Childhood Prevention of Mental Disorders

Introduction

In the studies that seek to obtain different methods of preventing mental disorders, researchers have come up with different view and opinions on how to ensure that mental disorders are reduced. In ensuring that individuals are not faced by mental disorders, different method has different impacts on different people. In some cases, the method used in ensuring that an individual does not have mental disorders have been effective in some individuals and this is still the main method which has had better results, in the paper the prevention measure involved in the prevention of mental disorders is prenatal and early childhood nurse home visitation program.

Childhood Prevention of Mental Disorders

Prenatal and early childhood nurse programs seem to be effective in the prevention of mental disorders. By identifying the disorder and dealing with it at an early age gives the professional a better chance to handle the situation compared to individuals who tend to seek treatment when it's too late and probably had the disorder so severe. Addressing a mental disorder at an early age is always accompanied by better results with successes in cases where there was an effective treatment (Jorm, A. F., & Mulder, R. J., 2018). However, if the method is not working for an individual, an alternative method is always advised. There has been an issue with the number of people affected by mental disorders at a certain point in their lives. Mental disorders may extend to affecting several family members in families where there have been people affected by the disorder. The issue of mental disorders has also been on the rise in the recent past and this makes the government adjust its budget to cater for the cost involved in the treatment of people with mental disorders. One of the main ways that have been practiced in

treating the disorder is through the early hood nurse visitation program which is costly for most of the people but effective in treating the disorder in return.

Not scientific

← In my opinion, the use of the early childhood nursing program is an effective method in treating the disorder and within the ethical considerations. Unlike methods that may involve medications and use of drugs to overcome mental disorders, the use of the early childhood visitation programs does not pose any harm to an individual thus being an ethically correct method of treatment. The visitation programs seem to be a better method because no harm is intended or expected to happen in the development of the child (Freud, 2108). This is unlike some methods which end up ^{exacerbating} worsening the state of the mental disorder in an individual or simply not working for some of the patients. However, it is crucial to have the guardians of the individual with the problem of mental disorder permission before carrying out the process on the young one. moreover, as the children grow up, they should be made aware of what is going on and have a say on whether they would like to continue with it (Freud, 2108).

What are examples of methods that made things worse?

2018?

This topic seems random...

Based on findings from a recently ^{??} conducted research, there are over 450 million people who suffer from mental disorders. Furthermore, it is estimated that about seventy percent of the people suffering from mental disorders are in developing countries. This is caused by a couple of issues that happen in the daily lives of people mostly in developing countries where there many occurrences of activities for instance violence, insecurity, and poverty among the citizens of the countries. Mental disorders don't only affect the sick but also their relatives, friends, the economy, and the country as a whole. Besides, there are many costs incurred in the treatment of mental disorders which include the medication for the disorder, transportation cost and the consultation fees for the doctors.

Redundant you already talked about this in 1st paragraph

Conclusion

You don't need a conclusion for this paper.

Prenatal and early childhood care program have been proven to have a great impact on the treatment of individuals with the disorder of mental illness. This is because the method involved identifying the disorder at an early age which in returns has successful outcomes in the treatment of mental illness. ^Bbesides, the ethical considerations are also met as no harm is likely to affect the individual undergoing the treatment. Mental disorders affect many people all over the world. Their impact is felt by the victims, family, and the economy (Jorm, ~~AA~~ & Mulder, ~~RL~~ ~~et al.~~, 2018). In carrying out these trails, it is essential to gain permission from parents and notify the children as they grow up in trying to eradicate the sickness, medical bodies and the government should work together in eradication the illness among its citizens.

- ① Your intro needs to be more focused.
- ② ~~§~~ So, what is your study about? There isn't any mention about what you ~~w~~ want to research and how you'll do it.
- ③ Need a method section
- ④ Need a hypothesis
- ⑤ Need more past research findings ~~supporting my idea~~ that lead up to your study's hypothesis
Justifying the importance of your study topic.
- ⑥ Need more references
