View Report Summary

served. The patient developed side effects in the form of decreased appetite. ③ The physicians observed ethical issues such as patient privacy and confidentiality, safety and informed consent. They only shared information about the patient's condition with the parents. Data collected on the patient and the family was also handled with the utmost confidentiality. The involvement of any other party was only done with the consent of the parents. The psychiatrist described the appropriate treatment procedure and the alternatives available to the parents to help them make an informed decision. ⑦ Decision #3 The third decision was to maintain the

current dose of Strattera and reevaluate the side effects after four weeks. The decision was reached since Strattera had already demonstrated positive results, including reversing the side effects of the first medication. The side effects associated with the medicine were expected to reduce and pass away with time. However, the medicine should be used with close monitoring to ensure the persistence of the effects is noted early enough. Increasing or reducing the dosage at this point would also risk
