Introduction

Bipolar disorder refers to a mental illness that significantly shifts patients' self-esteem, cognitive abilities, mood, and sleep patterns. Bipolar disorder is a common disease whereby two or one people have the disease in an adult population. The condition is common in people aged 25 years and above. (2) Bipolar disorder symptoms vary based on the episode type, which may be manic or depressive (Carvalho et al., 2020). In this case, the physical actions and moods of an individual determine the episode type. (2) For instance, the patient's change in behavior, attitude, and thinking is mental illness signs. The unpredictable mood disorder affects all people equally at any life stage, whether rich or poor. At times, the changes may be sudden, making the people in the surroundings notice. Generally, it is inappropriate to take bipolar disease for granted since it complicates with time. In this case, many suffer from the stigma that affects the disease process's severity and the capability of having normal work and social experience. (2) If identified at an early stage, the disease is
