

Question 3

1 pts

A researcher is investigating the effect of habitat on the average number of offspring that grey squirrels have each year. She monitored grey squirrels in three different habitats - a woodland forest, a suburban residential area, and an inner city urban area. At least 10 adult female grey squirrels were monitored in each habitat treatment and the researcher counted the number of offspring produced by each squirrel during a complete year. She then calculated the average number of offspring per female from each habitat.

The researcher should present this data in a

bar graph.

line graph.
