

## Question 4

1 pts

A researcher is investigating the effect of added nutrients on the growth of jalapeno pepper plants. Ten pepper plants are planted in pots of soil. Five of the plants are watered with pure water while the other five are watered with a solution of plant fertilizer. The researcher measures the height of each plant every day for two weeks. She then calculates the average height of the water-treated plants and the average height of the fertilizer-treated plants for each day of the two week period.

The researcher should present this data in a
