the idea of that object.

PROPOSITION 10: *The being of substance does not pertain to the essence of man; i.e., substance does not constitute the form [forma] of man.*

Proof: The being of substance involves necessary existence (Pr. 7, I). So if the being of substance pertained to the essence of man, man would necessarily be granted together with the granting of substance (Def. 2, II) and consequently man would necessarily exist, which is absurd (Ax. 1, II). Therefore . . . etc.

Scholium: This Proposition is also proved from Pr. 5, I, which states that there cannot be two substances of the same nature. Now since many men can exist, that which constitutes the form of man is not the being of substance. This Proposition is furthermore evident from the other properties of substance—that substance is by its own nature infinite, immutable, indivisible, etc., as everyone can easily see.

Corollary: Hence it follows that the essence of man is constituted by definite modifications of the attributes of God.

Proof: For the being of substance does not pertain to the essence of man (preceding Pr.), which must therefore be something that is in God, and which can neither be nor be conceived without God; i.e., an affection or mode (Cor. Pr. 25, I) which expresses the nature of God in a definite and determinate way.

Scholium: All must surely admit that nothing can be or be conceived without God. For all are agreed that God is the sole cause of all things, both of their essence and of their existence; that is, God is the cause of things not only in respect of their coming into being [*secundum fieri*], as they say, but also in respect of their being. But at the

same time many assert that that without which a thing can neither be nor be conceived pertains to the essence of the thing, and so they believe that either the nature of God pertains to the essence of created things or that created things can either be or be conceived without God; or else, more probably, they hold no consistent opinion. I think that the reason for this is their failure to observe the proper order of philosophical inquiry. For the divine nature, which they should have considered before all else—it being prior both in cognition and in Nature—they have taken to be last in the order of cognition, and the things that are called objects of sense they have taken as prior to everything. Hence it has come about that in considering natural phenomena, they have completely disregarded the divine nature. And when thereafter they turned to the contemplation of the divine nature, they could find no place in their thinking for those fictions on which they had built their natural science, since these fictions were of no avail in attaining knowledge of the divine nature. So it is little wonder that they have contradicted themselves on all sides.

But I pass over these points, for my present purpose is restricted to explaining why I have not said that that without which a thing can neither be nor be perceived pertains to the essence of the thing. My reason is that individual things can neither be nor be conceived without God, and yet God does not pertain to their essence. But I did say that that necessarily constitutes the essence of a thing which, when posited, posits the thing, and by the annulling of which the thing is annulled; i.e., that without which the thing can neither be nor be conceived, and vice versa, that which can neither be nor be conceived without the thing.

PROPOSITION 11: *That which constitutes the actual being of the human mind is basically nothing else but the idea of an individual actually existing thing.*

Proof: The essence of man (Cor. Pr. 10, II) is constituted by definite modes of the attributes of God, to wit (Ax. 2, II), modes of thinking. Of all these modes the idea is prior in nature (Ax. 3, II), and when the idea is granted, the other modes—modes to which the idea is prior by nature—must be in the same individual (Ax. 3, II). And so the idea is that which basically constitutes the being of the human mind. But not the idea of a nonexistent thing; for then (Cor. Pr. 8, II) the idea itself could not be said to exist. Therefore, it is the idea of an actually existing thing. But not the idea of an infinite thing, for an infinite thing (Prs. 21 and 22, I) must always necessarily exist, and this is absurd (Ax. 1, II). Therefore, that which first constitutes the actual being of the human mind is the idea of an individual actually existing thing.

Corollary: Hence it follows that the human mind is part of the infinite intellect of God; and therefore when we say that the human mind perceives this or that, we are saying nothing else but this: that God—not insofar as he is infinite but insofar as he is explicated through the nature of the human mind, that is, insofar as he constitutes the essence of the human mind—has this or that idea. And when we say that God has this or that idea not only insofar as he constitutes the essence of the human mind but also insofar as he has the idea of another thing simultaneously with the human mind, then we are saying that the human mind perceives a thing partially or inadequately.

Scholium: At this point our readers will no doubt find themselves in some difficulty and will think of many things that will give them pause. So I ask them to proceed slowly step by step with me, and to postpone judgment until they have read to the end.

PROPOSITION 12: *Whatever happens in the object of the idea constituting the human mind is bound to be perceived by the human mind; i.e., the idea of that thing will necessarily be in the human mind. That is to say, if the object of the idea constituting the human mind is a body, nothing can happen in that body without its being perceived by the mind.*

Proof: Whatever happens in the object of any idea, knowledge thereof is necessarily in God (Cor. Pr. 9, II) insofar as he is considered as affected by the idea of that object; that is (Pr. 11, II), insofar as he constitutes the mind of something. So whatever happens in the object of the idea constituting the human mind, knowledge thereof is necessarily in God insofar as he constitutes the nature of the human mind; that is (Cor. Pr. 11, II), knowledge of that thing is necessarily in the mind; i.e., the mind perceives it.

Scholium: This Proposition is also obvious, and is more clearly understood from Sch. Pr. 7, II, above.

PROPOSITION 13: *The object of the idea constituting the human mind is the body—i.e., a definite mode of extension actually existing, and nothing else.*

Proof: If the body were not the object of the human mind, the ideas of the affections of the body would not be in God (Cor. Pr. 9, II) insofar as he constitutes our mind, but insofar as he constitutes the mind of another thing; that is (Cor. Pr. 11, II), the ideas of the affections of the body would not be in our mind. But (Ax. 4, II) we do have ideas of the affections of a body. Therefore, the object of the idea constituting the human mind is a body, a body actually existing (Pr. 11, II). Again, if there were another object of the mind apart from the body, since nothing exists from which some effect does not follow (Pr. 36, I), there would necessarily have to be in our mind the idea of some effect of it (Pr. 12, II). But (Ax. 5, II) there is no such idea. Therefore, the object of our mind is an existing body, and nothing else.

Corollary: Hence it follows that man consists of mind and body, and the human body exists according as we sense it.

Scholium: From the above we understand not only that the human Mind is united to the Body but also what is to be understood by the union of Mind and Body. But nobody can understand this union adequately or distinctly unless he first gains adequate knowledge of the nature of our body. For what we have so far demonstrated is of quite general application, and applies to men no more than to other individuals, which are all animate, albeit in different degrees. For there is necessarily in God an idea of each thing whatever, of which idea God is the cause in the same way as he is the cause of the idea of the human body. And so whatever we have asserted of the idea of the human body must necessarily be asserted of the idea of each thing. Yet we cannot deny, too, that ideas differ among themselves as do their objects, and that one is more excellent and contains more reality than another, just as the object of one idea is more excellent than that of another and contains more reality. Therefore, in order to determine the difference between the human mind and others and in what way it surpasses them, we have to know the nature of its object (as we have said), that is, the nature of the human body. Now I cannot here explain this nature, nor is it essential for the points that I intend to demonstrate. But I will make this general assertion, that in proportion as a body is more apt than other bodies to act or be acted upon simultaneously in many ways, so is its mind more apt than other minds to perceive many things simultaneously; and in proportion as the actions of one body depend on itself alone and the less that other bodies concur with it in its actions, the more apt is its mind to understand distinctly. From this we can realize the superiority of one mind over

others, and we can furthermore see why we have only a very confused knowledge of our body, and many other facts which I shall deduce from this basis in what follows. Therefore, I have thought it worthwhile to explicate and demonstrate these things more carefully. To this end there must be a brief preface concerning the nature of bodies.

Axiom 1: All bodies are either in motion or at rest.

Axiom 2: Each single body can move at varying speeds.

Lemma 1: *Bodies are distinguished from one another in respect of motion-and-rest, quickness and slowness, and not in respect of substance.*

Proof: The first part of this Lemma I take to be self-evident. As to bodies not being distinguished in respect of substance, this is evident from both Pr. 5 and Pr. 8, Part I, and still more clearly from Sch. Pr. 15, Part I.

Lemma 2: *All bodies agree in certain respects.*

Proof: All bodies agree in this, that they involve the conception of one and the same attribute (Def. 1, II), and also in that they may move at varying speeds, and may be absolutely in motion or absolutely at rest.

Lemma 3: *A body in motion or at rest must have been determined to motion or rest by another body, which likewise has been determined to motion or rest by another body, and that body by another, and so ad infinitum.*

Proof: Bodies are individual things (Def. 1, II) which are distinguished from one another in respect of motion-and-rest (Lemma 1), and so (Pr. 28, I) each body must have been determined to motion or rest by another individual thing, namely, another body (Pr. 6, II), which is also in motion or at rest (Ax. 1). But this body again—by the same reasoning—could not have been in motion or at rest unless it had been determined to motion or rest by another body, and this body again—by the same reasoning—by another body, and so on, ad infinitum.

Corollary: Hence it follows that a body in motion will continue to move until it is determined to rest by another body, and a body at rest continues to be at rest until it is determined to move by another body. This, too, is self-evident; for when I suppose, for example, that a body A is at rest and I give no consideration to other moving bodies, I can assert nothing about body A but that it is at rest. Now if it should thereafter happen that body A is in motion, this surely could not have resulted from the fact that it was at rest; for from that fact nothing else could have followed than that body A should be at rest. If on the other hand A were supposed to be in motion, as long as we consider only A, we can affirm nothing of it but that it is in motion. If it should thereafter happen that A should be at rest, this surely could not have resulted from its previous motion; for from its motion nothing else could have followed but that A was in motion. So this comes about from a thing that was not in A, namely, an external cause by which the moving body A was determined to rest.

Axiom 1: All the ways in which a body is affected by another body follow from the nature of the affected body together with the nature of the body affecting it, so that one and the same body may move in various ways in accordance with the various natures of the bodies causing its motion; and, on the other hand, different bodies may be caused to move in different ways by one and the same body.

Axiom 2: When a moving body collides with a body at rest and is unable to cause it to move, it is reflected so as to continue its motion, and the angle between the line of motion of the reflection and the plane of the body at rest with which it has collided is equal to the angle between the line of incidence of motion and the said plane.

So far we have been discussing the simplest bodies, those which are distinguished from one another solely by motion-and-rest, quickness and slowness. Now let us advance to composite bodies.

Definition: When a number of bodies of the same or different magnitude form close contact with one another through the pressure of other bodies upon them, or if they are moving at the same or different rates of speed so as to preserve an unvarying relation of movement among themselves, these bodies are said to be united with one another and all together to form one body or individual thing, which is distinguished from other things through this union of bodies.

Axiom 3: The degree of difficulty with which the parts of an individual thing or composite body can be made to change their position and consequently the degree of difficulty with which the individual takes on different shapes is proportional to the extent of the surface areas along which they are in close contact. Hence bodies whose parts maintain close contact along large areas of their surfaces I term hard; those whose parts maintain contact along small surface areas I term soft; while those whose parts are in a state of motion among themselves I term liquid.

Lemma 4: *If from a body, or an individual thing composed of a number of bodies, certain bodies are separated, and at the same time a like number of other bodies of the same nature take their place, the individual thing will retain its nature as before, without any change in its form [forma].*

Proof: Bodies are not distinguished in respect of substance (Lemma 1). That which constitutes the form of the individual thing consists in a union of bodies (preceding definition). But this union, by hypothesis, is retained in spite of the continuous change of component bodies. Therefore, the individual thing will retain its own nature as before, both in respect of substance and of mode.

Lemma 5: *If the parts of an individual thing become greater or smaller, but so proportionately that they all preserve the same mutual relation of motion-and-rest as before, the individual thing will likewise retain its own nature as before without any change in its form.*

Proof: The reasoning is the same as in the preceding Lemma.

Lemma 6: *If certain bodies composing an individual thing are made to change the existing direction of their motion, but in such a way that they can continue their motion and keep the same mutual relation as before, the individual thing will likewise preserve its own nature without any change of form.*

Proof: This is evident; for, by hypothesis, the individual thing retains all that we, in defining it, asserted as constituting its form.

Lemma 7: *Furthermore, the individual thing so composed retains its own nature, whether as a whole it is moving or at rest, and in whatever direction it moves, provided that each constituent part retains its own motion and continues to communicate this motion to the other parts.*

Proof: This is evident from its definition, which you will find preceding Lemma 4.

Scholium: We thus see how a composite individual can be affected in many ways and yet preserve its nature. Now previously we have conceived an individual thing composed solely of bodies distinguished from one another only by motion-and-rest and speed of movement; that is, an individual thing composed of the simplest bodies. If we now conceive another individual thing composed of several individual things of different natures, we shall find that this can be affected in many other ways while still preserving its nature. For since each one of its parts is composed of several bodies, each single part can therefore (preceding Lemma), without any change in its nature, move with varying degrees of speed and consequently communicate its own motion to other parts with varying degrees of speed. Now if we go on to conceive a third kind of individual things composed of this second kind, we shall find that it can be affected in many other ways without any change in its form. If we thus continue to infinity, we shall readily conceive the whole of Nature as one individual whose parts—that is, all the constituent bodies—vary in infinite ways without any change in the individual as a whole. If my intention had been to write a full treatise on body, I should have had to expand my explications and demonstrations. But I have already declared a different intention, and the only reason for my dealing with this subject is that I may readily deduce therefrom what I have set out to prove.

Postulates

1. The human body is composed of very many individual parts of different natures, each of which is extremely complex.

2. Of the individual components of the human body, some are liquid, some are soft, and some are hard.

3. The individual components of the human body, and consequently the human body itself, are affected by external bodies in a great many ways.

4. The human body needs for its preservation a great many other bodies, by which, as it were [*quasi*], it is continually regenerated.

5. When a liquid part of the human body is determined by an external body to impinge frequently on another part which is soft, it changes the surface of that part and impresses on it certain traces of the external body acting upon it.

6. The human body can move external bodies and dispose them in a great many ways.

PROPOSITION 14: *The human mind is capable of perceiving a great many things, and this capacity will vary in proportion to the variety of states which its body can assume.*

Proof: The human body (Posts. 3 and 6) is affected by external bodies in a great many ways and is so structured that it can affect external bodies in a great many ways. But the human mind must perceive all that happens in the human body (Pr. 12, II). Therefore, the human mind is capable of perceiving very many things, and . . . etc.

PROPOSITION 15: *The idea which constitutes the formal being of the human mind is not simple, but composed of very many ideas.*

Proof: The idea which constitutes the formal being of the human mind is the idea of the body (Pr. 13, II), which is composed of a great number of very composite individual parts (Postulate 1). But in God there is necessarily the idea of every individual component part (Cor. Pr. 8, II). Therefore (Pr. 7, II), the idea of the human body is composed of these many ideas of the component parts.

PROPOSITION 16: *The idea of any mode wherein the human body is affected by external bodies must involve the nature of the human body together with the nature of the external body.*

Proof: All the modes wherein a body is affected follow from the nature of the body affected together with the nature of the affecting body (Ax. 1 after Cor. Lemma 3). Therefore, the idea of these modes will necessarily involve the nature of both bodies (Ax. 4, I). So the idea of any mode wherein the human body is affected by an external body involves the nature of the human body and the external body.

Corollary 1: Hence it follows that the human mind perceives the nature of very many bodies along with the nature of its own body.

Corollary 2: Secondly, the ideas that we have of external bodies indicate the constitution of our own body more than the nature of external bodies. This I have explained with many examples in Appendix, Part I.

PROPOSITION 17: *If the human body is affected in a way [modo] that involves the nature of some external body, the human mind will regard that same external body as actually existing, or as present to itself, until the human body undergoes a further modification which excludes the existence or presence of the said body.*

Proof: This is evident; for as long as the human body is thus affected, so long will the human mind (Pr. 12, II) regard this affection of the body; that is (by the preceding Proposition), so long will it have the idea of a mode existing in actuality, an idea involving the nature of an external body; that is, an idea which does not exclude but posits the existence or presence of the nature of the external body. So the mind (Cor. 1 of the preceding proposition) will regard the external body as actually existing, or as present, until . . . etc.

Corollary: The mind is able to regard as present external bodies by which the human body has been once affected, even if they do not exist and are not present.

Proof: When external bodies so determine the fluid parts of the human body that these frequently impinge on the softer parts, they change the surfaces of these softer parts (Post. 5). Hence it comes about (Ax. 2 after Cor. Lemma 3) that the fluid parts are reflected therefrom in a manner different from what was previously the case; and thereafter, again coming into contact with the said changed surfaces in the course of their own spontaneous motion, they are reflected in the same way as when they were impelled toward those surfaces by external bodies. Consequently, in continuing this reflected motion they affect the human body in the same manner, which manner will again be the object of thought in the mind (Pr. 12, II); that is (Pr. 17, II), the mind will again regard the external body as present. This will be repeated whenever the fluid parts of the human body come into contact with those same surfaces in the course of their own spontaneous motion. Therefore, although the external bodies by which the human body has once been affected may no longer exist, the mind will regard them as present whenever this activity of the body is repeated.

Scholium: So we see how it comes about that we regard as present things which are not so, as often happens. Now it is possible that there are other causes for this fact, but it is enough for me at this point to have indicated one cause through which I can explicate the matter just as if I had demonstrated it through its true cause. Yet I do not think that I am far from the truth, since all the postulates that I have assumed contain scarcely anything inconsistent with experience; and after demonstrating that the human body exists just as we sense it (Cor. Pr. 13, II), we may not doubt experience.

In addition (preceding Cor. and Cor. 2 Pr. 16, II), this gives a clear understanding of the difference between the idea, e.g., of Peter which constitutes the essence of Peter's mind, and on the other hand the idea of Peter which is in another man, say Paul. The former directly explicates the essence of Peter's body, and does not involve existence except as long as Peter exists. The latter indicates the constitution of Paul's body rather than the nature of Peter; and so, while that constitution of Paul's body continues to be, Paul's mind will regard Peter as present to him although Peter may not be in existence. Further, to retain the usual terminology, we will assign the word "images" [*imagines*] to those affections of the human body the ideas of which set forth external bodies as if they were present to us, although they do not represent shapes. And when the mind regards bodies in this way, we shall say that it "imagines" [*imaginari*].

At this point, to begin my analysis of error, I should like you to note that the imaginations of the mind, looked at in themselves, contain no error; i.e., the mind does not err from the fact that it imagines, but only insofar as it is considered to lack the idea which excludes the existence of those things which it imagines to be present to itself. For if the mind, in imagining nonexistent things to be present to it, knew at the same time that those things did not exist in fact, it would surely impute this power of imagining not to the defect but to the strength of its own nature, especially if this faculty of imagining were to depend solely on its own nature; that is (Def. 7, I), if this faculty of imagining were free.

PROPOSITION 18: *If the human body has once been affected by two or more bodies at the same time, when the mind afterward imagines one of them, it will straightway remember the others too.*

Proof: The mind imagines (preceding Cor.) any given body for the following reason, that the human body is affected and conditioned by the impressions of an external body in the same way as it was affected when certain of its parts were acted upon by the external body. But, by hypothesis, the human mind was at that time conditioned in such a way that the mind imagined two bodies at the same time. Therefore, it will now also imagine two bodies at the same time, and the mind, in imagining one of them, will straightway remember the other as well.

Scholium: Hence we clearly understand what memory is. It is simply a linking of ideas involving the nature of things outside the human body, a linking which occurs in the mind parallel to the order and linking of the affections of the human body. I say, firstly, that it is only the linking of those ideas that involve the nature of things outside the human body, not of those ideas that explicate the nature of the said things. For they are in fact (Pr. 16, II) ideas of the affections of the human body which involve the nature both of the human body and of external bodies. Secondly, my purpose in saying that this linking occurs in accordance with the order and linking of the affections of the human body is to distinguish it from the linking of ideas in accordance with the order of the intellect whereby the mind perceives things through their first causes, and which is the same in all men.

Furthermore, from this we clearly understand why the mind, from thinking of one thing, should straightway pass on to thinking of another thing which has no likeness to

the first. For example, from thinking of the word “pomum” [apple] a Roman will straightway fall to thinking of the fruit, which has no likeness to that articulated sound nor anything in common with it other than that the man’s body has often been affected by them both; that is, the man has often heard the word “pomum” while seeing the fruit. So everyone will pass on from one thought to another according as habit in each case has arranged the images in his body. A soldier, for example, seeing the tracks of a horse in the sand will straightway pass on from thinking of the horse to thinking of the rider, and then thinking of war, and so on. But a peasant, from thinking of a horse, will pass on to thinking of a plough, and of a field, and so on. So every person will pass on from thinking of one thing to thinking of another according as he is in the habit of joining together and linking the images of things in various ways.

PROPOSITION 19: *The human mind has no knowledge of the body, nor does it know it to exist, except through ideas of the affections by which the body is affected.*

Proof: The human mind is the very idea or knowledge of the human body (Pr. 13, II), and this idea is in God (Pr. 9, II) insofar as he is considered as affected by another idea of a particular thing; or, since (Post. 4) the human body needs very many other bodies by which it is continually regenerated, and the order and connection of ideas is the same (Pr. 7, II) as the order and connection of causes, this idea is in God insofar as he is considered as affected by the ideas of numerous particular things. Therefore, God has the idea of the human body, or knows the human body, insofar as he is affected by numerous other ideas, and not insofar as he constitutes the nature of the human mind; that is (Cor. Pr. 11, II), the human mind does not know the human body. But the ideas of the affections of the body are in God insofar as he does constitute the nature of human mind; i.e., the human mind perceives these affections (Pr. 12, II) and consequently perceives the human body (Pr. 16, II), and perceives it as actually existing (Pr. 17, II). Therefore, it is only to that extent that the human mind perceives the human body.

PROPOSITION 20: *There is also in God the idea or knowledge of the human mind, and this follows in God and is related to God in the same way as the idea or knowledge of the human body.*

Proof: Thought is an attribute of God (Pr. 1, II), and so (Pr. 3, II) the idea of both Thought and its affections—and consequently of the human mind as well—must necessarily be in God. Now this idea or knowledge of the mind does not follow in God insofar as he is infinite, but insofar as he is affected by another idea of a particular thing (Pr. 9, II). But the order and connection of ideas is the same as the order and connection of causes (Pr. 7, II). Therefore, the idea or knowledge of the mind follows in God and is related to God in the same way as the idea or knowledge of the body.

PROPOSITION 21: *This idea of the mind is united to the mind in the same way as the mind is united to the body.*

Proof: That the mind is united to the body we have shown from the fact that the body is the object of the mind (Prs. 12 and 13, II), and so by the same reasoning the idea of the mind must be united to its object—that is, to the mind itself—in the same way as the mind is united to the body.

Scholium: This proposition is understood far more clearly from Sch. Pr. 7, II. There we showed that the idea of the body and the body itself—that is (Pr. 13, II), mind and body—are one and the same individual thing, conceived now under the attribute of

Thought and now under the attribute of Extension. Therefore, the idea of the mind and the mind itself are one and the same thing, conceived under one and the same attribute, namely, Thought. The idea of the mind, I repeat, and the mind itself follow in God by the same necessity and from the same power of thought. For in fact the idea of the mind—that is, the idea of an idea—is nothing other than the form [*forma*] of the idea insofar as the idea is considered as a mode of thinking without relation to its object. For as soon as anyone knows something, by that very fact he knows that he knows, and at the same time he knows that he knows that he knows, and so on ad infinitum. But I will deal with this subject later.

PROPOSITION 22: *The human mind perceives not only the affections of the body but also the ideas of these affections.*

Proof: The ideas of ideas of affections follow in God and are related to God in the same way as ideas of affections, which can be proved in the same manner as Pr. 20, II. But the ideas of affections of the body are in the human mind (Pr. 12, II); that is (Cor. Pr. 11, II), in God insofar as he constitutes the essence of the human mind. Therefore, the ideas of these ideas will be in God insofar as he has knowledge or the idea of the human mind; that is (Pr. 21, II), they will be in the human mind itself, which therefore perceives not only the affections of the body but also the ideas of these affections.

PROPOSITION 23: *The mind does not know itself except insofar as it perceives ideas of affections of the body.*

Proof: The idea or knowledge of the mind (Pr. 20, II) follows in God and is related to God in the same way as the idea or knowledge of the body. But since (Pr. 19, II) the human mind does not know the human body—that is (Cor. Pr. 11, II), since the knowledge of the human body is not related to God insofar as he constitutes the nature of the human mind—therefore, neither is knowledge of the mind related to God insofar as he constitutes the essence of the human mind. And so (Cor. Pr. 11, II) the human mind to that extent does not know itself. Again, the ideas of the affections by which the body is affected involve the nature of the human body (Pr. 16, II); that is (Pr. 13, II), they are in agreement [*conveniunt*] with the nature of the mind. Therefore, the knowledge of these ideas will necessarily involve knowledge of the mind. But (preceding Pr.) the knowledge of these ideas is in the human mind. Therefore, the human mind knows itself but only to that extent.

PROPOSITION 24: *The human mind does not involve an adequate knowledge of the component parts of the human body.*

Proof: The component parts of the human body do not pertain to the essence of the body itself save insofar as they preserve an unvarying relation of motion with one another (Def. after Cor. Lemma 3), and not insofar as they can be considered as individual things apart from their relation to the human body. For the parts of the human body (Post. 1) are very composite individual things, whose parts can be separated from the human body (Lemma 4) without impairing in any way its nature and specific reality [*forma*], and can establish a quite different relation of motion with other bodies (Ax. 1 after Lemma 3). Therefore (Pr. 3, II), the idea or knowledge of any component part will be in God, and will be so (Pr. 9, II) insofar as he is considered as affected by another idea of a particular thing, a particular thing which is prior in Nature's order to the part itself (Pr. 7, II). Further, the same holds good of any part of an individual component part of the human body, and so of any component part of the human body there is knowledge in God insofar as he is affected by very many ideas of things, and not

insofar as he has the idea only of the human body, that is (Pr. 13, II), the idea that constitutes the nature of the human mind. So (Cor. Pr. 11, II) the human mind does not involve adequate knowledge of the component parts of the human body.

PROPOSITION 25: *The idea of any affection of the human body does not involve an adequate knowledge of an external body.*

Proof: We have shown that the idea of an affection of the human body involves the nature of an external body insofar as the external body determines the human body in some definite way (Pr. 16, II). But insofar as the external body is an individual thing that is not related to the human body, the idea or knowledge of it is in God (Pr. 9, II) insofar as God is considered as affected by the idea of another thing which is (Pr. 7, II) prior in nature to the said external body. Therefore, an adequate knowledge of the external body is not in God insofar as he has the idea of an affection of the human body; i.e., the idea of an affection of the human body does not involve an adequate knowledge of an external body.

PROPOSITION 26: *The human mind does not perceive any external body as actually existing except through the ideas of affections of its own body.*

Proof: If the human body is not affected in any way by an external body, then (Pr. 7, II) neither is the idea of the human body—that is (Pr. 13, II), the human mind—affected in any way by the idea of the existence of that body; i.e., it does not in any way perceive the existence of that external body. But insofar as the human body is affected in some way by an external body, to that extent it perceives the external body (Pr. 16, II, with Cor. 1).

Corollary: Insofar as the human mind imagines [*imaginatur*] an external body, to that extent it does not have an adequate knowledge of it.

Proof: When the human mind regards external bodies through the ideas of affections of its own body, we say that it imagines [*imaginatur*] (see Sch. Pr. 17, II), and in no other way can the mind imagine external bodies as actually existing (preceding Pr.). Therefore, insofar as the mind imagines external bodies (Pr. 25, II), it does not have adequate knowledge of them.

PROPOSITION 27: *The idea of any affection of the human body does not involve adequate knowledge of the human body.*

Proof: Any idea whatsoever of any affection of the human body involves the nature of the human body only to the extent that the human body is considered to be affected in some definite way (Pr. 16, II). But insofar as the human body is an individual thing that can be affected in many other ways, the idea . . . etc. (see Proof Pr. 25, II).

PROPOSITION 28: *The ideas of the affections of the human body, insofar as they are related only to the human mind, are not clear and distinct, but confused.*

Proof: The ideas of the affections of the human body involve the nature both of external bodies and of the human body itself (Pr. 16, II), and must involve the nature not only of the human body but also of its parts. For affections are modes in which parts of the human body (Post. 3), and consequently the body as a whole, are affected. But (Prs. 24 and 25, II) an adequate knowledge of external bodies, as also of the component parts of the human body, is not in God insofar as he is considered as affected by the human mind, but insofar as he is considered as affected by other ideas. Therefore, these ideas of affections, insofar as they are related only to the human mind, are like conclusions without premises; that is, as is self-evident, confused ideas.

Scholium: The idea that constitutes the nature of the human mind is likewise shown, when considered solely in itself, not to be clear and distinct, as is also the idea of the human mind and the ideas of affections of the human body insofar as they are related only to the human mind, as everyone can easily see.

PROPOSITION 29: *The idea of the idea of any affection of the human body does not involve adequate knowledge of the human mind.*

Proof: The idea of an affection of the human body (Pr. 27, II) does not involve adequate knowledge of the body itself; in other words, it does not adequately express the nature of the body; that is (Pr. 13, II), it does not adequately agree [*convenit*] with the nature of the mind. So (Ax. 6, I) the idea of this idea does not adequately express the nature of the human mind; i.e., it does not involve an adequate knowledge of it.

Corollary: Hence it follows that whenever the human mind perceives things after the common order of nature, it does not have an adequate knowledge of itself, nor of its body, nor of external bodies, but only a confused and fragmentary knowledge. For the mind does not know itself save insofar as it perceives ideas of the affections of the body (Pr. 23, II). Now it does not perceive its own body (Pr. 19, II) except through ideas of affections of the body, and also it is only through these affections that it perceives external bodies (Pr. 26, II). So insofar as it has these ideas, it has adequate knowledge neither of itself (Pr. 29, II) nor of its own body (Pr. 27, II) nor of external bodies (Pr. 25, II), but only a fragmentary [*mutilatam*] and confused knowledge (Pr. 28, II and Sch.).

Scholium: I say expressly that the mind does not have an adequate knowledge, but only a confused and fragmentary knowledge, of itself, its own body, and external bodies whenever it perceives things from the common order of nature, that is, whenever it is determined externally—namely, by the fortuitous run of circumstance—to regard this or that, and not when it is determined internally, through its regarding several things at the same time, to understand their agreement, their differences, and their opposition. For whenever it is conditioned internally in this or in another way, then it sees things clearly and distinctly, as I shall later show.

PROPOSITION 30: *We can have only a very inadequate knowledge of the duration of our body.*

Proof: The duration of our body does not depend on its essence (Ax. 1, II), nor again on the absolute nature of God (Pr. 21, I), but (Pr. 28, I) it is determined to exist and to act by causes which are also determined by other causes to exist and to act in a definite and determinate way, and these again by other causes, and so ad infinitum. Therefore, the duration of our body depends on the common order of nature and the structure of the universe. Now there is in God adequate knowledge of the structure of the universe insofar as he has ideas of all the things in the universe, and not insofar as he has only the idea of the human body (Cor. Pr. 9, II). Therefore, knowledge of the duration of our body is very inadequate in God insofar as he is considered only to constitute the nature of the human mind. That is (Cor. Pr. 11, II), this knowledge is very inadequate in the human mind.

PROPOSITION 31: *We can have only a very inadequate knowledge of the duration of particular things external to us.*

Proof: Each particular thing, just like the human body, must be determined by another particular thing to exist and to act in a definite and determinate way, and this latter thing again by another, and so on ad infinitum (Pr. 28, I). Now since we have

shown in the preceding Proposition that from this common property of particular things we can have only a very inadequate knowledge of the duration of the human body, in the case of the duration of particular things we have to come to the same conclusion: that we can have only a very inadequate knowledge thereof.

Corollary: Hence it follows that all particular things are contingent and perishable. For we can have no adequate knowledge of their duration (preceding Pr.), and that is what is to be understood by contingency and perishability (Sch. 1, Pr. 33, I). For apart from this there is no other kind of contingency (Pr. 29, I).

PROPOSITION 32: *All ideas are true insofar as they are related to God.*

Proof: All ideas, which are in God, agree completely with the objects of which they are ideas (Cor. Pr. 7, II), and so they are all true (Ax. 6, I).

PROPOSITION 33: *There is nothing positive in ideas whereby they can be said to be false.*

Proof: If this be denied, conceive, if possible, a positive mode of thinking which constitutes the form [*forma*] of error or falsity. This mode of thinking cannot be in God (preceding Pr.), but neither can it be or be conceived externally to God (Pr. 15, I). Thus there can be nothing positive in ideas whereby they can be called false.

PROPOSITION 34: *Every idea which in us is absolute, that is, adequate and perfect, is true.*

Proof: When we say that there is in us an adequate and perfect idea, we are saying only this (Cor. Pr. 11, II), that there is adequate and perfect idea in God insofar as he constitutes the essence of our mind. Consequently, we are saying only this, that such an idea is true (Pr. 32, II).

PROPOSITION 35: *Falsity consists in the privation of knowledge which inadequate ideas, that is, fragmentary and confused ideas, involve.*

Proof: There is nothing positive in ideas which constitutes the form [*forma*] of falsity (Pr. 33, II). But falsity cannot consist in absolute privation (for minds, not bodies, are said to err and be deceived), nor again in absolute ignorance, for to be ignorant and to err are different. Therefore, it consists in that privation of knowledge which inadequate knowledge, that is, inadequate and confused ideas, involves.

Scholium: In Sch. Pr. 17, II I explained how error consists in the privation of knowledge, but I will give an example to enlarge on this explanation. Men are deceived in thinking themselves free, a belief that consists only in this, that they are conscious of their actions and ignorant of the causes by which they are determined. Therefore, the idea of their freedom is simply the ignorance of the cause of their actions. As to their saying that human actions depend on the will, these are mere words without any corresponding idea. For none of them knows what the will is and how it moves the body, and those who boast otherwise and make up stories of dwelling places and habitations of the soul provoke either ridicule or disgust.

As another example, when we gaze at the sun, we see it as some two hundred feet distant from us. The error does not consist in simply seeing the sun in this way but in the fact that while we do so we are not aware of the true distance and the cause of our seeing it so. For although we may later become aware that the sun is more than six hundred times the diameter of the earth distant from us, we shall nevertheless continue to see it as close at hand. For it is not our ignorance of its true distance that causes us to see the sun to be so near; it is that the affection of our body involves the essence of the sun only to the extent that the body is affected by it.

PROPOSITION 36: *Inadequate and confused ideas follow by the same necessity as adequate, or clear and distinct, ideas.*

Proof: All ideas are in God (Pr. 15, I), and insofar as they are related to God, they are true (Pr. 32, II) and adequate (Cor. Pr. 7, II). So there are no inadequate or confused ideas except insofar as they are related to the particular mind of someone (see Prs. 24 and 28, II). So all ideas, both adequate and inadequate, follow by the same necessity (Cor. Pr. 6, II).

PROPOSITION 37: *That which is common to all things (see Lemma 2 above) and is equally in the part as in the whole does not constitute the essence of any one particular thing.*

Proof: If this is denied, conceive, if possible, that it does constitute the essence of one particular thing, B. Therefore, it can neither be nor be conceived without B (Def. 2, II). But this is contrary to our hypothesis. Therefore, it does not pertain to B's essence, nor does it constitute the essence of any other particular thing.

PROPOSITION 38: *Those things that are common to all things and are equally in the part as in the whole can be conceived only adequately.*

Proof: Let A be something common to all bodies, and equally in the part of any body as in the whole. I say that A can be conceived only adequately. For its idea (Cor. Pr. 7, II) will necessarily be in God both insofar as he has the idea of the human body and insofar as he has the ideas of affections of the human body, affections which partly involve the natures of both the human body and external bodies (Prs. 16, 25, and 27, II). That is (Prs. 12 and 13, II), this idea will necessarily be adequate in God insofar as he constitutes the human

Interior of a House, ca. 1660, by Pieter De Hooch (1629–1684). This Dutch Baroque painting provides a visual metaphor for the precise geometry of Spinoza's *Ethics*.
(© Alinari/Art Resource, NY)

mind; that is, insofar as he has the ideas which are in the human mind. Therefore, the mind (Cor. Pr. 11, II) necessarily perceives A adequately, and does so both insofar as it perceives itself and insofar as it perceives its own body or any external body; nor can A be perceived in any other way.

Corollary: Hence it follows that there are certain ideas or notions common to all men. For (by Lemma 2) all bodies agree in certain respects, which must be (preceding Pr.) conceived by all adequately, or clearly and distinctly.

PROPOSITION 39: *Of that which is common and proper to the human body and to any external bodies by which the human body is customarily affected, and which is equally in the part as well as in the whole of any of these bodies, the idea also in the mind will be adequate.*

Proof: Let A be that which is common and proper to the human body and to any external bodies and which is equally in the human body as in those same external bodies, and which is finally equally in the part of any external body as in the whole. There will be in God an adequate idea of A (Cor. Pr. 7, II) both insofar as he has the idea of the human body and insofar as he has ideas of those posited external bodies. Let it now be supposed that the human body is affected by an external body through that which is common to them both, that is, A. The idea of this affection will involve the property A (Pr. 16, II), and so (Cor. Pr. 7, II) the idea of this affection, insofar as it involves the property A, will be adequate in God insofar as he is affected by the idea of the human body; that is (Pr. 13, II), insofar as he constitutes the nature of the human mind. So this idea will also be adequate in the human mind (Cor. Pr. 11, II).

Corollary: Hence it follows that the mind is more capable of perceiving more things adequately in proportion as its body has more things in common with other bodies.

PROPOSITION 40: *Whatever ideas follow in the mind from ideas that are adequate in it are also adequate.*

Proof: This is evident. For when we say that an idea follows in the human mind from ideas that are adequate in it, we are saying no more than that there is in the divine intellect an idea of which God is the cause, not insofar as he is infinite nor insofar as he is affected by ideas of numerous particular things, but only insofar as he constitutes the essence of the human mind.

Scholium 1: I have here set forth the causes of those notions that are called “common,” and which are the basis of our reasoning processes. Now certain axioms or notions have other causes which it would be relevant to set forth by this method of ours; for thus we could establish which notions are useful compared with others, and which are of scarcely any value. And again, we could establish which notions are common to all, which ones are clear and distinct only to those not laboring under prejudices [*praejudiciis*] and which ones are ill-founded. Furthermore, this would clarify the origin of those notions called “secondary”—and consequently the axioms which are based on them—as well as other related questions to which I have for some time given thought. But I have decided not to embark on these questions at this point because I have set them aside for another treatise, and also to avoid wearying the reader with too lengthy a discussion of this subject. Nevertheless, to omit nothing that it is essential to know, I shall briefly deal with the question of the origin of the so-called “transcendental terms,” such as “entity,” “thing,” “something” [*ens, res, aliquid*].

These terms originate in the following way. The human body, being limited, is capable of forming simultaneously in itself only a certain number of distinct images.

(I have explained in Sch. Pr. 17, II what an image is.) If this number be exceeded, these images begin to be confused, and if the number of distinct images which the body is capable of forming simultaneously in itself be far exceeded, all the images will be utterly confused with one another. This being so, it is evident from Cor. Pr. 17 and Pr. 18, II that the human mind is able to imagine simultaneously and distinctly as many bodies as there are images that can be formed simultaneously in its body. But when the images in the body are utterly confused, the mind will also imagine all the bodies confusedly without any distinction, and will comprehend them, as it were, under one attribute, namely, that of entity, thing, etc. This conclusion can also be reached from the fact that images are not always equally vivid, and also from other causes analogous to these, which I need not here explicate. For it all comes down to this, that these terms signify ideas confused in the highest degree.

Again, from similar causes have arisen those notions called “universal,” such as “man,” “horse,” “dog,” etc.; that is to say, so many images are formed in the human body simultaneously (e.g., of man) that our capacity to imagine them is surpassed, not indeed completely, but to the extent that the mind is unable to imagine the unimportant differences of individuals (such as the complexion and stature of each, and their exact number) and imagines distinctly only their common characteristic insofar as the body is affected by them. For it was by this that the body was affected most repeatedly, by each single individual. The mind expresses this by the word “man,” and predicates this word of an infinite number of individuals. For, as we said, it is unable to imagine the determinate number of individuals.

But it should be noted that not all men form these notions in the same way; in the case of each person the notions vary according as that thing varies whereby the body has more frequently been affected, and which the mind more readily imagines or calls to mind. For example, those who have more often regarded with admiration the stature of men will understand by the word “man” an animal of upright stature, while those who are wont to regard a different aspect will form a different common image of man, such as that man is a laughing animal, a featherless biped, or a rational animal. Similarly, with regard to other aspects, each will form universal images according to the conditioning of his body. Therefore, it is not surprising that so many controversies have arisen among philosophers who have sought to explain natural phenomena through merely the images of these phenomena.

Scholium 2: From all that has already been said it is quite clear that we perceive many things and form universal notions:

1. From individual objects presented to us through the senses in a fragmentary [*mutilate*] and confused manner without any intellectual order (see Cor. Pr. 29, II); and therefore I call such perceptions “knowledge from casual experience.”

2. From symbols. For example, from having heard or read certain words we call things to mind and we form certain ideas of them similar to those through which we imagine things (Sch. Pr. 18, II).

Both these ways of regarding things I shall in future refer to as “knowledge of the first kind,” “opinion,” or “imagination.”

3. From the fact that we have common notions and adequate ideas of the properties of things (see Cor. Pr. 38 and 39 with its Cor., and Pr. 40, II). I shall refer to this as “reason” and “knowledge of the second kind.”

Apart from these two kinds of knowledge there is, as I shall later show, a third kind of knowledge, which I shall refer to as “intuition.” This kind of knowledge proceeds from an adequate idea of the formal essence of certain attributes of God to an

adequate knowledge of the essence of things. I shall illustrate all these kinds of knowledge by one single example. Three numbers are given; it is required to find a fourth which is related to the third as the second to the first. Tradesmen have no hesitation in multiplying the second by the third and dividing the product by the first, either because they have not yet forgotten the rule they learned without proof from their teachers, or because they have in fact found this correct in the case of very simple numbers, or else from the force of the proof of Proposition 19 of the Seventh Book of Euclid, to wit, the common property of proportionals. But in the case of very simple numbers, none of this is necessary. For example, in the case of the given numbers 1, 2, 3, everybody can see that the fourth proportional is 6, and all the more clearly because we infer in one single intuition the fourth number from the ratio we see the first number bears to the second.

PROPOSITION 41: *Knowledge of the first kind is the only cause of falsity; knowledge of the second and third kind is necessarily true.*

Proof: In the preceding Scholium we asserted that all those ideas which are inadequate and confused belong to the first kind of knowledge; and thus (Pr. 35, II) this knowledge is the only cause of falsity. Further, we asserted that to knowledge of the second and third kind there belong those ideas which are adequate. Therefore (Pr. 34, II), this knowledge is necessarily true.

PROPOSITION 42: *Knowledge of the second and third kind, and not knowledge of the first kind, teaches us to distinguish true from false.*

Proof: This Proposition is self-evident. For he who can distinguish the true from the false must have an adequate idea of the true and the false; that is (Sch. 2 Pr. 40, II), he must know the true and the false by the second or third kind of knowledge.

PROPOSITION 43: *He who has a true idea knows at the same time that he has a true idea, and cannot doubt its truth.*

Proof: A true idea in us is one which is adequate in God insofar as he is explicated through the nature of the human mind (Cor. Pr. 11, II). Let us suppose, then, that there is in God, insofar as he is explicated through the nature of the human mind, an adequate idea, A. The idea of this idea must also necessarily be in God, and is related to God in the same way as the idea A (Pr. 20, II, the proof being of general application). But by our supposition the idea A is related to God insofar as he is explicated through the nature of the human mind. Therefore, the idea of the idea A must be related to God in the same way; that is (Cor. Pr. 11, II), this adequate idea of the idea A will be in the mind which has the adequate idea A. So he who has an adequate idea, that is, he who knows a thing truly (Pr. 34, II), must at the same time have an adequate idea, that is, a true knowledge of his knowledge; that is (as is self-evident), he is bound at the same time to be certain.

Scholium: I have explained in the Scholium to Pr. 21, II what is an idea of an idea; but it should be noted that the preceding proposition is sufficiently self-evident. For nobody who has a true idea is unaware that a true idea involves absolute certainty. To have a true idea means only to know a thing perfectly, that is, to the utmost degree. Indeed, nobody can doubt this, unless he thinks that an idea is some dumb thing like a picture on a tablet, and not a mode of thinking, to wit, the very act of understanding. And who, pray, can know that he understands some thing unless he first understands it? That is, who can know that he is certain of something unless he is first certain of it? Again,

what standard of truth can there be that is clearer and more certain than a true idea? Indeed, just as light makes manifest both itself and darkness, so truth is the standard both of itself and falsity.

I think I have thus given an answer to those questions which can be stated as follows: If a true idea is distinguished from a false one only inasmuch as it is said to correspond with that of which it is an idea, then a true idea has no more reality or perfection than a false one (since they are distinguished only by an extrinsic characteristic) and consequently neither is a man who has true ideas superior to one who has only false ideas. Secondly, how do we come to have false ideas? And finally, how can one know for certain that one has ideas which correspond with that of which they are ideas? I have now given an answer, I repeat, to these problems. As regards the difference between a true and a false idea, it is clear from Pr. 35, II that the former is to the latter as being to non-being. The causes of falsity I have quite clearly shown from Propositions 19 to 35 with the latter's Scholium, from which it is likewise obvious what is the difference between a man who has true ideas and one who has only false ideas. As to the last question, how can a man know that he has an idea which corresponds to that of which it is an idea, I have just shown, with abundant clarity, that this arises from the fact that he does have an idea that corresponds to that of which it is an idea; that is, truth is its own standard. Furthermore, the human mind, insofar as it perceives things truly, is part of the infinite intellect of God (Cor. Pr. 11, II), and thus it is as inevitable that the clear and distinct ideas of the mind are true as that God's ideas are true.

PROPOSITION 44: *It is not in the nature of reason to regard things as contingent, but as necessary.*

Proof: It is in the nature of reason to perceive things truly (Pr. 41, II), to wit (Ax. 6, I), as they are in themselves; that is (Pr. 29, I), not as contingent, but as necessary.

Corollary 1: Hence it follows that it solely results from imagination [*imaginatio*] that we regard things, both in respect of the past and of the future, as contingent.

Scholium: I shall explain briefly how this comes about. We have shown above (Pr. 17, II and Cor.) that although things may not exist, the mind nevertheless always imagines them as present unless causes arise which exclude their present existence. Further, we have shown (Pr. 18, II) that if the human body has once been affected by two external bodies at the same time, when the mind later imagines one of them, it will straightway call the other to mind as well; that is, it will regard both as present to it unless other causes arise which exclude their present existence. Furthermore, nobody doubts that time, too, is a product of the imagination, and arises from the fact that we see some bodies move more slowly than others, or more quickly, or with equal speed. Let us therefore suppose that yesterday a boy saw Peter first of all in the morning, Paul at noon, and Simon in the evening, and that today he again sees Peter in the morning. From Pr. 18, II it is clear that as soon as he sees the morning light, forthwith he will imagine the sun as traversing the same tract of sky as on the previous day, that is, he will imagine a whole day, and he will imagine Peter together with morning, Paul with midday, and Simon with evening; that is, he will imagine the existence of Paul and Simon with reference to future time. On the other hand, on seeing Simon in the evening he will refer Paul and Peter to time past by imagining them along with time past. This train of events will be the more consistent the more frequently he sees them in that order. If it should at some time occur that on another evening he sees James instead of Simon, then the following morning he will imagine along with evening now Simon, now James, but not both together.

For we are supposing that he has seen only one of them in the evening, not both at the same time. Therefore, his imagination will waver, and he will imagine, along with a future evening, now one, now the other; that is, he will regard neither of them as going to be there for certain, but both of them contingently. This wavering of the imagination occurs in the same way if the imagination be of things which we regard with relation to past or present time, and consequently we shall imagine things, as related both to present and past or future time, as contingent.

Corollary 2: It is in the nature of reason to perceive things in the light of eternity [*sub quadam specie aeternitatis*].

Proof: It is in the nature of reason to regard things as necessary, not as contingent (previous Pr.). Now it perceives this necessity truly (Pr. 41, II); that is, as it is in itself (Ax. 6, I). But (Pr. 16, I) this necessity is the very necessity of God's eternal nature. Therefore, it is in the nature of reason to regard things in this light of eternity. Furthermore, the basic principles of reason are those notions (Pr. 38, II) which explicate what is common to all things, and do not explicate (Pr. 37, II) the essence of any particular thing, and therefore must be conceived without any relation to time, but in the light of eternity.

PROPOSITION 45: *Every idea of any body or particular thing existing in actuality necessarily involves the eternal and infinite essence of God.*

Proof: The idea of a particular thing actually existing necessarily involves both the essence and the existence of the thing (Cor. Pr. 8, II). But particular things cannot be conceived without God (Pr. 15, I). Now since they have God for their cause (Pr. 6, II) insofar as he is considered under that attribute of which the things themselves are modes, their ideas (Ax. 4, I) must necessarily involve the conception of their attribute; that is (Def. 6, I), the eternal and infinite essence of God.

Scholium: Here by existence I do not mean duration, that is, existence insofar as it is considered in the abstract as a kind of quantity. I am speaking of the very nature of existence, which is attributed to particular things because they follow in infinite numbers in infinite ways from the eternal necessity of God's nature (Pr. 16, I). I am speaking, I repeat, of the very existence of particular things insofar as they are in God. For although each particular thing is determined by another particular thing to exist in a certain manner, the force by which each perseveres in existing follows from the eternal necessity of God's nature. See Cor. Pr. 24, I.

PROPOSITION 46: *The knowledge of the eternal and infinite essence of God which each idea involves is adequate and perfect.*

Proof: The proof of the preceding proposition is universally valid, and whether a thing be considered as a part or a whole, its idea, whether of whole or part, involves the eternal and infinite essence of God (preceding Pr.). Therefore, that which gives knowledge of the eternal and infinite essence of God is common to all things, and equally in the part as in the whole. And so this knowledge will be adequate (Pr. 38, II).

PROPOSITION 47: *The human mind has an adequate knowledge of the eternal and infinite essence of God.*

Proof: The human mind has ideas (Pr. 22, II) from which (Pr. 23, II) it perceives itself, its own body (Pr. 19, II), and external bodies (Cor. 1, Pr. 16 and Pr. 17, II) as actually existing, and so it has an adequate knowledge of the eternal and infinite essence of God (Prs. 45 and 46, II).

Scholium: Hence we see that God's infinite essence and his eternity are known to all. Now since all things are in God and are conceived through God, it follows that from this knowledge we can deduce a great many things so as to know them adequately and thus to form that third kind of knowledge I mentioned in Sch. 2 Pr. 40, II, of the superiority and usefulness of which we shall have occasion to speak in Part V. That men do not have as clear a knowledge of God as they do of common notions arises from the fact that they are unable to imagine God as they do bodies, and that they have connected the word "God" with the images of things which they commonly see; and this they can scarcely avoid, being affected continually by external bodies. Indeed, most errors result solely from the incorrect application of words to things. When somebody says that the lines joining the center of a circle to its circumference are unequal, he surely understands by circle, at least at that time, something different from what mathematicians understand. Likewise, when men make mistakes in arithmetic, they have different figures in mind from those on paper. So if you look only to their minds, they indeed are not mistaken; but they seem to be wrong because we think that they have in mind the figures on the page. If this were not the case, we would not think them to be wrong, just as I did not think that person to be wrong whom I recently heard shouting that his hall had flown into his neighbor's hen, for I could see clearly what he had in mind. Most controversies arise from this, that men do not correctly express what is in their mind, or they misunderstand another's mind. For, in reality, while they are hotly contradicting one another, they are either in agreement or have different things in mind, so that the apparent errors and absurdities of their opponents are not really so.

PROPOSITION 48: *In the mind there is no absolute, or free, will. The mind is determined to this or that volition by a cause, which is likewise determined by another cause, and this again by another, and so ad infinitum.*

Proof: The mind is a definite and determinate mode of thinking (Pr. 11, II), and thus (Cor. 2, Pr. 17, I) it cannot be the free cause of its actions: that is, it cannot possess an absolute faculty of willing and nonwilling. It must be determined to will this or that (Pr. 28, I) by a cause, which likewise is determined by another cause, and this again by another, etc.

Scholium: In the same way it is proved that in the mind there is no absolute faculty of understanding, desiring, loving, etc. Hence it follows that these and similar faculties are either entirely fictitious or nothing more than metaphysical entities or universals which we are wont to form from particulars. So intellect and will bear the same relation to this or that idea, this or that volition, as stoneiness to this or that stone, or man to Peter and Paul. As to the reason why men think they are free, we explained that in the Appendix to Part I.

But before proceeding further, it should here be noted that by the will I mean the faculty of affirming and denying, and not desire. I mean, I repeat, the faculty whereby the mind affirms or denies what is true or what is false, not the desire whereby the mind seeks things or shuns them. But now that we have proved that these faculties are universal notions which are not distinct from the particulars from which we form them, we must inquire whether volitions themselves are anything more than ideas of things. We must inquire, I say, whether there is in the mind any other affirmation and denial apart from that which the idea, insofar as it is an idea, involves. On this subject see the following proposition and also Def. 3, II, lest thought becomes confused with pictures. For by ideas I do not mean images such as are formed at the back of the eye—or if you like, in the middle of the brain—but conceptions of thought.

PROPOSITION 49: *There is in the mind no volition, that is, affirmation and negation, except that which an idea, insofar as it is an idea, involves.*

Proof: There is in the mind (preceding Pr.) no absolute faculty of willing and non-willing, but only particular volitions, namely, this or that affirmation, and this or that negation. Let us therefore conceive a particular volition, namely, a mode of thinking whereby the mind affirms that the three angles of a triangle are equal to two right angles. This affirmation involves the conception, or idea, of a triangle; that is, it cannot be conceived without the idea of a triangle. For to say that A must involve the conception of B is the same as to say that A cannot be conceived without B. Again, this affirmation (Ax. 3, II) cannot even be without the idea of a triangle. Therefore, this idea can neither be nor be conceived without the idea of a triangle. Furthermore, this idea of a triangle must involve this same affirmation, namely, that its three angles are equal to two right angles. Therefore, vice versa, this idea of a triangle can neither be nor be conceived without this affirmation, and so (Def. 2, II) this affirmation belongs to the essence of the idea of a triangle, and is nothing more than the essence itself. And what I have said of this volition (for it was arbitrarily selected) must also be said of every volition, namely, that it is nothing but an idea.

Corollary: Will and intellect are one and the same thing.

Proof: Will and intellect are nothing but the particular volitions and ideas (Pr. 48, II and Sch.). But a particular volition and idea are one and the same thing (preceding Pr.). Therefore, will and intellect are one and the same thing.

Scholium: By this means we have removed the cause to which error is commonly attributed. We have previously shown that falsity consists only in the privation that fragmentary and confused ideas involve. Therefore, a false idea, insofar as it is false, does not involve certainty. So when we say that a man acquiesces in what is false and has no doubt thereof, we are not thereby saying that he is certain, but only that he does not doubt, or that he acquiesces in what is false because there is nothing to cause his imagination to waver. On this point see Sch. Pr. 44, II. So however much we suppose a man to adhere to what is false, we shall never say that he is certain. For by certainty we mean something positive (Pr. 43, II and Sch.), not privation of doubt. But by privation of certainty we mean falsity.

But for a fuller explanation of the preceding proposition some things remain to be said. Then, again, there is the further task of replying to objections that may be raised against this doctrine of ours. Finally, to remove every shred of doubt, I have thought it worthwhile to point out certain advantages of this doctrine. I say certain advantages, for the most important of them will be better understood from what we have to say in Part V.

I begin, then, with the first point, and I urge my readers to make a careful distinction between an idea—i.e., a conception of the mind—and the images of things that we imagine. Again, it is essential to distinguish between ideas and the words we use to signify things. For since these three—images, words, and ideas—have been utterly confused by many, or else they fail to distinguish between them through lack of accuracy, or, finally, through lack of caution, our doctrine of the will, which it is essential to know both for theory and for the wise ordering of life, has never entered their minds. For those who think that ideas consist in images formed in us from the contact of external bodies are convinced that those ideas of things whereof we can form no like image are not ideas, but mere fictions fashioned arbitrarily at will. So they look on ideas as dumb pictures on a tablet, and misled by this preconception they fail to see that an idea, insofar as it is an idea, involves affirmation or negation. Again, those who confuse words with idea, or with the affirmation which an idea involves, think that when they affirm or deny something merely by words contrary to what they feel,

they are able to will contrary to what they feel. Now one can easily dispel these misconceptions if one attends to the nature of thought, which is quite removed from the concept of extension. Then one will clearly understand that an idea, being a mode of thinking, consists neither in the image of a thing nor in words. For the essence of words and images is constituted solely by corporeal motions far removed from the concept of thought. With these few words of warning, I turn to the aforementioned objections.

The first of these rests on the confident claim that the will extends more widely than the intellect, and therefore is different from it. The reason for their belief that the will extends more widely than the intellect is that they find—so they say—that they do not need a greater faculty of assent, that is, of affirming and denying, than they already possess, in order to assent to an infinite number of other things that we do not perceive, but that we do need an increased faculty of understanding. Therefore, will is distinct from intellect, the latter being finite and the former infinite.

Second, it may be objected against us that experience appears to tell us most indisputably that we are able to suspend judgment so as not to assent to things that we perceive, and this is also confirmed by the fact that nobody is said to be deceived insofar as he perceives something, but only insofar as he assents or dissents. For instance, he who imagines a winged horse does not thereby grant that there is a winged horse; that is, he is not thereby deceived unless at the same time he grants that there is a winged horse. So experience appears to tell us most indisputably that the will, that is, the faculty of assenting, is free, and different from the faculty of understanding.

Third, it may be objected that one affirmation does not seem to contain more reality than another; that is, we do not seem to need greater power in order to affirm that what is true is true than to affirm that what is false is true. On the other hand, we do perceive that one idea has more reality or perfection than another. For some ideas are more perfect than others in proportion as some objects are superior to others. This, again, is a clear indication that there is a difference between will and intellect.

Fourth, it may be objected that if man does not act from freedom of will, what would happen if he should be in a state of equilibrium like Buridan's ass? Will he perish of hunger and thirst? If I were to grant this, I would appear to be thinking of an ass or a statue, not of a man. If I deny it, then the man will be determining himself, and consequently will possess the faculty of going and doing whatever he wants.

Besides these objections there may possibly be others. But since I am not obliged to quash every objection that can be dreamed up, I shall make it my task to reply to these objections only, and as briefly as possible.

To the first objection I reply that, if by the intellect is meant clear and distinct ideas only, I grant that the will extends more widely than the intellect, but I deny that the will extends more widely than perceptions, that is, the faculty of conceiving. Nor indeed do I see why the faculty of willing should be termed infinite any more than the faculty of sensing. For just as by the same faculty of willing we can affirm an infinite number of things (but in succession, for we cannot affirm an infinite number of things simultaneously), so also we can sense or perceive an infinite number of bodies (in succession) by the same faculty of sensing. If my objectors should say that there are an infinite number of things that we cannot sense, I retort that we cannot grasp them by any amount of thought, and consequently by any amount of willing. But, they say, if God wanted to bring it about that we should perceive these too, he would have had to give us a greater faculty of perceiving, but not a greater faculty of willing than he has already given us. This is the same as saying that if God wishes to bring it about that we should understand an infinite number of other entities, he would have to give us a greater intellect than he

already has, so as to encompass these same infinite entities, but not a more universal idea of entity. For we have shown that the will is a universal entity, or the idea whereby we explicate all particular volitions; that is, that which is common to all particular volitions. So if they believe that this common or universal idea of volitions is a faculty, it is not at all surprising that they declare this faculty to extend beyond the limits of the intellect to infinity. For the term "universal" is applied equally to one, to many, and to an infinite number of individuals.

To the second objection I reply by denying that we have free power to suspend judgment. For when we say that someone suspends judgment, we are saying only that he sees that he is not adequately perceiving the thing. So suspension of judgment is really a perception, not free will. To understand this more clearly, let us conceive a boy imagining a winged horse and having no other perception. Since this imagining involves the existence of a horse (Cor. Pr. 17, II), and the boy perceives nothing to annul the existence of the horse, he will regard the horse as present and he will not be able to doubt its existence, although he is not certain of it. We experience this quite commonly in dreams, nor do I believe there is anyone who thinks that while dreaming he has free power to suspend judgment regarding the contents of his dream, and of bringing it about that he should not dream what he dreams that he sees. Nevertheless, it does happen that even in dreams we suspend judgment, to wit, when we dream that we are dreaming. Furthermore, I grant that nobody is deceived insofar as he has a perception; that is, I grant that the imaginings of the mind, considered in themselves, involve no error (see Sch. Pr. 17, II). But I deny that a man makes no affirmation insofar as he has a perception. For what else is perceiving a winged horse than affirming wings of a horse? For if the mind should perceive nothing apart from the winged horse, it would regard the horse as present to it, and would have no cause to doubt its existence nor any faculty of dissenting, unless the imagining of the winged horse were to be connected to an idea which annuls the existence of the said horse, or he perceives that the idea which he has of the winged horse is inadequate. Then he will either necessarily deny the existence of the horse or he will necessarily doubt it.

In the above I think I have also answered the third objection by my assertion that the will is a universal term predicated of all ideas and signifying only what is common to all ideas, namely, affirmation, the adequate essence of which, insofar as it is thus conceived as an abstract term, must be in every single idea, and the same in all in this respect only. But not insofar as it is considered as constituting the essence of the idea, for in that respect particular affirmations differ among themselves as much as do ideas. For example, the affirmation which the idea of a circle involves differs from the affirmation which the idea of a triangle involves as much as the idea of a circle differs from the idea of a triangle. Again, I absolutely deny that we need an equal power of thinking to affirm that what is true is true as to affirm that what is false is true. For these two affirmations, if you look to their meaning and not to the words alone, are related to one another as being to nonbeing. For there is nothing in ideas that constitutes the form of falsity (see Pr. 35, II with Sch. and Sch. Pr. 47, II). Therefore, it is important to note here how easily we are deceived when we confuse universals with particulars, and mental constructs [*entia rationis*] and abstract terms with the real.

As to the fourth objection, I readily grant that a man placed in such a state of equilibrium (namely, where he feels nothing else but hunger and thirst and perceives nothing but such-and-such food and drink at equal distances from him) will die of hunger and thirst. If they ask me whether such a man is not to be reckoned an ass rather than a man,

I reply that I do not know, just as I do not know how one should reckon a man who hangs himself, or how one should reckon babies, fools, and madmen.

My final task is to show what practical advantages accrue from knowledge of this doctrine, and this we shall readily gather from the following points:

1. It teaches that we act only by God's will, and that we share in the divine nature, and all the more as our actions become more perfect and as we understand God more and more. Therefore, this doctrine, apart from giving us complete tranquillity of mind, has the further advantage of teaching us wherein lies our greatest happiness or blessedness, namely, in the knowledge of God alone, as a result of which we are induced only to such actions as are urged on us by love and piety. Hence we clearly understand how far astray from the true estimation of virtue are those who, failing to understand that virtue itself and the service of God are happiness itself and utmost freedom, expect God to bestow on them the highest rewards in return for their virtue and meritorious actions as if in return for the basest slavery.

2. It teaches us what attitude we should adopt regarding fortune, or the things that are not in our power, that is, the things that do not follow from our nature; namely, to expect and to endure with patience both faces of fortune. For all things follow from God's eternal decree by the same necessity as it follows from the essence of a triangle that its three angles are equal to two right angles.

3. This doctrine assists us in our social relations, in that it teaches us to hate no one, despise no one, ridicule no one, be angry with no one, envy no one. Then again, it teaches us that each should be content with what he has and should help his neighbor, not from womanish pity, or favor, or superstition, but from the guidance of reason as occasion and circumstance require. This I shall demonstrate in Part IV.

4. Finally, this doctrine is also of no small advantage to the commonwealth, in that it teaches the manner in which citizens should be governed and led; namely, not so as to be slaves, but so as to do freely what is best.

And thus I have completed the task I undertook in this Scholium, and thereby I bring to an end Part II, in which I think I have explained the nature of the human mind and its properties at sufficient length and as clearly as the difficult subject matter permits, and that from my account can be drawn many excellent lessons, most useful and necessary to know.

JOHN LOCKE

1632–1704

John Locke was born in Wrington, Somerset, the son of a Puritan lawyer. His father fought on the side of the Parliament against Charles I, and Locke himself was a lifelong defender of the parliamentary system.

As a teenager, Locke attended Westminster School, studying classics under the harsh discipline of the time. He later condemned the English educational system for its brutality and one-sided emphasis on the past. In 1652, he entered Christ Church, Oxford, where he received his B.A. in 1656 and an M.A. in 1658. Again, he found his Oxford education obsessed with the past—in particular the Scholasticism of the late Middle Ages. Hence, he sought knowledge in the emerging sciences. In 1659, he was named a Senior Student at Oxford—a position he held until he lost it for political reasons in 1684.

In 1662, Locke met Lord Ashley, the Earl of Shaftesbury. Locke and Shaftesbury became close friends and in 1667 Locke went to live with Shaftesbury as his personal physician, securing his medical degree and license in 1674. Locke also helped Shaftesbury with several projects, including writing a constitution for the colony of Carolina. As a member of Shaftesbury's entourage, Locke traveled extensively and met many of the leading thinkers of his day.

When Shaftesbury became the leader of the parliamentary opposition to the king, Locke's friendship became a liability. Shaftesbury was tried for treason in 1681; although he was acquitted, he fled to Holland where he died in 1683. Without the backing of his powerful patron, Locke also fled to Holland, where he became an advisor to William and Mary of Orange. Following the Glorious Revolution of 1688, which removed Locke's enemy, James II, from the throne, Locke returned home in the company of William and Mary—now king and queen of England.

Following his return to England, Locke published his two most important works, *Essay Concerning Human Understanding* (1690) and *Two Treatises of Government* (1690). Locke spent the rest of his life writing and serving the new government as Commissioner of Appeals and, later, as Commissioner of Trade and Plantations. He died quietly at the home of a friend in 1704.

* * *

Locke begins his first major work, *Essays Concerning Human Understanding*, with several arguments against the Cartesian notion of innate ideas. He claims that the mind is a *tabula rasa*, a blank tablet or “white paper, void of all characters, without any ideas.” All ideas come from one source: experience. Experience, in turn, is of two types: sensation or reflection. Sensations are derived from our sensory perceptions of the external world. Reflection, on the other hand, provides ideas by the mind “reflecting on its own operations within itself.”

Having explained the *origin* of ideas, Locke then explains the *nature* of ideas. All ideas are either simple or complex. Simple ideas are uncompounded; that is, they cannot be broken down further, such as the ideas of “sweetness” or “redness.” Complex ideas are composed of two or more simple ideas, such as the idea of a red, sweet apple. Locke then classifies simple and complex ideas by sources (sensation, reflection, or both).

Having explained the sources of ideas, Locke next asks if the ideas that come from sensation actually resemble the qualities of the external objects that gave rise to them. He answers first by dividing qualities into primary and secondary. Primary qualities are “utterly inseparable” from external objects regardless of their state—such qualities include solidity, extension, figure, motion, rest, and number. On the other hand, secondary qualities are “nothing in the objects themselves, but powers to produce various sensations in us by their primary qualities.” These secondary qualities would include such characteristics as colors, sounds, tastes, and the like. So, for example, the primary qualities of an apple (a solid, being extended in space, etc.) have the power to produce the secondary quality of a sweet taste and a red color. This analysis means that the world *as we experience it* is only a representation of the way the world actually is. The blooming, buzzing, colorful world of our experience is not the real world.

Finally, Locke asks what these primary and secondary qualities are qualities of. He argues that there must be “some *substratum* wherein [ideas] do subsist, and from which they do result, which therefore we call *substance*.” Although we cannot have any idea of substance, nor can we explain the concept, we must posit substance as a “supporter” of qualities—a “something I know not what,” Locke said.

Locke spent twenty years preparing his *Essay Concerning Human Understanding* for publication in 1690. The *Essay* went through several editions while Locke was still living, including an abridgment with his consent. The following selection is an abridgment by Walter Kaufmann, which I have modified. This abridgment owes much to John Wynne’s (1695) editing and to the modern work of A.S. Pringle-Pattison.

In addition this work, Locke wrote *Two Treatises of Government* (1690), *The Reasonableness of Christianity as Delivered in the Scriptures* (1695), *Vindications of the Reasonableness of Christianity* (1695 and 1697), and several “Letters” concerning toleration.

* * *

The best commentary on Locke's thought in general and on the *Essay* in particular is Richard I. Aaron, *John Locke* (Oxford: Clarendon Press, 1971). Also useful as a general overview are D.J. O'Connor, *John Locke* (Harmondsworth, Middlesex: Penguin Books, 1952); John W. Yolton, *Locke and the Way of Ideas* (Oxford: Clarendon Press, 1968); R.S. Woolhouse, *Locke* (Minneapolis: University of Minnesota Press, 1983); John Dunn, *Locke* (New York: Oxford University Press, 1984)—part of the "Past Masters" series, now reprinted in the combined volume of John Dunn et al., eds., *The British Empiricists* (Oxford: Oxford University Press, 1992); Michael Ayers, *Locke* (Oxford: Routledge, 1994); Nicholas Jolley, *Locke: His Philosophical Thought* (Oxford: Oxford University Press, 1999); and Roger Woolhouse, *Locke: A Biography* (Cambridge: Cambridge University Press, 2007). For help with Locke's *Essay*, see John W. Yolton, *Locke and the Compass of Human Understanding: A Selective Commentary on the "Essay"* (London: Cambridge University Press, 1970); John L. Mackie, *Problems from Locke* (Oxford: Oxford University Press, 1976); Gary Fuller et al, *John Locke: An Essay Concerning Human Understanding in Focus* (London: Routledge, 2000); and E.J. Lowe, *Locke* (London: Routledge, 2005); Lex Newman, ed., *The Cambridge Companion to Locke's Essay Concerning Human Understanding* (Cambridge: Cambridge University Press, 2007); and William Uzgalis, *Locke's Essay Concerning Human Understanding: A Reader's Guide* (London: Continuum, 2007). Nicholas Wolterstorff, *John Locke and the Ethics of Belief* (Cambridge: Cambridge University Press, 1996) provides guidance to the last section of the *Essay*. For guides to Locke's political thought, see John Dunn, *The Political Thought of John Locke* (Cambridge: Cambridge University Press, 1969); J.W. Gough, *John Locke's Political Philosophy* (Oxford: Clarendon Press, 1973); and Greg Forster, *John Locke's Politics of Moral Consensus* (Cambridge: Cambridge University Press, 2005). John Yolton, *A Locke Dictionary* (Oxford: Basil Blackwell, 1993) provides a useful reference work. For collections of essays on Locke's thought, see C.B. Martin and D.M. Armstrong, eds., *Locke and Berkeley: A Collection of Critical Essays* (Notre Dame, IN: Notre Dame University Press, 1968); John W. Yolton, ed., *John Locke: Problems and Perspectives: A Collection of New Essays* (Cambridge: Cambridge University Press, 1969); Vere Chappell's books, *Essays on Early Modern Philosophers: John Locke—Theory of Knowledge, John Locke—Political Philosophy* (all Hamden, CT: Garland Press, 1992), and *The Cambridge Companion to Locke* (Cambridge: Cambridge University Press, 1994); J.R. Milton, ed., *Locke's Moral, Political and Legal Philosophy* (New York: Ashgate, 1999); and Udo Thiel, ed., *Locke: Epistemology and Metaphysics* (New York: Ashgate, 2001). For an interesting, if unusual, analysis of Locke's political thought, see Leo Strauss, *Natural Right and History* (Chicago: University of Chicago Press, 1952).

AN ESSAY CONCERNING HUMAN UNDERSTANDING (abridged)

INTRODUCTION

1. *An enquiry into the understanding, pleasant and useful.*—Since it is the *understanding* that sets man above the rest of sensible beings, and gives him all the advantage and dominion which he has over them, it is certainly a subject, even for its nobleness, worth our labour to enquire into. The understanding, like the eye, whilst it makes us see and perceive all other things, takes no notice of itself; and it requires art and pains to set it at a distance, and make it its own object. But whatever be the difficulties that lie in the way of this enquiry; whatever it be that keeps us so much in the dark to ourselves; sure I am that all the light we can let in upon our own minds, all the acquaintance we can make with our own understandings, will not only be very pleasant, but bring us great advantage in directing our thoughts in the search of other things.

2. *Design.*—This, therefore, being my purpose, to enquire into the original, certainty, and extent of *human knowledge*, together with the grounds and degrees of *belief*, *opinion*, and *assent*, I shall not at present meddle with the physical consideration of the mind, or trouble myself to examine wherein its essence consists, or by what motions of our spirits, or alterations of our bodies, we come to have any *sensation* by our organs, or any *ideas* in our understandings; and whether those ideas do, in their formation, any or all of them, depend on matter or no. These are speculations which, however curious and entertaining, I shall decline, as lying out of my way in the design I am now upon. It shall suffice to my present purpose, to consider the discerning faculties of a man as they are employed about the objects which they have to do with: and I shall imagine I have not wholly misemployed myself in the thoughts I shall have on this occasion, if, in this historical, plain method, I can give any account of the ways whereby our understandings come to attain those notions of things we have, and can set down any measures of the certainty of our knowledge, or the grounds of those persuasions which are to be found amongst men, so various, different, and wholly contradictory; and yet asserted somewhere or other with such assurance, and confidence, that he that shall take a view of the opinions of mankind, observe their opposition, and at the same time consider the fondness and devotion wherewith they are embraced, the resolution and eagerness wherewith they are maintained, may perhaps have reason to suspect that either there is no such thing as truth at all, or that mankind hath no sufficient means to attain a certain knowledge of it.

3. *Method.*—It is therefore worth while to search out the bounds between opinion and knowledge, and examine by what measures, in things whereof we have no certain knowledge, we ought to regulate our assent, and moderate our persuasions. In order whereunto, I shall pursue this following method:—

First, I shall enquire into the original of those *ideas*, notions, or whatever else you please to call them, which a man observes, and is conscious to himself he has in his mind; and the ways whereby the understanding comes to be furnished with them.

Secondly, I shall endeavour to show what *knowledge* the understanding hath by those ideas, and the certainty, evidence, and extent of it.

Thirdly, I shall make some enquiry into the nature and grounds of *faith* or *opinion*: whereby I mean that assent which we give to any proposition as true, of whose

truth yet we have no certain knowledge. And here we shall have occasion to examine the reasons and degrees of assent.

* * *

8. *What "idea" stands for.*—Thus much I thought necessary to say concerning the occasion of this enquiry into human understanding. But, before I proceed on to what I have thought on this subject, I must here, in the entrance, beg pardon of my reader for the frequent use of the word *idea* which he will find in the following treatise. It being that term which, I think, serves best to stand for whatsoever is the object of the understanding when a man thinks, I have used it to express whatever is meant by *phantasm*, *notion*, *species*, or whatever it is which the mind can be employed about in thinking; and I could not avoid frequently using it.

I presume it will be easily granted me, that there are such *ideas* in men's minds; every one is conscious of them in himself, and men's words and actions will satisfy him that they are in others.

Our first enquiry then shall be,—how they come into the mind.

BOOK I. NEITHER PRINCIPLES NOR IDEAS ARE INNATE

CHAPTER 1. NO INNATE PRINCIPLES IN THE MIND

1. *The way shown how we come by any knowledge, sufficient to prove it not innate.*—It is an established opinion amongst some men, that there are in the understanding certain innate principles; some primary notions, (*koinai ennoiai*), characters, as it were stamped upon the mind of man, which the soul receives in its very first being, and brings into the world with it. It would be sufficient to convince unprejudiced readers of the falseness of this supposition, if I should only show (as I hope I shall in the following parts of this discourse) how men, barely by the use of their natural faculties, may attain to all the knowledge they have, without the help of any innate impressions; and may arrive at certainty, without any such original notions or principles. For I imagine any one will easily grant, that it would be impertinent to suppose the ideas of colours innate in a creature to whom God hath given sight, and a power to receive them by the eyes from external objects: and no less unreasonable would it be to attribute several truths to the impressions of nature and innate characters, when we may observe in ourselves faculties fit to attain as easy and certain knowledge of them as if they were originally imprinted on the mind.

But because a man is not permitted without censure to follow his own thoughts in the search of truth, when they lead him ever so little out of the common road, I shall set down the reasons that made me doubt of the truth of that opinion, as an excuse for my mistake, if I be in one; which I leave to be considered by those who, with me, dispose themselves to embrace truth wherever they find it.

2. *General assent the great argument.*—There is nothing more commonly taken for granted, than that there are certain principles, both *speculative* and *practical* (for they speak of both), universally agreed upon by all mankind; which therefore, they argue, must needs be the constant impressions which the souls of men receive in their

first beings and which they bring into the world with them, as necessarily and really as they do any of their inherent faculties.

3. *Universal consent proves nothing innate.*—This argument, drawn from universal consent, has this misfortune in it, that if it were true in matter of fact, that there were certain truths wherein all mankind agreed, it would not prove them innate, if there can be any other way shown, how men may come to that universal agreement in the things they do consent in; which I presume may be done.

4. *“What is, is,” and “It is impossible for the same Thing to be and not to be,” not universally assented to.*—But, which is worse, this argument of universal consent which is made use of to prove innate principles, seems to me a demonstration that there are none such: because there are none to which all mankind give an universal assent. I shall begin with the speculative, and instance in those magnified principles of demonstration, “Whatsoever is, is,” and “It is impossible for the same thing to be and not to be”; which, of all others, I think have the most allowed title to innate. These have so settled a reputation of maxims universally received, that it will no doubt be thought strange if any one should seem to question it. But yet I take liberty to say, that these propositions are so far from having an universal assent, that there are a great part of mankind to whom they are not so much as known.

5. *Not on the mind naturally imprinted, because not known to children, idiots, etc.*—For, first, it is evident, that all children and idiots have not the least apprehension or thought of them. And the want of that is enough to destroy that universal assent, which must needs be the necessary concomitant of all innate truths: it seeming to me near a contradiction to say, that there are truths imprinted on the soul which it perceives or understands not; imprinting, if it signify anything, being nothing else but the making certain truths to be perceived . . . No proposition can be said to be in the mind which it never yet knew, which it was never yet conscious of. For if any one may, then, by the same reason, all propositions that are true, and the mind is *capable* ever of assenting to, may be said to be in the mind, and to be imprinted; since if any one can be said to be in the mind, which it never yet knew, it must be only because it is capable of knowing it; and so the mind is of all truths it ever shall know. Nay, thus truths may be imprinted on the mind which it never did, nor ever shall know: for a man may live long, and die at last in ignorance of many truths which his mind was capable of knowing, and that with certainty. So that if the capacity of knowing be the natural impression contended for, all the truths a man ever comes to know will, by this account, be every one of them innate: and this great point will amount to no more, but only to a very high improper way of speaking. But then, to what end such contest for certain innate maxims? If truths can be imprinted on the understanding without being perceived, I can see no difference there can be between any truths the mind is capable of knowing in respect of their original: they must all be innate, or all adventitious; in vain shall a man go about to distinguish them. He therefore that talks of innate notions in the understanding, cannot (if he intend thereby any distinct sort of truths) mean such truths to be in the understanding as it never perceived, and is yet wholly ignorant of. For if these words “to be in the understanding” have any propriety, they signify to be understood. If therefore these two propositions: “Whatsoever is, is,” and, “It is impossible for the same thing to be, and not to be,” are by nature imprinted, children cannot be ignorant of them; infants, and all that have souls, must necessarily have them in their understandings, know the truth of them, and assent to it.

BOOK II. OF IDEAS

CHAPTER I. OF IDEAS IN GENERAL AND THEIR ORIGINAL

1. *Idea is the object of thinking.*—Every man being conscious to himself that he thinks, and that which his mind is applied about whilst thinking being the ideas that are there, it is past doubt that men have in their minds several ideas, such as are those expressed by the words *whiteness, hardness, sweetness, thinking, motion, man, elephant, army, drunkenness*, and others. It is in the first place then to be enquired, How he comes by them?

I know it is a received doctrine, that men have native ideas and original characters stamped upon their minds in their very first being. This opinion I have at large examined already; and, I suppose, what I have said in the foregoing Book will be much more easily admitted, when I have shown whence the understanding may get all the ideas it has, and by what ways and degrees they may come into the mind; for which I shall appeal to every one's own observation and experience.

2. *All ideas come from sensation or reflection.*—Let us then suppose the mind to be, as we say, white paper, void of all characters, without any ideas; how comes it to be furnished? Whence comes it by that vast store, which the busy and boundless fancy of man has painted on it with an almost endless variety? Whence has it all the *materials* of reason and knowledge? To this I answer, in one word, from EXPERIENCE; in that all our knowledge is founded, and from that it ultimately derives itself. Our observation, employed either about external sensible objects, or about the internal operations of our minds, perceived and reflected on by ourselves, is that which supplies our understandings with all the materials of thinking. These two are the fountains of knowledge, from whence all the ideas we have or can naturally have, do spring.

3. *The objects of sensation one source of ideas.*—First, our senses, conversant about particular sensible objects, do convey into the mind several distinct perceptions of things, according to those various ways wherein those objects do affect them; and thus we come by those *ideas* we have of *yellow, white, heat, cold, soft, hard, bitter, sweet*, and all those which we call sensible qualities; which when I say the senses convey into the mind, I mean, they from external objects convey into the mind what produces there those perceptions. This great source of most of the ideas we have, depending wholly upon our senses, and derived by them to the understanding, I call, SENSATION.

4. *The operations of our minds the other source of them.*—Secondly, the other fountain, from which experience furnishes the understanding with ideas, is the perception of the operations of our mind within us, as it is employed about the ideas it has got; which operations, when the soul comes to reflect on and consider, do furnish the understanding with another set of ideas which could not be had from things without: and such are *perception, thinking, doubting, believing, reasoning, knowing, willing*, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do from these receive into our understanding as distinct ideas, as we do from bodies affecting our senses. This source of ideas every man has wholly in himself: and though it be not sense, as having nothing to do with external objects, yet it is very like it, and might properly enough be called *internal sense*. But as I call the other SENSATION, so I call this REFLECTION, the ideas it affords being such only as the mind gets by reflecting on its own operations within itself. By Reflection, then, in the following part of this discourse, I would be understood to mean that notice which the mind takes of its own

St. Paul's Cathedral, London, facade, built 1675–1710. Like Locke, Sir Christopher Wren (1632–1723) was interested in science and combining reason and religion. The left turret of the facade he designed for St. Paul's conceals an observatory (opposite the clock in the right turret). (©Angelo Hornak/Alamy Stock Photo)

operations, and the manner of them, by reason whereof there come to be ideas of these operations in the understanding. These two, I say, viz., external material things as the objects of SENSATION, and the operations of our own minds within as the objects of REFLECTION are, to me, the only originals from whence all our ideas take their beginnings. The term *operations* here, I use in a large sense, as comprehending not barely the actions of the mind about its ideas, but some sort of passions arising sometimes from them, such as is the satisfaction or uneasiness arising from any thought.

5. *All our ideas are of the one or the other of these.*—The understanding seems to me not to have the least glimmering of any ideas which it doth not receive from one of these two. *External objects* furnish the mind with the ideas of sensible qualities, which are all those different perceptions they produce in us; and *the mind* furnishes the understanding with ideas of its own operations. These, when we have taken a full survey of them, and their several modes, combinations, and relations, we shall find to contain all our whole stock of ideas; and that we have nothing in our minds which did not come in one of these two ways. Let any one examine his own thoughts, and thoroughly search into his understanding, and then let him tell me, whether all the original ideas he has there, are any other than of the objects of his senses, or of the operations of his mind considered as objects of his reflection; and how great a mass of knowledge soever he imagines to be lodged there, he will, upon taking a strict view, see that he has not any idea in his mind but what one of these two have imprinted, though perhaps with infinite variety compounded and enlarged by the understanding, as we shall see hereafter.

6. *Observable in children.*—He that attentively considers the state of a child at his first coming into the world, will have little reason to think him stored with plenty of ideas that are to be the matter of his future knowledge. It is *by degrees* he comes to be

furnished with them: and though the ideas of obvious and familiar qualities themselves before the memory begins to keep a register of time and order, yet it is often so late before some unusual qualities come in the way, that there are few men that cannot recollect the beginning of their acquaintance with them: and if it were worth while, no doubt a child might be so ordered as to have but a very few even of the ordinary ideas till he were grown up to a man. But all that are born into the world being surrounded with bodies that perpetually and diversely affect them, variety of ideas, whether care be taken about it or no, are imprinted on the minds of children. Light and colours are busy and at hand everywhere when the eye is but open; sounds and some tangible qualities fail not to solicit their proper senses, and force an entrance to the mind; but yet I think it will be granted easily, that if a child were kept in a place where he never saw any other but black and white till he were a man, he would have no more ideas of scarlet or green, than he that from his childhood never tasted an oyster or a pineapple has of those particular relishes.

7. *Men are differently furnished with these according to the different objects they converse with.*—Men then come to be furnished with fewer or more simple ideas from without, according as the objects they converse with afford greater or less variety; and from the operations of their minds within, according as they more or less reflect on them. For, though he that contemplates the operations of his mind cannot but have plain and clear ideas of them; yet, unless he turn his thoughts that way, and considers them *attentively*, he will no more have clear and distinct ideas of all the operations of his mind, and all that may be observed therein, than he will have all the particular ideas of any landscape, or of the parts and motions of a clock, who will not turn his eyes to it, and with attention heed all the parts of it. The picture or clock may be so placed, that they may come in his way every day; but yet he will have but a confused idea of all the parts they are made up of, till he applies himself with attention to consider them each in particular.

8. *Ideas of reflection later, because they need attention.*—And hence we see the reason why it is pretty late before most children get ideas of the operations of their own minds; and some have not any very clear or perfect ideas of the greatest part of them all their lives. Because, though they pass there continually, yet, like floating visions, they make not deep impressions enough to leave in the mind clear, distinct, lasting ideas, till the understanding turns inward upon itself, reflects on its own operations, and makes them the object of its own contemplation. Children, when they come first into it, are surrounded with a world of new things, which, by a constant solicitation of their senses, draw the mind constantly to them, forward to take notice of new, and apt to be delighted with the variety of changing objects. Thus the first years are usually employed and diverted in looking abroad. Men's business in them is to acquaint themselves with what is to be found without; and so, growing up in a constant attention to outward sensations, seldom make any considerable reflection on what passes within them till they come to be of riper years; and some scarce ever at all.

9. *The soul begins to have ideas when it begins to perceive.*—To ask, at what time a man has first any ideas, is to ask when he begins to perceive; having ideas, and perception, being the same thing. I know it is an opinion, that the soul always thinks; and that it has the actual perception of ideas in itself constantly, as long as it exists; and that actual thinking is as inseparable from the soul, as actual extension is from the body: which if true, to enquire after the beginning of a man's ideas is the same as to enquire after the beginning of his soul. For by this account, soul and its ideas, as body and its extension, will begin to exist both at the same time.

CHAPTER 2. OF SIMPLE IDEAS

1. *Uncompounded appearances.*—The better to understand the nature, manner, and extent of our knowledge, one thing is carefully to be observed concerning the ideas we have; and that is, that some of them are *simple*, and some *complex*.

Though the qualities that affect our senses are, in the things themselves, so united and blended that there is no separation, no distance between them; yet it is plain the ideas they produce in the mind enter by the senses simple and unmixed. For though the sight and touch often take in from the same object at the same time different ideas; as a man sees at once motion and colour, the hand feels softness and warmth in the same piece of wax; yet the simple ideas thus united in the same subject are as perfectly distinct as those that come in by different senses. The coldness and hardness which a man feels in a piece of ice being as distinct ideas in the mind as the smell and whiteness of a lily, or as the taste of sugar and smell of a rose: and there is nothing can be plainer to a man than the clear and distinct perception he has of those simple ideas; which, being each in itself uncompounded, contains in it nothing but *one uniform appearance or conception in the mind*, and is not distinguishable into different ideas.

2. *The mind can neither make nor destroy them.*—These simple ideas, the materials of all our knowledge, are suggested and furnished to the mind only by those two ways above mentioned, viz., sensation and reflection. When the understanding is once stored with these simple ideas, it has the power to repeat, compare, and unite them, even to an almost infinite variety, and so can make at pleasure new complex ideas. But it is not in the power of the most exalted wit or enlarged understanding, by any quickness or variety of thought, to *invent* or *frame* one new simple idea in the mind, not taken in by the ways before mentioned; nor can any force of the understanding *destroy* those that are there. The dominion of man in this little world of his own understanding, being much-what the same as it is in the great world of visible things, wherein his power, however managed by art and skill, reaches no farther than to compound and divide the materials that are made to his hand, but can do nothing towards the making the least particle of new matter, or destroying one atom of what is already in being. The same inability will every one find in himself, who shall go about to fashion in his understanding any simple idea not received in by his senses from external objects, or by reflection from the operations of his own mind about them. I would have any one try to fancy any taste which had never affected his palate, or frame the idea of a scent he had never smelt; and when he can do this, I will also conclude, that a blind man hath ideas of colours, and a deaf man true distinct notions of sounds.

3. *Only the qualities that affect the sense are imaginable.*—This is the reason why, though we cannot believe it impossible to God to make a creature with other organs, and more ways to convey into the understanding the notice of corporeal things than those five, as they are usually counted, which he has given to man—yet I think it is *not possible* for any one to imagine any other qualities in bodies, howsoever constituted, whereby they can be taken notice of, besides sounds, tastes, smells, visible and tangible qualities. And had mankind been made with but four senses, the qualities then which are the object of the fifth sense, had been as far from our notice, imagination, and conception, as now any belonging to a sixth, seventh, or eighth sense, can possibly be: which, whether yet some other creatures, in some other parts of this vast and stupendous universe, may not have, will be a great presumption to deny. He that will not set himself proudly at the top of all things, but will consider the immensity of this fabric, and the great variety that is to be found in this little and inconsiderable part of it which he has to do with, may be apt to

think, that in other mansions of it there may be other and different intelligible beings, of whose faculties he has as little knowledge or apprehension, as a worm shut up in one drawer of a cabinet hath of the senses or understanding of a man; such variety and excellency being suitable to the wisdom and power of the Maker. I have here followed the common opinion of man's having but five senses, though perhaps there may be justly counted more, but either supposition serves equally to my present purpose.

CHAPTER 3. OF IDEAS OF ONE SENSE

1. *Division of simple ideas.*—The better to conceive the ideas we receive from sensation, it may not be amiss for us to consider them in reference to the different ways whereby they make their approaches to our minds, and make themselves perceivable by us.

First, then, There are some which come into our minds *by one sense only*.

Secondly. There are others that convey themselves into the mind *by more senses than one*.

Thirdly. Others that are from *reflection only*.

Fourthly. There are some that make themselves way, and are suggested to the mind *by all the ways of sensation and reflection*.

We shall consider them apart under these several heads.

Ideas of one sense. There are some ideas which have admittance only through one sense, which is peculiarly adapted to receive them. Thus light and colours, as white, red, yellow, blue, with their several degrees or shades and mixtures, as green, scarlet, purple, sea-green, and the rest come in only by the eyes; all kinds of noises, sounds, and tones, only by the ears; the several tastes and smells, by the nose and palate. And if these organs, or the nerves which are the conduits to convey them from without to their audience in the brain, the mind's presence-room (as I may so call it), are, any of them, so disordered as not to perform their functions, they have no postern to be admitted by, no other way to bring themselves into view, and be perceived by the understanding.

The most considerable of those belonging to the touch are heat, and cold, and solidity; all the rest, consisting almost wholly in the sensible configuration, as smooth and rough; or else, more or less firm adhesion of the parts, as hard and soft, tough and brittle, are obvious enough.

2. *Few simple ideas have names.*—I think it will be needless to enumerate all the particular simple ideas belonging to each sense. Nor indeed is it possible if we would, there being a great many more of them belonging to most of the senses than we have names for. The variety of smells, which are as many almost, if not more than species of bodies in the world, do most of them want names. Sweet and stinking commonly serve our turn for these ideas, which in effect is little more than to call them pleasing or displeasing; though the smell of a rose and violet, both sweet, are certainly very distinct ideas. Nor are the different tastes that by our palates we receive ideas of, much better provided with names. Sweet, bitter, sour, harsh, and salt, are almost all the epithets we have to denominate that numberless variety of relishes which are to be found distinct, not only in almost every sort of creatures, but in the different parts of the same plant, fruit, or animal. The same may be said of colours and sounds. I shall therefore, in the account of simple ideas I am here giving, content myself to set down only such as are most material to our present purpose, or are in themselves less apt to be taken notice of, though they are very frequently the ingredients of our complex ideas; amongst which, I think, I may well account solidity, which therefore I shall treat of in the next chapter.

CHAPTER 4. OF SOLIDITY

1. *We receive this idea from touch.*—The idea of solidity we receive by our touch; and it arises from the resistance which we find in body to the entrance of any other body into the place it possesses, till it has left it. There is no idea which we receive more constantly from sensation than solidity. Whether we move or rest, in what posture soever we are, we always feel something under us that supports us, and hinders our farther sinking downwards; and the bodies which we daily handle make us perceive that whilst they remain between them, they do, by an insurmountable force, hinder the approach of the parts of our hands that press them. *That which thus hinders the approach of two bodies, when they are moving one towards another, I call solidity.* I will not dispute whether this acceptance of the word solid be nearer to its original signification than that which mathematicians use it in: it suffices that, I think, the common notion of solidity will allow, if not justify, this use of it; but if any one think it better to call it *impenetrability*, he has my consent. Only I have thought the term solidity the more proper to express this idea, not only because of its vulgar use in that sense, but also because it carries something more of positive in it than impenetrability, which is negative, and is, perhaps, more a consequence of solidity than solidity itself. This, of all other, seems the idea most intimately connected with and essential to body, so as nowhere else to be found or imagined, but only in matter; and though our senses take no notice of it, but in masses of matter, of a bulk sufficient to cause a sensation in us; yet the mind, having once got this idea from such grosser sensible bodies, traces it farther, and considers it, as well as figure, in the minutest particle of matter that can exist, and finds it inseparably inherent in body, wherever or however modified.

2. *Solidity fills space.*—This is the idea which belongs to body, whereby we conceive it to fill space. The idea of which filling of space is,—that where we imagine any space taken up by a solid substance, we conceive it so to possess it, that it excludes all other solid substances; and will for ever hinder any other two bodies, that move towards one another in a straight line, from coming to touch one another, unless it removes from between them in a line not parallel to that which they move in. This idea of it, the bodies which we ordinarily handle sufficiently furnish us with.

3. *Distinct from space.*—This resistance, whereby it keeps other bodies out of the space which it possesses, is so great, that no force, how great soever, can surmount it. All the bodies in the world, pressing a drop of water on all sides, will never be able to overcome the resistance which it will make, as soft as it is, to their approaching one another, till it be removed out of their way: whereby our idea of solidity is distinguished both from pure space, which is capable neither of resistance nor motion, and from the ordinary idea of hardness. For a man may conceive two bodies at a distance so as they may approach one another without touching or displacing any solid thing till their superficies come to meet; whereby, I think, we have the clear idea of space without solidity. For (not to go so far as annihilation of any particular body) I ask, whether a man cannot have the idea of the motion of one single body alone, without any other succeeding immediately into its place? I think it is evident he can: the idea of motion in one body no more including the idea of motion in another, than the idea of a square figure in one body includes the idea of a square figure in another. I do not ask, whether bodies do so exist, that the motion of one body cannot really be without the motion of another? To determine this either way is to beg the question for or against a *vacuum*. But my question is, whether one cannot have the *idea* of one body moved, whilst others are at rest?

And I think this no one will deny: if so, then the place it deserted gives us the idea of pure space without solidity, whereinto another body may enter without either resistance or protrusion of anything. When the sucker in a pump is drawn, the space it filled in the tube is certainly the same, whether any other body follows the motion of the sucker or no; nor does it imply a contradiction that upon the motion of one body, another that is only contiguous to it should not follow it. The necessity of such a motion is built only on the supposition, that the world is full, but not on the distinct *ideas* of space and solidity; which are as different as resistance and not resistance, protrusion and not protrusion. And that men have ideas of space without body, their very disputes a vacuum plainly demonstrate as is showed in another place.

4. *From hardness.*—Solidity is hereby also differenced from hardness, in that solidity consists in repletion, and so an utter exclusion of other bodies out of the space it possesses; but hardness, in a firm cohesion of the parts of matter, making up masses of a sensible bulk, so that the whole does not easily change its figure. And, indeed, hard and soft are names that we give to things only in relation to the constitutions of our own bodies; that being generally called hard by us which will put us to pain sooner than change figure by the pressure of any part of our bodies; and that, on the contrary, soft which changes the situation of its parts upon an easy and unpainful touch.

But this difficulty of changing the situation of the sensible parts amongst themselves, or of the figure of the whole, gives no more solidity to the hardest body in the world than to the softest; nor is an adamant one jot more solid than water. For though the two flat sides of two pieces of marble will more easily approach each other, between there is nothing but water or air, than if there be a diamond between them; yet it is not that the parts of the diamond are more solid than those of water, or resist more, but because the parts of water being more easily separable from each other, they will by a side-motion be more easily removed and give way to the approach of the two pieces of marble: but if they could be kept from making place by that side-motion, they would eternally hinder the approach of these two pieces of marble as much as the diamond. The softest body in the world will as invincibly resist the coming together of any two other bodies, if it be not put out of the way, but remain between them, as the hardest that can be found or imagined. He that shall fill a yielding soft body well with air or water will quickly find its resistance: and he that thinks that nothing but bodies that are hard can keep his hands from approaching one another, may be pleased to make a trial with the air enclosed in a football. The experiment I have been told was made at Florence, with a hollow globe of gold filled with water, and exactly closed, farther shows the solidity of so soft a body as water. For the golden globe thus filled being put into a press which was driven by the extreme force of screws, the water made its way through the pores of that very close metal, and finding no room for a nearer approach of its particles within, got to the outside, where it rose like a dew, and so fell in drops before the sides of the globe could be made to yield to the violent compression of the engine that squeezed it.

5. *On solidity depend impulse, resistance, and protrusion.*—By this idea of solidity is the extension of body distinguished from the extension of space. The extension of body being nothing but the cohesion or continuity of solid, separable parts; and the extension of space, the continuity of unsolid, inseparable, and immovable parts. Upon the solidity of bodies also depend their mutual impulse, resistance, and protrusion. Of pure space then, and solidity, there are several (amongst which I confess myself one) who persuade themselves they have clear and distinct ideas; and that they can think on

space without anything in it that resists or is protruded by body. This is the idea of pure space, which they think they have as clear as any idea they can have of the extension of body . . .

6. *What solidity is.*—If any one asks me, *what this solidity is*, I send him to his senses to inform him: let him put a flint or a football between his hands, and then endeavour to join them, and he will know. If he thinks this is not a sufficient explanation of solidity, what it is, and wherein it consists, I promise to tell him what it is, and wherein it consists, when he tells me what thinking is, or wherein it consists; or explains to me what extension or motion is, which perhaps seems much easier. The simple ideas we have are such as experience teaches them to us; but if, beyond that, we endeavour by words to make them clearer in the mind, we shall succeed no better than if we went about to clear up the darkness of a blind man's mind by talking, and to discourse into him the ideas of light and colours. The reason of this I shall show in another place.

CHAPTER 5. OF SIMPLE IDEAS OF DIVERS SENSES

Ideas received both by seeing and touching.—The ideas we get by more than one sense are of space or extension, figure, rest and motion: for these make perceivable impressions both on the eyes and touch; and we can receive and convey into our minds the ideas of the extension, figure, motion, and rest of bodies, both by seeing and feeling. But having occasion to speak more at large of these in another place, I here only enumerate them.

CHAPTER 6. OF SIMPLE IDEAS OF REFLECTION

1. *Simple ideas are the operations of the mind about its other ideas.*—The mind, receiving the ideas mentioned in the foregoing chapters from without, when it turns its view inward upon itself, and observes its own actions about those ideas it has, takes from thence other ideas, which are as capable to be the objects of its contemplation as any of those it received from foreign things.

2. *The idea of perception, and idea of willing, we have from reflection.*—The two great and principal actions of the mind, which are most frequently considered, and which are so frequent that every one that pleases may take notice of them in himself, are these two:—*Perception* or *Thinking*, and *Volition* or *Willing*. The power of thinking is called the *Understanding* and the power of volition is called the *Will*; and these two powers or abilities in the mind are denominated *faculties*. Of some of the *modes* of these simple ideas of reflection, such as are *remembrance*, *discerning*, *reasoning*, *judging*, *knowledge*, *faith*, *etc.*, I shall have occasion to speak hereafter.

CHAPTER 7. OF SIMPLE IDEAS OF BOTH SENSATION AND REFLECTION

1. *Ideas of pleasure and pain.*—There be other simple ideas which convey themselves into the mind by all the ways of sensation and reflection; viz., *pleasure* or *delight*, and its opposite, *pain* or *uneasiness*; *power*; *existence*; *unity*.

2. *Mix with almost all our other ideas.*—Delight or uneasiness, one or other of them, join themselves to almost all our ideas both of sensation and reflection; and there is scarce any affection of our senses from without, any retired thought of our mind within, which is not able to produce in us pleasure or pain. By pleasure and pain, I would be understood to signify whatsoever delights or molests us; whether it arises from the thoughts of our minds, or anything operating on our bodies. For whether we call it satisfaction, delight, pleasure, happiness, etc., on the one side, or uneasiness, trouble, pain, torment, anguish, misery, etc., on the other, they are still but different degrees of the same thing, and belong to the ideas of pleasure and pain, delight or uneasiness; which are the names I shall most commonly use for those two sorts of ideas.

3. *As motives of our actions.*—The infinite wise Author of our being, . . . to excite us to these actions of thinking and motion that we are capable of, has been pleased to join to several thoughts and several sensations a perception of delight. If this were wholly separated from all our outward sensations and inward thoughts, we should have no reason to prefer one thought or action to another, negligence to attention, or motion to rest. And so we should neither stir our bodies, nor employ our minds, but let our thoughts (if I may so call it) run adrift, without any direction or design; and suffer the ideas of our minds, like unregarded shadows, to make their appearances there as it happened, without attending to them. In which state man, however furnished with the faculties of understanding and will, would be a very idle, unactive creature, and pass his time only in a lazy, lethargic dream . . .

4. *An end and use of pain.*—Pain has the same efficacy and use to set us on work that pleasure has, we being as ready to employ our faculties to avoid that, as to pursue this: only this is worth our consideration, that pain is often produced by the same objects and ideas that produce pleasure in us . . . Thus heat, that is very agreeable to us in one degree, by a little greater increase of it proves no ordinary torment; and the most pleasant of all sensible objects, light itself, if there be too much of it, if increased beyond a due proportion to our eyes, causes a very painful sensation. Which is wisely and favourably so ordered by nature, that when any object does by the vehemency of its operation disorder the instruments of sensation, whose structures cannot but be very nice and delicate, we might by the pain be warned to withdraw before the organ be quite put out of order, and so be unfitted for its proper functions for the future.

* * *

7. *Ideas of existence and unity.*—Existence and unity are two other ideas that are suggested to the understanding by every object without, and every idea within. When ideas are in our minds, we consider them as being actually there, as well as we consider things to be actually without us: which is, that they exist, or have existence. And whatever we can consider as one thing, whether a real being or idea, suggests to the understanding the idea of unity.

8. *Idea of power.*—Power also is another of those ideas which we receive from sensation and reflection. For, observing in ourselves that we do and can think, and that we can at pleasure move several parts of our bodies which were at rest, the effects also that natural bodies are able to produce in one another occurring every moment to our senses, we both these ways get the idea of power.

9. *Idea of succession.*—Besides these there is another idea, which though suggested by our senses yet is more constantly offered us by what passes in our own minds; and that is the idea of succession. For if we look immediately into ourselves, and reflect

on what is observable there, we shall find our ideas always, whilst we are awake or have any thought, passing in train, one going and another coming without intermission.

10. *Simple ideas the materials of all our knowledge.*—These, if they are not all, are at least (as I think) the most considerable of those simple ideas which the mind has, and out of which is made all its other knowledge: all of which it receives only by the two forementioned ways of sensation and reflection.

Nor let any one think these too narrow bounds for the capacious mind of man to expatiate in, which takes its flight farther than the stars, and cannot be confined by the limits of the world. I grant all this, but desire any one to assign any *simple idea* which is not received from one of those inlets before mentioned, or any *complex idea* not made out of those simple ones.

Nor will it be so strange to think these few simple ideas sufficient to employ the quickest thought or largest capacity, and to furnish the materials of all that various knowledge and more various fancies and opinions of all mankind, if we consider how many words may be made out of the various composition of twenty-four letters; or if, going one step farther, we will but reflect on the variety of combinations may be made with barely one of the above-mentioned ideas, viz., number, whose stock is inexhaustible and truly infinite: and what a large and immense field doth extension alone afford the mathematicians?

CHAPTER 8. SOME FURTHER CONSIDERATIONS CONCERNING OUR SIMPLE IDEAS OF SENSATION

* * *

7. *Ideas in the mind, qualities in bodies.*—To discover the nature of our ideas the better, and to discourse of them intelligibly, it will be convenient to distinguish them *as they are ideas or perceptions in our minds, and as they are modifications of matter in the bodies that cause such perceptions in us*: that so we may not think (as perhaps usually is done) that they are exactly the images and resemblances of something inherent in the subject; most of those of sensation being in the mind no more the likeness of something existing without us than the names that stand for them are the likeness of our ideas, which yet upon hearing they are apt to excite in us.

8. *Our ideas and the qualities of bodies.*—Whatsoever the mind perceives *in itself*, or is the immediate object of perception, thought, or understanding, that I call *idea*; and the power to produce any idea in our mind, I call *quality* of the subject wherein that power is. Thus a snowball having the power to produce in us the ideas of white, cold, and round, the powers to produce those ideas in us as they are in the snowball, I call qualities; and as they are sensations or perceptions in our understandings, I call them ideas; which *ideas*, if I speak of them sometimes as in the things themselves, I would be understood to mean those qualities in the objects which produce them in us.

9. *Primary qualities of bodies.*—Qualities thus considered in bodies are, *First*, such as are utterly inseparable from the body, in what estate soever it be; such as, in all the alterations and changes it suffers, all the force can be used upon it, it constantly keeps; and such as sense constantly finds in every particle of matter which has bulk enough to be perceived, and the mind finds inseparable from every particle of matter, though less than to make itself singly be perceived by our senses: v.g., take a grain of wheat, divide it into two parts, each part has still solidity, extension, figure, and mobility;

divide it again, and it retains still the same qualities: and so divide it on, till the parts become insensible; they must retain still each of them all those qualities . . . These I call *original* or *primary qualities* of body, which I think we may observe to produce simple ideas in us, viz., solidity, extension, figure, motion or rest, and number.

10. *Secondary qualities of bodies.*—Secondly, such qualities, which in truth are nothing in the objects themselves, but powers to produce various sensations in us by their primary qualities, i.e., by the bulk, figure, texture, and motion of their insensible parts, as colours, sounds, tastes, etc., these I call *secondary qualities*. To these might be added a third sort, which are allowed to be barely powers, though they are as much real qualities in the subject as those which I, to comply with the common way of speaking, call qualities, but, for distinction, secondary qualities. For the power in fire to produce a new colour or consistence in *wax* or *clay* by its primary qualities, is as much a quality in fire as the power it has to produce in me a new idea or sensation of warmth or burning, which I felt not before, by the same primary qualities, viz., the bulk, texture, and motion of its insensible parts.

11. *How bodies produce ideas in us.*—The next thing to be considered is, how bodies produce ideas in us; and that is manifestly by impulse, the only way which we can conceive bodies operate in.

12. *By motions, external, and in our organism.*—If, then, external objects be not united to our minds when they produce ideas in it, and yet we perceive these original qualities in such of them as singly fall under senses, it is evident that some motion must be thence continued by our nerves or animal spirits, by some parts of our bodies, to the brains or the seat of sensation, there to produce in our minds the particular ideas we have of them. And since the extension, figure, number, and motion of bodies of an observable bigness, may be perceived at a distance by the sight, it is evident some singly imperceptible bodies must come from them to the eyes, and thereby convey to the brain some motion which produces these ideas which we have of them in us.

13. *How secondary qualities produce their ideas.*—After the same manner that the ideas of these original qualities are produced in us, we may conceive that the ideas of *secondary qualities* are also produced, viz., by the operation of insensible particles on our senses . . . The different motions and figures, bulk and number of such particles, affecting the several organs of our senses, produce in us those different sensations which we have from the colours and smells of bodies; v.g., that a violet, by the impulse of such insensible particle, of matter of peculiar figures and bulks, and in different degrees and modifications of their motions, causes the ideas of the blue colour and sweet scent of that flower to be produced in our minds. It being no more impossible to conceive that God should annex such ideas to such motions with which they have no similitude, than that he should annex the idea of pain to the motion of a piece of steel dividing our flesh, with which that idea hath no resemblance.

14. *They depend on the primary qualities.*—What I have said concerning colours and smells may be understood also of tastes and sounds, and other the like sensible qualities; which, whatever reality we by mistake attribute to them, are in truth nothing in the objects themselves, but powers to produce various sensations in us, and depend on those primary qualities, viz., bulk, figure, texture, and motion of parts, as I have said.

15. *Ideas of primary qualities are resemblances; of secondary, not.*—From whence I think it is easy to draw this observation, that the ideas of primary qualities of bodies are resemblances of them, and their patterns do really exist in the bodies themselves; but the ideas produced in us by these secondary qualities have no resemblance of them at all. There is nothing like our ideas existing in the bodies themselves. They are,

in the bodies we denominate from them, only a power to produce those sensations in us: and what is sweet, blue, or warm in idea, is but the certain bulk, figure, and motion of the insensible parts in the bodies themselves, which we call so.

16. *Examples.*—Flame is denominated hot and light; snow, white and cold; and manna, white and sweet, from the ideas they produce in us. Which qualities are commonly thought to be the same in those bodies that those ideas are in us, the one the perfect resemblance of the other, as they are in a mirror; and it would by most men be judged very extravagant, if one should say otherwise. And yet he that will consider that the same fire that at one distance produces in us the sensation of warmth, does at a nearer approach produce in us the far different sensation of pain, ought to bethink himself what reason he has to say, that his idea of warmth which was produced in him by the fire, is *actually in the fire*; and his idea of pain which the same fire produced in him the same way is not in the fire. Why is whiteness and coldness in snow, and pain not, when it produces the one and the other idea in us, and can do neither, but by the bulk, figure, number, and motion of its solid parts?

17. *The ideas of the primary alone really exist.*—The particular bulk, number, figure, and motion of the parts of fire or snow are really in them, whether any one's senses perceive them or no; and therefore they may be called *real* qualities, because they really exist in those bodies. But light, heat, whiteness, or coldness, are no more really in them than sickness or pain is in manna. Take away the sensation of them; let not the eyes see light or colours, nor the ears hear sounds; let the palate not taste, nor the nose smell; and all colours, tastes, odours, and sounds, *as they are such particular ideas*, vanish and cease, and are reduced to their causes, i.e., bulk, figure, and motion of parts.

18. *Secondary exist only as modes of the primary.*—A piece of manna of a sensible bulk is able to produce in us the idea of a round or square figure; and, by being removed from one place to another, the idea of motion. This idea of motion represents it as it really is in the manna moving; a circle or square are the same, whether in idea or existence, in the mind or in the manna; and this, both motion and figure are really in the manna, whether we take notice of them or no: this everybody is ready to agree to. Besides, manna, by the bulk, figure, texture, and motion of its parts, has a power to produce the sensations of sickness, and sometimes of acute pains or gripings, in us. That these ideas of sickness and pain are not in the manna, but effects of its operations on us, and are nowhere when we feel them not: this also every one readily agrees to. And yet men are hardly to be brought to think that sweetness and whiteness are not really in manna, which are but the effects of the operations of manna by the motion, size, and figure of its particles on the eyes and palate: as the pain and sickness caused by manna are confessedly nothing but the effects of its operations on the stomach . . . Why the pain and sickness, ideas that are the effects of manna, should be thought to be nowhere when they are not felt; and yet the sweetness and whiteness, effects of the same manna on other parts of the body, by ways equally as unknown, should be thought to exist in the manna, when they are not seen nor tasted, would need some reason to explain.

19. *Examples.*—Let us consider the red and white colours in porphyry: hinder light but from striking on it, and its colours vanish; it no longer produces any such ideas in us. Upon the return of light, it produces these appearances on us again. Can any one think any real alterations are made in the porphyry by the presence or absence of light, and that those ideas of whiteness and redness are really in porphyry in the light, when it is plain *it has no colour in the dark*? It has indeed such a configuration of particles, both night and day, as are apt, by the rays of light rebounding from some parts of that hard

stone, to produce in us the idea of redness, and from others the idea of whiteness: but whiteness or redness are not in it at any time, but such a texture that hath the power to produce such a sensation in us.

* * *

22. *Excursion into natural philosophy.*—I have, in what just goes before, been engaged in physical enquiries a little farther than perhaps I intended. But it being necessary to make the nature of sensation a little understood, and to make the difference between the *qualities* in bodies and the *ideas* produced by them in the mind to be distinctly conceived, without which it were impossible to discourse intelligibly of them, I hope I shall be pardoned this little excursion into natural philosophy, it being necessary in our present enquiry to distinguish the *primary* and *real* qualities of bodies, which are always in them (viz., solidity, extension, figure, number, and motion or rest, and are sometimes perceived by us, viz., when the bodies they are in are big enough singly to be discerned), from those *secondary* and *imputed* qualities, which are but the powers of several combinations of those primary ones, when they operate without being distinctly discerned: whereby we also may come to know what ideas are, and what are not, resemblances of something really existing in the bodies we denominate from them.

23. *Three sorts of qualities in bodies.*—The qualities then that are in bodies, rightly considered, are of three sorts:

First, the bulk, figure, number, situation, and motion or rest of their solid parts. Those are in them, whether we perceive them or no; and when they are of that size that we can discover them, we have by these an idea of the thing as it is in itself, as is plain in artificial things. These I call *primary qualities*.

Secondly, the power that is in any body, by reason of its insensible primary qualities, to operate after a peculiar manner on any of our senses, and thereby produce in us the different ideas of several colours, sounds, smells, tastes, etc. These are usually called *sensible qualities*.

Thirdly, the power that is in any body, by reason of the particular constitution of its primary qualities, to make such a change in the bulk, figure, texture, and motion of *another body*, as to make it operate on our senses differently from what it did before. Thus the sun has a power to make wax white, and fire, to make lead fluid. These are usually called *powers*.

The first of these, as has been said, I think may be properly called real, original, or primary qualities, because they are in the things themselves, whether they are perceived or no: and upon their different modifications it is that the secondary qualities depend.

The other two are only powers to act differently upon other things, which powers result from the different modifications of those primary qualities.

24. *The first are resemblances; the second thought to be resemblances, but are not; the third neither are, nor are thought so.*—But though these two latter sorts of qualities are powers barely, and nothing but powers, relating to several other bodies, and resulting from the different modifications of the original qualities, yet they are generally otherwise thought of . . . V.g., the idea of heat or light which we receive by our eyes or touch from the sun, are commonly thought real qualities existing in the sun, and something more than mere powers in it. But when we consider the sun in reference to wax, which it melts or blanches, we look upon the whiteness and softness produced in the wax, not as qualities in the sun, but effects produced by powers in it: whereas, if rightly

considered, these qualities of light and warmth, which are perceptions in me when I am warmed or enlightened by the sun, are no otherwise in the sun than the changes made in the wax, when it is blanched or melted, are in the sun. They are all of them equally powers in the sun, depending on its primary qualities . . .

25. *Why the secondary are ordinarily taken for real qualities, and not for bare powers.*—The reason why the one are ordinarily taken for real qualities, and the other only for bare powers, seems to be because the ideas we have of distinct colours, sounds, etc., containing nothing at all in them of bulk, figure, or motion, we are not apt to think them the effects of these primary qualities which appear not to our senses to operate in their production, and with which they have not any apparent congruity, or conceivable connexion. Hence it is that we are so forward to imagine that those ideas are the resemblances of something really existing in the objects themselves . . . But, in the other case, in the operations of bodies changing the qualities one of another, we plainly discover that the quality produced hath commonly no resemblance with anything in the thing producing it; wherefore we look on it as a bare effect of power . . .

* * *

CHAPTER 9. OF PERCEPTION

1. *Perception the first simple idea of reflection.*—PERCEPTION, as it is the first faculty of the mind exercised about our ideas; so it is the first and simplest idea we have from reflection, and is by some called thinking in general. Though thinking, in the propriety of the English tongue, signifies that sort of operation in the mind about its ideas, wherein the mind is active; where it, with some degree of voluntary attention, considers anything. For in bare naked perception, the mind is, for the most part, only passive; and what it perceives, it cannot avoid perceiving.

2. *Reflection alone can give us the idea of what, perception is.*—What perception is, every one will know better by reflecting on what he does himself, when he sees, hears, feels, etc., or thinks, than by any discourse of mine. Whoever reflects on what passes in his own mind cannot miss it. And if he does not reflect, all the words in the world cannot make him have any notion of it.

3. *Arises in sensation only when the mind notices the organic impression.*—This is certain, that whatever alterations are made in the body, if they reach not the mind; whatever impressions are made on the outward parts, if they are not taken notice of within, there is no perception. Fire may burn our bodies with no other effect than it does a billet, unless the motion be continued to the brain, and there the sense of heat, or idea of pain, produced in the mind; wherein consists actual perception.

4. *Impulse on the organ insufficient.*—How often may a man observe in himself, that whilst his mind is intently employed in the contemplation of some objects, and curiously surveying some ideas that are there, it takes no notice of impressions of sounding bodies made upon the organ of hearing, with the same alteration that uses to be for the producing the idea of sound? A sufficient impulse there may be on the organ; but it not reaching the observation of the mind, there follows no perception: and though the motion that uses to produce the idea of sound be made in the ear, yet no sound is heard. Want of sensation, in this case, is not through any defect in the organ, or that the man's ears are less affected than at other times when he does hear: but that which uses to produce the idea, though conveyed in by the usual organ, not being taken notice of in the understanding, and so imprinting no idea in the mind, there follows no sensation.

So that wherever there is sense or perception, there some idea is actually produced, and present in the understanding.

* * *

8. *Sensations often changed by the judgment.*—We are further to consider concerning perception, that the ideas we receive by sensation are often, in grown people, altered by the judgment, without our taking notice of it. When we set before our eyes a round globe of any uniform colour, v.g., gold, alabaster, or jet, it is certain that the idea thereby imprinted on our mind is of a flat circle, variously shadowed, with several degrees of light and brightness coming to our eyes. But we having, by use, been accustomed to perceive what kind of appearance convex bodies are wont to make in us; what alterations are made in the reflections of light by the difference of the sensible figures of bodies;—the judgment presently, by an habitual custom, alters the appearances into their causes. So that from that which is truly variety of shadow or colour, collecting the figure, it makes it pass for a mark of figure, and frames to itself the perception of a convex figure and an uniform colour; when the idea we receive from thence is only a plane variously coloured, as is evident in painting. To which purpose I shall here insert a problem of that very ingenious and studious promoter of real knowledge, the learned and worthy Mr. Molyneux, which he was pleased to send me in a letter some months since; and it is this:—“Suppose a man born blind, and now adult, and taught by his touch to distinguish between a cube and a sphere of the same metal, and nighly of the same bigness, so as to tell, when he felt one and the other, which is the cube, which the sphere. Suppose then the cube and sphere placed on a table, and the blind man be made to see: *quære* whether by his sight, before he touched them, he could now distinguish and tell which is the globe, which the cube?” To which the acute and judicious proposer answers, “Not. For, though he has obtained the experience of how a globe, how a cube affects his touch, yet he has not yet obtained the experience, that what affects his touch so or so, must affect his sight so or so; or that a protuberant angle in the cube, that pressed his hand unequally, shall appear to his eye as it does in the cube.”—I agree with this thinking gentleman, whom I am proud to call my friend, in his answer to this problem; and am of opinion that the blind man, at first sight, would not be able with certainty to say which was the globe, which the cube, whilst he only saw them; though he could unerringly name them by his touch, and certainly distinguish them by the difference of their figures felt. This I have set down, and leave with my reader, as an occasion for him to consider how much he may be beholden to experience, improvement, and acquired notions, where he thinks he had not the least use of, or help from them. And the rather, because this observing gentleman further adds, that “having, upon the occasion of my book, proposed this to divers very ingenious men, he hardly ever met with one that at first gave the answer to it which he thinks true, till by hearing his reasons they were convinced.”

* * *

CHAPTER 12. OF COMPLEX IDEAS

1. *Made by the mind out of simple ones.*—We have hitherto considered those ideas, in the reception whereof the mind is only passive, which are those simple ones received from sensation and reflection before mentioned, whereof the mind cannot

make one to itself, nor have any idea which does not wholly consist of them. [But as the mind is wholly passive in the reception of all its simple ideas, so it exerts several acts of its own, whereby out of its simple ideas, as the materials and foundations of the rest, the other are framed. The acts of the mind wherein it exerts its power over its simple ideas are chiefly these three: (1) Combining several simple ideas into one compound one; and thus all *complex ideas* are made. (2) The second is bringing two ideas, whether simple or complex, together, and setting them by one another, so as to take a view of them at once, without uniting them into one; by which it gets all its *ideas of relations*. (3) The third is separating them from all other ideas that accompany them in their real existence; this is called abstraction: and thus all its *general ideas* are made. This shows man's power and its way of operation to be much the same in the material and intellectual world. For, the materials in both being such as he has no power over, either to make or destroy, all that man can do is either to unite them together, or to set them by one another, or wholly separate them. I shall here begin with the first of these in the consideration of complex ideas, and come to the other two in their due places.] As simple ideas are observed to exist in several combinations united together, so the mind has a power to consider several of them united together as one idea; and that not only as they are united in external objects, but as itself has joined them. Ideas thus made up of several simple ones put together I call *complex*; such as are beauty, gratitude, a man, an army, the universe; which, though complicated of various simple ideas or complex ideas made up of simple ones, yet are, when the mind pleases, considered each by itself as one entire thing, and signified by one name.

2. *Made voluntarily*.—In this faculty of repeating and joining together its ideas, the mind has great power in varying and multiplying the objects of its thoughts infinitely beyond what sensation or reflection furnished it with: but all this still confined to those simple ideas which it received from those two sources, and which are the ultimate materials of all its compositions. For simple ideas are all from things themselves; and of these the mind can have no more nor other than what are suggested to it. It can have no other ideas of sensible qualities than what come from without by the senses, nor any ideas of other kind of operations of a thinking substance than what it finds in itself: but when it has once got these simple ideas, it is not confined barely to observation, and what offers itself from without; it can, by its own power, put together those ideas it has, and make new complex ones which it never received so united.

3. *Complex ideas are either modes, substances, or relations*.—COMPLEX IDEAS, however compounded and decomposed, though their number be infinite, and the variety endless wherewith they fill and entertain the thoughts of men, yet I think they may be all reduced under these three heads: 1. *Modes*. 2. *Substances*. 3. *Relations*.

4. *Ideas of modes*.—First, *Modes* I call such complex ideas which, however compounded, contain not in them the supposition of subsisting by themselves, but are considered as dependences on, or affections of substances; such as are the ideas signified by the words triangle, gratitude, murder, etc. And if in this I use the word mode in somewhat a different sense from its ordinary signification, I beg pardon; it being unavoidable in discourses differing from the ordinary received notions, either to make new words, or to use old words in somewhat a new signification: the latter whereof, in our present case, is perhaps the more tolerable of the two.

5. *Simple and mixed modes of simple ideas*.—Of these modes there are two sorts which deserve distinct consideration. First, there are some which are only variations or different combinations of the same simple idea, without the mixture of any other, as a dozen, or score; which are nothing but the ideas of so many distinct units added

together: and these I call *simple modes*, as being contained within the bounds of one simple idea. Secondly, there are others compounded of simple ideas of several kinds, put together to make one complex one; v.g., beauty, consisting of a certain composition of colour and figure, causing delight in the beholder; theft, which, being the concealed change of the possession of anything, without the consent of the proprietor, contains, as is visible, a combination of several ideas of several kinds: and these I call *mixed modes*.

6. *Ideas of substances, single or collective*.—Secondly, the ideas of *Substances* are such combinations of simple ideas as are taken to represent distinct particular things subsisting by themselves, in which the supposed or confused idea of substance, such as it is, is always the first and chief. Thus, if to substance be joined the simple idea of a certain dull whitish colour, with certain degrees of weight, hardness, ductility, and fusibility, we have the idea of lead; and a combination of the ideas of a certain sort of figure, with the powers of motion, thought, and reasoning, joined to substance, make the ordinary idea of a man. Now of substances also there are two sorts of ideas, one of single substances, as they exist separately, as of a man or a sheep; the other of several of those put together, as an army of men, or flock of sheep; which *collective* ideas of several substances thus put together, are as much each of them one single idea as that of a man or an unit.

7. *Ideas of relation*.—Thirdly, the last sort of complex ideas is that we call Relation, which consists in the consideration and comparing one idea with another. Of these several kinds we shall treat in their order.

8. *The abstrusest ideas we can have are all from two sources*.—If we will trace the progress of our minds, and with attention observe how it repeats, adds together, and unites its simple ideas received from sensation or reflection, it will lead us farther than at first perhaps we should have imagined. And I believe we shall find, if we warily observe the originals of our notions, that *even the most abstruse ideas*, how remote soever they may seem from sense, or from any operation of our own minds, are yet only such as the understanding frames to itself, by repeating and joining together ideas that it had either from objects of sense, or from its own operations about them: so that those even large and abstract ideas are *derived from sensation or reflection*, being no other than what the mind, by the ordinary use of its own faculties, employed about ideas received from objects of sense, or from the operations it observes in itself about them, may and does attain unto. This I shall endeavour to show in the ideas we have of space, time, and infinity, and some few other, that seem the most remote from those originals.

* * *

CHAPTER 21. OF POWER

1. *This idea how got*.—The mind being every day informed, by the senses, of the alteration of those simple ideas it observes in things without; and taking notice how one comes to an end and ceases to be, and another begins to exist which was not before; reflecting also, on what passes within itself, and observing a constant change of its ideas, sometimes by the impression of outward objects on the senses, and sometimes by the determination of its own choice; and concluding from what it has so constantly observed to have been, that the like changes will for the future be made in the same things by like agents, and by the like ways; considers in one thing the possibility of having any of its

simple ideas changed, and in another the possibility of making that change; and so comes by that idea which we call *power*. Thus we say, fire has a power to melt gold, i.e., to destroy the consistency of its insensible parts, and consequently its hardness, and make it fluid; and gold has a power to be melted: that the sun has a power to blanch wax; and wax a power to be blanched by the sun, whereby the yellowness is destroyed, and whiteness made to exist in its room. In which and the like cases, the power we consider is in reference to the change of perceivable ideas. For we cannot observe any alteration to be made in, or operation upon, anything, but by the observable change of its sensible ideas: nor conceive any alteration to be made, but by conceiving a change of some of its ideas.

2. *Power, active and passive*.—Power thus considered is twofold, viz., as able to make, or able to receive, any change: the one may be called *active*, and the other passive, power. Whether matter be not wholly destitute of active power, as its author, God, is truly above all passive power; and whether the intermediate state of created spirits be not that alone which is capable of both active and passive power, may be worth consideration. I shall not now enter into that enquiry: my present business being not to search into the original of power, but how we come by the *idea* of it. But since active powers make so great a part of our complex ideas of natural substances (as we shall see hereafter), yet they being not, perhaps, so truly active powers as our hasty thoughts are apt to represent them, I judge it not amiss, by this intimation, to direct our minds to the consideration of God and spirits, for the clearest idea of *active* power.

3. *Power includes relation*.—I confess power includes in it some kind of relation (a relation to action or change), as indeed, which of our ideas, of what kind soever, when attentively considered, does not? For our ideas of extension, duration, and number, do they not all contain in them a secret relation of the parts? Figure and motion have something relative in them much more visibly: and sensible qualities, as colours and smells, etc., what are they but the powers of different bodies in relation to our perception? And if considered in the things themselves, do they not depend on the bulk, figure, texture, and motion of the parts? All which include some kind of relation in them. Our idea therefore of power, I think, may well have a place amongst other *simple ideas*, and be considered as one of them, being one of those that make a principal ingredient in our complex ideas of substances, as we shall hereafter have occasion to observe.

4. *The clearest idea of active power had from spirit*.—We are abundantly furnished with the idea of passive power, by almost all sorts of sensible things. In most of them we cannot avoid observing their sensible qualities, nay, their very substances, to be in a continual flux: and therefore with reason we look on them as liable still to the same change. Nor have we of *active* power (which is the more proper signification of the word power) fewer instances. Since whatever change is observed, the mind must collect a power somewhere, able to make that change, as well as a possibility in the thing itself to receive it. But yet, if we will consider it attentively, bodies by our senses do not afford us so clear and distinct an idea of active power as we have from reflection on the operations of our minds. For all power relating to action, and there being but two sorts of action whereof we have any idea, viz., thinking and motion, let us consider whence we have the clearest ideas of the powers which produce these actions. (1) Of thinking, body affords us no idea at all: it is only from reflection that we have that. (2) Neither have we from body any idea of the beginning of motion. A body at rest affords us no idea of any active power to move; and when it is set in motion itself, that motion is rather a passion than an action in it. For when the ball

obeys the stroke of a billiard-stick, it is not any action of the ball, but bare passion. Also when by impulse it sets another ball in motion that lay in its way, it only communicates the motion it had received from another, and loses in itself so much as the other received: which gives us but a very obscure idea of an *active* power of moving in body, whilst we observe it only to *transfer*, but not *produce* any motion . . . The idea of the *beginning* of motion we have only from reflection on what passes in ourselves, where we find by experience, that, barely by willing it, barely by a thought of the mind, we can move the parts of our bodies which were before at rest. So that it seems to me, we have, from the observation of the operation of bodies by our senses, but a very imperfect, obscure idea of *active* power, since they afford us not any idea in themselves of the power to begin any action, either motion or thought. But if, from the impulse bodies are observed to make one upon another, any one thinks he has a clear idea of power, it serves as well to my purpose, sensation being one of those ways whereby the mind comes by its ideas: only I thought it worth while to consider here by the way, whether the mind doth not receive its idea of active power clearer from reflection on its own operations, than it doth from any external sensation.

* * *

The Funeral of Phocion, 1648, by Nicholas Poussin (1594–1665). In this classical-style painting, nature is depicted in geometrical terms that imply a sense of permanence. Locke believed that the complex ideas we have about such scenes are built up out of “a great number of the simple ideas conveyed in by the senses.” (The Louvre/Paris/© Photo R.M.N.)

CHAPTER 23. OF OUR COMPLEX IDEAS OF SUBSTANCES

1. *Ideas of particular substances, how made.*—The mind being, as I have declared, furnished with a great number of the simple ideas conveyed in by the senses, as they are found in exterior things, or by reflection on its own operations, takes notice also, that a certain number of these simple ideas go constantly together; which being presumed to belong to one thing, and words being suited to common apprehensions, and made use of for quick dispatch, are called, so united in one subject, by one name; which, by inadvertency, we are apt afterward to talk of and consider as one simple idea, which indeed is a complication of many ideas together: because, as I have said, not imagining how these simple ideas can subsist by themselves, we accustom ourselves to suppose some *substratum* wherein they do subsist, and from which they do result, which therefore we call *substance*.

2. *Our obscure idea of substance in general.*—So that if any one will examine himself concerning his notion of pure substance in general, he will find he has no other idea of it at all, but only a supposition of he knows not what *support* of such qualities which are capable of producing simple ideas in us; which qualities are commonly called accidents. If any one should be asked, what is the subject wherein colour or weight inheres, he would have nothing to say, but the solid extended parts: and if he were demanded, what is it that that solidity and extension inhere in, he would not be in a much better case than the Indian before mentioned, who saying that the world was supported by a great elephant, was asked, what the elephant rested on; to which his answer was, a great tortoise: but being again pressed to know what gave support to the broad-backed tortoise, replied, *something, he knew not what*. And thus here, as in all other cases where we use words without having clear and distinct ideas, we talk like children; who being questioned what such a thing is which they know not, readily give this satisfactory answer, that it is *something*; which in truth signifies no more, when so used, either by children or men, but that they know not what; and that the thing they pretend to know, and talk of, is what they have no distinct idea of at all, and so are perfectly ignorant of it, and in the dark. The idea, then, we have, to which we give the general name substance, being nothing but the supposed, but unknown, support of those qualities we find existing, which we imagine cannot subsist *sine re substante*, without something to support them, we call that support *substantia*; which, according to the true import of the word, is, in plain English, standing under, or upholding.

3. *Of the sorts of substances.*—An obscure and relative idea of *substance in general* being thus made, we come to have the ideas of *particular sorts of substances*, by collecting *such* combinations of simple ideas as are, by experience and observation of men's senses, taken notice of to exist together, and are therefore supposed to flow from the particular internal constitution or unknown essence of that substance. Thus we come to have the ideas of a man, horse, gold, water, etc., of which substances, whether any one has any other *clear* idea, farther than of certain simple ideas coexisting together, I appeal to every one's own experience. It is the ordinary qualities observable in iron or a diamond, put together, that make the true complex idea of those substances, which a smith or a jeweller commonly knows better than a philosopher; who, whatever *substantial forms* he may talk of, has no other idea of those substances than what is framed by a collection of those simple ideas which are to be found in them. Only we must take notice, that our complex ideas of substances, besides all these simple ideas they are made up of, have always the confused idea of something to which they belong and in which they subsist. And therefore, when we speak of any sort of substance, we

say it is a thing having such or such qualities; as body is a thing that is extended, figured, and capable of motion; a spirit, a thing capable of thinking; and so hardness, friability, and power to draw iron, we say, are qualities to be found in a loadstone. These and the like fashions of speaking intimate that the substance is supposed always *something besides* the extension, figure, solidity, motion, thinking, or other observable ideas, though we know not what it is.

4. *No clear or distinct idea of substance in general.*—Hence, when we talk or think of any particular sort of corporeal substances, as horse, stone, etc., though the idea we have of either of them be but the complication or collection of those several simple ideas of sensible qualities which we use to find united in the thing called horse or stone; yet *because we cannot conceive how they should subsist alone, nor one in another*, we suppose them existing in, and supported by, some common subject; which support we denote by the name substance, though it be certain we have no clear or distinct idea of that thing we suppose a support.

5. *As clear an idea of spiritual substance as of corporeal substance.*—The same happens concerning the operations of the mind, viz., thinking, reasoning, fearing, etc., which we concluding not to subsist of themselves, nor apprehending how they can belong to body, or be produced by it, we are apt to think these the actions of some other *substance*, which we call *spirit*; whereby yet it is evident, that having no other idea or notion of matter, but something wherein those many sensible qualities which affect our senses do subsist; by supposing a substance wherein thinking, knowing, doubting, and a power of moving, etc., do subsist; we have as clear a notion of the substance of spirit as we have of body; the one being supposed to be (without knowing what it is) the *substratum* to those simple ideas we have from without; and the other supposed (with a like ignorance of what it is) to be the *substratum* to those operations which we experiment in ourselves within. It is plain, then, that the idea of *corporeal substance* in matter is as remote from our conceptions and apprehensions as that of *spiritual substance* or spirit; and therefore, from our not having any notion of the substance of spirit, we can no more conclude its nonexistence than we can, for the same reason, deny the existence of body: it being as rational to affirm there is no body, because we have no clear and distinct idea of the substance of matter, as to say there is no spirit, because we have no clear and distinct idea of the substance of a spirit.

6. *Our ideas of particular sorts of substances.*—Whatever therefore be the secret and abstract nature of substance in general, all the ideas we have of particular distinct sorts of substances are nothing but several combinations of simple ideas coexisting in such, though unknown, cause of their union, as makes the whole subsist of itself. It is by such combinations of simple ideas, and nothing else, that we represent particular sorts of substances to ourselves. Such are the ideas we have of their several species in our minds; and such only do we, by their specific names, signify to others, v.g., man, horse, sun, water, iron; upon hearing which words, every one who understands the language frames in his mind a combination of those several simple ideas which he has usually observed or fancied to exist together under that denomination; all which he supposes to rest in, and be, as it were, adherent to, that unknown common subject, which inheres not in anything else. Though in the meantime it be manifest, and every one upon enquiry into his own thoughts will find, that he has no other idea of any substance but what he has barely of those sensible qualities, which he supposes to inhere, with a supposition of such a *substratum*, as gives, as it were, a support to those qualities or simple ideas, which he has observed to exist united together. Thus the idea of the sun, what is it but an aggregate of those several simple ideas, bright, hot, roundish, having a constant regular

motion, at a certain distance from us, and perhaps some other? As he who thinks and discourses of the sun, has been more or less accurate in observing those sensible qualities, ideas, or properties, which are in that thing which he calls the sun.

7. *Their active and passive powers a great part of our complex ideas of substances.*—For he has the perfectest idea of any of the particular sorts of substances who has gathered and put together most of those simple ideas which do exist in it, among which are to be reckoned its active powers and passive capacities; which, though not simple ideas, yet in this respect, for brevity's sake, may conveniently enough be reckoned amongst them; . . . We immediately by our senses perceive in fire its heat and colour; which are, if rightly considered, nothing but powers in it to produce those ideas in us: we also by our senses perceive the colour and brittleness of charcoal, whereby we come by the knowledge of another power in fire, which it has to change the colour and consistency of *wood*. By the former, fire immediately, by the latter, it mediately discovers to us these several powers; which therefore we look upon to be a part of the qualities of fire, and so make them a part of the complex idea of it. For all those powers that we take cognizance of, terminating only in the alteration of some sensible qualities in those subjects on which they operate, and so making them exhibit to us new sensible ideas; therefore it is that I have reckoned these powers amongst the simple ideas which make the complex ones of the sorts of substances; though these powers, considered in themselves, are truly complex ideas . . .

8. *And why.*—Nor are we to wonder that powers make a great part of our complex ideas of substances, since their secondary qualities are those which, in most of them, serve principally to distinguish substances one from another and commonly make a considerable part of the complex idea of the several sorts of them. For our senses failing us in the discovery of the bulk, texture, and figure of the minute parts of bodies, on which their real constitutions and differences depend, we are fain to make use of their secondary qualities as the characteristical notes and marks whereby to frame ideas of them in our minds, and distinguish them one from another. All which secondary qualities, as has been shown, are nothing but bare powers. For the colour and taste of opium are, as well as its soporific or anodyne virtues, mere powers depending on its primary qualities, whereby it is fitted to produce different operations on different parts of our bodies.

9. *Three sorts of ideas make our complex ones of corporeal substances.*—The ideas that make our complex ones of corporeal substances are of these three sorts. First, the ideas of the primary qualities of things which are discovered by our senses, and are in them even when we perceive them not: such are the bulk, figure, number, situation, and motion of the parts of bodies, which are really in them, whether we take notice of them or no. Secondly, the sensible secondary qualities which, depending on these, are nothing but the powers those substances have to produce several ideas in us by our senses; which ideas are not in the things themselves otherwise than as anything is in its cause. Thirdly, the aptness we consider in any substance to give or receive such alterations of primary qualities as that the substance so altered should produce in us different ideas from what it did before; these are called active and passive powers: all which powers, as far as we have any notice or notion of them, terminate only in sensible simple ideas. For whatever alteration a loadstone has the power to make in the minute particles of iron, we should have no notion of any power it had at all to operate on iron, did not its sensible motion discover it; and I doubt not but there are a thousand changes that bodies we daily handle have a power to cause in one another, which we never suspect, because they never appear in sensible effects.

10. *Powers thus make a great part of our complex ideas of particular substances.*—Powers therefore justly make a great part of our complex ideas of substances. He that will examine his complex idea of gold, will find several of its ideas that make it up to be only powers: as the power of being melted, but of not spending itself in the fire, of being dissolved in *aqua regia*, are ideas as necessary to make up our complex idea of gold, as its colour and weight: which, if duly considered, are also nothing but different powers. For to speak truly, yellowness is not actually in gold, but is a power in gold to produce that idea in us by our eyes when placed in a due light: and the heat which we cannot leave out of our idea of the sun, is no more really in the sun than the white colour it introduces into wax . . .

11. *The now secondary qualities of bodies would disappear, if we could discover the primary ones of their minute parts.*—Had we senses acute enough to discern the minute particles of bodies, and the real constitution on which their sensible qualities depend, I doubt not but they would produce quite different ideas in us, and that which is now the yellow colour of gold would then disappear, and instead of it we should see an admirable texture of parts of a certain size and figure. This microscopes plainly discover to us; for what to our naked eyes produces a certain colour is, by thus augmenting the acuteness of our senses, discovered to be quite a different thing; and the thus altering, as it were, the proportion of the bulk of the minute parts of a coloured object to our usual sight, produces different ideas from what it did before. Thus sand, or pounded glass, which is opaque and white to the naked eye, is pellucid in a microscope: . . . blood to the naked eye appears all red; but by a good microscope, wherein its lesser parts appear, shows only some few globules of red, swimming in a pellucid liquor; and how these red globules would appear, if glasses could be found that yet could magnify them one thousand or ten thousand times more, is uncertain.

* * *

37. *Recapitulation.*—And thus we have seen what kind of ideas we have of *substances of all kinds*, wherein they consist, and how we come by them. From whence, I think, it is very evident,

First, That all our ideas of the several *sorts* of substances are nothing but collections of simple ideas, with a supposition of *something* to which they belong, and in which they subsist; though of this supposed something we have no clear distinct idea at all.

Secondly, That all the simple ideas that, thus united in one common *substratum*, make up our complex ideas of several *sorts* of substances, are no other but such as we have received from sensation or reflection . . .

Thirdly, That most of the simple ideas that make up our complex ideas of substances, when truly considered, are only *powers*, however we are apt to take them for positive qualities: v.g., the greatest part of the ideas that make our complex idea of *gold* are yellowness, great weight, ductility, fusibility, and solubility in *aqua regia*, etc., all united together in an unknown *substratum*; all which ideas are nothing else but so many relations to other substances, and are not really in the gold considered barely in itself, though they depend on those real and primary qualities of its internal constitution, whereby it has a fitness differently to operate and be operated on by several other substances.

* * *

CHAPTER 27. OF IDENTITY AND DIVERSITY

1. *Wherein identity consists.*—Another occasion the mind often takes of comparing, is the very being of things, when, considering *anything as existing at any determined time and place*, we compare it with *itself existing at another time*, and thereon form the ideas of *identity* and *diversity*. When we see anything to be in any place in any instant of time, we are sure (be it what it will) that it is that very thing, and not another which at that same time exists in another place, how like and undistinguishable soever it may be in all other respects: and in this consists *identity*, when the ideas it is attributed to vary not at all from what they were that moment wherein we consider their former existence, and to which we compare the present. For we never finding, nor conceiving it possible, that two things of the same kind should exist in the same place at the same time, we rightly conclude, that, whatever exists anywhere at any time, excludes all of the same kind, and is there itself alone. When therefore we demand whether anything be the *same* or no, it refers always to something that existed such a time in such a place, which it was certain, at that instant, was the same with itself, and no other. From whence it follows, that one thing cannot have two beginnings of existence, nor two things one beginning; it being impossible for two things of the same kind to be or exist in the same instant, in the very same place; or one and the same thing in different places. That, therefore, that had one beginning, is the same thing; and that which had a different beginning in time and place from that, is not the same, but diverse. That which has made the difficulty about this relation has been the little care and attention used in having precise notions of the things to which it is attributed.

2. *Identity of substances.*—We have the ideas but of three sorts of substances: 1. *God*. 2. *Finite intelligences*. 3. *Bodies*.

First, *God* is without beginning, eternal, unalterable, and everywhere, and therefore concerning his identity there can be no doubt.

Secondly, *finite spirits* having had each its determinate time and place of beginning to exist, the relation to that time and place will always determine to each of them its identity, as long as it exists.

Thirdly, The same will hold of every *particle of matter*, to which no addition or subtraction of matter being made, it is the same. For, though these three sorts of substances, as we term them, do not exclude one another out of the same place, yet we cannot conceive but that they must necessarily each of them exclude any of the same kind out of the same place: or else the notions and names of identity and diversity would be in vain, and there could be no such distinctions of substances, or anything else one from another. For example: could two bodies be in the same place at the same time; then those two parcels of matter must be one and the same, take them great or little; nay, all bodies must be one and the same. For, by the same reason that two particles of matter may be in one place, all bodies may be in one place: which, when it can be supposed, takes away the distinction of identity and diversity of one and more, and renders it ridiculous. But it being a contradiction that two or more should be one, identity and diversity are relations and ways of comparing well founded, and of use to the understanding.

Identity of modes and relations.—All other things being but modes or relations ultimately terminated in substances, the identity and diversity of each particular existence of them too will be by the same way determined: only as to things whose existence is in succession, such as are the actions of finite beings, v.g., *motion* and *thought*, both which consist in a continued train of succession, concerning *their* diversity there can be no question: because each perishing the moment it begins, they cannot exist in

different times, or in different places, as permanent beings can at different times exist in distant places; and therefore no motion or thought, considered as at different times, can be the same, each part thereof having a different beginning of existence.

3. *Principium individuationis*.—From what has been said, it is easy to discover what is so much inquired after, the *principium individuationis*; and that, it is plain, is existence itself; which determines a being of any sort to a particular time and place, incommunicable to two beings of the same kind. This, though it seems easier to conceive in simple substances or modes; yet, when reflected on, is not more difficult in compound ones, if care be taken to what it is applied: v.g., let us suppose an atom, i.e., a continued body under one immutable superficies, existing in a determined time and place; it is evident, that, considered in any instant of its existence, it is in that instant the same with itself. For, being at that instant what it is, and nothing else, it is the same, and so must continue as long as its existence is continued; for so long it will be the same, and no other. In like manner, if two or more atoms be joined together into the same mass, every one of those atoms will be the same, by the foregoing rule: and whilst they exist united together, the mass, consisting of the same atoms, must be the same mass, or the same body, let the parts be ever so differently jumbled. But if one of these atoms be taken away, or one new one added, it is no longer the same mass or the same body. In the state of living creatures, their identity depends not on a mass of the same particles, but on something else. For in them the variation of great parcels of matter alters not the identity: an oak growing from a plant to a great tree, and then lopped, is still the same oak; and a colt grown up to a horse, sometimes fat, sometimes lean, is all the while the same horse: though, in both these cases, there may be a manifest change of the parts; so that truly they are not either of them the same masses of matter, though they be truly one of them the same oak, and the other the same horse. The reason whereof is, that, in these two cases—a *mass of matter* and a *living body*—identity is not applied to the same thing.

4. *Identity of vegetables*.—We must therefore consider wherein an oak differs from a mass of matter, and that seems to me to be in this, that the one is only the cohesion of particles of matter any how united, the other such a disposition of them as constitutes the parts of an oak; and such an organization of those parts as is fit to receive and distribute nourishment, so as to continue and frame the wood, bark, and leaves, etc., of an oak, in which consists the vegetable life. That being then one plant which has such an organization of parts in one coherent body, partaking of one common life, it continues to be the same plant as long as it partakes of the same life, though that life be communicated to new particles of matter vitally united to the living plant, in a like continued organization conformable to that sort of plants. For this organization, being at any one instant in any one collection of matter, is in that particular concrete distinguished from all other, and is that individual life, which existing constantly from that moment both forwards and backwards, in the same continuity of insensibly succeeding parts united to the living body of the plant, it has that identity which makes the same plant, and all the parts of it, parts of the same plant, during all the time that they exist united in that continued organization, which is fit to convey that common life to all the parts so united.

5. *Identity of animals*.—The case is not so much different in brutes but that any one may hence see what makes an animal and continues it the same. Something we have like this in machines, and may serve to illustrate it. For example, what is a watch? It is plain it is nothing but a fit organization or construction of parts to a certain end, which, when a sufficient force is added to it, it is capable to attain. If we would suppose this machine one continued body, all whose organized parts were repaired, increased, or diminished by a constant addition or separation of insensible parts, with one common

life, we should have something very much like the body of an animal; with this difference, That, in an animal the fitness of the organization, and the motion wherein life consists, begin together, the motion coming from within; but in machines the force coming sensibly from without, is often away when the organ is in order, and well fitted to receive it.

6. *The identity of man.*—This also shows wherein the identity of the same *man* consists; viz., in nothing but a participation of the same continued life, by constantly fleeting particles of matter, in succession vitally united to the same organized body. He that shall place the identity of man in anything else, but, like that of other animals, in one fitly organized body, taken in any one instant, and from thence continued, under one organization of life, in several successively fleeting particles of matter united to it, will find it hard to make an embryo, one of years, mad and sober, the *same* man, by any supposition, that will not make it possible for Seth, Ismael, Socrates, Pilate, St. Austin, and Caesar Borgia, to be the same man. For if the identity of *soul alone* makes the same *man*; and there be nothing in the nature of matter why the same individual spirit may not be united to different bodies, it will be possible that those men, living in distant ages, and of different tempers, may have been the same man: which way of speaking must be from a very strange use of the word *man*, applied to an idea out of which body and shape are excluded. And that way of speaking would agree yet worse with the notions of those philosophers who allow of transmigration, and are of opinion that the souls of men may, for their miscarriages, be detruded into the bodies of beasts, as fit habitations, with organs suited to the satisfaction of their brutal inclinations. But yet I think nobody, could he be sure that the *soul* of Heliogabalus were in one of his hogs, would yet say that hog were a *man* or Heliogabalus.

7. *Idea of identity suited to the idea it is applied to.*—It is not therefore unity of substance that comprehends all sorts of identity, or will determine it in every case; but to conceive and judge of it aright, we must consider what idea the word it is applied to stands for: it being one thing to be the same *substance*, another the same *man*, and a third the same *person*, if *person*, *man*, and *substance*, are three names standing for three different ideas;—for such as is the idea belonging to that name, such must be the identity; which, if it had been a little more carefully attended to, would possibly have prevented a great deal of that confusion which often occurs about this matter, with no small seeming difficulties, especially concerning personal identity, which therefore we shall in the next place a little consider.

* * *

9. *Personal identity.*—This being premised, to find wherein personal identity consists, we must consider what *person* stands for;—which, I think, is a thinking intelligent being, that has reason and reflection, and can consider itself as itself, the same thinking thing, in different times and places; which it does only by that consciousness which is inseparable from thinking, and, as it seems to me, essential to it: it being impossible for any one to perceive without *perceiving* that he does perceive. When we see, hear, smell, taste, feel, meditate, or will anything, we know that we do so. Thus it is always as to our present sensations and perceptions: and by this every one is to himself that which he calls *self*:—it not being considered, in this case, whether the same self be continued in the same or divers substances. For, since consciousness always accompanies thinking, and it is that which makes every one to be what he calls self, and thereby distinguishes himself from all other thinking things, in this alone consists personal identity, i.e., the

sameness of a rational being: and as far as this consciousness can be extended backwards to any past action or thought, so far reaches the identity of that person; it is the same self now it was then; and it is by the same self with this present one that now reflects on it, that that action was done.

10. *Consciousness makes personal identity.*—But it is further inquired, whether it be the same identical substance. This few would think they had reason to doubt of, if these perceptions, with their consciousness, always remained present in the mind, whereby the same thinking thing would be always consciously present, and, as would be thought, evidently the same to itself. But that which seems to make the difficulty is this, that this consciousness being interrupted always by forgetfulness, there being no moment of our lives wherein we have the whole train of all our past actions before our eyes in one view, but even the best memories losing the sight of one part whilst they are viewing another; and we sometimes, and that the greatest part of our lives, not reflecting on our past selves, being intent on our present thoughts, and in sound sleep having no thoughts at all, or at least none with that consciousness which remarks our waking thoughts,—I say, in all these cases, our consciousness being interrupted, and we losing the sight of our past selves, doubts are raised whether we are the same thinking thing, i.e., the same *substance* or no. Which, however reasonable or unreasonable, concerns not *personal* identity at all. The question being what makes the same person, and not whether it be the same identical substance, which always thinks in the same person, which, in this case, matters not at all: different substances, by the same consciousness (where they do partake in it) being united into one person, as well as different bodies by the same life are united into one animal, whose identity is preserved in that change of substances by the unity of one continued life. For, it being the same consciousness that makes a man be himself to himself, personal identity depends on that only, whether it be annexed solely to one individual substance, or can be continued in a succession of several substances. For as far as any intelligent being *can* repeat the idea of any past action with the same consciousness it had of it at first, and with the same consciousness it has of any present action; so far it is the same personal self. For it is by the consciousness it has of its present thoughts and actions, that it is *self* to *itself* now, and so will be the same self, as far as the same consciousness can extend to actions past or to come; and would be by distance of time, or change of substance, no more two persons, than a man be two men by wearing other clothes today than he did yesterday, with a long or a short sleep between: the same consciousness uniting those distant actions into the same person, whatever substances contributed to their production.

* * *

16. *Consciousness alone unites actions into the same person.*—But though the same immaterial substance or soul does not alone, wherever it be, and in whatsoever state, make the same *man*; yet it is plain, consciousness, as far as ever it can be extended—should it be to ages past—unites existences and actions very remote in time into the same *person*, as well as it does the existences and actions of the immediately preceding moment: so that whatever has the consciousness of present and past actions, is the same person to whom they both belong. Had I the same consciousness that I saw the ark and Noah's flood, as that I saw an overflowing of the Thames last winter, or as that I write now, I could no more doubt that I who write this now, that saw the Thames overflowed last winter, and that viewed the flood at the general deluge, was the same *self*,—place that self in what *substance* you please—than that I who write this am the

same myself now whilst I write (whether I consist of all the same substance, material or immaterial, or no) that I was yesterday. For as to this point of being the same self, it matters not whether this present self be made up of the same or other substances—I being as much concerned, and as justly accountable for any action that was done a thousand years since, appropriated to me now by this self consciousness, as I am for what I did the last moment.

17. *Self depends on consciousness, not on substance.*—Self is that conscious thinking thing,—whatever substance made up of, (whether spiritual or material, simple or compounded, it matters not)—which is sensible or conscious of pleasure and pain, capable of happiness or misery, and so is concerned for itself, as far as that consciousness extends. Thus every one finds that, whilst comprehended under that consciousness, the little finger is as much a part of himself as what is most so. Upon separation of this little finger, should this consciousness go along with the little finger, and leave the rest of the body, it is evident the little finger would be the person, the same person; and self then would have nothing to do with the rest of the body. As in this case it is the consciousness that goes along with the substance, when one part is separate from another, which makes the same person, and constitutes this inseparable self: so it is in reference to substances remote in time. That with which the consciousness of this present thinking thing *can* join itself, makes the same person, and is one self with it, and with nothing else; and so attributes to itself, and owns all the actions of that thing, as its own, as far as that consciousness reaches, and no further; as every one who reflects will perceive.

18. *Persons, not substances, the objects of reward and punishment.*—In this personal identity is founded all the right and justice of reward and punishment; happiness and misery being that for which every one is concerned for *himself*, and not mattering what becomes of any *substance*, not joined to, or affected with that consciousness. For, as it is evident in the instance I gave but now, if the consciousness went along with the little finger when it was cut off, that would be the same self which was concerned for the whole body yesterday, as making part of itself, whose actions then it cannot but admit as its own now. Though, if the same body should still live, and immediately from the separation of the little finger have its own peculiar consciousness, whereof the little finger knew nothing, it would not at all be concerned for it, as a part of itself, or could own any of its actions, or have any of them imputed to him.

19. *Which shows wherein personal identity consists.*—This may show us wherein personal identity consists: not in the identity of substance, but, as I have said, in the identity of consciousness, wherein if Socrates and the present mayor of Queinborough agree, they are the same person: if the same Socrates waking and sleeping do not partake of the same consciousness, Socrates waking and sleeping are not the same person. And to punish Socrates waking for what Socrates sleeping thought, and waking Socrates was never conscious of, would be no more of right, than to punish one twin for what his brother-twin did, whereof he knew nothing, because their outsides were so alike, that they could not be distinguished; for such twins have been seen.

20. *Absolute oblivion separates what is thus forgotten from the person, but not from the man.*—But yet possibly it will still be objected,—Suppose I wholly lose the memory of some parts of my life, beyond a possibility of retrieving them, so that perhaps I shall never be conscious of them again; yet am I not the same person that did those actions, had those thoughts that I once was conscious of, though I have now forgot them? To which I answer, that we must here take notice what the word *I* is applied to; which, in this case, is the *man* only. And the same man being presumed to be the

same person, I is easily here supposed to stand also for the same person. But if it be possible for the same man to have distinct incommunicable consciousness at different times, it is past doubt the same man would at different times make different persons; which, we see, is the sense of mankind in the solemnest declaration of their opinions, human laws not punishing the mad man for the sober man's actions, nor the sober man for what the mad man did,—thereby making them two persons: which is somewhat explained by our way of speaking in English when we say such an one is “not himself,” or is “beside himself”; in which phrases it is insinuated, as if those who now, or at least first used them, thought that self was changed; the self-same person was no longer in that man.

* * *

22. *Is not a man drunk and sober the same person?*—Why else is he punished for the fact he commits when drunk, though he be never afterwards conscious of it? Just as much the same person as a man that walks, and does other things in his sleep, is the same person, and is answerable for any mischief he shall do in it. Human laws punish both, with a justice suitable to *their* way of knowledge;—because, in these cases, they cannot distinguish certainly what is real, what counterfeit: and so the ignorance in drunkenness or sleep is not admitted as a plea. For, though punishment be annexed to personality, and personality to consciousness, and the drunkard perhaps be not conscious of what he did, yet human judicatures justly punish him; because the fact is proved against him, but want of consciousness cannot be proved for him. But in the Great Day, wherein the secrets of all hearts shall be laid open, it may be reasonable to think, no one shall be made to answer for what he knows nothing of; but shall receive his doom, his conscience accusing or excusing him.

* * *

25. *Consciousness unites substances, material or spiritual, with the same personality.* — I agree, that more probable opinion is, that this consciousness is annexed to, and the affection of, one individual immaterial substance.

But let men, according to their diverse hypotheses, resolve of that as they please. This every intelligent being, sensible of happiness or misery, must grant—that there is something that is *himself*, that he is concerned for, and would have happy; that this self has existed in a continued duration more than one instant, and therefore it is possible may exist, as it has done, months and years to come, without any certain bounds to be set to its duration; and may be the same self, by the same consciousness continued on for the future. And thus, by this consciousness he finds himself to be the same self which did such and such an action some years since, by which he comes to be happy or miserable now. In all which account of self, the same numerical substance is not considered as making the same self; but the same continued *consciousness*, in which several substances may have been united, and again separated from it, which, whilst they continued in a vital union with that wherein this consciousness then resided, made a part of that same self. Thus any part of our bodies, vitally united to that which is conscious in us, makes a part of ourselves: but upon separation from the vital union by which that consciousness is communicated, that which a moment since was part of ourselves, is now no more so than a part of another man's self is a part of me: and it is

not impossible but in a little time may become a real part of another person. And so we have the same numerical substance become a part of two different persons; and the same person preserved under the change of various substances. Could we suppose any spirit wholly stripped of all its memory or consciousness of past actions, as we find our minds always are of a great part of ours, and sometimes of them all; the union or separation of such a spiritual substance would make no variation of personal identity, any more than that of any particle of matter does. Any substance vitally united to the present thinking being is a part of that very same self which now is; anything united to it by a consciousness of former actions, makes also a part of the same self, which is the same both then and now.

* * *

BOOK III. OF WORDS

CHAPTER 2. OF THE SIGNIFICATION OF WORDS

1. *Words are sensible signs, necessary for communication of ideas.*—Man, though he have great variety of thoughts, and such from which others as well as himself might receive profit and delight; yet they are all within his own breast, invisible and hidden from others, nor can of themselves be made to appear. The comfort and advantage of society not being to be had without communication of thoughts, it was necessary that man should find out some external sensible signs, whereof those invisible ideas, which his thoughts are made up of, might be made known to others. For this purpose nothing was so fit, either for plenty or quickness, as those articulate sounds, which with so much ease and variety he found himself able to make. Thus we may conceive how words, which were by nature so well adapted to that purpose, came to be made use of by men as the signs of their ideas; not by any natural connexion that there is between particular articulate sounds and certain ideas, for then there would be but one language amongst all men; but by a voluntary imposition, whereby such a word is made arbitrarily the mark of such an idea. The use, then, of words, is to be sensible marks of ideas; and the ideas they stand for are their proper and immediate signification.

* * *

3. *Examples of this.*—This is so necessary in the use of language, that in this respect the knowing and the ignorant, the learned and the unlearned, use the words they speak (with any meaning) all alike. They, in every man's mouth, stand for the ideas he has, and which he would express by them. A child having taken notice of nothing in the metal he hears called *gold*, but the bright shining yellow colour, he applies the word gold only to his own idea of that colour, and nothing else; and therefore calls the same colour in a peacock's tail gold. Another that hath better observed, adds to shining yellow great weight: and then the sound gold, when he uses it, stands for a complex idea of a shining yellow and a very weighty substance. Another adds to those qualities fusibility: and then the word gold signifies to him a body, bright, yellow, fusible, and very heavy. Another adds malleability. Each of these uses equally the word gold, when they

have occasion to express the idea which they have applied it to: but it is evident that each can apply it only to his own idea; nor can he make it stand as a sign of such a complex idea as he has not.

* * *

CHAPTER 3. OF GENERAL TERMS

1. *The greatest part of words are general terms.*—All things that exist being particulars, it may perhaps be thought reasonable that words, which ought to be conformed to things, should be so too,—I mean in their signification: but yet we find quite the contrary. The far greatest part of words that make all languages are general terms: which has not been the effect of neglect or chance, but of reason and necessity.

2. *That every particular thing should have a name for itself is impossible.*—First, It is impossible that every particular thing should have a distinct peculiar name. For, the signification and use of words depending on that connexion which the mind makes between its ideas and the sounds it uses as signs of them, it is necessary, in the application of names to things, that the mind should have distinct ideas of the things, and retain also the particular name that belongs to every one, with its peculiar appropriation to that idea. But it is beyond the power of human capacity to frame and retain distinct ideas of all the particular things we meet with: every bird and beast men saw; every tree and plant that affected the senses, could not find a place in the most capacious understanding. If it be looked on as an instance of a prodigious memory, that some generals have been able to call every soldier in their army by his proper name, we may easily find a reason why men have never attempted to give names to each sheep in their flock, or crow that flies over their heads; much less to call every leaf of plants, or grain of sand that came in their way, by a peculiar name.

3. *And would be useless, if it were possible.*—Secondly, If it were possible, it would yet be useless; because it would not serve to the chief end of language. Men would in vain heap up names of particular things, that would not serve them to communicate their thoughts. Men learn names, and use them in talk with others, only that they may be understood: which is then only done when, by use or consent, the sound I make by the organs of speech, excites in another man's mind who hears it, the idea I apply it to in mine, when I speak it. This cannot be done by names applied to particular things; whereof I alone having the ideas in my mind, the names of them could not be significant or intelligible to another, who was not acquainted with all those very particular things which had fallen under my notice.

4. *A distinct name for every particular thing, not fitted for enlargement of knowledge.*—Thirdly, But yet, granting this also feasible, (which I think is not), yet a distinct name for every particular thing would not be of any great use for the improvement of knowledge: which, though founded in particular things, enlarges itself by general views; to which things reduced into sorts, under general names, are properly subservient. These, with the names belonging to them, come within some compass, and do not multiply every moment, beyond what either the mind can contain, or use requires. And therefore, in these, men have for the most part stopped: but yet not so as to hinder themselves from distinguishing particular things by appropriated names, where convenience demands it. And therefore in their own species, which they have most to do with,

and wherein they have often occasion to mention particular persons, they make use of proper names; and there distinct individuals have distinct denominations.

5. *What things have proper names, and why.*—Besides persons, countries also, cities, rivers, mountains, and other the like distinctions of place have usually found peculiar names, and that for the same reason; they being such as men have often an occasion to mark particularly, and, as it were, set before others in their discourses with them. And I doubt not but, if we had reason to mention particular horses as often as we have to mention particular men, we should have proper names for the one, as familiar as for the other, and Bucephalus would be a word as much in use as Alexander. And therefore we see that, amongst jockeys, horses have their proper names to be known and distinguished by, as commonly as their servants: because, amongst them, there is often occasion to mention this or that particular horse when he is out of sight.

6. *How general words are made.*—The next thing to be considered is,—How general words come to be made. For, since all things that exist are only particulars, how come we by general terms; or where find we those general natures they are supposed to stand for? Words become general by being made the signs of general ideas: and ideas become general, by separating from them the circumstances of time and place, and any other ideas that may determine them to this or that particular existence. By this way of abstraction they are made capable of representing more individuals than one; each of which having in it a conformity to that abstract idea, is (as we call it) of that sort.

7. *Shown by the way we enlarge our complex ideas from infancy.*—But, to deduce this a little more distinctly, it will not perhaps be amiss to trace our notions and names from their beginning, and observe by what degrees we proceed, and by what steps we enlarge our ideas from our first infancy. There is nothing more evident, than that the ideas of the persons children converse with (to instance in them alone) are like the persons themselves, only particular. The ideas of the nurse and the mother are well framed in their minds; and, like pictures of them there, represent only those individuals. The names they first gave to them are confined to these individuals; and the names of *nurse* and *mamma*, the child uses, determine themselves to those persons. Afterwards, when time and a larger acquaintance have made them observe that there are a great many other things in the world, that in some common agreements of shape, and several other qualities, resemble their father and mother, and those persons they have been used to, they frame an idea, which they find those many particulars do partake in; and to that they give, with others, the name *man*, for example. And thus they come to have a general name, and a general idea. Wherein they make nothing new; but only leave out of the complex idea they had of Peter and James, Mary and Jane, that which is peculiar to each, and retain only what is common to them all.

8. *And further enlarge our complex ideas, by still leaving out properties contained in them.*—By the same way that they come by the general name and idea of man, they easily advance to more general names and notions. For, observing that several things that differ from their idea of man, and cannot therefore be comprehended under that name, have yet certain qualities wherein they agree with man, by retaining only those qualities, and uniting them into one idea, they have again another and more general idea; to which having given a name they make a term of a more comprehensive extension: which new idea is made, not by any new addition, but only as before, by

leaving out the shape, and some other properties signified by the name man, and retaining only a body, with life, sense, and spontaneous motion, comprehended under the name animal.

9. *General natures are nothing but abstract end partial ideas of more complex ones.*—That this is the way whereby men first formed general ideas, and general names to them, I think is so evident, that there needs no other proof of it but the considering of a man's self, or others, and the ordinary proceedings of their minds in knowledge. And he that thinks *general natures* or *notions* are anything else but such abstract and partial ideas of more complex ones, taken at first from particular existences, will, I fear, be at a loss where to find them. For let any one effect, and then tell me, wherein does his idea of *man* differ from that of *Peter* and *Paul*, or his idea of horse from that of *Bucephalus*, but in the leaving out something that is peculiar to each individual, and retaining so much of those particular complex ideas of several particular existences as they are found to agree in? Of the complex ideas signified by the names *man* and *horse*, leaving out but those particulars wherein they differ, and retaining only those wherein they agree, and of those making a new distinct complex idea, and giving the name *animal* to it, one has a more general term, that comprehends with man several other creatures. Leave out of the idea of *animal*, sense and spontaneous motion, and the remaining complex idea, made up of the remaining simple ones of body, life, and nourishment, becomes a more general one, under the more comprehensive term, *vivens*. And, not to dwell longer upon this particular, so evident in itself; by the same way the mind proceeds to *body*, *substance*, and at last to *being*, *thing*, and such universal terms, which stand for any of our ideas whatsoever. To conclude: this whole mystery of genera and species, which make such a noise in the schools, and are with justice so little regarded out of them, is nothing else but *abstract ideas*, more or less comprehensive, with names annexed to them. In all which this is constant and unvariable, that every more general term stands for such an idea, and is but a part of any of those contained under it.

10. *Why the genus is ordinarily made use of in definitions.*—This may show us the reason why, in the defining of words, which is nothing but declaring their signification, we make use of the *genus*, or next general word that comprehends it. Which is not out of necessity, but only to save the labour of enumerating the several simple ideas which the next general word or genus stands for; or, perhaps, sometimes the shame of not being able to do it. But though defining by *genus* and *differentia* (I crave leave to use these terms of art, though originally Latin, since they most properly suit those notions they are applied to), I say, though defining by the *genus* be the shortest way, yet I think it may be doubted whether it be the best. This I am sure, it is not the only, and so not absolutely necessary. For, definition being nothing but making another understand by words what idea the term defined stands for, a definition is best made by enumerating those simple ideas that are combined in the signification of the term defined: and, if, instead of such an enumeration, men have accustomed themselves to use the next general term, it has not been out of necessity, or for greater clearness, but for quickness and dispatch sake. For I think that, to one who desired to know what idea the word man stood for; if it should be said, that man was a solid extended substance, having life, sense, spontaneous motion, and the faculty of reasoning, I doubt not but the meaning of the term man would be as well understood, and the idea it stands for be at least as clearly made known, as when it is defined to be a rational animal: which, by the several definitions of *animal*, *vivens*, and *corpus*, resolves itself into those enumerated ideas.

I have, in explaining the term man, followed here the ordinary definition of the schools; which, though perhaps not the most exact, yet serves well enough to my present purpose. And one may, in this instance, see what gave occasion to the rule, that a definition must consist of *genus* and *differentia*; and it suffices to show us the little necessity there is of such a rule, or advantage in the strict observing of it. For, definitions, as has been said, being only the explaining of one word by several others, so that the meaning or idea it stands for may be certainly known; languages are not always so made according to the rules of logic, that every term can have its signification exactly and clearly expressed by two others. Experience sufficiently satisfies us to the contrary; or else those who have made this rule have done ill, that they have given us so few definitions conformable to it. But of definitions more in the next chapter.

11. *General and universal are creatures of the understanding, and belong not to the real existence of things.*—To return to general words: it is plain, by what has been said, that *general* and *universal* belong not to the real existence of things; but are the inventions and creatures of the understanding, made by it for its own use, and concern only signs, whether words or ideas. Words are general, as has been said, when used for signs of general ideas, and so are applicable indifferently to many particular things; and ideas are general when they are set up as the representatives of many particular things: but universality belongs not to things themselves, which are all of them particular in their existence, even those words and ideas which in their signification are general. When therefore we quit particulars, the generals that rest are only creatures of our own making; their general nature being nothing but the capacity they are put into, by the understanding, of signifying or representing many particulars. For the signification they have is nothing but a relation that, by the mind of man, is added to them.

12. *Abstract ideas are the essences of genera and species.*—The next thing therefore to be considered is, What kind of signification it is that general words have. For, as it is evident that they do not signify barely one particular thing; for then they would not be general terms, but proper names, so, on the other side, it is as evident they do not signify a plurality; for *man* and *men* would then signify the same; and the distinction of numbers (as the grammarians call them) would be superfluous and useless. That then which general words signify is a *sort* of things; and each of them does that, by being a sign of an abstract idea in the mind; to which idea, as things existing are found to agree, so they come to be ranked under that name, or, which is all one, be of that sort. Whereby it is evident that the *essences* of the sorts, or, if the Latin word pleases better, *species* of things, are nothing else but these abstract ideas. For the having the essence of any species, being that which makes anything to be of that species; and the conformity to the idea to which the name is annexed being that which gives a right to that name; the having the essence, and the having that conformity, must needs be the same thing: since to be of any species, and to have a right to the name of that species, is all one. As, for example, to be a *man*, or of the *species* man, and to have right to the *name* man, is the same thing. Again, to be a man, or of the species man, and have the *essence* of a man, is the same thing. Now, since nothing can be a man, or have a right to the name man, but what has a conformity to the abstract idea the name man stands for, nor anything be a man, or have a right to the species man, but what has the essence of that species; it follows, that the abstract idea for which the name stands, and the essence of the species, is one and the same. From whence it is easy to observe, that the essences of the sorts of things, and, consequently, the sorting of things, is the workmanship of the understanding that abstracts and makes those general ideas.

13. *They are the workmanship of the understanding, but have their foundation in the similitude of things.*—I would not here be thought to forget, much less to deny, that Nature, in the production of things, makes several of them alike: there is nothing more obvious, especially in the races of animals, and all things propagated by seed. But yet I think we may say, *the sorting of them under names is the workmanship of the understanding, taking occasion, from the similitude it observes amongst them, to make abstract general ideas*, and set them up in the mind, with names annexed to them, as patterns or forms (for, in that sense, the word *form* has a very proper signification) to which as particular things existing are found to agree, so they come to be of that species, have that denomination, or are put into that *classis*. For when we say this is a man, that a horse; this justice, that cruelty; this a watch, that a jack; what do we else but rank things under different specific names, as agreeing to those abstract ideas, of which we have made those names the signs? And what are the essences of those species set out and marked by names, but those abstract ideas in the mind; which are, as it were, the bonds between particular things that exist, and the names they are to be ranked under? And when general names have any connexion with particular beings, these abstract ideas are the medium that unites them: so that the essences of species, as distinguished and denominated by us, neither are nor can be anything but those precise abstract ideas we have in our minds. And therefore the supposed real essences of substances, if different from our abstract ideas, cannot be the essences of the species we rank things into. For two species may be one, as rationally as two different essences be the essence of one species: and I demand what are the alterations [which] may, or may not be made in a *horse* or *lead*, without making either of them to be of another species? In determining the species of things by *our* abstract ideas, this is easy to resolve, but if any one will regulate himself herein by supposed *real* essences, he will, I suppose, be at a loss: and he will never be able to know when anything precisely ceases to be of the species of a *horse* or *lead*.

14. *Each distinct abstract idea is a distinct essence.*—Nor will any one wonder that I say these essences, or abstract ideas (which are the measures of name, and the boundaries of species) are the workmanship of the understanding, who considers that at least the complex ones are often, in several men, different collections of simple ideas; and therefore that is *covetousness* to one man, which is not so to another. Nay, even in substances, where their abstract ideas seem to be taken from the things themselves, they are not constantly the same; no, not in that species which is most familiar to us, and with which we have the most intimate acquaintance: it having been more than once doubted, whether the *fetus* born of a woman were a *man*, even so far as that it hath been debated, whether it were or were not to be nourished and baptized: which could not be, if the abstract idea or essence to which the name man belonged were of nature's making; and were not the uncertain and various collection of simple ideas, which the understanding put together, and then, abstracting it, affixed a name to it. So that, in truth, every distinct abstract idea is a distinct essence; and the names that stand for such distinct ideas are the names of things essentially different. Thus a circle is as essentially different from an oval as a sheep from a goat; and rain is as essentially different from snow as water from earth: that abstract idea which is the essence of one being impossible to be communicated to the other. And thus any two abstract ideas, that in any part vary one from another, with two distinct names annexed to them, constitute two distinct sorts, or, if you please, species, as essentially different as any two of the most remote or opposite in the world.

15. *Several significations of the word "essence."*—But since the essences of things are thought by some (and not without reason) to be wholly unknown, it may not be amiss to consider the several significations of the word essence.

Real essence.—First, Essence may be taken for the very being of anything, whereby it is what it is. And thus the real internal, but generally (in substances) unknown constitution of things, whereon their discoverable qualities depend, may be called their essence. This is the proper original signification of the word, as is evident from the formation of it; *essentia*, in its primary notation, signifying properly, being. And in this sense it is still used, when we speak of the essence of *particular* things, without giving them any name.

Nominal essences.—Secondly, The learning and disputes of the schools having been much busied about *genus* and *species*, the word *essence* has almost lost its primary signification: and, instead of the real constitution of things, has been almost wholly applied to the artificial constitution of *genus* and *species*. It is true, there is ordinarily supposed a real constitution of the sorts of things; and it is past doubt there must be some real constitution, on which any collection of simple ideas co-existing must depend. But, it being evident that things are ranked under names into sorts or species, only as they agree to certain abstract ideas, to which we have annexed those names, the essence of each *genus*, or sort, comes to be nothing but that abstract idea which the general, or sortal (if I may have leave so to call it from sort, as I do general from genus) name stands for. And this we shall find to be that which the word essence imports in its most familiar use.

These two sorts of essences, I suppose, may not unfitly be termed, the one the *real*, the other *nominal essence*.

* * *

BOOK IV. OF KNOWLEDGE AND PROBABILITY

CHAPTER 1. OF KNOWLEDGE IN GENERAL

1. *Our knowledge conversant about our ideas only.*—Since the mind, in all its thoughts and reasonings, hath no other immediate object but its own ideas, which it alone does or can contemplate, it is evident that our knowledge is only conversant about them.

2. *Knowledge is the perception of the agreement or disagreement of two ideas.*—*Knowledge* then seems to me to be nothing but the *perception of the connexion and agreement, or disagreement and repugnancy, of any of our ideas*. In this alone it consists. Where this perception is, there is knowledge; and where it is not, there, though we may fancy, guess, or believe, yet we always come short of knowledge. For when we know that white is not black, what do we else but perceive that these two ideas do not agree? When we possess ourselves with the utmost security of the demonstration that the three angles of a triangle are equal to two right ones, what do we more but perceive, that equality to two right ones does necessarily agree to, and is inseparable from, the three angles of a triangle?

3. *This agreement or disagreement may be any of four sorts.*—But to understand a little more distinctly wherein this agreement or disagreement consists, I think we may

reduce it all to these four sorts: (1) *Identity*, or *diversity*. (2) *Relation*. (3) *Coexistence*, or *necessary connexion*. (4) *Real existence*.

4. *Of identity, or diversity in ideas.*—*First*, As to the first sort of agreement or disagreement, viz., *identity*, or *diversity*. It is the first act of the mind, when it has any sentiments or ideas at all, to perceive its ideas, and, so far as it perceives them, to know each what it is, and thereby also to perceive their difference, and that one is not another. This is so absolutely necessary, that without it there could be no knowledge, no reasoning, no imagination, no distinct thoughts at all. By this the mind clearly and infallibly perceives each idea to agree with itself, and to be what it is; and all distinct ideas to disagree, i.e., the one not to be the other: and this it does without pains, labour, or deduction; but at first view, by its natural power of perception and distinction. And though men of art have reduced this into those general rules, *What is, is*; and, *It is impossible for the same thing to be and not to be*, for ready application in all cases wherein there may be occasion to reflect on it; yet it is certain that the first exercise of this faculty is about particular ideas. A man infallibly knows, as soon as ever he has them in his mind, that the ideas he calls *white* and *round* are the very ideas they are, and that they are not other ideas which he calls *red* or *square*. Nor can any maxim or proposition in the world make him know it clearer or surer than he did before, and without any such general rule. This then is the first agreement or disagreement which the mind perceives in its ideas; which it always perceives at first sight; and if there ever happen any doubt about it, it will always be found to be about the names, and not the ideas themselves, whose identity and diversity will always be perceived as soon and as clearly as the ideas themselves are, nor can it possibly be otherwise.

5. *Of abstract relations between ideas.*—*Secondly*, The next sort of agreement or disagreement the mind perceives in any of its ideas may, I think, be called *relative*, and is nothing but the perception of the *relation* between any two ideas, of what kind soever, whether substances, modes, or any other. For, since all distinct ideas must eternally be known not to be the same, and so be universally and constantly denied one of another, there could be no room for any positive knowledge at all, if we could not perceive any relation between our ideas, and find out the agreement or disagreement they have one with another, in several ways the mind takes of comparing them.

6. *Of their necessary coexistence in substances.*—*Thirdly*, The third sort of agreement or disagreement to be found in our ideas, which the perception of the mind is employed about, is *coexistence*, or *non-coexistence* in the *same subject*; and this belongs particularly to substances. Thus when we pronounce concerning gold that it is fixed, our knowledge of this truth amounts to no more but this, that fixedness, or a power to remain in the fire unconsumed, is an idea that always accompanies and is joined with that particular sort of yellowness, weight, fusibility, malleableness, and solubility in aqua regia, which make our complex idea, signified by the word gold.

7. *Of real existence agreeing to any idea.*—*Fourthly*, The fourth and last sort is that of *actual real existence* agreeing to any idea. Within these four sorts of agreement or disagreement is, I suppose, contained all the knowledge we have or are capable of; for all the enquiries that we can make concerning any of our ideas, all that we know or can affirm concerning any of them, is, that it is or is not the same with some other; that it does or does not always coexist with some other idea in the same subject; that it has this or that relation to some other idea; or that it has a real existence without the mind. Thus, “Blue is not yellow,” is of identity. “Two triangles upon equal bases between two parallels are equal,” is of relation. “Iron is susceptible of magnetical

impressions," is of coexistence. "God is," is of real existence. Though identity and coexistence are truly nothing but relations, yet they are so peculiar ways of agreement or disagreement of our ideas, that they deserve well to be considered as distinct heads, and not under relation in general: since they are so different grounds of affirmation and negation, as will easily appear to any one who will but reflect on what is said in several places of this Essay. I should now proceed to examine the several degrees of our knowledge, but that it is necessary first to consider the different acceptations of the word knowledge.

8. *Knowledge is either actual or habitual.*—There are several ways wherein the mind is possessed of truth, each of which is called knowledge.

(1) There is *actual knowledge*, which is the present view the mind has of the agreement or disagreement of any of its ideas, or of the relation they have one to another.

(2) A man is said to know any proposition which having been once laid before his thoughts, he evidently perceived the agreement or disagreement of the ideas whereof it consists; and so lodged it in his memory, that whenever that proposition comes again to be reflected on, he, without doubt or hesitation, embraces the right side, assents to and is certain of the truth of it. This, I think, one may call *habitual knowledge* . . . For our finite understandings being able to think clearly and distinctly but on one thing at once, if men had no knowledge of any more than what they actually thought on, they would all be very ignorant; and he that knew most would know but one truth, that being all he was able to think on at one time.

9. *Habitual knowledge is of two degrees.*—Of habitual knowledge there are also, vulgarly speaking, two degrees:—

First, The one of such truths laid up in the memory as, whenever they occur to the mind, it *actually perceives the relation is between those ideas*. And this is in all those truths whereof we have an intuitive knowledge, where the ideas themselves, by an immediate view, discover their agreement or disagreement one with another.

Secondly, The other is of such truths, whereof the mind having been convinced, it retains *the memory of the conviction without the proofs*. Thus a man that remembers certainly that he once perceived the demonstration that the three angles of a triangle are equal to two right ones, is certain that he knows it, because he cannot doubt of the truth of it. In his adherence to a truth where the demonstration by which it was at first known is forgot, though a man may be thought rather to believe his memory than really to know, and this way of entertaining a truth seemed formerly to me like something between opinion and knowledge, a sort of assurance which exceeds bare belief, for that relies on the testimony of another; yet, upon a due examination, I find it comes not short of perfect certainty, and is, in effect, true knowledge. That which is apt to mislead our first thoughts into a mistake in this matter is, that the agreement or disagreement of the ideas in this case is not perceived, as it was at first, by an actual view of all the intermediate ideas whereby the agreement or disagreement of those in the proposition was at first perceived; but by other intermediate ideas, that show the agreement or disagreement of the ideas contained in the proposition whose certainty we remember. For example: in this proposition, that "the three angles of a triangle are equal to two right ones," one who has seen and clearly perceived the demonstration of this truth knows it to be true, when that demonstration is gone out of his mind, so that at present it is not actually in view, and possibly cannot be recollected; but he knows it in a different way from what he did before. The agreement of the two ideas joined in that proposition is perceived; but it is by the intervention of other ideas than those which at first produced

that perception. He remembers, i.e., he knows (for remembrance is but the reviving of some past knowledge) that he was once certain of the truth of this proposition, that “the three angles of a triangle are equal to two right ones.” The immutability of the same relations between the same immutable things is now the idea that shows him, that if the three angles of a triangle were once equal to two right ones, they will always be equal to two right ones. And hence he comes to be certain, that what was once true in the case is always true; what ideas once agreed will always agree: and consequently, what he once knew to be true he will always know to be true, as long as he can remember that he once knew it. Upon this ground it is that particular demonstrations in mathematics afford general knowledge. If then the perception that the same ideas will eternally have the same habitudes and relations be not a sufficient ground of knowledge, there could be no knowledge of general propositions in mathematics; for no mathematical demonstration would be any other than particular and when a man had demonstrated any proposition concerning one triangle or circle, his knowledge would not reach beyond that particular diagram. If he would extend it farther, he must renew his demonstration in another instance, before he could know it to be true in another like triangle, and so on by which means one could never come to the knowledge of any general propositions. Nobody, I think, can deny that Mr. Newton certainly knows any proposition that he now at any time reads in his book to be true, though he has not in actual view that admirable chain of intermediate ideas whereby he at first discovered it to be true. Such a memory as that, able to retain such a train of particulars, may be well thought beyond the reach of human faculties, when the very discovery, perception, and laying together that wonderful connexion of ideas is found to surpass most readers’ comprehension. But yet it is evident the author himself knows the proposition to be true, remembering he once saw the connexion of those ideas, as certainly as he knows such a man wounded another, remembering that he saw him run him through. But because the memory is not always so clear as actual perception, and does in all men more or less decay in length of time, this amongst other differences, is one which shows that *demonstrative* knowledge is much more imperfect than *intuitive*, as we shall see in the following chapter.

CHAPTER 2. OF THE DEGREES OF OUR KNOWLEDGE

1. *Of the degree, or differences in clearness, of our knowledge: I. Intuitive*—All our knowledge consisting, as I have said, in the view the mind has of its own ideas, which is the utmost light and greatest certainty we, with our faculties and in our way of knowledge, are capable of, it may not be amiss to consider a little the degrees of its evidence. The different clearness of our knowledge seems to me to lie in the different way of perception the mind has of the agreement or disagreement of any of its ideas. For if we will reflect on our own ways of thinking, we shall find that sometimes the mind perceives the agreement or disagreement of two ideas *immediately by themselves*, without the intervention of any other and this, I think, we may call *intuitive knowledge*. For in this the mind is at no pains of proving or examining, but perceives the truth, as the eye doth light, only by being directed towards it. Thus the mind perceives that *white* is not black, that a *circle* is not a *triangle*, that *three* are more than *two*, and equal to *one and two*. Such kind of truths the mind perceives at the first sight of the ideas together, by bare intuition, without the intervention of any other idea; and this kind of knowledge is

the clearest and most certain that human frailty is capable of. This part of knowledge is irresistible, and like bright sunshine, forces itself immediately to be perceived as soon as ever the mind turns its view that way; and leaves no room for hesitation, doubt, or examination, but the mind is presently filled with the clear light of it. *It is on this intuition that depends all the certainty and evidence of all our knowledge*; which certainty every one finds to be so great, that he cannot imagine, and therefore not require, a greater for a man cannot conceive himself capable of a greater certainty, than to know that any idea in his mind is such as he perceives it to be; and that two ideas wherein he perceives a difference, are different, and not precisely the same. He that demands a greater certainty that this demands he knows not what, and shows only that he has a mind to be a skeptic without being able to be so. Certainty depends so wholly on this intuition, that in the next degree of knowledge, which I call demonstrative, this intuition is necessary in all the connexions of the intermediate ideas, without which we cannot attain knowledge and certainty.

2. II. *Demonstrative*.—The next degree of knowledge is, where the mind perceives the agreement or disagreement of any ideas, but not immediately . . . In this case, when the mind cannot so bring its ideas together as, by their immediate comparison and, as it were, juxtaposition or application one to another, to perceive their agreement or disagreement, it is fain, by the intervention of other ideas (one or more, as it happens), to discover the agreement or disagreement which it searches; and this is that which we call *reasoning*. Thus the mind, being willing to know the agreement or disagreement in bigness between the three angles of a triangle and two right ones, cannot, by an immediate view and comparing them, do it: because the three angles of a triangle cannot be brought at once, and be compared with any other one or two angles; and so of this the mind has no immediate, no intuitive knowledge. In this case the mind is fain to find out some other angles, to which the three angles of a triangle have an equality; and finding those equal to two right ones, comes to know their equality to two right ones.

3. *Demonstration depends on clearly perceived proofs*.—Those intervening ideas which serve to show the agreement of any two others, are called *proofs*; and where the agreement or disagreement is by this means plainly and clearly perceived, it is called *demonstration*, it being *shown* to the understanding, and the mind made to see that it is so. A quickness in the mind to find out these intermediate ideas (that shall discover the agreement or disagreement of any other), and to apply them right, is, I suppose, that which is called *sagacity*.

4. *As certain, but not so easy and ready as intuitive knowledge*.—This knowledge by intervening proofs, though it be certain, yet the evidence of it is not altogether so clear and bright, nor the assent so ready, as in intuitive knowledge. For though in demonstration the mind does at last perceive the agreement or disagreement of the ideas it considers, yet it is not without pains and attention: there must be more than one transient view to find it. A steady application and pursuit is required to this discovery: and there must be a progression by steps and degrees before the mind can in this way arrive at certainty . . .

5. *The demonstrated conclusion not without doubt, precedent to the demonstration*.—Another difference between intuitive and demonstrative knowledge is, that though in the latter all doubt be removed, when by the intervention of the intermediate ideas the agreement or disagreement is perceived; yet before the demonstration there was a doubt; which in intuitive knowledge cannot happen to the mind that has its faculty of perception left to a degree capable of distinct ideas, no more than it can be a doubt to the eye (that can distinctly see white and black), whether this ink and this paper be all of a colour . . .

6. *Not so clear as intuitive knowledge.*—It is true, the perception produced by demonstration is also very clear; yet it is often with a great abatement of that evident lustre and full assurance that always accompany that which I call intuitive; like a face reflected by several mirrors one to another, where, as long as it retains the similitude and agreement with the object, it produces a knowledge; but it is still, in every successive reflection, with a lessening of that perfect clearness and distinctness which is in the first, till at last, after many removes, it has a great mixture of dimness, and is not at first sight so knowable, especially to weak eyes. Thus it is with knowledge made out by a long train of proofs.

7. *Each step in demonstrated knowledge must have intuitive evidence.*—Now, in every step reason makes in demonstrative knowledge, there is an intuitive knowledge of that agreement or disagreement it seeks with the next intermediate idea, which it uses as a proof: for it were not so, that yet would need a proof; since without the perception of such agreement or disagreement there is no knowledge produced . . . This intuitive perception of the agreement or disagreement of the intermediate ideas, in each step and progression of the demonstration, must also be carried exactly in the mind, and a man must be sure that no part is left out: which, because in long deductions, and the use of many proofs, the memory does not always so readily and exactly retain; therefore it comes to pass, that this is more imperfect than intuitive knowledge, and men embrace often falsehood for demonstrations.

8. *Hence the mistake, ex præcognitis et præconcessis.*—The necessity of this intuitive knowledge, in each step of scientific or demonstrative reasoning, gave occasion, I imagine, to that mistaken axiom, that all reasoning was *ex præcognitis et præconcessis*; which how far it is mistaken, I shall have occasion to show more at large where I come to consider propositions, and particularly those propositions which are called “maxims”; and to show that it is by a mistake that they are supposed to be the foundations of all our knowledge and reasonings.

9. *Demonstration not limited to ideas of mathematical quantity.*—It has been generally taken for granted, that mathematics alone are capable of demonstrative certainty: but to have such an agreement or disagreement as may intuitively be perceived being, as I imagine, not the privilege of the ideas of number, extension, and figure alone, it may possibly be the want of due method and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge, and been scarce so much as aimed at by any but mathematicians . . .

10. *Why it has been thought to be so limited.*—The reason why it has been generally sought for and supposed to be only in those, I imagine, has been not only the general usefulness of those sciences, but because, in comparing their equality or excess, the modes of numbers have every the least difference very clear and perceivable: and though in extension every the least excess is not so perceptible, yet the mind has found out ways to examine and discover demonstratively the just equality of two angles, or extensions, or figures . . .

11. *Modes of qualities not demonstrable like modes of quantity.*—But in other simple ideas, whose modes and differences are made and counted by degrees, and not quantity, we have not so nice and accurate a distinction of their differences as to perceive or find ways to measure their just equality or the least differences. For those other simple ideas, being appearances or sensations produced in us by the size, figure, number, and motion of minute corpuscles singly insensible, their different degrees also depend upon

the variation of some or all of those causes; which since it cannot be observed by us in particles of matter whereof each is too subtle to be perceived, it is impossible for us to have any exact measures of the different degrees of these simple ideas . . .

* * *

13. *The secondary qualities of things not discovered by demonstration.*—Not knowing what number of particles, nor what motion of them, is fit to produce any precise degree of whiteness, we cannot demonstrate the certain equality of any two degrees of whiteness; because we have no certain standard to measure them by, nor means to distinguish every the least real difference; the only help we have being from our senses, which in this point fail us. But where the difference is so great as to produce in the mind clearly distinct ideas, whose differences can be perfectly retained, there these ideas of colours, as we see in different kinds, as blue and red, are as capable of demonstration as ideas of number and extension. What I have here said of whiteness and colours, I think, holds true in all secondary qualities, and their modes.

14. *Sensitive knowledge of the particular existence of finite beings without us.*—These two, viz., intuition and demonstration, are the degrees of our *knowledge*; whatever comes short of one of these, with what assurance soever embraced, is but *faith* or *opinion*, but not knowledge, at least in all general truths. There is, indeed, another perception of the mind employed about *the particular existence of finite beings without us*, which, going beyond bare probability, and yet not reaching perfectly to either of the foregoing degrees of certainty, passes under the name of *knowledge*. There can be nothing more certain, than that the idea we receive from an external object is in our minds; this is intuitive knowledge. But whether there be anything more than barely that idea in our minds, whether we can thence certainly infer the existence of anything without us which corresponds to that idea, is that whereof some men think there may be a question made; because men may have such ideas in their minds when no such thing exists, no such object affects their senses. But yet here, I think, we are provided with an evidence that puts us past doubting; for I ask any one, whether he be not invincibly conscious to himself of a different perception when he looks on the sun by day, and thinks on it by night; when he actually tastes wormwood, or smells a rose, or only thinks on that savour or odour? We as plainly find the difference there is between any idea revived in our minds by our own memory, and actually coming into our minds by our senses, as we do between any two distinct ideas. If any one say, a dream may do the same thing, and all these ideas may be produced in us without any external objects; he may please to dream that I make him this answer: (1) That it is no great matter whether I remove his scruple or no: where all is but dream, reasoning and arguments are of no use, truth and knowledge nothing. (2) That I believe he will allow a very manifest difference between dreaming of being in the fire, and being actually in it. But yet if he be resolved to appear so skeptical as to maintain, that what I call being actually in the fire is nothing but a dream; and that we cannot thereby certainly know that any such thing as fire actually exists without us; I answer, that we certainly finding that pleasure or pain follows upon the application of certain objects to us, whose existence we perceive, or dream that we perceive, by our senses; this certainly is as great as our happiness or misery, beyond which we have no concernment to know or to be. So that, I think, we may add to the two former sorts of knowledge this also, of the existence of particular external objects by that perception and consciousness we have of the actual entrance of ideas from them, and allow these three degrees of knowledge, viz.,

intuitive, demonstrative, and sensitive: in each of which there are different degrees and ways of evidence and certainty.

* * *

CHAPTER 3. OF THE EXTENT OF HUMAN KNOWLEDGE

1. *Extent of our knowledge*.—KNOWLEDGE, as has been said, lying in the perception of the agreement or disagreement of any of our ideas, it follows from hence that,

It extends no farther than we have ideas.—First, We can have knowledge no farther than we have ideas.

2. *It extends no farther than we can perceive their agreement or disagreement*.—Secondly, That we can have no knowledge farther than we can have perception of that agreement or disagreement: which perception being, (1) Either by *intuition*, or the immediate comparing any two ideas; or, (2) By *reason*, examining the agreement or disagreement of two ideas by the intervention of some others; or (3) By *sensation*, perceiving the existence of particular things; hence it also follows,

3. *Intuitive knowledge extends itself not to all the relations of all our ideas*.—Thirdly, that we cannot have an *intuitive knowledge* that shall extend itself to all our ideas, and all that we would know about them; because we cannot examine and perceive all the relations they have one to another by juxtaposition, or an immediate comparison one with another. Thus having the ideas of an obtuse and an acute angled triangle, both drawn from equal bases, and between parallels, I can by intuitive knowledge perceive the one not to be the other; but cannot that way know whether they be equal or no: because their agreement or disagreement in equality can never be perceived by an immediate comparing them; the difference of figure makes their parts incapable of an exact immediate application; and therefore there is need of some intervening quantities to measure them by, which is demonstration or rational knowledge.

4. *Nor does demonstrative knowledge*.—Fourthly, It follows also, from what is above observed, that our *rational knowledge* cannot reach to the whole extent of our ideas. Because between two different ideas we would examine, we cannot always find such mediums as we can connect one to another with an intuitive knowledge, in all the parts of the deduction; and wherever that fails, we come short of knowledge and demonstration.

5. *Sensitive knowledge narrower than either*.—Fifthly, *Sensitive knowledge*, reaching no farther than the existence of things actually present to our senses, is yet much narrower than either of the former.

* * *

CHAPTER 9. OF OUR THREEFOLD KNOWLEDGE OF EXISTENCE

1. *General propositions that are certain concern not existence*.—Hitherto we have only considered the essences of things; which being only abstract ideas, and thereby removed in our thoughts from particular existence, (that being the proper operation of the mind, in abstraction, to consider an idea under no other existence but what

it has in the understanding,) gives us no knowledge of real existence at all. Where, by the way, we may take notice, that universal propositions of whose truth or falsehood we can have certain knowledge concern not existence: and further, that all particular affirmations or negations that would not be certain if they were made general, are only concerning existence; they declaring only the accidental union or separation of ideas in things existing, which, in their abstract natures, have no known necessary union or repugnancy.

2. *A threefold knowledge of existence.*—But, leaving the nature of propositions, and different ways of predication to be considered more at large in another place, let us proceed now to inquire concerning our knowledge of the *existence of things*, and how we come by it. I say, then, that we have the knowledge of *our own* existence by intuition; of the existence of *God* by demonstration; and of *other things* by sensation.

3. *Our knowledge of our own existence is intuitive.*—As for our own existence, we perceive it so plainly and so certainly, that it neither needs nor is capable of any proof. For nothing can be more evident to us than our own existence. I think, I reason, I feel pleasure and pain: can any of these be more evident to me than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt of that. For if I know I feel pain, it is evident I have as certain perception of my own existence, as of the existence of the pain I feel: or if I know I doubt, I have as certain perception of the existence of the thing doubting, as of that thought which I *call doubt*. Experience then convinces us, that we have an *intuitive knowledge* of our own existence, and an internal infallible perception that we are. In every act of sensation, reasoning, or thinking, we are conscious to ourselves of our own being; and, in this matter, come not short of the highest degree of certainty.

CHAPTER 10. OF OUR KNOWLEDGE OF THE EXISTENCE OF A GOD

1. *We are capable of knowing certainly that there is a God.*—Though God has given us no innate ideas of himself; though he has stamped no original characters on our minds, wherein we may read his being; yet having furnished us with those faculties our minds are endowed with, he hath not left himself without witness: since we have sense, perception, and reason, and cannot want a clear proof of him, as long as we carry *ourselves* about us. Nor can we justly complain of our ignorance in this great point; since he has so plentifully provided us with the means to discover and know him; so far as is necessary to the end of our being, and the great concernment of our happiness. But, though this be the most obvious truth that reason discovers, and though its evidence be (if I mistake not) equal to mathematical certainty: yet it requires thought and attention; and the mind must apply itself to a regular deduction of it from some part of our intuitive knowledge, or else we shall be as uncertain and ignorant of this as of other propositions, which are in themselves capable of clear demonstration. To show, therefore, that we are capable of *knowing*, i.e., *being certain* that there is a God, and *how we may come by* this certainty, I think we need go no further than *ourselves*, and that undoubted knowledge we have of our own existence.

2. *For man knows that he himself exists.*—I think it is beyond question, that man has a clear idea of his own being; he knows certainly he exists, and that he is something. He that can doubt—whether he be anything or no, I speak not to; no more than I would argue with pure nothing, or endeavour to convince nonentity that it were something. If any one pretends to be so sceptical as to deny his own existence,

(for really to doubt of it is manifestly impossible,) let him for me enjoy his beloved happiness of being nothing, until hunger or some other pain convince him of the contrary. This, then, I think I may take for a truth, which every one's certain knowledge assures him of, beyond the liberty of doubting, viz., that he is something that actually exists.

3. *He knows also that nothing cannot produce a being; therefore something must have existed from eternity.*—In the next place, man knows, by an intuitive certainty, that bare *nothing can no more produce any real being, than it can be equal to two right angles*. If a man knows not that nonentity, or the absence of all being, cannot be equal to two right angles, it is impossible he should know any demonstration in Euclid. If, therefore, we know there is some real being, and that nonentity cannot produce any real being, it is an evident demonstration, that *from eternity there has been something*; since what was not from eternity had a beginning; and what had a beginning must be produced by something else.

4. *And that eternal Being must be most powerful.*—Next, it is evident, that what had its being and beginning from another, must also have all that which is in and belongs to its being from another too. All the powers it has must be owing to and received from the same source. This eternal source, then, of all being must also be the source and original of all power; and so *this eternal Being must be also the most powerful*.

5. *And most knowing.*—Again, a man finds in *himself* perception and knowledge. We have then got one step further; and we are certain now that there is not only some being, but some knowing, intelligent being in the world. There was a time, then, when there was no knowing being and when knowledge began to be; or else there has been also a *knowing being from eternity*. If it be said, there was a time when no being had any knowledge, when that eternal being was void of all understanding; I reply, that then it was impossible there should ever have been any knowledge: it being as impossible that things wholly void of knowledge, and operating blindly, and without any perception, should produce a knowing being, as it is impossible that a triangle should make itself three angles bigger than two right ones. For it is as repugnant to the idea of senseless matter, that it should put into itself sense, perception, and knowledge, as it is repugnant to the idea of a triangle, that it should put into itself greater angles than two right ones.

6. *And therefore God.*—Thus, from the consideration of ourselves, and what we infallibly find in our own constitutions, our reason leads us to the knowledge of this certain and evident truth,—*That there is an eternal, most powerful, and most knowing Being*; which whether any one will please to call God, it matters not. The thing is evident, and from this idea duly considered, will easily be deduced all those other attributes, which we ought to ascribe to this eternal Being. If, nevertheless, any one should be found so senselessly arrogant, as to suppose man alone knowing and wise, but yet the product of mere ignorance and chance; and that all the rest of the universe acted only by that blind haphazard; I shall leave with him that very rational and emphatical rebuke of Tully, to be considered at his leisure: “What can be more sillily arrogant and misbecoming, than for a man to think that he has a mind and understanding in him, but yet in all the universe beside there is no such thing? Or that those things, which with the utmost stretch of his reason he can scarce comprehend, should be moved and managed without any reason at all?” . . .

From what has been said, it is plain to me we have a more certain knowledge of the existence of a God, than of anything our senses have not immediately discovered to

us. Nay, I presume I may say, that we more certainly know that there is a God, than that there is anything else without us. When I say we *know*, I mean there is such a knowledge within our reach which we cannot miss, if we will but apply our minds to that, as we do to several other inquiries.

* * *

CHAPTER 11. OF OUR KNOWLEDGE OF THE EXISTENCE OF OTHER THINGS

1. *Knowledge of the existence of other finite beings is to be had only by actual sensation.*—The knowledge of our own being we have by intuition. The existence of a God, reason clearly makes known to us, as has been shown.

The knowledge of the existence of *any other thing* we can have only by sensation: for there being no necessary connexion of real existence with any idea a man hath in his memory; nor of any other existence but that of God with the existence of any particular man: no particular man can know the existence of any other being, but only when, by actual operating upon him, it makes itself perceived by him. For, the having the idea of anything in our mind, no more proves the existence of that thing, than the picture of a man evidences his being in the world, or the visions of a dream make thereby a true history.

2. *Instance: whiteness of this paper.*—It is therefore the *actual receiving* of ideas from without that gives us notice of the existence of other things, and makes us know, that something doth exist at that time without us, which causes that idea in us; though perhaps we neither know nor consider how it does it. For it takes not from the certainty of our senses, and the ideas we receive by them, that we know not the manner wherein they are produced: v.g., whilst I write this, I have, by the paper affecting my eyes, that idea produced in my mind, which, whatever object causes, I call *white*; by which I know that that quality or accident (i.e., whose appearance before my eyes always causes that idea) doth really exist, and hath a being without me. And of this, the greatest assurance I can possibly have, and to which my faculties can attain, is the testimony of my eyes, which are the proper and sole judges of this thing; whose testimony I have reason to rely on as so certain, that I can no more doubt, whilst I write this, that I see white and black, and that something really exists that causes that sensation in me, than that I write or move my hand; which is a certainty as great as human nature is capable of, concerning the existence of anything, but a man's self alone, and of God.

3. *This notice by our senses, though not so certain as demonstration, yet may be called knowledge, and proves the existence of things without us.*—The notice we have by our senses of the existing of things without us, though it be not altogether so certain as our intuitive knowledge, or the deductions of our reason employed about the clear abstract ideas of our own minds; yet it is an assurance that deserves the name of *knowledge*. If we persuade ourselves that our faculties act and inform us right concerning the existence of those objects that affect them, it cannot pass for an ill-grounded confidence: for I think nobody can, in earnest, be so sceptical as to be uncertain of the existence of those things which he sees and feels. At least, he that can doubt so far, (whatever he may have with his own thoughts,) will never have any controversy with

me; since he can never be sure I say anything contrary to his own opinion. As to myself, I think God has given me assurance enough of the existence of things without me: since, by their different application, I can produce in myself both pleasure and pain, which is one great concernment of my present state. This is certain: the confidence that our faculties do not herein deceive us, is the greatest assurance we are capable of concerning the existence of material beings. For we cannot act anything but by our faculties; nor talk of knowledge itself, but by the help of those faculties which are fitted to apprehend even what knowledge is.

But besides the assurance we have from our senses themselves, that they do not err in the information they give us of the existence of things without us, when they are affected by them, we are further confirmed in this assurance by other concurrent reasons:—

4. I. *Confirmed by concurrent reasons:—First, because we cannot have ideas of sensation but by the inlet of the senses.*—It is plain those perceptions are produced in us by exterior causes affecting our senses: because those that want the organs of any sense, never can have the ideas belonging to that sense produced in their minds. This is too evident to be doubted: and therefore we cannot but be assured that they come in by the organs of that sense, and no other way. The organs themselves, it is plain, do not produce them: for then the eyes of a man in the dark would produce colours, and his nose smell roses in the winter: but we see nobody gets the relish of a pineapple, till he goes to the Indies, where it is, and tastes it.

5. II. *Secondly, Because we find that an idea from actual sensation, and another from memory, are very distinct perceptions.*—Because sometimes I find that *I cannot avoid the having those ideas produced in my mind.* For though, when my eyes are shut, or windows fast, I can at pleasure recall to my mind the ideas of light, or the sun, which former sensations had lodged in my memory; so I can at pleasure lay by *that* idea, and take into my view that of the smell of a rose, or taste of sugar. But, if I turn my eyes at noon towards the sun, I cannot avoid the ideas which the light or sun then produces in me. So that there is a manifest difference between the ideas laid up in my memory, (over which, if they were there only, I should have constantly the same power to dispose of them, and lay them by at pleasure,) and those which force themselves upon me, and I cannot avoid having. And therefore it must needs be some exterior cause, and the brisk acting of some objects without me, whose efficacy I cannot resist, that produces those ideas in my mind, whether I will or no. Besides, there is nobody who doth not perceive the difference in himself between contemplating the sun, as he hath the idea of it in his memory, and actually looking upon it: of which two, his perception is so distinct, that few of his ideas are more distinguishable one from another. And therefore he hath certain knowledge that they are not *both* memory, or the actions of his mind, and fancies only within him; but that actual seeing hath a cause without.

6. III. *Thirdly, because pleasure or pain, which accompanies actual sensation, accompanies not the returning of those ideas without the external objects*—Add to this, that many of those ideas are *produced in us with pain*, which afterwards we remember without the least offence. Thus, the pain of heat or cold, when the idea of it is revived in our minds, gives us no disturbance; which, when felt, was very troublesome; and is again, when actually repeated: which is occasioned by the disorder the external object causes in our bodies when applied to them: and we remember the pains of hunger, thirst, or the headache, without any pain at all; which would either never disturb us, or else constantly do it, as often as we thought of it, were there nothing more but ideas

floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad. The same may be said of *pleasure*, accompanying several actual sensations. And though mathematical demonstration depends not upon sense, yet the examining them by diagrams gives great credit to the evidence of our sight, and seems to give it a certainty approaching to that of demonstration itself. For, it would be very strange, that a man should allow it for an undeniable truth, that two angles of a figure, which he measures by lines and angles of a diagram, should be bigger one than the other, and yet doubt of the existence of those lines and angles, which by looking on he makes use of to measure that by.

7. IV. *Fourthly, because our senses assist one Another's testimony of the existence of outward things, and enable us to predict.*—Our senses in many cases *bear witness to the truth of each other's report*, concerning the existence of sensible things without us. He that sees a fire, may, if he doubt whether it be anything more than a bare fancy, *feel* it too; and be convinced, by putting his hand in it. Which certainly could never be put into such exquisite pain by a bare idea or phantom, unless that the pain be a fancy too: which yet he cannot, when the burn is well, by raising the idea of it, bring upon himself again.

Thus I see, whilst I write this, I can change the appearance of the paper; and by designing the letters, tell *beforehand* what new idea it shall exhibit the very next moment, by barely drawing my pen over it: which will neither appear (let me fancy as much as I will) if my hands stand still; or though I move my pen, if my eyes be shut: nor, when those characters are once made on the paper, can I choose afterwards but see them as they are; that is, have the ideas of such letters as I have made. Whence it is manifest, that they are not barely the sport and play of my own imagination, when I find that the characters that were made at the pleasure of my own thoughts, do not obey them; nor yet cease to be, whenever I shall fancy it, but continue to affect my senses constantly and regularly, according to the figures I made them. To which if we will add, that the sight of those shall, from another man, draw such sounds as I beforehand design they shall stand for, there will be little reason left to doubt that those words I write do really exist without me, when they cause a long series of regular sounds to affect my ears, which could not be the effect of my imagination, nor could my memory retain them in that order.
