## Academic Analysis

In 8-12 pages, in APA format, you will analyze a specific subject in the physical world through a scientific, academic lens. While the paper will likely not have primary experimentation, it should carefully review and analyze relevant, credible sources to build background information and provide context to the subject's main question or area of inquiry. The writing should be factual rather than opinionated and may focus on the findings, methods, and conclusions of other researchers.

While different types of analysis can be utilized, the focus of the essay and its overall purpose should be clear. A common organizational structure for this type of academic writing includes the following:

- Abstract
- Introduction including objective and importance
- Literature Review may include research methods
- Findings (often includes sub-topics)
- Conclusion, relevance, and future studies
